Part 1

Welcome to PRTG

1 Welcome to PRTG

Welcome to PRTG. You have chosen a software product that comes with a comprehensive set of features to monitor your entire network.

A Standard Installation of PRTG

Why Network Monitoring is Important

Today, nearly every business relies on a computer and network infrastructure for internet, internal management, telephone, and email. A complex set of servers and network equipment is required to ensure that business data flows seamlessly between employees, offices, and customers. The economic success of an organization is tightly connected to a hitch-free flow of data.

That is why your computer network has to work successfully: reliability, speed, and efficiency are crucial. But, like all other technical objects, network devices may fail from time to time and may potentially cause trouble and loss of sales, no matter what migration efforts have been made up front.

You need to take three key steps to maintain network uptime, reliability, and speed:

1. Set up a well-planned network with reliable components.
2. Create recovery plans for the event of device failure.
3. Monitor the network to get informed about failures when they (are about to) occur.

Monitoring Networks with PRTG

PRTG is a comprehensive network monitoring application for Windows-based systems. It is suitable for networks of all sizes and capable of LAN, WAN, WLAN, and VPN monitoring. You can also monitor physical or virtual web, mail, and file servers, Linux systems, Windows clients, routers, and much more.

PRTG monitors network availability and bandwidth usage, as well as various other network parameters such as quality of service, memory load, and CPU usage, even on remote machines. PRTG provides system administrators with live readings and periodical usage trends to optimize the efficiency, layout, and setup of leased lines, routers, firewalls, servers, and other network components.

The software monitors a network that uses Simple Network Management Protocol (SNMP), Windows Management Instrumentation (WMI), packet sniffer, Cisco NetFlow (as well as IPFIX, sFlow, and jFlow), and many other industry standard protocols. It runs on a Windows-based machine in your network for 24 hours a day. PRTG constantly records the network usage parameters and the availability of network systems. The recorded data is stored in an internal database for later analysis.

Welcome to PRTG

1.1 About this Document

This document introduces you to the system concepts of PRTG Network Monitor and Paessler PRTG Enterprise Monitor (hereinafter referred to as **PRTG**) and explains how to set up the software to achieve the best monitoring results. It shows you how to plan your monitoring setup, how to set up your devices and sensors, dependencies, reports, notifications, maps, user accounts, and how to use a cluster for fail-safe monitoring.

This document is also meant as a reference for all available settings in PRTG. Short contextual help is already provided within the PRTG web interface. In this manual, you often get more detailed help regarding the different options that are available. Whether you use PRTG Hosted Monitor or PRTG on premises, all the information that you need is in this document.

This document does **not** give an in-depth explanation of monitoring protocols and file formats. Also, the use of the application programming interface (API) built into PRTG is only briefly addressed. Whenever possible, hyperlinks to more detailed resources are provided, such as articles in our [Knowledge Base](#).

■ To use PRTG right away, see section [Quick Start Guide](#)^[44]. To learn more about monitoring with PRTG, see section [Introduction: Monitoring with PRTG](#)^[34]. For more detailed instructions, browse the manual content or use the manual search with keywords and choose the section that you want to read.

■ For an overview of the icons and abbreviations that are used in this document, see section [Appendix](#)^[454].

1.2 Key Features

PRTG offers two options to monitor your network: PRTG on premises and PRTG Hosted Monitor. With PRTG on premises, the PRTG core server and local probe run within your network. PRTG Hosted Monitor is the PRTG cloud solution, where we at Paessler run the PRTG core server and hosted probe for you. The PRTG web interface for monitoring configuration and reviewing monitoring data is the same for both PRTG Hosted Monitor and PRTG on premises.

What is PRTG for?

Monitoring with PRTG

- Monitoring and alerting you about uptimes and downtimes or slow servers
- System health monitoring of your various hardware devices
- Network device monitoring and bandwidth accounting
- Application monitoring
- Monitoring virtual servers

- Service level agreement (SLA) monitoring
- System usage monitoring (for example, CPU load, free memory, or free disk space)
- Database performance and table values monitoring
- Email server monitoring and reviewing various backup solutions
- Monitoring your network's physical environment
- Classifying network traffic by source or destination, as well as content
- Discovering unusual, suspicious, or malicious activity with devices or users
- Measuring Quality of Service (QoS) and Voice over IP (VoIP) parameters
- Cloud monitoring services
- Discovering and evaluating network devices
- Collecting system information for various hardware types
- Finding unexpected relationships between your network components to detect potential security issues and assessing the real usage of your network and hardware
- Fail-safe monitoring with a cluster

What is Included in PRTG?

The PRTG on premises installer or a PRTG Hosted Monitor instance contains everything that is necessary to immediately run your monitoring system.

- High performance: The database system stores raw monitoring results as well as logs, Toplists, and tickets. This outperforms Structured Query Language (SQL) servers for monitoring data. You can distribute high loads among probes. You can also access the database through the PRTG API.
- Minimal [system requirements](#)^[23]: For PRTG on premises, an average PC that is not older than 2 years is sufficient, and a netbook can also monitor over a thousand sensors. PRTG Hosted Monitor requires no hardware for the PRTG core server.
- High security standards: Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connections and web servers, secure ciphers, a personalized user rights management, and much more.
 - For more information, see the Knowledge Base: [What security features does PRTG include?](#)
- An SSL/TLS-secured web server with HTTP and HTTPS support for the PRTG web interface, which works as a Single Page Application (SPA) to avoid time-intensive page reloading.
- An email relay server for automatic email delivery.
- Customizable, personalized alerting:
 - Various notification methods, for example, email, push, SMS text messages, Syslog messages and Simple Network Management Protocol (SNMP) traps, HTTP requests, event logs, Amazon Simple Notification Service (SNS), executing scripts.
 - Multiple ways to trigger notifications, for example, status alerts, limit alerts, threshold alerts, multiple condition alerts, escalation alerts.
 - Gradual dependencies to avoid alarm floods, acknowledging certain alarms to avoid further notifications for this alarm, and alert scheduling.
- In-depth report generator to create reports on demand or scheduled reports in HTML, as .pdf file, .csv or .xml data files. Several report templates are available by default.

- Graphics engine for user-friendly live graphs and historic data graphs.
- Network analysis modules to automatically discover network devices and sensors.
- Distributed monitoring to monitor several networks in different locations.
- Special features for managed service providers (MSP) to monitor customer networks and increase the quality of service.
- Data publishing with real-time dashboards (private and public maps) including live performance and status information. You can design these dashboards with many different objects and you can integrate external objects as well.
- Multiple languages such as English, German, Spanish, French, Portuguese, Dutch, Japanese, Russian, and Simplified Chinese.
- Customization: The PRTG API lets you develop your own features. Additionally, you can create custom sensors, notifications, and device templates according to your specific requirements.

PRTG supports monitoring up to several thousand sensors per installation, depending on various parameters. It can optionally work with remote probes to monitor multiple sites or network segments from one central core installation, and to distribute high monitoring loads. You can also configure fail-safe monitoring with a cluster to perform automatic failovers.

1.3 New in This Version

The continuous development and rollout of PRTG constantly expands its functionalities. Instead of delivering only a few versions with massive changes in every update each year, PRTG is automatically and continuously enhanced with new features and fixes.

We provide three release channels for PRTG on premises:

- **Stable:** Best tested version for live systems. It is updated about once or twice a month. It is for use on live systems.
- **Preview:** Offers the latest features and fixes and is updated several times a month. Consider this version as "beta", so do not use this version on live systems you depend on.
- **Canary:** Provides nightly builds and is updated very often. It is not extensively tested. Never use it on live systems you depend on.

With the release channels, you can choose from maximum stability, early access to new features, or a mix of both.

☁ PRTG Hosted Monitor does not have release channels. Instead, we roll out the latest Stable version to PRTG Hosted Monitor instances in stages.

■ For an overview of all changes in the different versions, see the [Release notes for the "stable" release channel](#) on our website.

More

■ [PAESSLER WEBSITE](#)

Release notes for the "stable" release channel

- [Available Licenses](#) ²¹
- [System Requirements](#) ²³
- [Introduction: Monitoring with PRTG](#) ³⁴

1.4 Available Licenses

Our licenses count by sensors. We define one sensor as one aspect that you monitor on a device.

Three different editions are available.

Freeware Edition

The Freeware Edition is a good solution for starters or for private use:

- Free for personal and commercial use.
- Can monitor up to 100 sensors.
- Supports all available sensors.

If you want to use the Freeware Edition, install the Trial Edition first and get a free trial key. After the trial period has ended, your Trial Edition automatically turns into a Freeware Edition.

☁ This option is not available in PRTG Hosted Monitor.

Trial Edition

The Trial Edition is intended for evaluation purposes:

- Can monitor an unlimited number of sensors.
- Supports all available sensors.
- For PRTG on premises, you have to request the temporary license key from our website. Usually, you see the license details and the key if you click the Free Download button on the [Paessler website](#).
- The trial period of PRTG on premises is limited to 30 days and automatically turns into a Freeware Edition afterward.
- PRTG Hosted Monitor provides a 10-day trial. Afterward, your instance is deleted. Purchase a commercial edition to keep your instance.
- Each PRTG on premises license includes one single failover [cluster](#)^[135] that consists of two cluster nodes. A cluster with two and three failover nodes requires an additional trial license key. A cluster with four failover nodes requires two additional trial license keys.

After the trial period has ended, a PRTG on premises Trial Edition automatically turns into a Freeware Edition that lets you to monitor up to 100 sensors for free.

Commercial Editions

Several licenses that suit the demands of smaller as well as larger customers and organizations are available:

- Can monitor a maximum number of sensors (consider our [recommendations](#)^[28]).
- Supports all available sensors.
- Each PRTG on premises license includes one single failover cluster that consists of two cluster nodes. A cluster with two and three failover nodes requires an additional license of the same size. A cluster with four failover nodes requires two additional licenses of the same size.

■ For more information about available commercial licenses, see the Paessler website: [Pricing](#)

1.5 System Requirements

There are different aspects that you need to consider regarding the system requirements for PRTG. Meet these requirements to avoid issues while you monitor your network.

In this section:

- [Basic System Requirements](#) ^[23]
 - [Requirements for the PRTG Core Server \(PRTG on premises\)](#) ^[23]
 - [Requirements for Remote Probes](#) ^[24]
 - [General Performance Impact Considerations](#) ^[25]
 - [Running PRTG in Virtual Environments](#) ^[26]
 - [Running PRTG in a Cluster](#) ^[26]
 - [Large PRTG Installations](#) ^[27]
- [Detailed System Requirements](#) ^[27]
 - [Supported Operating Systems for the PRTG Core Server and Remote Probes](#) ^[27]
 - [Hardware and Network Size Requirements for the PRTG Core Server](#) ^[28]
 - [Hardware and Network Size Requirements for Remote Probes](#) ^[29]
 - [Performance Impact Considerations Based on Sensor Types](#) ^[29]
 - [Supported Web Browsers](#) ^[30]
- [Further System Requirements](#) ^[31]
 - [Screen Resolution](#) ^[31]
 - [Requirements for Monitored Devices](#) ^[31]
 - [Requirements for Smartphones and Tablets](#) ^[32]
- [More](#) ^[32]

Basic System Requirements

PRTG consists of two main [system parts](#) ^[130], the PRTG core server and the probes.

- If you want to use PRTG on premises, you need to install PRTG on a system that meets the [basic system requirements for the PRTG core server \(PRTG on premises\)](#) ^[23].
- If you want to use PRTG Hosted Monitor, you need to install at least one remote probe on a system that meets the [basic system requirements for remote probes](#) ^[24].

Requirements for the PRTG Core Server (PRTG on premises)

■ For more detailed information, see the [hardware and network size requirements](#) ^[28] for the PRTG core server.

For installations of the [PRTG core server](#) ^[131], you need to meet the following requirements.

Category	Requirement
Hardware	We recommend that you use x64 server hardware or a properly configured virtual environment ²⁶ .
Operating system	We recommend that you use Microsoft Windows Server 2019, Microsoft Windows Server 2016, or Microsoft Windows Server 2012 R2.
Microsoft .NET Framework	Microsoft .NET Framework .NET 4.7.2 or later must be installed on the PRTG core server system or the remote probe system. For new installations of the PRTG core server or remote probes, we recommend .NET Framework 4.8 . ■ For more information, see the Knowledge Base: Which .NET version does PRTG require?
Web browser	The following browsers are officially supported by the PRTG web interface (in order of performance and reliability): <ul style="list-style-type: none"> ▪ Google Chrome 72 ▪ Mozilla Firefox 65 ▪ Microsoft Internet Explorer 11 <p>ⓘ For security and performance reasons, we strongly recommend that you always use the latest version of Google Chrome to access the PRTG web interface.</p>

☁ PRTG Hosted Monitor does not require any hardware for the PRTG core server, but it needs at least one remote probe installation to monitor your local network.

Requirements for Remote Probes

■ For more detailed information, see the [hardware and network size requirements](#) ²⁹ for remote probes.

For installations of [remote probes](#) ⁴⁵⁰³, you need to meet the following requirements:

Category	Requirement
Hardware	We recommend that you use compatible x86 hardware or a properly configured virtual environment ²⁶ .
Operating system	We recommend that you use Microsoft Windows Server 2019, Microsoft Windows Server 2016, Microsoft Windows Server 2012 R2, or Microsoft Windows 10.

Category	Requirement
.NET Framework	<p>Microsoft .NET Framework .NET 4.7.2 or later must be installed on the PRTG core server system or the remote probe system. For new installations of the PRTG core server or remote probes, we recommend .NET Framework 4.8.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Stable network connection	<p>Remote probes require a stable network connection between the PRTG core server and the remote probe. Remote probes that connect to a PRTG Hosted Monitor instance need a reliable internet connection. Unstable connections, for example via 3G, might work but you might lose monitoring data if the connection is unreliable.</p>

General Performance Impact Considerations

Category	Performance Impact Considerations
Hardware resources	<p>For a PRTG core server to work properly, it is crucial to have a certain amount of hardware resources available. If the server runs out of resources, PRTG sends warning and emergency messages to the primary email address of the PRTG System Administrator user.</p> <p> You receive warning messages if the available disk space falls below 1 GB or if the available memory falls below 500 MB, and emergency messages if the available disk space or memory fall below 50 MB. In this case, react immediately and free up system resources.</p>
Sensors	<p>Ping and SNMP sensors create much less load than complex sensors like xFlow sensors, VMware sensors, Sensor Factory sensors, WMI sensors, or Syslog Receiver or SNMP Trap Receiver sensors, for example.</p> <p> There are also limitations for some sensors that do not depend on hardware resources, for example, WMI and SNMP v3 sensors. You can overcome these limitations if you distribute the sensors between remote probes.</p> <p> For clusters, we recommend that you stay below 2,500 sensors per cluster.</p>
Channels	<p>We recommend that you use sensors with less than 50 channels. Note that sensors with more than 50 channels are not officially supported and can have a high impact on system performance.</p>
Scanning interval	<p>For a single PRTG core server setup without a cluster, we recommend that you mainly use 1-minute scanning intervals for up to 2,000 sensors and 5-minute intervals if you have more sensors.</p>

Category	Performance Impact Considerations
	<p>i To give you an impression: To monitor 5,000 sensors with a 1-minute scanning interval, PRTG takes 7.2 million measurements and evaluates, notifies, and stores them. This adds 700 MB of additional data to the database every single day.</p>
CPU-intensive features	<p>Try to limit the use of the following features:</p> <ul style="list-style-type: none"> ▪ Many quickly refreshed maps⁴⁰⁹⁵, ▪ The frequent generation of huge reports⁴⁰⁶⁹, ▪ Heavy usage of packet sniffing⁴³⁰³, Sensor Factory sensors, and Toplists⁴⁰⁰², ▪ Frequent automatically scheduled auto-discoveries²⁹⁶ for large network segments, and ▪ Constant queries of monitoring data via the PRTG API⁴³⁸⁹.
Network connection quality	<p>The quality of your network also plays an important role. When you monitor via User Datagram Protocol (UDP), for example, a high packet loss rate can lead to frequent timeouts. Remote probes that connect via unstable (WAN) connections can lead to delays as well.</p>

Running PRTG in Virtual Environments

You can run the PRTG core server and remote probes on virtualized platforms. However, PRTG consists of a lot of different components that all rely on the performance and the stability of the probe system where virtual environments add even more layers of complexity. This needs to be considered when you want to set up your PRTG installation in a way that you can achieve the same level of performance as on a physical server.

Most PRTG installations from 500 to 5,000 sensors do not need any specific optimization regarding your virtual infrastructure.

If you run larger installations of PRTG with more than 5,000 sensors, we strongly recommend that you follow the instructions in our Best Practice Guide: Running large installations of PRTG in a virtual environment.

 To download the Best Practice Guide, see the [Paessler website](#).

Running PRTG in a Cluster

We recommend a single failover [cluster](#)¹³⁵ for fail-safe monitoring. This consists of two PRTG core servers that each work as a cluster node.

In a cluster, the monitoring load doubles with each cluster node, so the performance of each additional cluster node is halved. Therefore, in a single failover cluster, divide our recommended numbers from earlier in the section in half.

☁ This feature is not available in PRTG Hosted Monitor.

Large PRTG Installations

The maximum number of sensors you can monitor with one PRTG on premises installation mainly depends on the monitoring technology and the scanning intervals you use. In general, we recommend that you use a dedicated physical machine to run both the PRTG core server and remote probes. [Running large installations of PRTG in a virtual environment](#) is possible if you follow some specific rules and guidelines to achieve the required level of performance.

■ For more information, see section [Detailed System Requirements](#) ²⁷.

■ For more information, see the Knowledge Base: [How can I speed up PRTG—especially for large installations?](#)

☁ PRTG Hosted Monitor is restricted to a maximum of 10,000 sensors. More sensors are not possible.

Detailed System Requirements

Supported Operating Systems for the PRTG Core Server and Remote Probes

Category	Requirements
Supported operating systems	<p>The 32-bit and 64-bit versions of the following operating systems are officially supported for the PRTG core server service and PRTG probe service:</p> <ul style="list-style-type: none"> ▪ Microsoft Windows Server 2019* ▪ Microsoft Windows Server 2016* ▪ Microsoft Windows Server 2012 R2* ▪ Microsoft Windows Server 2012* ▪ Microsoft Windows 10 ▪ Microsoft Windows 8.1 ▪ Microsoft Windows 8 ▪ Microsoft Windows 7 ▪ Microsoft Windows Server 2008 R2* <p>* Windows servers in Core mode or Minimal Server Interface are not officially supported.</p>
Operating system version	The version (32-bit or 64-bit) of the PRTG core server depends on the version of your operating system.

Category	Requirements
Microsoft .NET Framework	<p>Microsoft .NET Framework .NET 4.7.2 or later must be installed on the PRTG core server system or the remote probe system. For new installations of the PRTG core server or remote probes, we recommend .NET Framework 4.8.</p> <ul style="list-style-type: none"> ■ For more information, see the Knowledge Base: Which .NET version does PRTG require? ⓘ The .NET framework is imperative if you want to monitor VMware and XenServer virtual environments. Many other sensors also need an installed Microsoft .NET Framework.
Disabled FIPS mode	<p>Make sure that the Federal Information Processing Standards (FIPS) mode (Windows security option "System Cryptography: Use FIPS-compliant algorithms for encryption, hashing, and signing.") is disabled on Windows systems that run the PRTG core server service or PRTG probe service. FIPS-compliant encryption can cause issues with sensors that use the .NET framework.</p> <ul style="list-style-type: none"> ■ For more information, see the Knowledge Base: Why should I disable the FIPS mode under Windows?

☁ PRTG Hosted Monitor is restricted to a maximum of 10,000 sensors. More sensors are not possible.

Hardware and Network Size Requirements for the PRTG Core Server

Hardware requirements for the PRTG core server service mainly depend on the sensors and scanning intervals that you use. Your network size can also influence the performance of your monitoring.

Sensors per PRTG core server	CPU cores	RAM	Disk space	Concurrently active administrator sessions	Number of remote probes
Up to 500	4	4 GB	100 GB	< 30	< 30
Up to 1,000	6	6 GB	500 GB	< 30	< 30
Up to 2,500	8	8 GB	750 GB	< 20	< 60
Up to 5,000	8	12 GB	1,000 GB	< 20	< 60
Up to 10,000	10 - 12	16 GB	1,500 GB	< 15	< 80

Sensors per PRTG core server	CPU cores	RAM	Disk space	Concurrently active administrator sessions	Number of remote probes
> 10,000	We recommend that you set up additional PRTG core servers. For more information on scaling, you can also contact the Paessler Presales team .				

Hardware and Network Size Requirements for Remote Probes

Hardware requirements for the PRTG probe service mainly depend on the sensors and scanning intervals that you use. Your network size can also influence performance of your monitoring.

Sensors per remote probe	CPU cores	RAM	Disk space
Up to 200	2	2 GB	40 GB
200 - 2,000	4	4 GB	40 GB
2,000 - 5,000	6	6 GB	40 GB
> 5,000	We recommend that you set up additional remote probes. For more information on scaling, you can also contact the Paessler Presales team .		

i A remote probe system does not have any special disk requirements (< 1 GB). In general, we recommend at least 40 GB.

Performance Impact Considerations Based on Sensor Types

You can find the [performance impact](#)⁴²⁴³ of a specific sensor on the sensor's Overview tab or in the [Add Sensor](#)³⁶² dialog.

■ For an overview list of sensors sorted by performance impact, see section [List of Sensors by Performance Impact](#)⁴⁶⁷².

In general, consider the following rules for the of different sensor types:

Sensor Type	Performance Impact Considerations
SNMP v1 and v2, Ping, Port, and HTTP	We recommend that you use these sensor types for scenarios with thousands of sensors.

Sensor Type	Performance Impact Considerations
SNMP v3	SNMP v3 has performance limitations because of the use of encryption. Furthermore, keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3.
WMI	Try to keep the number of WMI sensors per probe below 120 sensors (with a 60-second scanning interval), or below 600 sensors (with a 300-second scanning interval).
xFlow	The maximum number of xFlow sensors depends on the traffic pattern, the number of xFlow packets per second that the probe receives, as well as the performance of the probe system.
Packet Sniffer	This sensor type creates the highest CPU load on the probe system. We only recommend this technology for monitoring low traffic connections (< 50 Mbit/s steady stream). If the traffic often exceeds 10 Mbit/s, use a dedicated remote probe.
VMware monitoring	Monitoring VMware is limited to about 30 sensors at a 60-second scanning interval, or 100 sensors at a 5-minute scanning interval. On probes that run on Windows Server 2012 R2 or later, you can use more VMware sensors. These limitations issue from the VMware platform. <div style="background-color: #0070C0; color: white; padding: 2px;"> ■ For more information, see the Knowledge Base: How can I increase the connection limit on VMware systems? PE121 </div>

i You can overcome these limitations if you distribute the sensors between remote probes.

Detailed Information about Supported Web Browsers

Category	Requirements
Firefox	<p>i Firefox is potentially vulnerable to cross-site scripting (XSS) attacks. These XSS exploits are possible if you click, for example, phishing links in emails that contain malicious code, and you are logged in to PRTG with Firefox.</p> <p>■ For more information, see the Knowledge Base: How secure is it to access the PRTG web interface with Firefox?</p>
Microsoft Internet Explorer 11 and unsupported browsers	<ul style="list-style-type: none"> ▪ Microsoft Internet Explorer 11 and older versions of Microsoft Edge, as well as other browsers that are not officially supported, have issues with some functionalities of the PRTG web interface. However, you can access the PRTG web interface with any browser. ▪ Deprecated Internet Explorer versions as well as some mobile browsers might not be able to display all features of the PRTG web interface.

Category	Requirements
Plugins	<p>Plugins can also have an effect when you view the PRTG web interface. Make sure that you add exceptions for PRTG in the plugins' settings, particularly if you use ad blockers.</p> <ul style="list-style-type: none"> For more information, see the Knowledge Base: The logs page in the PRTG web interface does not load. What can I do?

Further System Requirements

Screen Resolution

A screen resolution of at least 1024x768 pixels is sufficient for most functions of PRTG. However, we recommend a screen resolution of 1200x800 pixels or higher.

Requirements for Monitored Devices

Category	Requirement
SNMP monitoring	<p>The monitored devices must support SNMP v1, v2c, or v3. An SNMP-compatible software must be installed on the device. You must enable SNMP on the device and you must grant the PRTG core server system access to the SNMP interface.</p> <ul style="list-style-type: none"> For more information, see section Monitoring via SNMP ⁴²⁸⁶.
Windows/WMI monitoring	<p>To monitor via WMI, you need a Windows network. Use only the officially supported operating systems ²⁷ except for Microsoft Windows Server 2008 that has strong performance issues when you monitor via WMI.</p> <ul style="list-style-type: none"> For more information, see section Monitoring via WMI ⁴²⁹⁸.
xFlow monitoring	<p>The monitored devices must be able to send NetFlow (NetFlow v5, NetFlow v9, or IPFIX) data packets or sFlow v5 packets to the probe system.</p> <ul style="list-style-type: none"> For more information, see section Monitoring Bandwidth via xFlows ⁴³⁰⁵.
Packet sniffer monitoring	<p>PRTG can only analyze data packets that pass the local machine's network card. Switches with monitoring ports are necessary for network-wide monitoring in switched networks.</p> <ul style="list-style-type: none"> For more information, see section Monitoring Bandwidth via Packet Sniffing ⁴³⁰³.

Category	Requirement
Other sensor types	You can find specific sensor and device requirements (for example, modules, components, device configurations) in the corresponding sensor section and in the Add Sensor dialog.

Requirements for Smartphones and Tablets

You can optionally use the PRTG apps for iOS and Android.

■ For more information and system requirements, see section [PRTG Apps for Mobile Network Monitoring](#) ⁴²⁷⁸.

1.6 Introduction: Monitoring with PRTG

This section provides an overview of basic principles of PRTG. It shows you how to prepare your IT infrastructure for monitoring with PRTG. You do not have to re-configure your whole network for PRTG, but there are several topics that are useful to consider before you actually use PRTG.

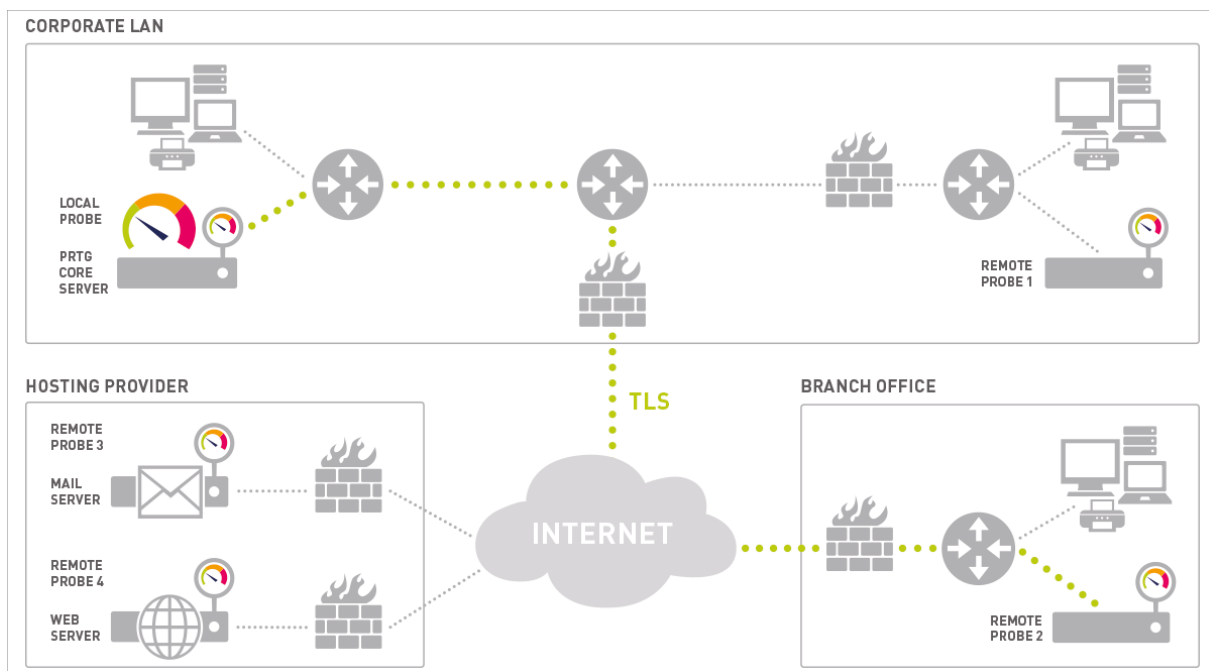

In this section:

- [What PRTG Does](#) ^[34]
- [How to Monitor with PRTG](#) ^[35]
- [What PRTG Monitors](#) ^[35]
- [How to Prepare Monitoring](#) ^[36]
- [Which Hardware Do I Want to Monitor](#) ^[37]
- [Types of Logins and Credentials](#) ^[37]
- [Monitoring Technologies](#) ^[38]
- [Notifications from PRTG](#) ^[41]

■ You can also see section [Quick Start Guide](#) ^[44] to immediately start monitoring.

What PRTG Does

PRTG is a unified monitoring tool with which you can monitor almost any object with an IP address. PRTG consists of the [PRTG core server](#) ^[131] that is responsible, for example, for the configuration, data management, and web server, and one or more [probes](#) ^[131] that perform data collection and monitoring processes on [devices](#) ^[140] via [sensors](#) ^[140].

PRTG Architecture

Sensors are the building blocks of PRTG. A sensor can tell you about one or more aspects of a device. For example:

- Uptime
- Load
- Interface throughput
- Bandwidth usage
- Loading times
- Speed
- Hardware status
- Temperature
- Quality
- Resource consumption
- User counts
- Record counts
- Log events
- Database requests

How to Monitor with PRTG

PRTG uses the following ways to receive monitoring data from target devices:

- Poll or query sensor data: PRTG actively obtains data from a device and refreshes it in regular intervals. This includes, for example, device status, resource usage, and performance metrics. Most sensors use this method. PRTG can also consume and collect sensor data based on interfaces with, for example, HTTP or HTTPS requests, port checks, email checks, File Transfer Protocol (FTP) downloads, and database requests.
- Listen for or receive sensor data: PRTG passively receives data that is pushed to PRTG by a device or application. This includes, for example, unexpected events, Syslogs and Simple Network Management Protocol (SNMP) traps, detailed data flow (bandwidth monitoring), and event log messages.

Most of the monitoring data that PRTG collects is actively queried. It is the basis for statistical sampling to see how a device or application performs over time.

 For more information, see section [Monitoring Technologies](#) ³⁸.

What PRTG Monitors

PRTG comes with more than [200 different sensors](#) ⁴⁵⁸¹ that range from platform-specific sensors to generic hardware and bandwidth sensors to custom scripts. It also comes with preconfigured sensors for common configurations. Add these sensors to the target devices that they are designed for to immediately receive monitoring data.

Additionally, you can add custom sensors in PRTG. For example, you can create individual sensors for devices for which PRTG does not provide native sensors, or you can write scripts that return data from applications. See also the [PRTG Sensor Hub](#) for ready-to-use custom sensors.

What Can PRTG Monitor?

How to Prepare Monitoring

Best practice for taking the first step in comprehensive monitoring is to make a plan. Think about the following questions.

- What do I need to monitor in my IT infrastructure?
- How can I retrieve the needed information? Which technologies and credentials are required?
- Which notification methods do I want to use to receive alerts if something is wrong?

You can use the following sections as a basis for your monitoring plan.

Which Hardware Do I Want to Monitor

When you plan what you want to monitor, we recommend that you add the most important devices within your infrastructure first. Start with the core network and other infrastructure that all network devices depend upon, your **Business Critical Tier-1**. This usually includes key infrastructure such as core routers, switches, VPN, firewalls, and basic network services such as the Dynamic Host Configuration Protocol (DHCP), the Domain Name System (DNS), and authentication like the Lightweight Directory Access Protocol (LDAP).

Hardware Overview

There is a huge number of different vendors with a lot of different hardware devices, so hardware details go beyond the scope of this article. Every IT infrastructure is individual, but here are the main points you should consider.

- Core infrastructure
 - a. Routers, switches, firewalls
 - b. Core network services: DNS, Active Directory, LDAP servers
- 1. For your hardware devices, you need statistics on availability, usage, and performance.
- 2. PRTG retrieves data via standard protocols:
 - a. Ping, SNMP; web queries via HTTP and HTTPS; email via Post Office Protocol version 3 (POP3), Internet Message Access Protocol (IMAP), Simple Mail Transfer Protocol (SMTP)
 - b. Hardware parameters via SNMP, Secure Shell (SSH), Simple Object Access Protocol (SOAP)
 - c. Bandwidth usage via xFlow (NetFlow, jFlow, sFlow, IPFIX), packet sniffing, SNMP
 - d. Windows systems via Windows Management Instrumentation (WMI)
 - e. Other interfaces via SSH and scripts (for example, PowerShell and Python)

PRTG monitors, tracks, and charts data, as well as generates alarms.

Types of Logins and Credentials

Many of the sensors included in PRTG rely on access through logins to specific systems. You need different credentials with sufficient permission for all the different devices, operating systems, and domains. The configuration might also be different if you want PRTG to act as a Syslog or SNMP trap receiver or to track xFlows.

In most cases, PRTG uses the following credential types to access the devices that you want to monitor.

- SNMP credentials
- Windows credentials (WMI)
- Linux, Solaris, and macOS credentials (SSH/Web-based Enterprise Management (WBEM))
- VMware and XenServer credentials
- Database management system (DBMS) credentials
- Other credentials (for example, AWS keys, HTTP proxy)

Define your (administrative) credentials for all types of target devices that you want to monitor in the root group of the device tree. Devices that you add to PRTG automatically [inherit](#)¹⁴² these credentials, so you do not usually have to reenter credentials, depending on the used monitoring technology.

Monitoring Technologies

This section briefly describes the most common monitoring technologies.

■ For more information, see section [Sensor Technologies](#)⁴²⁸⁵.

Monitoring with Simple Network Management Protocol (SNMP)

Simple Network Management Protocol (SNMP) is a set of standards for communication with devices in a Transmission Control Protocol (TCP)/IP network. SNMP monitoring is useful if you are responsible for servers and network devices such as hosts, routers, hubs, and switches. It enables you to keep an eye on network and bandwidth usage, and monitor important issues such as uptime and traffic levels.

You can use SNMP to monitor the bandwidth usage of routers and switches on a port-by-port basis, as well as device readings such as memory and CPU load. The target devices must support SNMP. Most devices with enabled SNMP require the same configuration like SNMP version and community string. To find out how to set up SNMP on a specific device, search the internet for your device name or model and SNMP configuration.

Network Monitoring via SNMP

When you use a sensor with this technology, PRTG sends small data packets to devices, for example, querying routers, switches, and servers for the traffic counters of each port. These queries trigger reply packets from the device. Compared to other bandwidth monitoring technologies via World Wide Name (WWW), packet sniffing, or Windows Management Instrumentation (WMI), the SNMP option creates the least CPU and network load.

PRTG supports three versions of the Simple Network Management Protocol (SNMP) protocol: version 1, version 2c, and version 3.

SNMP v1

This is the oldest and most basic version of SNMP.

- Pro: Supported by most SNMP-compatible devices.
- Con: Limited security because it only uses a simple password ([community string](#)^[4289]) and sends data in clear text (unencrypted). Because of this, you should only use it inside LANs behind firewalls, but not in WANs. Version 1 only supports 32-bit counters, which are not enough for high-load (gigabits/second) bandwidth monitoring.

SNMP v2c

This version adds 64-bit counters.

- Pro: Supports 64-bit counters to monitor bandwidth usage in networks with gigabits/second loads.
- Con: Limited security (same as with SNMP v1).

SNMP v3

This version adds authentication and encryption to SNMP.

- Pro: Offers user accounts and authentication for multiple users and optional data packet encryption to increase the available security, and has all advantages of Version 2c in addition.
- Con: Difficult to configure and higher overhead for the probe, which reduces the number of devices that you can monitor (see [here](#)^[4288] for more information).

SNMP Traps

Various devices can send SNMP trap messages to notify you of system events.

- PRTG supports SNMP v1 and SNMP v2c traps.
- The destination for SNMP traps is the IP address of the trap receiver, which is the IP of the probe system to which you add the [SNMP Trap Receiver sensor](#)^[3107].

Which SNMP Version Should I Choose?

The SNMP version you should choose depends on your environment. Here are some guidelines:

- If your network is publicly accessible, you might want to use SNMP v3, which has encryption and secure access. However, security and encryption add overhead, which results in less performance.
- If your network is isolated or well-protected behind firewalls, the lower security level of SNMP v1 or SNMP v2c might be sufficient.
- From the perspective of monitoring with PRTG, SNMP v2c is preferable if you have a lot of devices to monitor. This lets you monitor more devices with a shorter scanning interval, and it supports 64-bit counters.

The most important aspect is to set the same SNMP version in the PRTG settings (for example, in the [root group settings](#)^[366]) as you have configured in your target device. If you select an SNMP version that is not supported by the server or device that you want to monitor, you receive an error message. Unfortunately, these error messages, in most cases, do not explicitly point to the possibility that you are using the incorrect SNMP version. These messages provide minimum information only, such as [cannot connect](#). Similar errors occur when community strings, usernames, or passwords do not match.

- For more information about basic requirements for SNMP monitoring, see this Knowledge Base article: [My SNMP sensors don't work. What can I do?](#)

Monitoring Windows Systems

You can monitor Windows systems via [Windows Management Instrumentation \(WMI\)](#)^[4298] and [Windows performance counters](#)^[4298]. WMI is the Microsoft base technology for monitoring and managing Windows-based systems. PRTG uses this technology to access data of various Windows configuration parameters and status values. However, sensors using the WMI protocol generally have a high impact on system performance. In addition to strict WMI sensors, there are sensors that can use performance counters to monitor Windows systems.

To monitor via WMI and performance counters, it is usually sufficient to provide Credentials for Windows Systems in PRTG. However, monitoring via WMI is not always trivial and often causes issues.

■ If you run into issues, see the Knowledge Base: [My WMI sensors don't work. What can I do?](#)

It is also possible to use Simple Network Management Protocol (SNMP) for Windows devices. The same information is often available using any of these protocols. From a performance perspective, the preference is SNMP, then WMI or performance counters.

Bandwidth and Traffic Monitoring: xFlows and Packet Sniffing

Using xFlow (NetFlow, jFlow, sFlow, IPFIX) protocols, you can monitor the bandwidth usage of all packets going through a device. In PRTG, you can view [Toplists](#)^[4002] for all xFlow sensors.

xFlows are monitoring data pushed from network devices to PRTG. You can use them to monitor where and how much data is traveling to and from. This way, they determine which machine, protocol, or user is consuming bandwidth. PRTG supports the following xFlow types:

- NetFlow v5/v9 and IPFIX: Originally introduced by Cisco and supported by several vendors.
- jFlow: Traffic sampling technology introduced by Juniper networks.
- sFlow: Short for [sampled flow](#), introduced by HP. sFlow uses statistical sampling of the traffic at defined intervals to achieve scalability for high volume interfaces.

You can also use [packet sniffing](#)^[4303] for bandwidth monitoring if your hardware does not support any of these xFlow versions.

Monitoring Passively Received Data

PRTG provides the option to monitor passively received data. For this purpose, you can set up a device in a way that it automatically sends the data to PRTG. Specific sensors can receive this data and alert you based on your individual settings. For example, all Linux/Unix and most network devices support remote devices generating data that has to be configured on each device, and sending the messages to a probe system. Usually, only the destination IP address and port are required.

Examples for this monitoring technology are [HTTP Push sensors](#)^[4336], as well as [Syslog Receiver](#)^[3326] and [SNMP Trap Receiver sensors](#)^[3107].

▶ For more information, see the video tutorial: [SNMP Trap Receiver and Syslog Receiver sensors](#).

Monitoring with Hypertext Transfer Protocol (HTTP)

HTTP is a standard application layer protocol and the basis for data communication on the internet. HTTP is a request-response method for client-server architectures, where the client sends a request and the server processes and responds to the request.

Monitoring via HTTP is useful if you want to monitor websites or web servers. It enables you to keep an eye on the availability and download times of a website or the performance statistics of a web server. There are also a lot of other possible use cases for HTTP sensors. For example, you can request any application programming interface (API) that is reachable via HTTP and monitor returned values. This approach lets you include almost any type of device or application into your monitoring.

Notifications from PRTG

PRTG can notify you in [various ways](#)⁴¹³⁸ if it detects that there is something wrong in your network. You can individually define when (for example, based on [thresholds](#)⁴⁰³⁴ or on [sensor states](#)¹⁹⁷¹) and how you want to receive notifications from PRTG. The most common methods are email, SMS text message, and push notifications to your smartphone that runs a [PRTG app for iOS or Android](#)⁴²⁷⁸.

For your critical infrastructure it is best practice to set up two redundant notifications with different delivery methods (for example, email and SMS via a gateway).

 For more information about notifications, see the video tutorial: [Notifications](#).

Email Notifications

The most common notification method is to send emails with the SMTP server built into PRTG. This means that no SMTP server setup or configuration is required, but if you want to deliver emails through your email server, you have to configure it in the [SMTP settings](#)⁴¹⁹⁵.

SMS Notifications

PRTG on premises can also notify you on your mobile phone. To [deliver SMS notifications](#)⁴¹⁹⁸, you can select one of the SMS service providers that PRTG includes by default and use it with your credentials for this provider. Of course, you can also use any other service provider if you define a custom URL (look in your provider's documentation for the required format). You can also use an SMS gateway to receive messages even if your internet connection is down.

 For a list of third-party tools, see the Knowledge Base: [How can I send SMS text message notifications via a modem or a mobile phone with PRTG?](#)

Push Notifications

PRTG can send push notifications to your iOS and Android devices when you run the according PRTG app on your smartphone.

 For more information, see the Knowledge Base: [How can I use push notifications with PRTG?](#)

- [System Requirements](#) ²³
- [Introduction: Monitoring with PRTG](#) ³⁴

Part 2

Quick Start Guide

2 Quick Start Guide

Welcome to PRTG. This section gives you a quick start into monitoring with PRTG.

Welcome Screen

To set up your network monitoring, download the PRTG installer from the [Paessler website](#) and follow the steps in the installation wizard, or set up a PRTG Hosted Monitor instance on <https://www.paessler.com/prtg-hosted-monitor> and install a remote probe in your LAN. Provide some information about your network in the [smart setup](#) and PRTG immediately starts to monitor your network. You can adjust the setup to your needs later on.

Quick Start Guide

- [Step 1: Download, Installation, and First Login](#)
- [Step 2: Smart Setup](#)

2.1 Step 1: Download, Installation, and First Login

To use PRTG on premises, download it from the [Paessler website](#) and install it on a Windows system.

☁ For information on how to set up a PRTG Hosted Monitor instance, see section [Create a PRTG Hosted Monitor Instance](#)^[57].

Download PRTG on premises

You can find the PRTG installer on the [Paessler website](#). There, you can also log in to the Paessler shop to buy or upgrade your license or to renew your maintenance.

Download PRTG

Download PRTG

Download the latest stable version of PRTG from the [Paessler website](#) as a [trial version](#)^[21].

ⓘ Once you have installed PRTG, the [auto-update](#)^[4257] automatically downloads and installs new software versions.

Install PRTG on premises

Double-click the setup file on the system that you want to use as the PRTG core server. Follow the [installation wizard](#)^[100] and install the software.

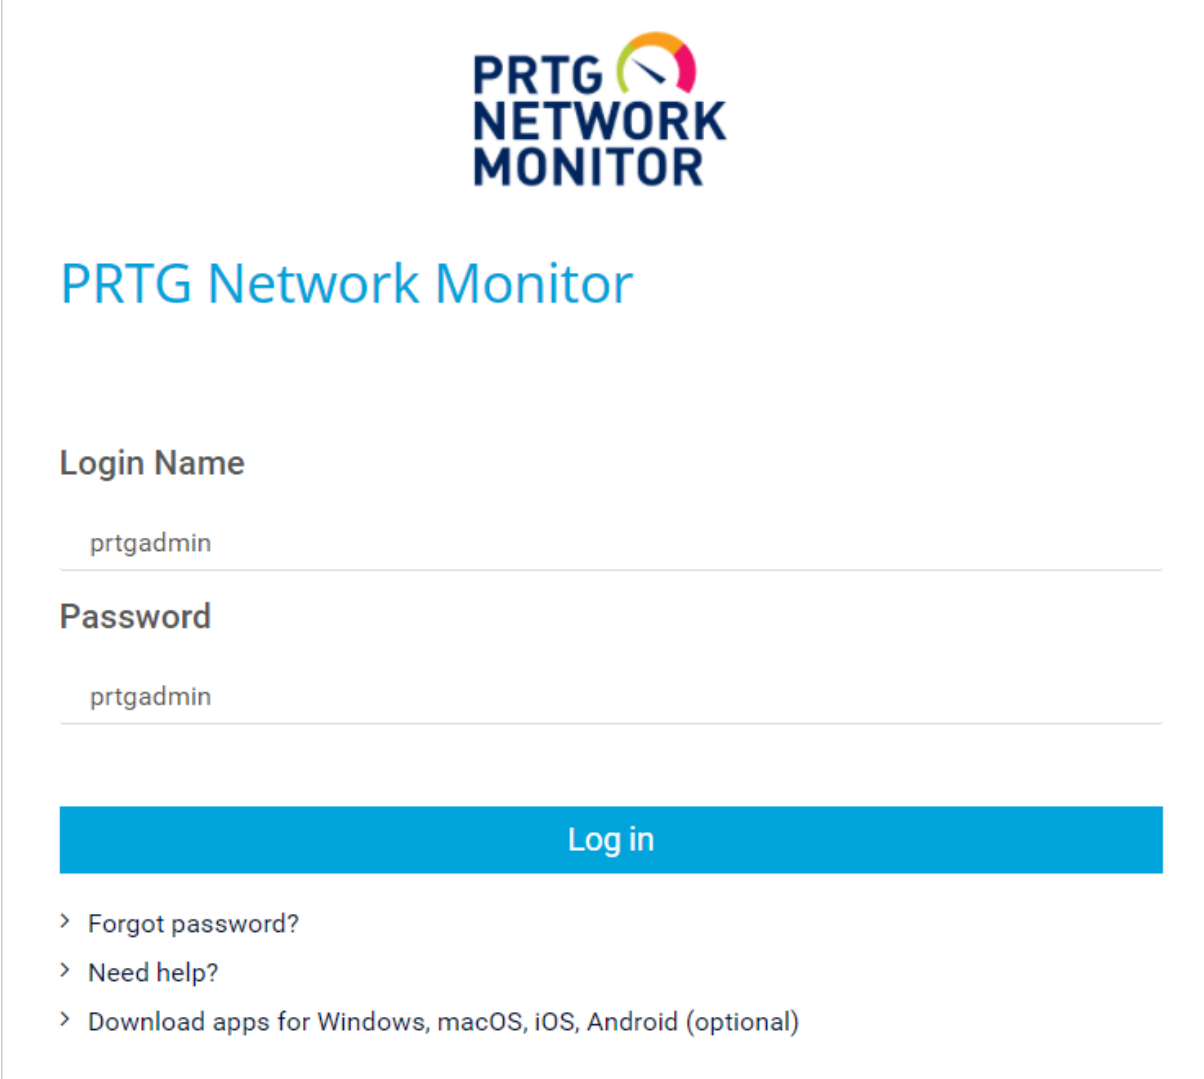

At the end of the installation, open the PRTG web interface with one of the officially supported browsers:

- Google Chrome 72,
- Mozilla Firefox 65, or
- Microsoft Internet Explorer 11.

ⓘ Because of scripting incompatibilities, you might not be able to use all functionalities of the PRTG web interface with Internet Explorer 10 or earlier and other older browsers. If you cannot access the PRTG web interface, open the URL of PRTG in a different supported browser.

Login

After you installed PRTG on premises, open the PRTG web interface with a supported browser. You see the login screen.

PRTG NETWORK MONITOR

PRTG Network Monitor

Login Name

prtgadmin

Password

prtgadmin

Log in

- > Forgot password?
- > Need help?
- > Download apps for Windows, macOS, iOS, Android (optional)

PRTG on premises Login Screen

PRTG automatically fills in the credentials of the predefined [PRTG System Administrator](#) user. The login name and the initial password is [prtgadmin](#). Click Login to proceed.

■ See the [next step](#) ⁴⁸¹ for more information about the initial configuration of PRTG.

More

 VIDEO TUTORIAL

All video tutorials

- <https://www.paessler.com/learn/videos>

Quick Start Guide

- [Step 1: Download, Installation, and First Login](#) 
- [Step 2: Smart Setup](#) 

2.2 Step 2: Smart Setup

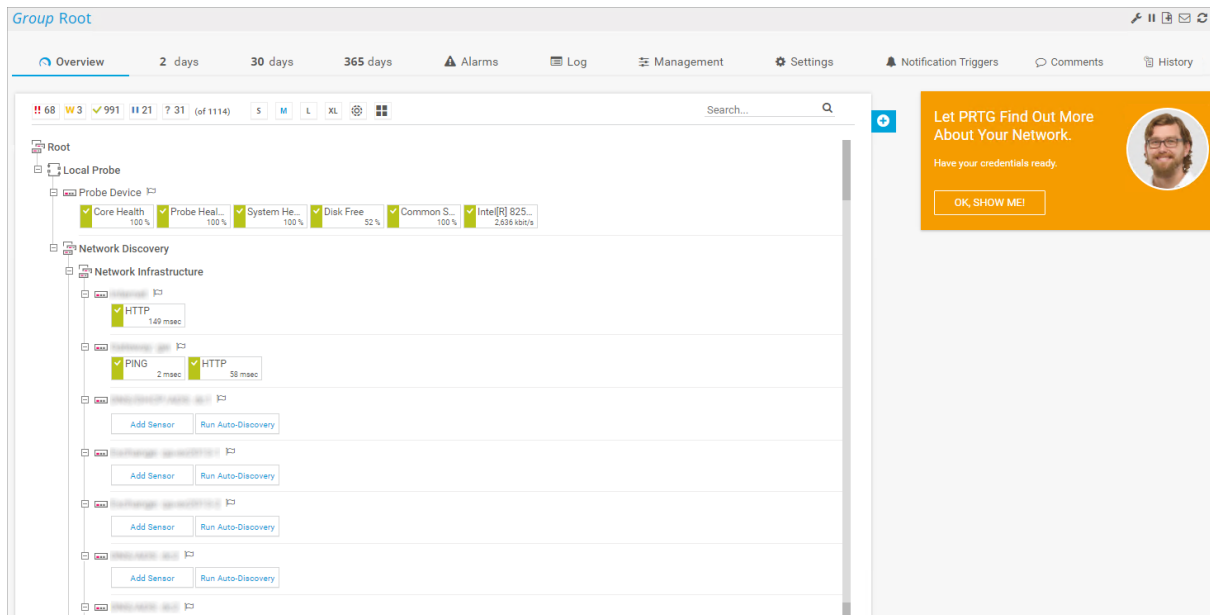

PRTG automatically starts the smart setup on a new PRTG installation. This setup assistant guides you through the initial setup of your network monitoring system. The smart setup reappears until you have completed all steps. You can skip the introduction altogether right at the beginning.

First Start

When you log in for the first time, you see the [device tree](#)^[183]. PRTG on premises already includes several [devices](#)^[140] with [sensors](#)^[140] that monitor your network, sorted into different [groups](#)^[139]. PRTG automatically creates the device tree during the installation process via the [auto-discovery](#)^[296] function.

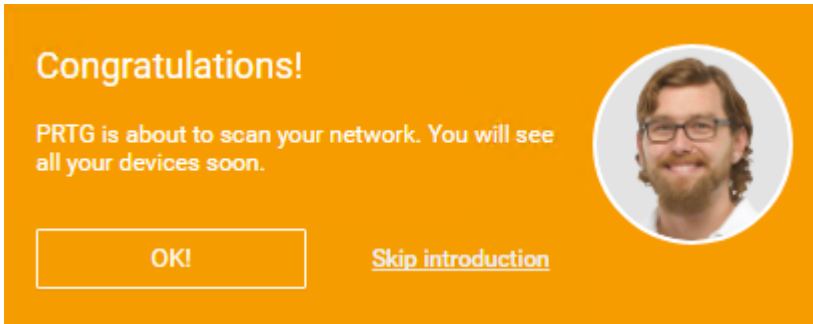

PRTG scans your network by pinging IP addresses in the subnet of your PRTG core server and adds all reachable devices to your specific network monitoring structure.

- ❗ The smart setup scans only for devices with IP addresses in private network ranges. You can manually start an auto-discovery for other subnets later.

Device Tree after Initial Auto-Discovery

In the upper-right corner of the PRTG web interface, you can see the smart setup assistant. They guide you through 5 setup steps during which you can enter more information about your network. PRTG runs another auto-discovery with this information to add additional devices and sensors to your monitoring. You can still edit the settings that you provided during the smart setup later on to adjust the monitoring to your needs.

Start Your Introduction to PRTG

Click OK! to start a guided tour.

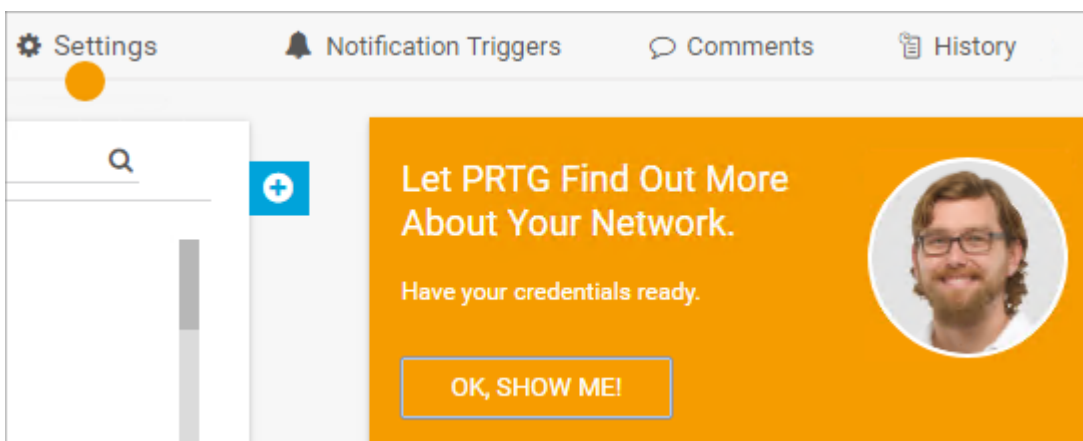

i If you click Skip introduction, the smart setup assistant never appears again. We strongly recommend that you take the guided tour if you are new to PRTG.

The steps to take are:

- [Step 1: Provide Credentials](#)⁴⁹
- [Step 2: Enter Location Information](#)⁵¹
- [Step 3: Change Your PRTG Login Password](#)⁵¹
- [Step 4: Confirm Your Email Address](#)⁵²
- [Step 5: Switch to SSL/TLS](#)⁵³ (if you access PRTG from a different system)

Step 1: Provide Credentials

Your smart setup assistant asks you to provide credentials for devices in your network. Click OK, Show Me!, follow the animated mouse pointer, and open the Settings tab of the root group.

Have Your Credentials Ready

On the Settings tab, enter various administrator credentials for your network environment. With these credentials, PRTG can automatically add a large number of additional devices and sensors to your device tree. This way, you do not need to manually add every single device.

Credentials for Windows Systems

Domain or Computer Name

User

Password

How Can PRTG Access Your Systems?

Please enter administrator credentials so PRTG can discover more sensors for your devices.

[OK, DONE!](#)

Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems

User

Login Login via Password
 Login via Private Key

Password

For WBEM Use Protocol HTTP
 HTTPS

For WBEM Use Port Set automatically (port 5988 or 5989)
 Set manually

SSH Port

SSH Rights Elevation Run the command as the user connecting (default)
 Run the command as another user using 'sudo' (with password)
 Run the command as another user using 'sudo' (without password)
 Run the command as another user using 'su'

SSH Engine Default (recommended)
 Compatibility Mode (deprecated)

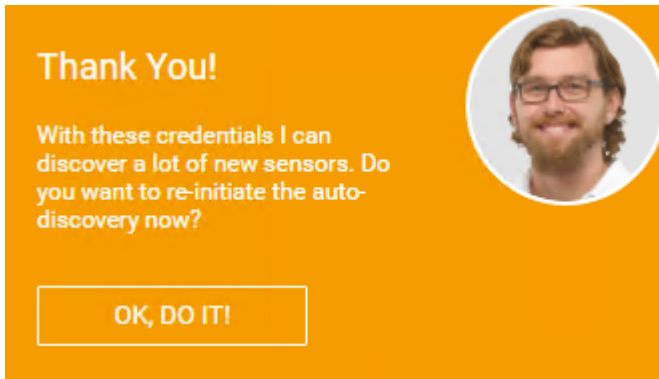

Provide Your Credentials

- To monitor your Windows clients and servers via Windows Management Instrumentation (WMI), enter Windows administrator credentials for your network. We recommend that you use domain administrator credentials if you use an Active Directory. For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)^[4298].
- If you have systems that run on Linux, Solaris, or macOS, enter root access credentials for these systems. For a general introduction to Secure Shell (SSH) monitoring, see section [Monitoring via SSH](#)^[4301].
- If you use the virtual environments VMware or Citrix XenServer, enter root access credentials for these systems. For a general introduction to the monitoring of virtual environments, see section [Monitoring Virtual Environments](#)^[4318].
- To monitor hardware like routers or switches, the Simple Network Management Protocol (SNMP) is the most commonly used protocol. Usually, all SNMP-enabled devices use the same settings by default: SNMP **v2c**, the community string **public**, and SNMP port **161**. For a general introduction to the technology behind SNMP, see section [Monitoring via SNMP](#)^[4286].
- You can also enter credentials for database management systems or credentials for Amazon Web Services (AWS) monitoring.

PRTG stores these credentials in the root group of your device tree. All dependent devices automatically inherit these credentials and use them for monitoring. You can disable the [inheritance of settings](#)^[142] at any level if you want to enter other credentials instead.

■ For more information about the available options, see section [Root Group Settings](#)^[368].

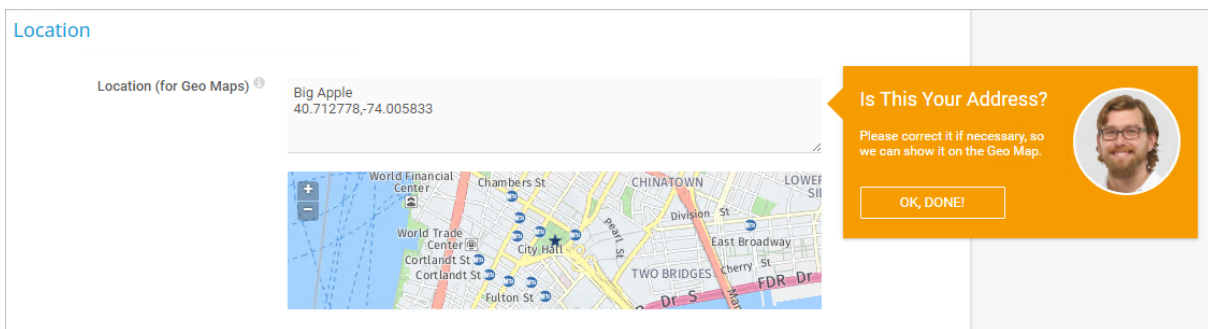

Click OK, Done! to finish this setup step. Click OK, Do It! to start a detailed auto-discovery.

Start a Detailed Auto-Discovery

Step 2: Enter Location Information

While PRTG runs a new auto-discovery in your network with the provided credentials, the setup assistant asks you to provide the location of your PRTG core server. This information is displayed in [geographical maps](#)⁴⁰²⁶. Enter your location and confirm with OK, Done!. Click OK, Show Me! to get back to the device tree.

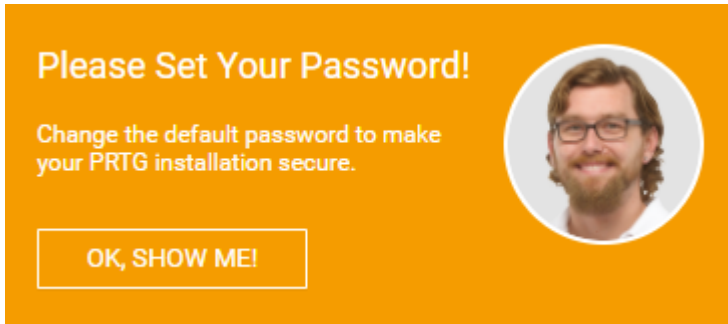

Enter Your Location

■ For more information about the available options, see section [Root Group Settings](#)³⁶⁷.

Step 3: Change Your PRTG Login Password

Back in the device tree, the setup assistant in PRTG on premises asks you to change your password. Click OK, Show Me! and follow the assistant to your account settings. By default, PRTG uses the [PRTG System Administrator](#) user account with the login name [prtgadmin](#) and the password [prtgadmin](#). So we strongly recommend that you change the password to protect PRTG from unauthorized access.

Start the Password Change

Enter your New Password and confirm it under Retype Password. The password must meet the following requirements:

- At least eight characters long
- At least one numeral
- At least one capitalized letter

Click OK, Done! to save your new password.

Change the Default Password

For more information about the available options, see section [My Account](#) ⁴¹²³.

Step 4: Confirm Your Email Address

To complete the smart setup, check whether the email address that you entered during the installation is correct.

- i** A correct email address is mandatory for PRTG to reach you via email notifications when there are alarms and for other important messages.

Click OK, Done! and follow the assistant back to the device tree.

The screenshot shows the 'User Account Settings' form. The fields are: Login Name (prtgadmin), Display Name (PRTG System Administrator), Primary Email Address (johnpublic@company.com), Password (Don't change selected), and Passhash (Show passhash button). An orange overlay on the right says 'Please Verify Your Email Address.' with a profile picture and an 'OK, DONE!' button.

Verify Your Email Address

For more information about the available options, see section [My Account](#)⁴¹²³.

Step 5: Switch to SSL/TLS

For PRTG on premises, if you access the PRTG web interface from a system other than the system where you installed PRTG, the setup assistant asks you to switch to a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. We strongly recommend that you run the PRTG web interface secured with SSL/TLS, especially if you make your PRTG web interface available from the internet. Otherwise, your passwords are sent over your network without encryption.

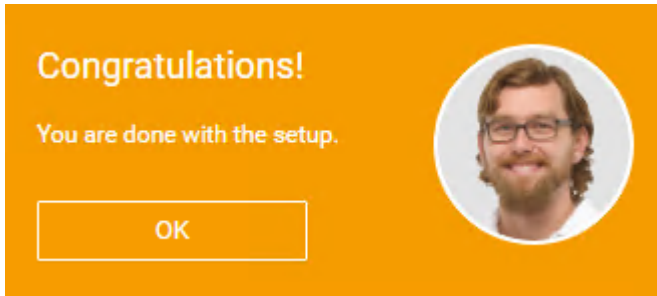

- Click OK, Switch Now! to get more information about using SSL/TLS for the PRTG web server.
- In the new window, click Yes, Switch to SSL/TLS to switch to an SSL/TLS-secured connection.
- PRTG must restart its services to apply the changes. The PRTG web interface is reachable under an HTTPS URL afterward.
- When the PRTG web interface reloads, it most likely shows a [certificate warning](#)¹⁶⁸³. Confirm the certificate warning to proceed to the login screen.

Switch to a Secure Connection

For more information, see sections [User Interface](#)⁴¹⁷⁵ and [SSL Certificate Warning](#)¹⁶⁸³.

You Are Done

Finish the Smart Setup

While you went through the smart setup, PRTG created additional devices and sensors for you. The first monitoring values are also available.

■ To become familiar with the PRTG web interface, we recommend that you read on in section [General Layout](#)¹⁸³.

- [Manage a PRTG Hosted Monitor Subscription](#)^[70]
- [Use Multi-Factor Authentication with PRTG Hosted Monitor](#)^[81]

3.1 Create a PRTG Hosted Monitor Instance

To create a PRTG Hosted Monitor instance, open a web browser and go to the [PRTG Hosted Monitor web page](#).

i We recommend that you use Google Chrome 72.

The image is a promotional banner for PRTG Hosted Monitor. It features a blue background with the PRTG logo at the top center. Below the logo, the text reads "IT monitoring in the cloud" in a large, white, sans-serif font. Underneath that, a smaller white font says "Simply focus on your infrastructure, leave the hosting to us." At the bottom center, there is a prominent orange button with the text "START FREE TRIAL" in white, uppercase letters. Below the button, a line of white text states: "Sign up for a free 10-day trial. Cancel anytime or upgrade to a paid subscription."

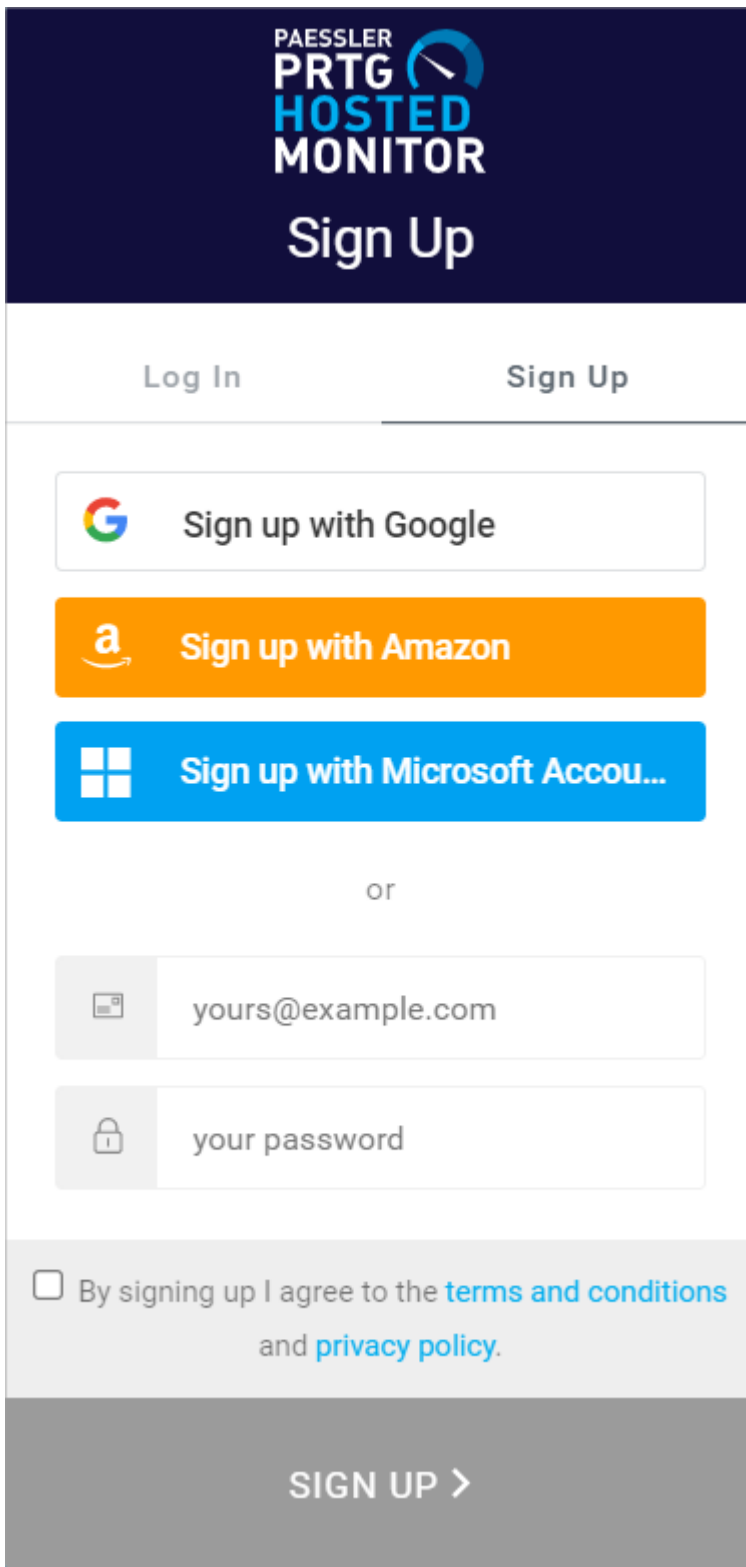

[Start Your Free Trial Now](#)

PRTG Hosted Monitor Instance Ready

15. Your PRTG Hosted Monitor instance is now ready. Click Open PRTG to open your PRTG Hosted Monitor instance in the PRTG web interface.

16. Enter your credentials on the [login screen](#) .

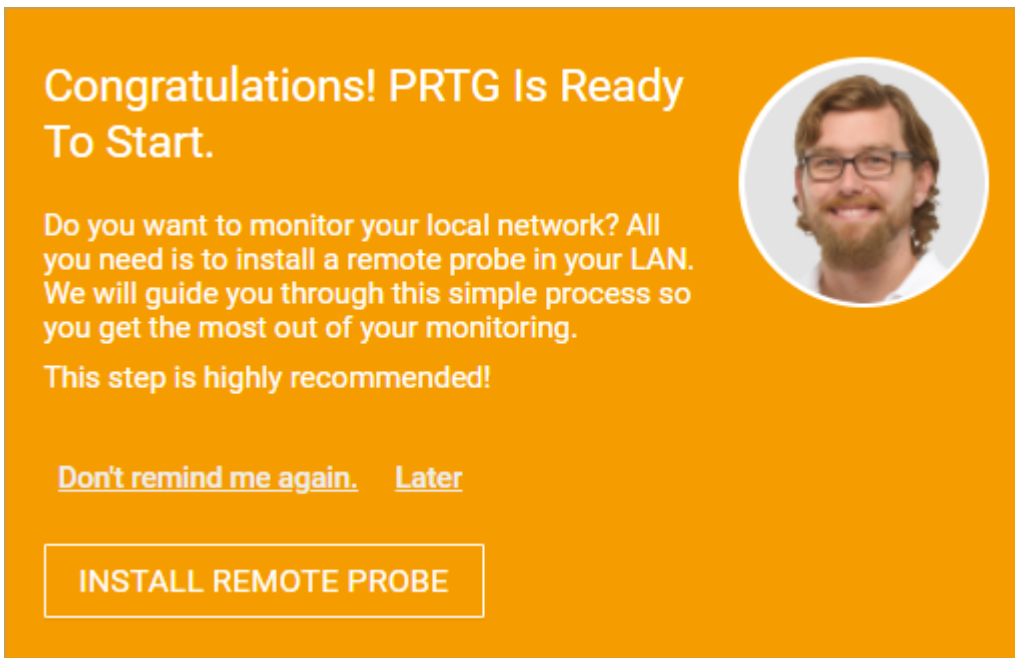

Your PRTG Hosted Monitor instance is now up and running. To open the [device tree](#)¹⁸³, click View Results, or click Devices in the [main menu bar](#)²⁷⁸.

PRTG Hosted Monitor automatically creates a [hosted probe](#)¹³¹ that runs on the hosted instance. It shows several health values of the instance and you can instantly monitor all servers, services, and devices that are publicly available via the internet with the hosted probe.

Smart Setup for PRTG Hosted Monitor

A Paessler employee guides you through the smart setup. In particular, you must install a [remote probe](#)⁴⁵⁰³, which is required for monitoring your LAN. We strongly recommend that you do so.

The image shows a screenshot of a PRTG Smart Setup window with an orange background. The text reads: "Congratulations! PRTG Is Ready To Start." followed by "Do you want to monitor your local network? All you need is to install a remote probe in your LAN. We will guide you through this simple process so you get the most out of your monitoring. This step is highly recommended!". There are two links: "Don't remind me again." and "Later". A large button labeled "INSTALL REMOTE PROBE" is at the bottom. A circular profile picture of a man with glasses and a beard is on the right side.

Smart Setup: Install a Remote Probe

Click Install Remote Probe to start the installation.

■ For more information, see section [Install a Remote Probe](#)^[112].

■ For more information about other steps of the smart setup, see section [Smart Setup](#)^[48] for PRTG on premises.

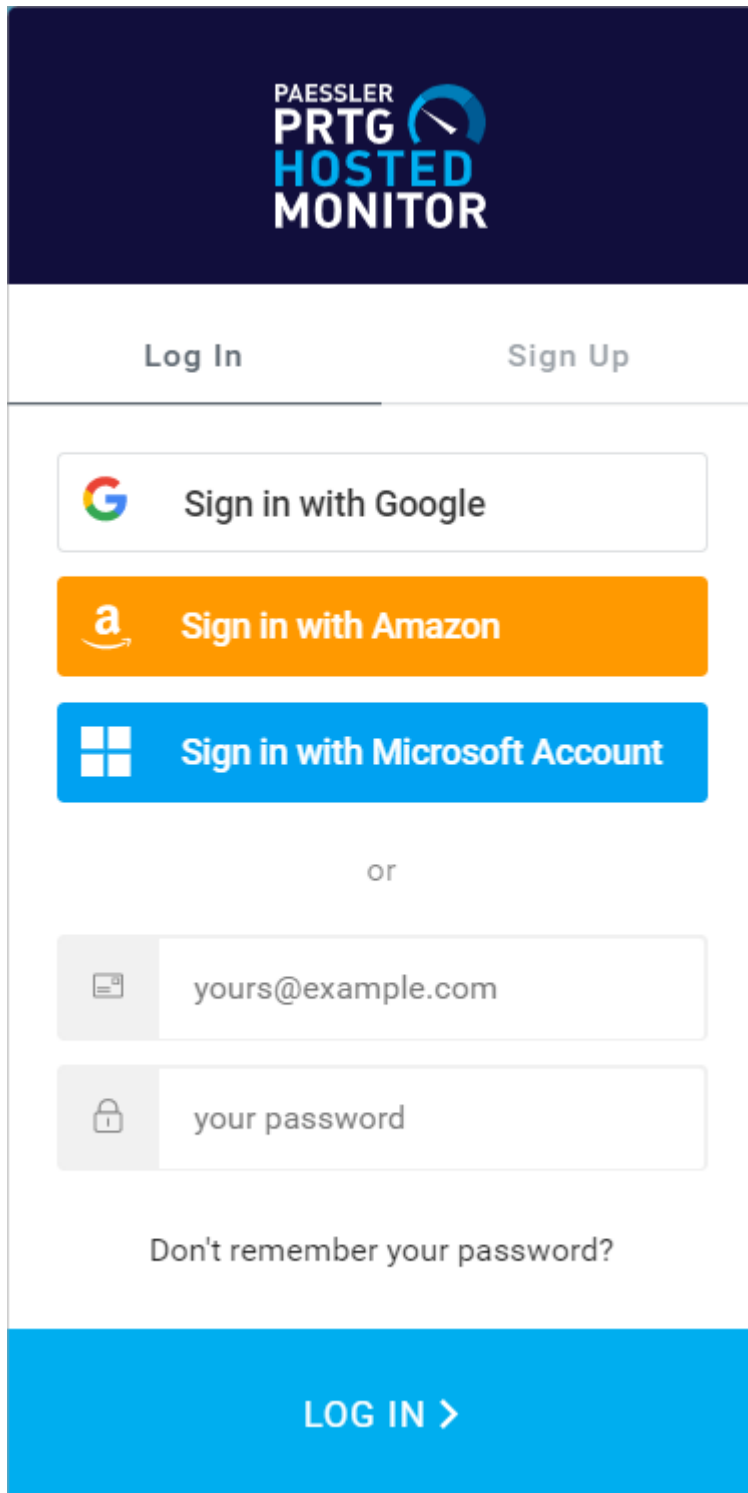

Using PRTG Hosted Monitor

Manage Subscription

Change PRTG Subdomain

Here you can change your subdomain. The domain name can be anywhere from 4 to 60 characters long.

1. Enter a new domain name such as [myfirstdomain](#). If you enter [myfirstdomain](#) as the domain name, for example, your PRTG Hosted Monitor instance is reachable under [myfirstdomain.my-prtg.com](#).
i If you have remote probes, you must manually change the domain name for the PRTG core server. This corresponds to the Server (IPv4 Address or DNS Name) setting in the [PRTG Administration Tool](#) ⁴³⁷³.

CHANGE YOUR SUBDOMAIN

ⓘ IF YOU HAVE REMOTE PROBES, YOU MUST CHANGE THE DOMAIN FOR THE CORE AS WELL. [READ MORE ABOUT HERE.](#)

ⓘ PLEASE BE PATIENT, IT CAN TAKE UP TO 24 HOURS UNTIL YOUR PRTG INSTANCE IS AVAILABLE UNDER YOUR NEW DOMAIN.

Do you really want to change your subdomain to **myfirstdomain.my-prtg.com**?

[CANCEL](#) [GOT IT](#)

Domain Change

2. Click Got It to continue. You can see the progress in the status bar.

ⓘ This can take a few minutes.

🕒  15%

Domain Change Progress

When the change is complete, the PRTG Hosted Monitor instance is ready.

- [Manage a PRTG Hosted Monitor Subscription](#) ⁷⁰
- [Use Multi-Factor Authentication with PRTG Hosted Monitor](#) ⁸¹

3.3 Use Multi-Factor Authentication with PRTG Hosted Monitor

You can use multi-factor authentication with PRTG Hosted Monitor. In combination with an authenticator app that supports the Time-based One-time Password algorithm (TOTP), such as Google Authenticator, you can make your PRTG Hosted Monitor instance even more secure.

☁ Multi-factor authentication is only available in PRTG Hosted Monitor. For more information, see the Knowledge Base: [Can I enable multi-factor authentication for my PRTG Hosted Monitor instance?](#)

In this section:

- [Initial Setup](#) ⁸¹
- [Manually Enter the QR Code](#) ⁸⁵
- [Log In With Multi-Factor Authentication](#) ⁸⁶
- [Disable Multi-Factor Authentication](#) ⁸⁷
- [Use The Recovery Code](#) ⁸⁸

Initial Setup

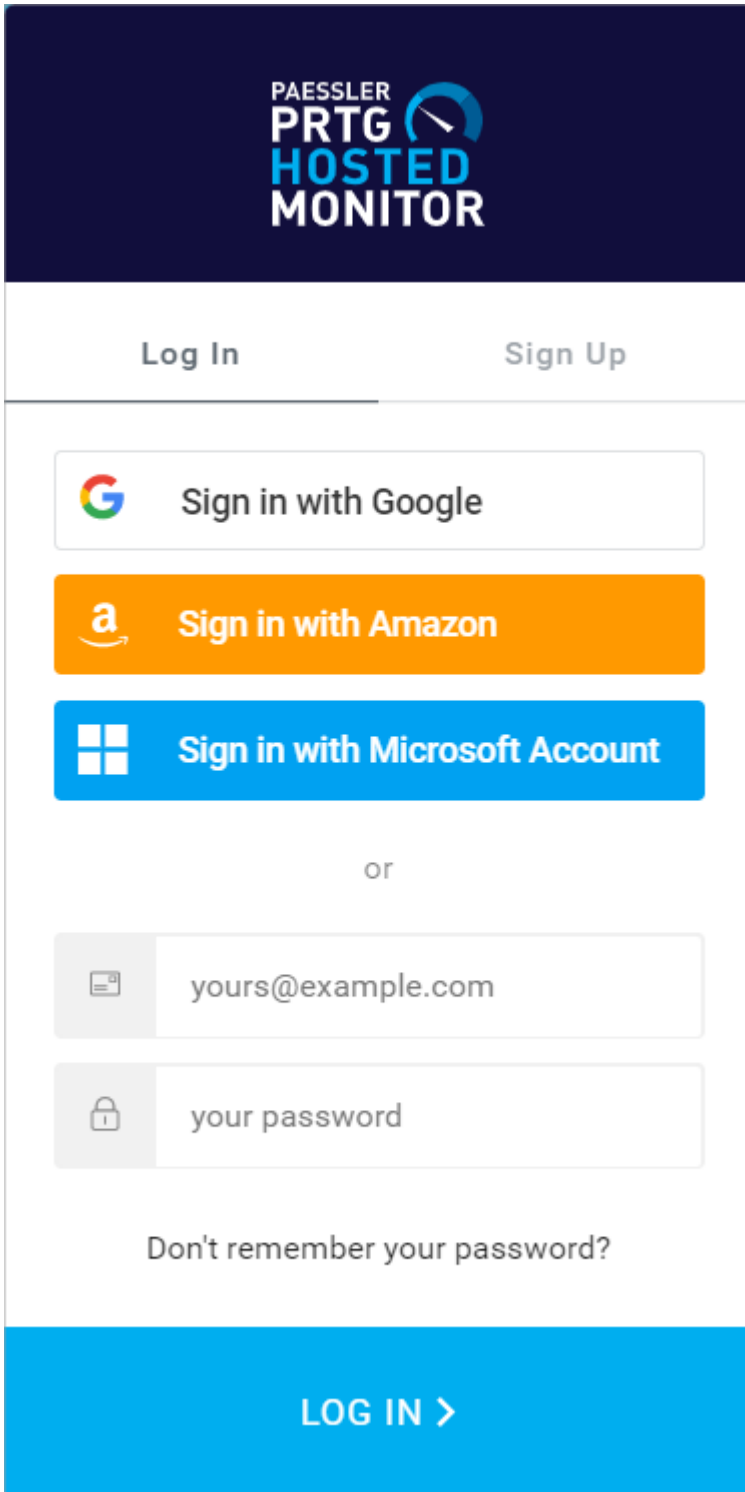

To set up multi-factor authentication for your PRTG Hosted Monitor instance, open a web browser, go to the [PRTG Hosted Monitor web portal](#), and log in. Then click your account in the upper-right corner.

- ① We recommend that you use Google Chrome 72.
- ① You can only enable multi-factor authentication for your own user account. Other users can separately enable or disable it in their settings.

Account Overview

1. To enable multi-factor authentication, click .
 ⓘ If you enable multi-factor authentication for the first time, you must log in again.

 your password

Don't remember your password?

LOG IN >

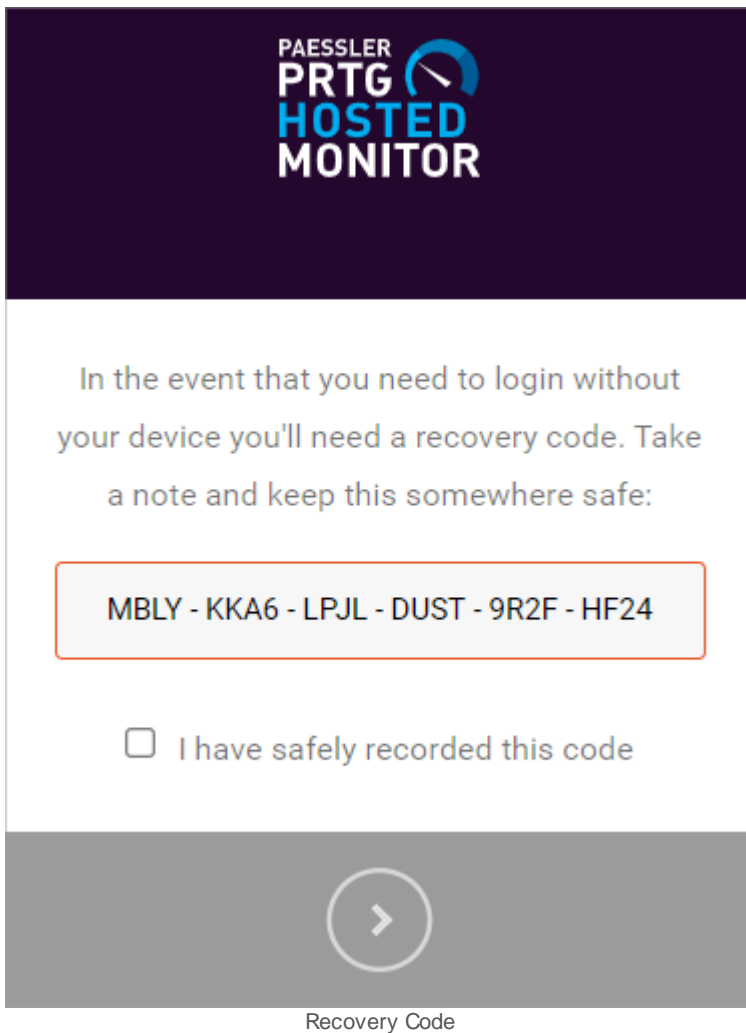

Login Screen

2. Provide the credentials you entered when you signed up and click Log In, or use single sign-on (SSO) and continue with your Google, Amazon, or Windows account via the respective button.

Scan QR Code

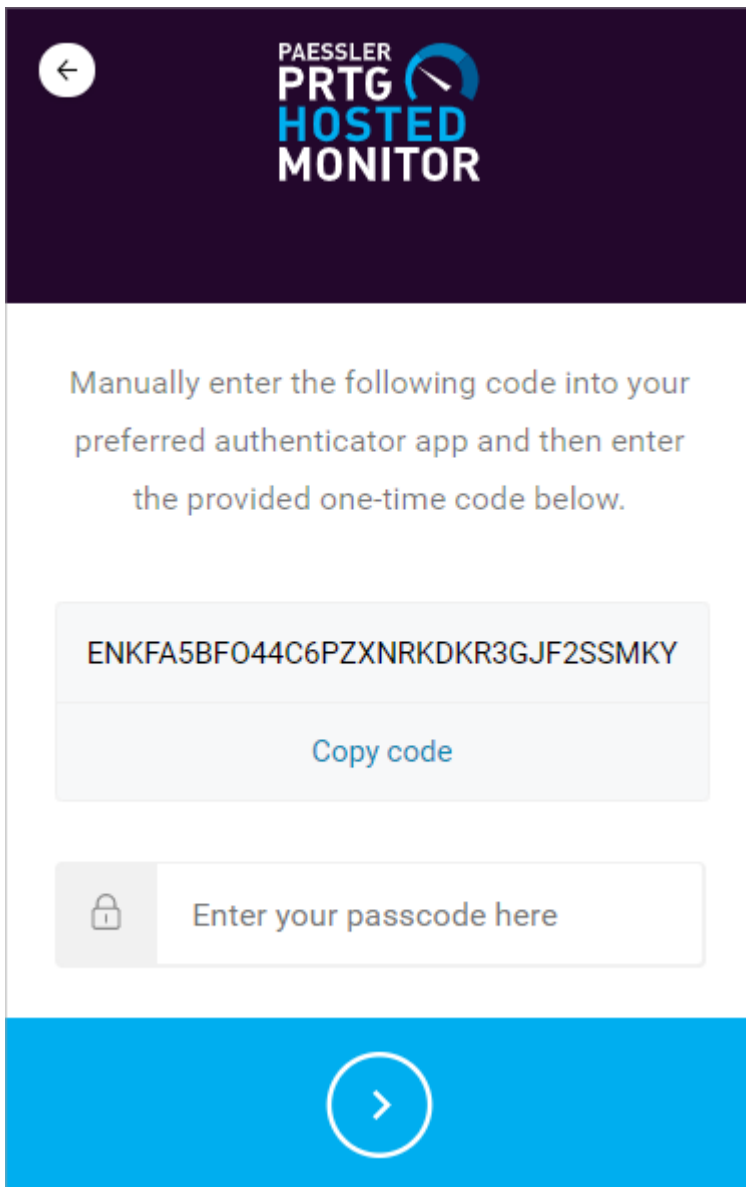

3. Scan the QR code with your authenticator app and enter the passcode from the authenticator app in the field below the QR code.
 - If your authenticator app is unable to scan the code, see [Manually enter the QR code](#) ⁸⁵ for more information.

4. You receive a recovery code. Make sure to save it somewhere safe. Click the check box to confirm that you have safely recorded the code.
5. Click  to log in to the [PRTG Hosted Monitor web portal](#).
-  If you lose your recovery code, [contact the Paessler support team](#) .

Manually Enter the QR Code

1. If your authenticator app is unable to scan the QR code, click Trouble scanning?.

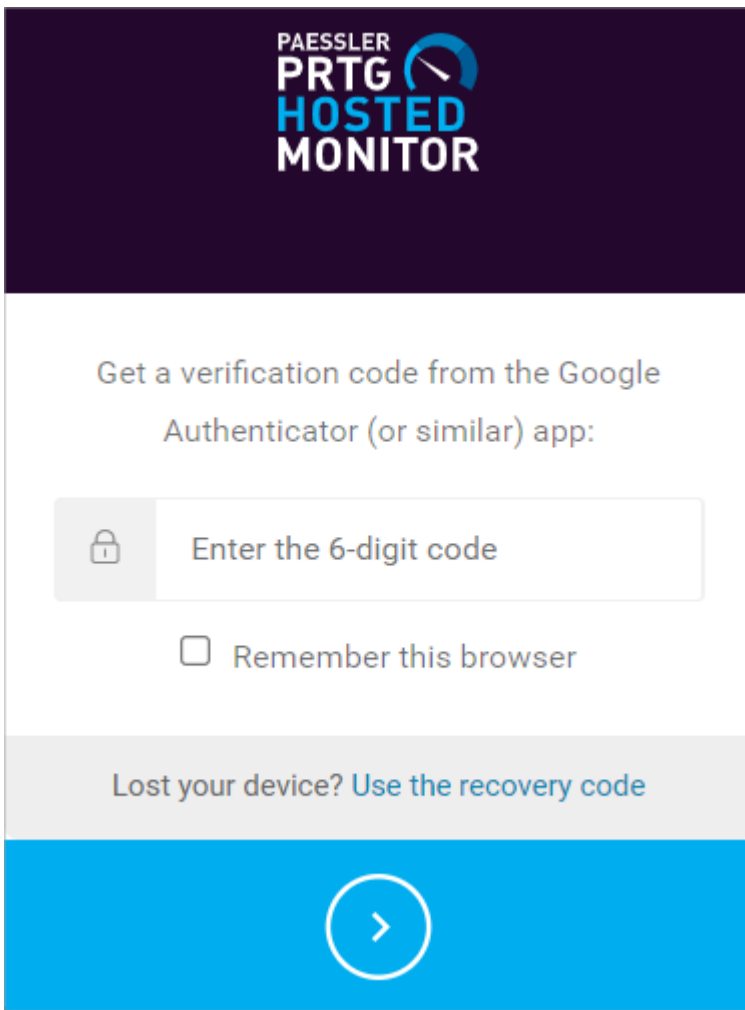

Manually Enter the Code

2. Follow the instructions in your authenticator app to manually enter the code.
3. Enter the one-time passcode that your authenticator app generates in the [Enter your passcode here](#) field.
4. Click  to continue.

Log In with Multi-Factor Authentication

After you set up multi-factor authentication, the next time you log in to the [PRTG Hosted Monitor web portal](#), you see an additional login screen.

Log In With Multi-Factor Authentication

1. Enter the 6-digit code from your authenticator app.
 2. Select the check box next to Remember this browser if you do not want to enter the code in this browser every time you log in.
 - i** This applies for 30 days. If you clear your browsing data such as cookies during this time, it no longer applies.
 3. Click  to continue.
- i** If you lose your device, see [Use The Recovery Code](#)⁸⁸ for more information.

Disable Multi-Factor Authentication

To disable multi-factor authentication, follow these steps:

1. Log in to the [PRTG Hosted Monitor web portal](#).
2. Click your account in the upper-right corner.
3. Click  under Multi-Factor Authentication.

You see the following message.

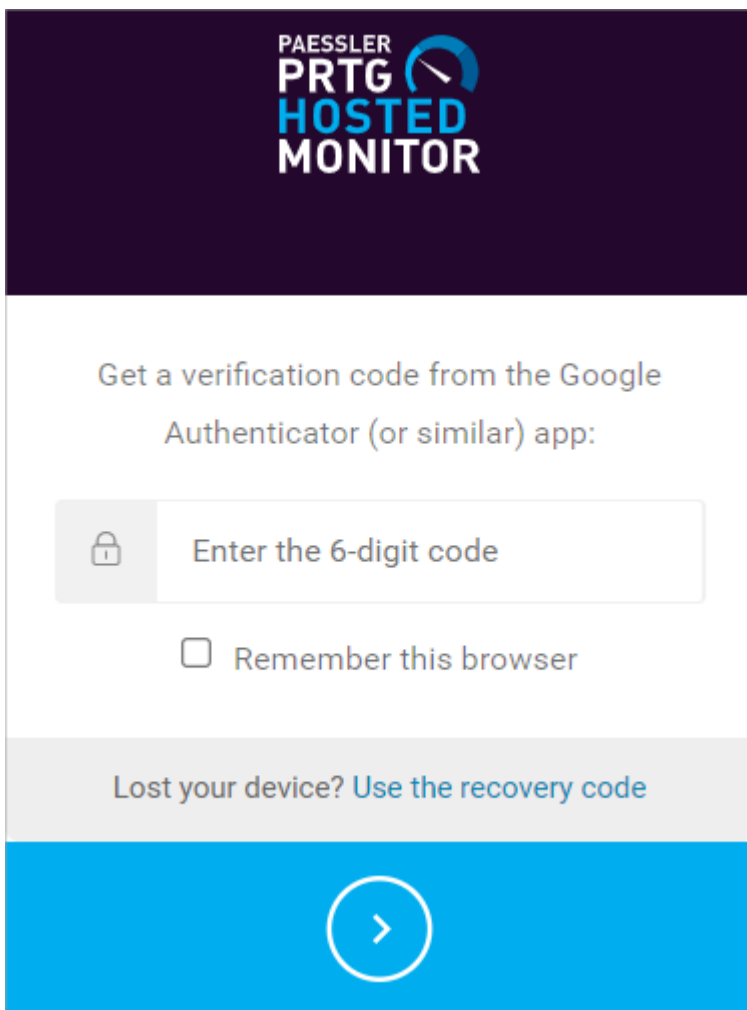

Multi-factor authentication is now disabled. **CLOSE**

Multi-Factor Authentication Now Disabled

The next time you log in to the PRTG Hosted Monitor web portal, multi-factor authentication is no longer enabled.

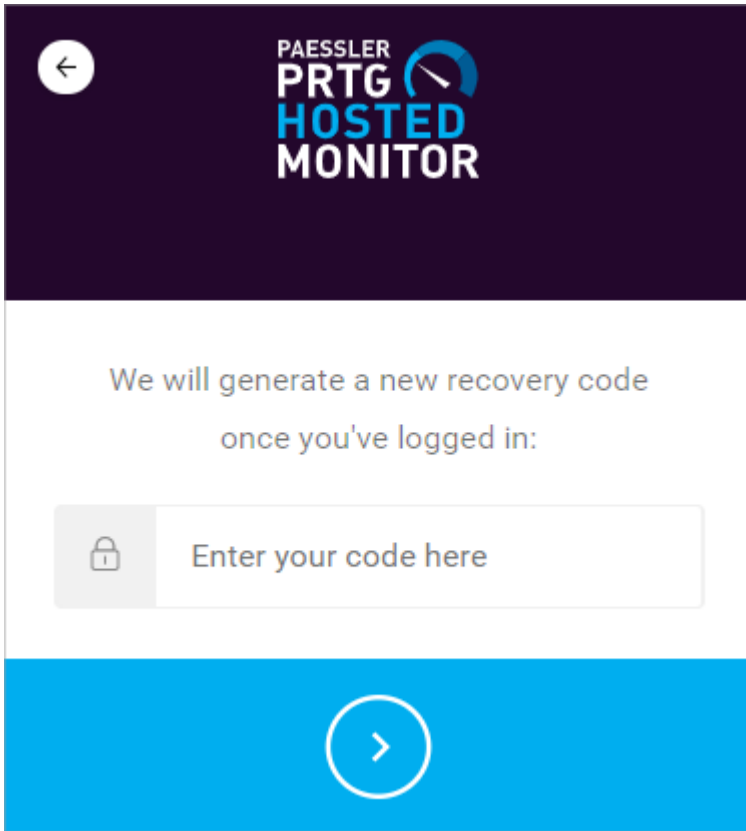

Use The Recovery Code

1. If you lose your device, click Use the recovery code on the login screen.

Log In With Multi-Factor Authentication

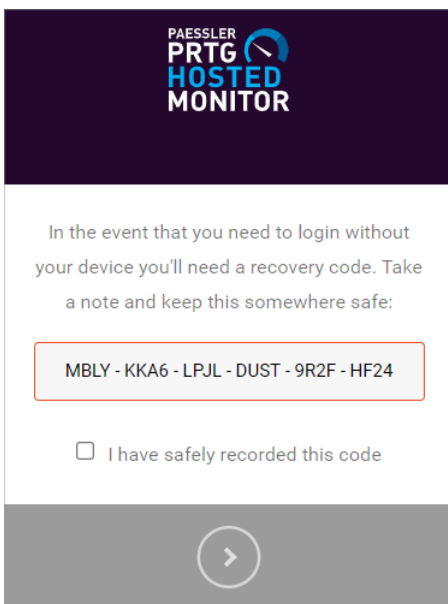

You see the following screen.

Enter Recovery Code

2. Enter your recovery code and click  to continue.
 The recovery code must contain 24 alphanumeric characters.

You receive a new recovery code.

Recovery Code

3. Make sure to save the recovery code somewhere safe. Click the check box to confirm that you have safely recorded the code.

4. Click  to log in to the [PRTG Hosted Monitor web portal](#).

 If you lose your recovery code, [contact the Paessler support team](#) .

KNOWLEDGE BASE

Can I enable multi-factor authentication for my PRTG Hosted Monitor instance?

- <https://kb.paessler.com/en/topic/88234>

Using PRTG Hosted Monitor

- [Create a PRTG Hosted Monitor Instance](#) 
- [Manage a PRTG Hosted Monitor Subscription](#) 
- [Use Multi-Factor Authentication with PRTG Hosted Monitor](#) 

Part 4

Installing the Software

4 Installing the Software

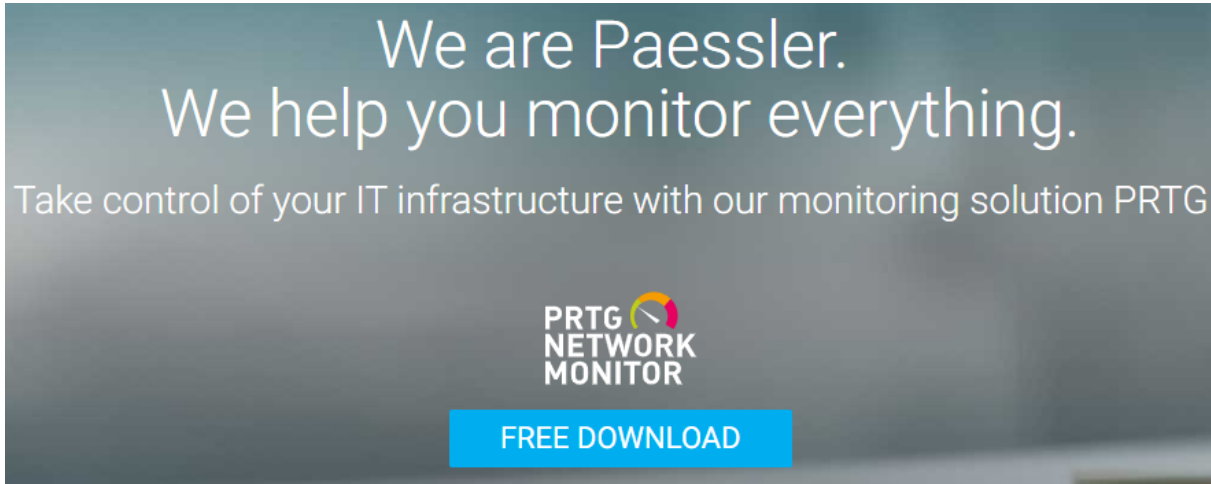

The following sections show you how to download and install PRTG on premises. If you want to use PRTG Hosted Monitor, go straight to section [Create a PRTG Hosted Monitor Instance](#)^[57] to get started.

Installing the Software

- [Download PRTG](#)^[93]
- [Update From Previous Versions](#)^[94]
- [Install a PRTG Core Server](#)^[100]
- [Install a Cluster](#)^[106]
- [Enter a License Key](#)^[107]
- [Activate the Product](#)^[110]
- [Install a Remote Probe](#)^[112]
- [Uninstall PRTG Products](#)^[125]

4.1 Download PRTG

You can find the PRTG installer on the [Paessler website](#). There, you can also log in to the Paessler shop to buy or upgrade your license or to renew your maintenance.

Download PRTG

Download PRTG

Download the latest stable version of PRTG from the [Paessler website](#) as a [trial version](#)^[21].

i Once you have installed PRTG, the [auto-update](#)^[4257] automatically downloads and installs new software versions.

Installing the Software

- [Download PRTG](#)^[93]
- [Update From Previous Versions](#)^[94]
- [Install a PRTG Core Server](#)^[100]
- [Install a Cluster](#)^[106]
- [Enter a License Key](#)^[107]
- [Activate the Product](#)^[110]
- [Install a Remote Probe](#)^[112]
- [Uninstall PRTG Products](#)^[123]

4.2 Update From Previous Versions

If you have a previous PRTG version installed, there are several things you need to consider before you update to the newest PRTG version. See also the [system requirements](#)^[23] for all requirements.

i We recommend that you always have a backup of your monitoring data and configuration. In most cases, both are maintained when you update. Anyway, we recommend a backup before you update. For more information, see the Knowledge Base: [How do I back up all data and configuration of my PRTG installation?](#)

i In certain cases, antivirus software like Windows Defender interferes with the PRTG installer. This might cause high CPU load on the PRTG core server, which might prevent a successful update of PRTG. Temporarily disable Windows Defender and other antivirus software if you have issues when you install PRTG updates.

☁ On PRTG Hosted Monitor instances, the update process is managed automatically, so you do not have to care about updates.

In this section:

- [Update from PRTG 16.1.22 or later](#)^[94]
- [Update from PRTG 13.1.1 through 16.1.21](#)^[95]
- [Removed Sensors as of PRTG 16.2.25](#)^[95]
- [PRTG Web Interface Customizations as of PRTG 13.2.3](#)^[96]
- [Update from PRTG 9 and 12](#)^[96]
- [Update from PRTG 7 or 8](#)^[97]
- [Update from Older PRTG Products](#)^[98]
- [More](#)

Update from PRTG 16.1.22 or later

If you run PRTG 16.1.22 or later, [install](#)^[100] the newest version on top of the previous version. Your configuration is kept. PRTG automatically updates [remote probes](#)^[4503] as well. If you have configured PRTG as a [cluster](#)^[135], you only have to install an update on any cluster node (master node or failover node). PRTG automatically deploys the new version to the cluster.

We recommend that you use the [auto-update](#)^[4257] to install the newest version. Always have a proper backup of your monitoring data as well.

i Important notes:

- PRTG 19.3.52: PRTG does not run on the outdated operating system Windows XP anymore. Make sure that you install PRTG on an [officially supported operating system](#)^[27].
- PRTG 19.1.48: Sensors that require the .NET framework need version .NET 4.7.2 or later. For more information, see the Knowledge Base: [Which .NET version does PRTG require?](#)
- PRTG 18.3.43: PRTG does not start and run on outdated Windows versions like Windows Server 2003 R2 anymore. Make sure that you install PRTG on an [officially supported operating system](#)^[27].

- PRTG 17.3.34: This version comes with a completely rewritten PRTG web interface. If you have customized the PRTG web interface with one of the dedicated files in a previous version, all your customizations are lost as soon as you install PRTG 17.3.34. You have to redo your changes to keep the customizations. For more information, see the Knowledge Base: [How can I re-brand and customize the PRTG web interface using CSS and JavaScript?](#)
- PRTG 16.3.26: The Mobile Web GUI was removed from PRTG.
- PRTG 16.2.25: Several sensors were [removed from PRTG](#)⁹⁵.

Update from PRTG 13.1.1 through 16.1.21

As of PRTG 16.1.22, PRTG is signed with renewed certificates. To seamlessly update to PRTG 16.1.22 or later, an intermediate update is required for the PRTG core server and all probes if you run a version previous to PRTG 16.1.21.1691/1692. If you auto-update from previous versions (lower than PRTG 16.1.21.1691/1692), PRTG automatically installs an intermediate version first. The intermediate version you receive via auto-update or from the Paessler support team is PRTG 16.1.21.1924. You have to perform an additional auto-update to install the newest version. PRTG notifies you with a [ticket](#)²⁴⁰ about this approach. Your configuration is kept.

 We recommend that you use the auto-update to install the newest PRTG version. If you update manually with an installer downloaded from the Paessler online shop, the intermediate update is only necessary if you run a version previous to PRTG 16.1.21.1691/1692 with one or more remote probes or in a cluster. If you do not perform this intermediate update, you have to update your remote probes and cluster nodes manually. [Contact the Paessler support team](#)⁴²⁶ to get the installer for this version if you do not use the auto-update.

- As of PRTG 14, Internet Explorer 9 is no longer officially supported for access to the PRTG web interface.
- Also as of PRTG 14, PRTG core and probes no longer officially support Windows XP and Windows Server 2003 (including SP1 and SP2).
- As of PRTG 15, Internet Explorer 10 is no longer officially supported for access to the PRTG web interface.

Removed Sensors as of PRTG 16.2.25

We removed several sensors from PRTG 16.2.25. Sensors of these types that you still use in your PRTG installation stop monitoring and show a Down status as soon as you update to PRTG 16.2.25 or later. Most of the affected sensors were deprecated in PRTG 16.2.23 or before. You receive tickets from PRTG that inform you if your PRTG setup is affected.

The sensors concerned were used by very few users and/or created substantial load for both the Paessler support team and development team. We believe that the majority of users prefers that we focus on features that many customers use every day rather than spending our precious energy on niche issues.

- For a list of all discontinued sensors, possible alternatives, and more details about this approach, see the Knowledge Base: [Which sensor types will you remove from PRTG and what are the alternatives?](#)

PRTG Web Interface Customizations as of PRTG 13.2.3

As of PRTG 13.2.3, the website subfolder of the PRTG program directory is not used anymore. This means that if you update from a version older than PRTG 13.2.3 to the newest version, all customizations to the PRTG web interface are disabled and you have to revise them. You might find a way for a similar customization that you can add to the files in the webroot subfolder that now contains the PRTG web interface files.

■ For more information, see the Knowledge Base: [What about my web interface customizations as of PRTG 13.2.3?](#)

Update from PRTG 9 and 12

i We strongly recommend that you perform a clean install of the newest PRTG version instead of updating from PRTG 9 or 12.

If you use PRTG 9 or 12 now, your configuration is kept when you install the newest PRTG version in Standalone Mode or when you install a master node. But there are a few things you should consider.

i We recommend that you always have a backup of your monitoring data.

- Intermediate versions: You have to install two intermediate versions before you can update to the newest version.
 - If you run PRTG 12.4.5.3164/3165 or lower, install the intermediate version PRTG 12.4.7.3507 before you proceed.
 - If you have installed version 12.4.7.3507, install the intermediate version PRTG 16.1.21 before you proceed. Afterward, you can seamlessly update to the newest version. For details about this intermediate update, see section [Update from PRTG Network Monitor 13.1.1 through 16.1.21](#)^[95].
 - We recommend that you use the auto-update feature. In this case, PRTG automatically installs the intermediate versions. Run the auto-update three times if you come from a version previous to PRTG 12.4.7.3507, run it twice if you come from a version previous to PRTG 16.1.21.1691/1692. If you do not use the auto-update, [contact the Paessler support team](#)^[4206] to get the installers for these intermediate versions.
- Discontinued sensors: Instances of the following sensors stop working as of PRTG V12 and must be replaced with their successor sensors.
 - VMware Host Server (SOAP)
 - VMware Virtual Machine (SOAP)
 - Xen Virtual Machine

If your configuration contains these sensors, they stop monitoring after you update to the newest version. We recommend that you pause them to keep their data. To continue monitoring, add the sensors anew (for example, via the auto-discovery).

- Install .NET 4.0: We strongly recommend that you install .NET 4.0 on PRTG core server systems (and remote probe systems). Otherwise the following features do not work: [VMware](#)^[4625] auto-discovery and monitoring, [Citrix XenServer](#)^[670] auto-discovery and monitoring, [SIP Options Ping sensor](#)^[2251], Windows Last Update sensor (deprecated as of PRTG 16.x.23).
- Changed Geo Maps provider: When you update to the newest version, the provider for geographical maps automatically switches from Google Maps to MapQuest (using Open Street Map data).

- Windows 2000 not supported: As of PRTG 7, we do not officially support Windows 2000 systems anymore. This means that you cannot install PRTG on systems that run Windows 2000, and you cannot officially monitor Windows 2000 systems (for example, via WMI). However, if you were able to successfully monitor your Windows 2000 systems with PRTG 9, this might actually not be possible anymore with the newest version.
- ⓘ We recommend that you have a look at the [system requirements](#)^[23] before you update. Officially supported operating systems, browsers, and other requirements may have changed since PRTG 9.

Update from PRTG 7 or 8

- ⓘ We strongly recommend that you perform a clean install of the newest version instead of updating from PRTG 7 or 8.

If you use PRTG 7 or 8 now, you have to update PRTG to intermediate versions first to ensure all data is transferred correctly. You cannot update to PRTG 15 or later directly from PRTG 7 or 8.

- We recommend that you first update to the newest PRTG 8 version.
- From the newest PRTG 8 version, update to PRTG version 9.
- From PRTG 9, update to both [intermediate versions](#)^[96] PRTG 12.4.7.3507 and 16.1.21.1691/1692, then to the newest PRTG version.

[Contact the Paessler support team](#)^[4738] to obtain download links for these versions. Always keep a proper backup of your configuration and monitoring data.

Updating from PRTG 7 or 8 to Newest PRTG Version

- Packet Sniffer (Content) sensors are not supported anymore. Sensors of this type automatically switch to Packet Sniffer (Header) sensors after the update. As a benefit, you can now also sniff IPv6 traffic.
- Internet Explorer 8 is no longer supported for access to the PRTG web interface.
- You might experience a slow Enterprise Console (deprecated; former 'Windows GUI') because different reasons.
- When you install a failover node on top of a standalone PRTG 7, 8, 9, 12, or 13+ installation, the configuration cannot be kept and is written to a backup folder. Afterward, the new configuration is received from the master node. As all cluster nodes work with the same configuration, a failover node's old configuration and monitoring data can no longer be used. If you want to keep a configuration of PRTG 7, install the master node on top of the old installation and use other servers for the failover node installations.
- Since PRTG 9, SNMP sensors use the IPv4 Outgoing IP set for the PRTG probe service (this setting was formerly ignored by those sensors, which used the auto setting instead). If you experience sensors that fail, check the setting in the [probe settings](#)^[409].
- If you (manually) configured the PRTG probe service or PRTG core server service to run under a different Windows user account (for example, for successful internet access through an ISA server firewall), apply the respective Windows user account for the PRTG probe service and/or PRTG core server service anew after you install the newest PRTG version.
- For system requirements for the PRTG core server and probes, see section [System Requirements](#)^[23].

- If you use the default data path in your PRTG setup, it is changed automatically. Up to PRTG 8, all data was stored in a subfolder that reflected a PRTG version number (v7 or v8). As of PRTG 9, this subfolder is omitted, and data is stored directly in `%ALLUSERSPROFILE%\Application data\Paessler\PRTG Network Monitor`. During setup, all data is moved to the new directory. If you use a custom data path, it is not changed.
- Up to PRTG 8, all data in the registry was stored in a subkey that reflected a PRTG version number (v7 or v8). As of PRTG 9, this subkey is omitted and registry data is stored directly under the key `HKEY_LOCAL_MACHINE\SOFTWARE\Paessler\PRTG Network Monitor` (on 32-bit systems), respectively `HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Paessler\PRTG Network Monitor` (on 64-bit systems). During setup, all registry values are moved to the new key.

 We strongly recommend that you see the system requirements before you update to the newest version. Officially supported operating systems, browsers, and other requirements may have changed since PRTG 8.

Updating from PRTG 7 to Newest PRTG Version

- Regarding custom sensors, the interpretation of returned values is handled more strictly as of PRTG 8. If you use custom sensors with PRTG 7, these may not work with the newest PRTG version if they do not fully apply to the [API definition](#)⁴³⁸⁹.

Update from Older PRTG Products

For all other predecessor products, a direct data import into the newest version is not possible.

If you use IPCheck 5 or PRTG Traffic Grapher 6, perform a clean installation of PRTG and set up your configuration anew. Use the [auto-discovery](#)²⁹⁶ to quickly configure monitoring of your entire network.

 For more information, see section [Quick Start Guide](#)⁴⁴.

4.3 Install a PRTG Core Server

Installing PRTG works like other Windows-based applications. To install PRTG on premises, run the installation setup program from the .zip file that you downloaded.

1. Confirm the question of the [Windows User Account Control](#) with Yes to allow PRTG to install. The installation dialog guides you through the installation process.

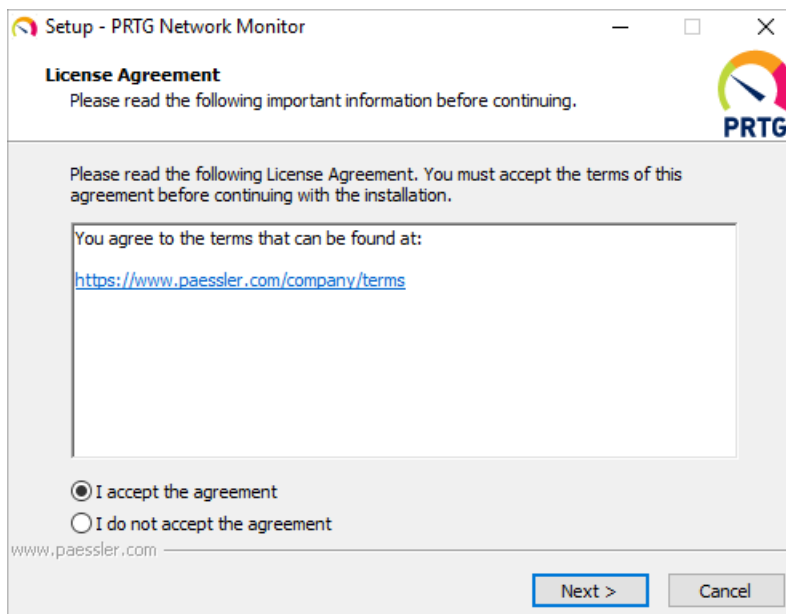

Windows User Account Control Confirmation Request

2. Select a language for the installation and click OK. The available language options depend on both your Windows version and the setup file.

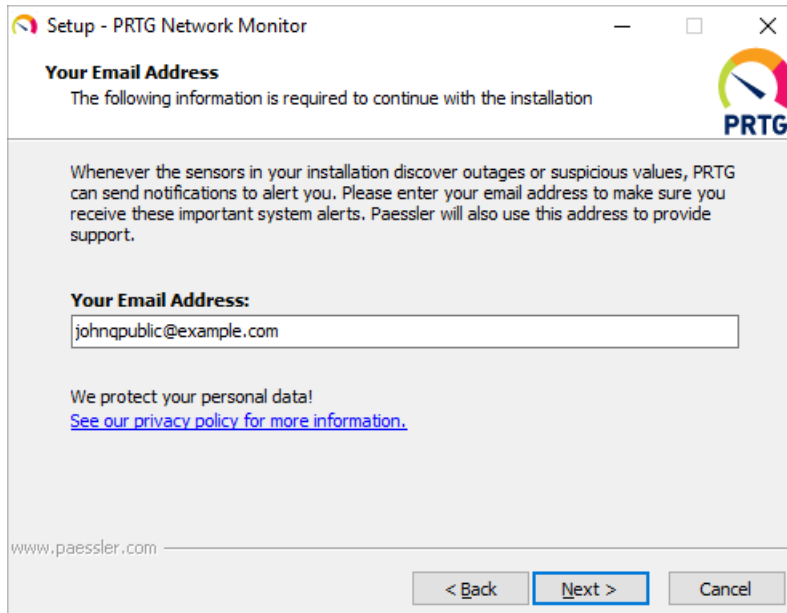

Setup Language Selection

3. Accept the [license agreement](#) and click Next.

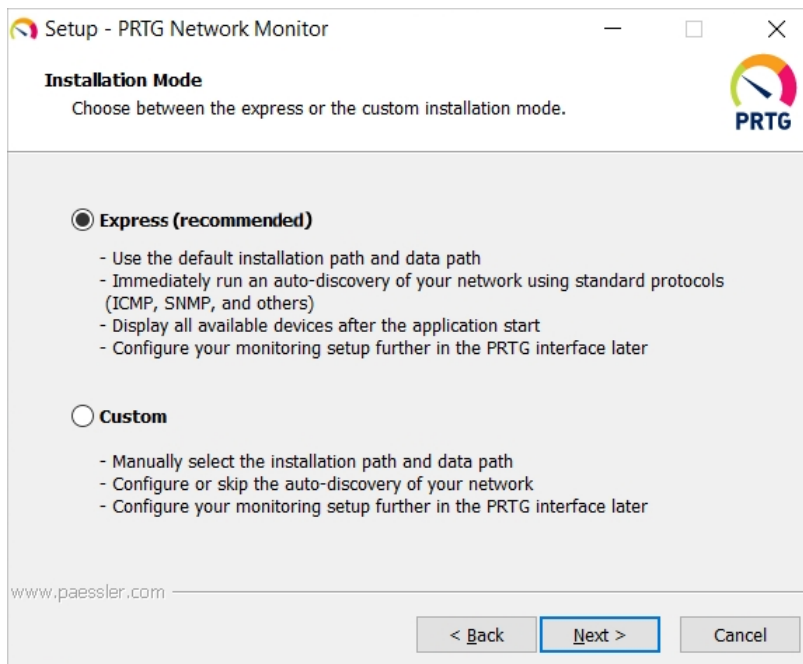

Setup Dialog: License Agreement

4. Enter your email address to make sure you receive important system alerts and click Next.

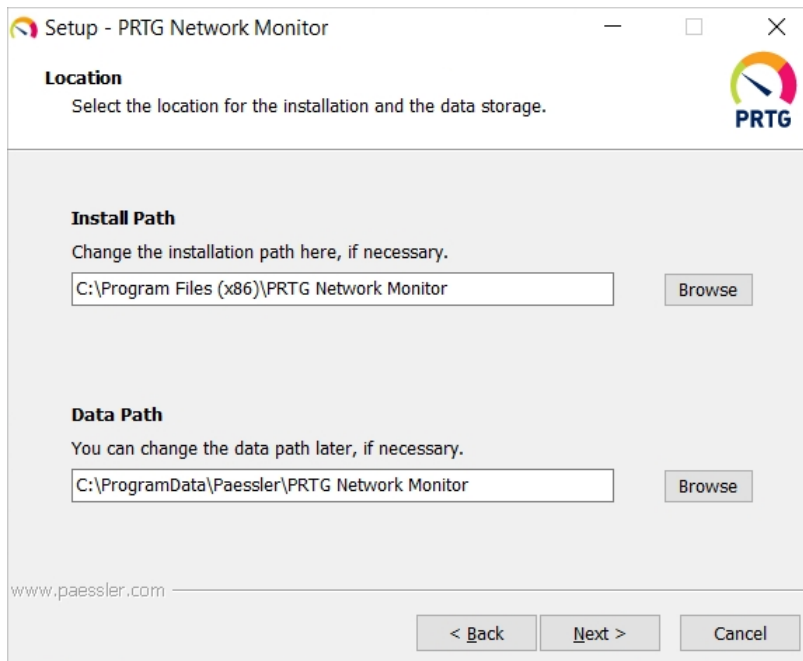

Setup Dialog: Your Email Address

5. Select if you want to use the Express or the Custom installation mode and click Next. If you select the Express installation mode, you can directly proceed with step 9.

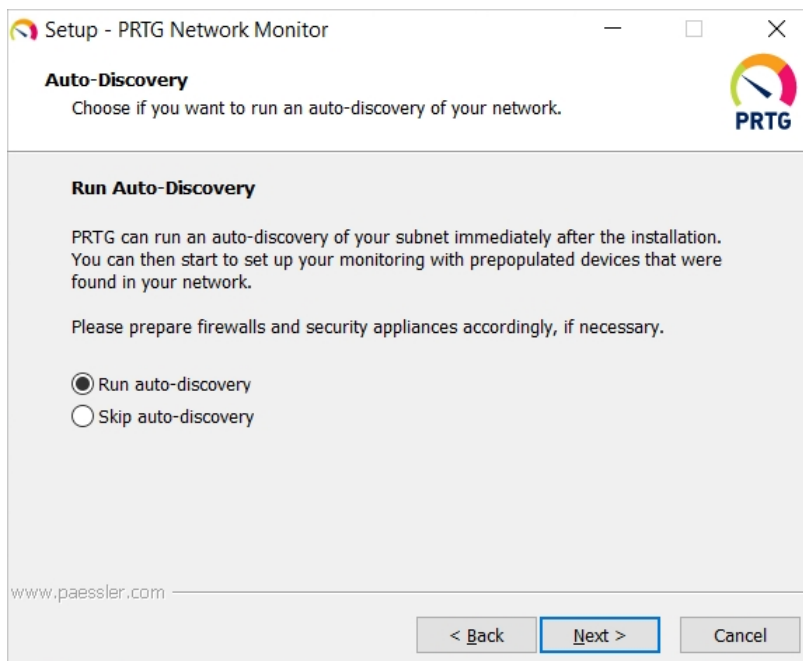

Setup Dialog: Installation Mode

- This page is only visible if you use the Custom installation mode. You can change the paths to the [PRTG program directory and PRTG data directory](#), if necessary. Click Next.

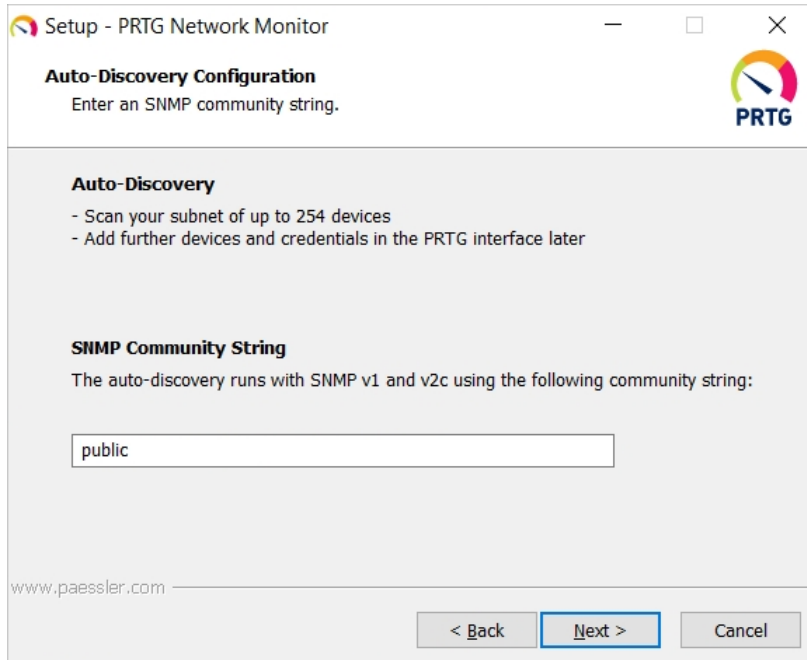

Setup Dialog: Location for Installation and Data Storage

- This page is only visible if you use the Custom installation mode. Select if you want to run an [auto-discovery](#) of your network or if you want to skip the auto-discovery. Click Next.

Setup Dialog: Run or Skip Auto-Discovery

- 8. This page is only visible if you select Run auto-discovery. You can enter an Simple Network Management Protocol (SNMP) community string. The default SNMP community string is [public](#). Click Next.

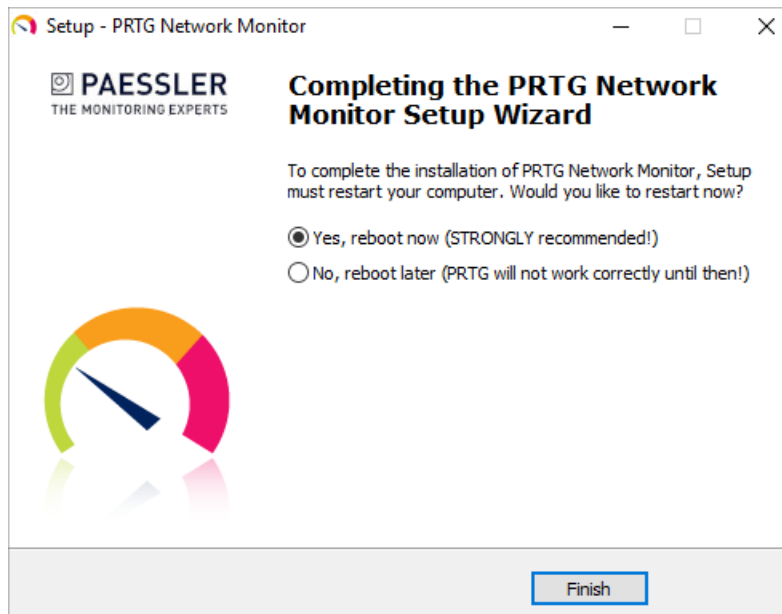

Setup Dialog: Auto-Discovery Configuration

- 9. PRTG is installed on your computer.

Setup: Installing PRTG

10. Select Yes, reboot now to complete the installation of PRTG and use all its functionalities after the restart. Click Finish to complete the setup of PRTG.

Setup: Finish Installation

After installation, you can open the [PRTG web interface](#)^[163] in your system's default browser. Make sure that Google Chrome 72, Mozilla Firefox 65, or Microsoft Internet Explorer 11 is available on the system.

■ For more information, see section [System Requirements](#)^[30].

ⓘ In some cases, antivirus software like Windows Defender interferes with the PRTG installer. This might cause high CPU load on the PRTG core server, which might prevent a successful installation. Temporarily disable Windows Defender and other antivirus software in these cases.

Enter License Information

PRTG validates your license information during the installation process by connecting to the activation server. If there are issues with the trial installation, PRTG asks you for your License Name and Key. In this case, you are directed to our website.

Enter both License Name and License Key exactly as received from Paessler.

■ For more information, see section [Enter a License Key](#)^[107].

If you think that you have correctly entered your license information but get a License Invalid message, contact sales@paessler.com.

ⓘ You can find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name, for which you might be asked while installing PRTG or when you [change your license key](#)^[107].

ⓘ When you update a commercial version with a new trial installer, PRTG ignores the new trial license key.

- [Uninstall PRTG Products](#)^[125]

4.4 Install a Cluster

PRTG offers one single failover cluster in all licenses, including the freeware edition. A single failover cluster consists of two machines ([master node](#) and [failover node](#)) that each run one installation of PRTG. They are connected to each other and exchange configuration and monitoring data. You can run a cluster with up to five cluster nodes.

☁ This feature is not available in PRTG Hosted Monitor.

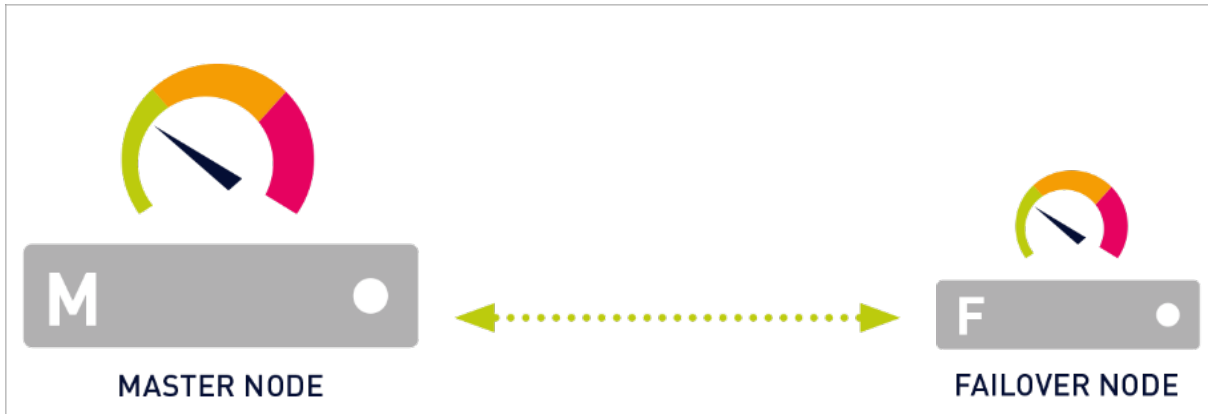

Illustration of a Single Failover Cluster

■ For more information, see section [Failover Cluster Configuration](#) ⁴⁵¹³.

More

- [Install a PRTG Core Server](#) ¹⁰⁰
- [Install a Cluster](#) ¹⁰⁶
- [Enter a License Key](#) ¹⁰⁷
- [Activate the Product](#) ¹¹⁰
- [Install a Remote Probe](#) ¹¹²
- [Uninstall PRTG Products](#) ¹²⁵

4.5 Enter a License Key

A license key for PRTG on premises consists of the License Name and a License Key. The key is a string that consists of 8 blocks with 5 characters each.

Your Personal License Information

You have received the License Name and the License Key from Paessler via email or in a license document in the [Paessler Software Shop and Customer Service Center](#). Copy this information and insert it when PRTG asks you to enter your license information in the setup dialog.

- i You can find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name, for which you might be asked while installing PRTG or when you [change your license key](#)^[107].
- i For the Trial and Freeware Editions, you receive the required license information on the Paessler web page when you download the trial or freeware version of PRTG. For a Commercial Edition, use your commercial license information.

License Information	Example
License Name	ExampleOrganization
License Key	P1000-FFSEJ-ZHGRD-UR1CS-U73FG-G645F-YVF1D-H8323

There are two license key types:

- Trial/Freeware license key: With a Trial license key, you can experience unlimited functionality of PRTG during the 30-day trial period. Your installation automatically switches to a Freeware Edition afterward.
■ For more information about how to get your free Trial edition, see section [Download PRTG](#)^[93].
- Commercial license key: You can only enter this key if you have purchased a commercial license. Your installation allows the number of sensors according to your [license](#)^[21].

During the setup process for installing a Commercial Edition, PRTG asks you to enter your license information. We recommend that you copy and paste your license data. If you install a Trial Edition, you do not have to enter a license key.

Change License Key

Usually, you do not need to manually enter a key after the installation to activate it because PRTG asks for it during the install process. However, there are still scenarios where you need to change your key and activate the respective license. You have to provide your commercial license key, for example, if you have purchased a Commercial Edition and want to upgrade your running Freeware or Trial Edition, or if you upgrade a commercial license to a higher edition.

1. To enter a new license key, log in to the [PRTG web interface](#)^[163].
2. Select Setup | License Information from the [main menu bar](#)^[278].

Sensor count

- <https://www.paessler.com/learn/videos/sensor-count>

Installing the Software

- [Download PRTG](#)  93
- [Update From Previous Versions](#)  94
- [Install a PRTG Core Server](#)  100
- [Install a Cluster](#)  106
- [Enter a License Key](#)  107
- [Activate the Product](#)  110
- [Install a Remote Probe](#)  112
- [Uninstall PRTG Products](#)  125

4.6 Activate the Product

PRTG on premises automatically activates your license via the internet during the installation process. If PRTG cannot directly connect to the internet and therefore cannot access the activation server, you have to manually activate your license.

 You have to complete the product activation process once to use PRTG, otherwise it does not run. Do not forget to activate your commercial license when you want to upgrade your trial or freeware installation.

Online Activation

Usually, you do not need to manually enter a key after the installation to activate it because PRTG asks for it during the install process. However, there are still scenarios where you need to change your key and activate the respective license. You have to provide your commercial license key, for example, if you have purchased a Commercial Edition and want to upgrade your running Freeware or Trial Edition, or if you upgrade a commercial license to a higher edition.

1. To enter a new license key, log in to the [PRTG web interface](#) .
2. Select Setup | License Information from the [main menu bar](#) .
3. Click Change License Key. The Update Your License page appears where you can activate your new license.
4. Select the activation type Automatic (online activation with optional HTTP proxy) if your PRTG core server can connect to the internet.
 -  Without internet access, you have to select Manual (offline activation). The activation process works a bit differently in this case and requires manual interaction.
5. Provide your license information and click Update License.
6. PRTG connects to the Paessler activation server via a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection on port 443 and validates your license.

If everything works fine, you see the message Activation was successful as License Status at the top of the page.

 For more information, see section [License Information: Update Your License](#) .

 The PRTG core server needs an internet connection on port 443 to activate. If a proxy connection is needed, configure it in [step 3](#)  on the Update Your License page. If the activation fails, you can also try an offline activation.

Offline Activation

If no internet connection is available, you have to activate PRTG manually.

1. In the PRTG web interface, select Setup | License Information from the main menu bar.
2. Click Change License Key. The Update Your License page appears where you can activate your license.
3. Select the activation type Manual (offline activation) if your PRTG core server cannot connect to the internet.
4. Provide your license information and follow the instructions in [step 3](#)  and [step 4](#) .

5. Click Update License.

If the activation was successful, you see the message Activation was successful as License Status at the top of the page.

■ For more information, see section [License Information: Update Your License](#)⁴²⁵³.

i If your PRTG core server is offline, you need to manually activate your license after you renew your maintenance. This ensures that you can install updates, for example. Your maintenance information has to fit the PRTG installer, so you need to activate your license offline before you install an update.

- [Install a Cluster](#)¹⁰⁶
- [Enter a License Key](#)¹⁰⁷
- [Activate the Product](#)¹¹⁰
- [Install a Remote Probe](#)¹¹²
- [Uninstall PRTG Products](#)¹²⁵

4.7 Install a Remote Probe

Remote probes can extend your monitoring with PRTG.

- With remote probes, you can monitor different subnetworks that are separated from your PRTG on premises core server by a firewall, and you can keep an eye on remote locations. You can install [one or more remote probes](#)^[4503].
- Remote probes are useful if you want to distribute monitoring load by taking it from the PRTG core server system and putting it on one or more remote probe systems.
- You need a remote probe if you want to monitor your local network using a PRTG Hosted Monitor instance.

i PRTG automatically updates remote probes but, in rare cases, you have to manually update remote probes. You receive a [ToDo ticket](#)^[240] in this case. Follow the steps [below](#)^[112] to manually update remote probes.

i If you run PRTG in a cluster, see [Cluster and Remote Probes Outside the LAN](#)^[115] in this section.

■ If you have issues after the installation, see section [Debugging Remote Probe Connection Issues](#)^[127].

■ For a partially automatic installation of a remote probe directly from the device tree in the PRTG web interface, see section [Remote Probe Setup via Device Tools](#)^[4507]. For a quick installation guide, see the Paessler Website: [How to install a PRTG remote probe in 4 steps](#).

Steps to Take

To install a remote probe with the Remote Probe Installer, follow these steps:

- [Step 1: Meet the Requirements](#)^[112]
- [Step 2: Prepare the PRTG Core Server](#)^[113]: start here if you use PRTG on premises
- [Step 3: Download the Remote Probe Installer from the PRTG Web Interface](#)^[115]: start here if you use PRTG Hosted Monitor
- [Step 4: Install a New Remote Probe](#)^[116]
- [Step 5: Approve the New Remote Probe](#)^[119]

Step 1: Meet the Requirements

To install a remote probe on a computer, make sure that you meet the following requirements.

- The target computer runs the operating system Windows 7 or later.
- The target computer is accessible through remote procedure call (RPC). This is usually the case when your PRTG core server and the target computer are located in the same LAN segment. Otherwise, open Windows [services.msc](#) on the target computer and start the RPC service.
- Programs are allowed to communicate through your Windows Firewall. Open the settings of your firewall and select Allow an app through firewall. Mark the check box for Remote Service Management, and the check box Public in the corresponding line.

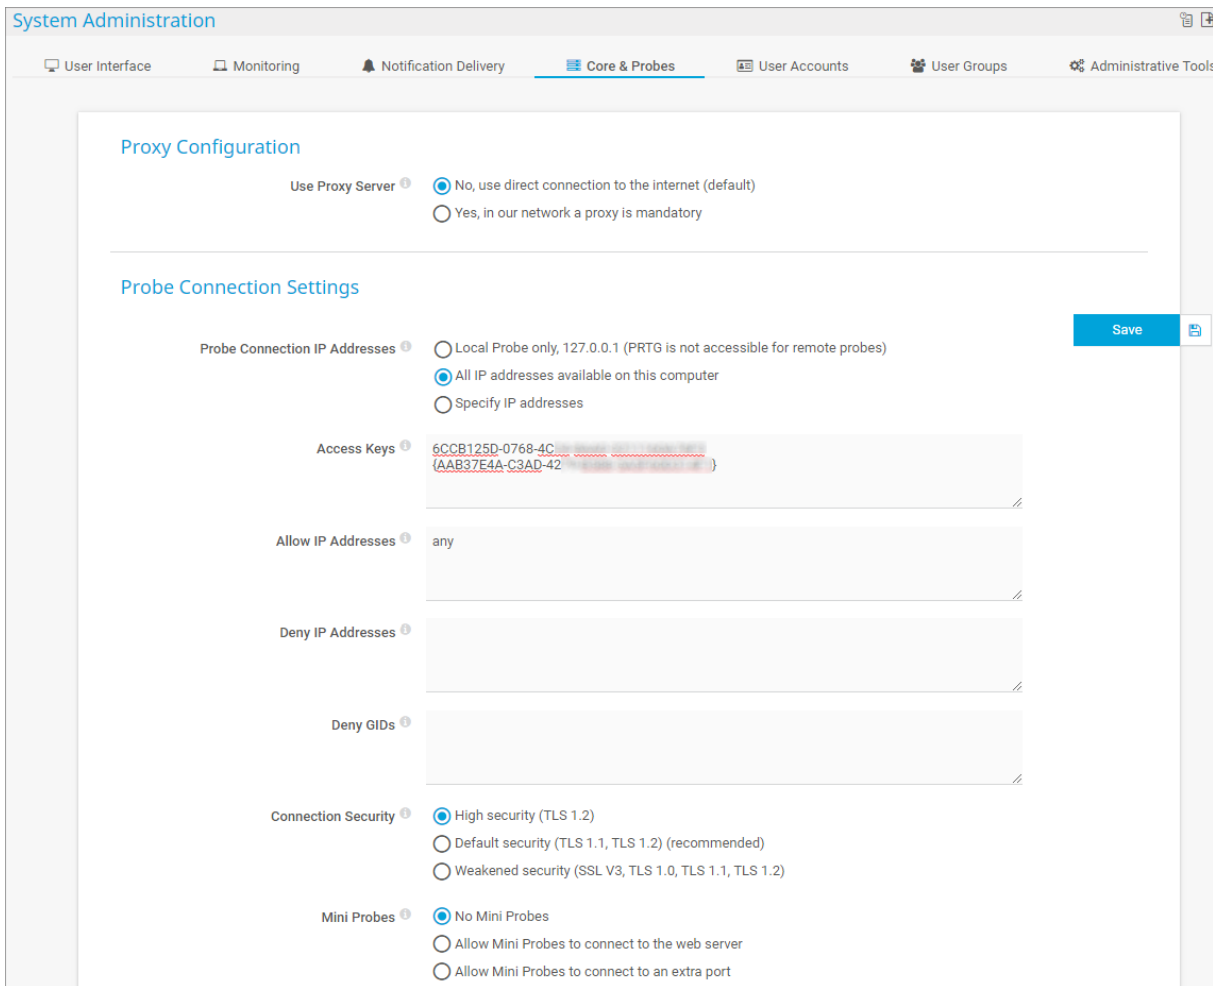

- Connections between remote probes and the PRTG core server require port [23560](#). Make sure that on your PRTG core server side, this port is not blocked by firewall rules, and, on the remote probe side, the Transmission Control Protocol (TCP) port [23560](#) is open for outgoing connections as well.
 - If you need to set a different port (not recommended), see the Knowledge Base: [How can I customize ports for core-probe connections used by PRTG?](#)
- ⓘ Your PRTG on premises or PRTG Hosted Monitor installations already include a local probe or hosted probe on the PRTG core server. This is why you cannot additionally install a remote probe on your PRTG core server system.
 - For more information on the requirements for remote probes, see section [System Requirements](#) ²⁴.

Step 2: Prepare the PRTG Core Server

If you use PRTG Hosted Monitor, you can start with [Step 3: Download the Remote Probe Installer from the PRTG Web Interface](#) ¹¹⁵ right away.

- ⓘ Because your remote probe needs to connect to your PRTG core server, PRTG needs to accept incoming remote probe connections. So, with PRTG on premises, first prepare your PRTG core server before you install the remote probe.

Edit the relevant settings in section [Core & Probes](#) ⁴²⁰². From the main menu in the [PRTG web interface](#) ¹⁶⁴, select Setup | System Administration | Core & Probes to access the probe settings and go to the Probe Connection Settings.

Probe Connection Settings in System Administration

Step 2.1: Probe Connection IPs

By default, a PRTG core server accepts connections from the Local Probe only (IP address [127.0.0.1](#)). This setting is the most secure setting, but it does not allow any remote probes to connect to your PRTG core server.

To accept remote probes, select one of the following settings:

- All IP addresses available on this computer: Any IP on your PRTG core server system accepts incoming probe connections.
- Specify IP addresses: Specify selected IP addresses that accept incoming connections.

Step 2.2: Allow IP Addresses

In the Allow IP Addresses field, you can enter the IP address of the computer on which you want to install a remote probe. You can also enter the word [any](#). This sets the PRTG core server to accept remote probe connections from any IP address.

i If you use [any](#), make sure that you only write the word in lower case. Any other variations are not valid.

Changing other settings is not required. For details about the fields for Access Keys, Deny IP addresses, and Deny GIDs, see section [Core & Probes](#)^[4204].

When you are done, click Save to save your settings.

i If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of [PRTG Desktop](#)^[4275], or of [PRTG Apps for Mobile Network Monitoring](#)^[4276] are disconnected and reconnected.

i To edit the core–probe connection settings, you can also use the [PRTG Administration Tool](#)^[4347] on your PRTG core server.

Cluster and Remote Probes Outside the LAN

i If you run PRTG as a cluster and you want to run remote probes outside your local network, you have to make sure that your cluster nodes and the addresses they use are reachable from the outside. Check your cluster node settings under [Cluster](#)^[4229] before you install a remote probe outside your local network. Enter valid addresses (Domain Name System (DNS) names or IPs) for both cluster nodes to reach each other and for remote probes to individually reach all cluster nodes. Remote probes outside your LAN cannot connect to your cluster nodes if they use local addresses.

If you already have a remote probe installed outside your LAN and the remote probe is disconnected because of this, follow these steps:

1. Uninstall the remote probe.
2. Update the [cluster node settings](#)^[4230] with addresses that are reachable from outside your LAN.
3. Restart your PRTG core servers.
4. Install the remote probe again. It then obtains the IP address or DNS name entries that it can reach.

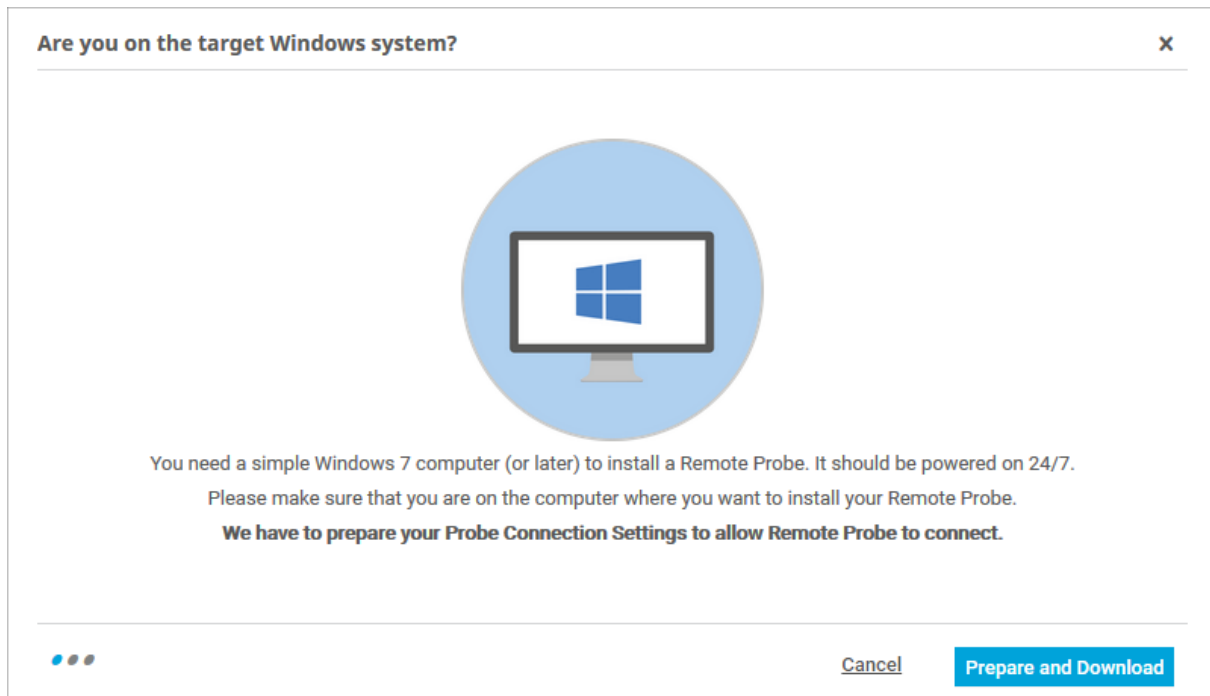

■ See also section [Failover Cluster Configuration](#)^[4515], section Remote Probes in a Cluster.

Step 3: Download the Remote Probe Installer from the PRTG Web Interface

1. On the computer on which you want to install a remote probe, log in to the PRTG web interface.
2. From the main menu bar, select Setup | Optional Downloads | Remote Probe Installer.
3. Click Add Remote Probe to start the installation assistant.
 - i** The Add Remote Probe button is also available in the device tree.
4. Wait until the installation is completed. The remote probe then automatically connects to your PRTG core server.
5. In the appearing dialog window, click Prepare and Download to start the download.
6. Save the setup program to your local disk.

In the installation approach with the assistant, PRTG guides you through the installation process. If you Download the Remote Probe Installer directly, you have to install the remote probe without the assistant.

■ If you connect your remote probe to a PRTG on premises instance, [prepare](#)^[113] your Probe Connection Settings first.

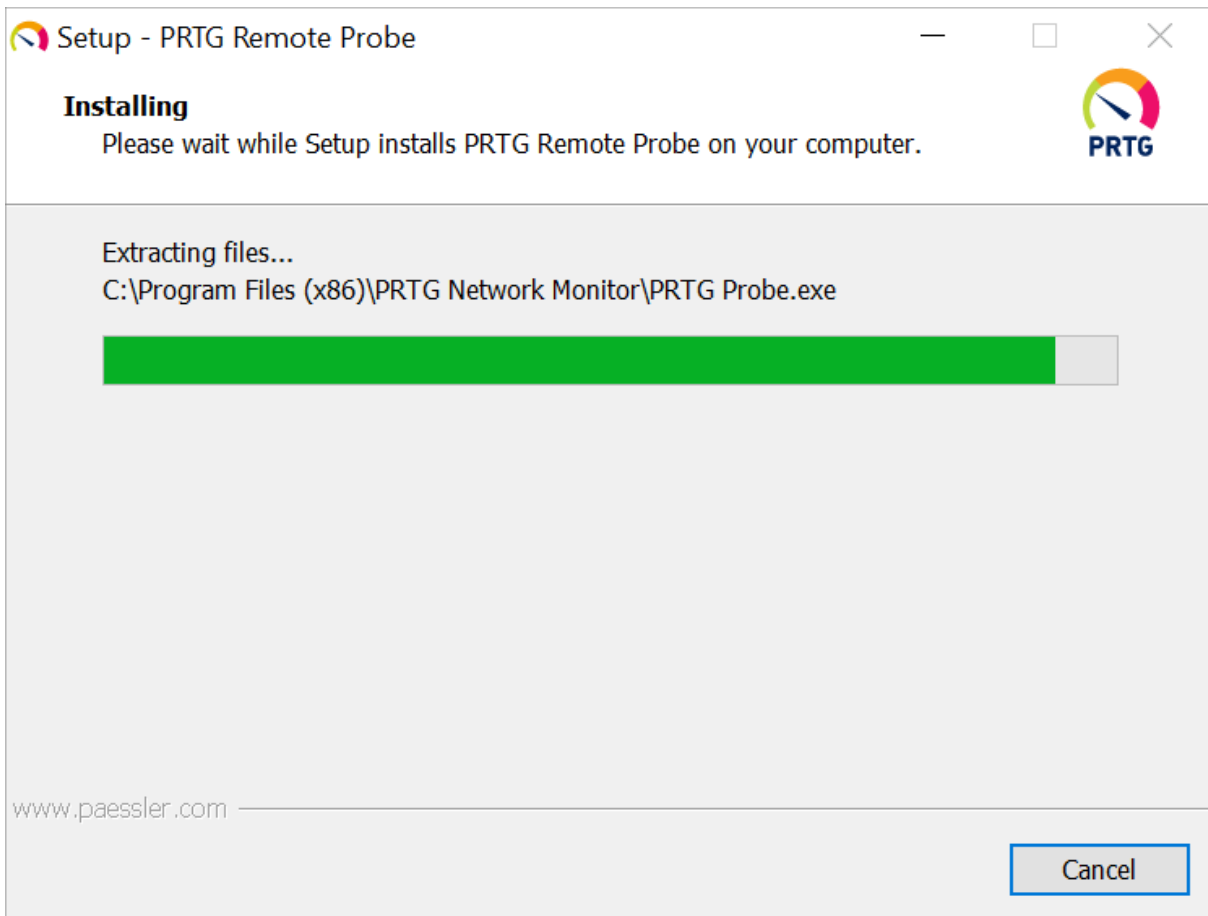

Add Remote Probe Assistant

i The PRTG version numbers of the PRTG core server service and PRTG probe service must match. PRTG automatically updates remote probes when you install a new version on the PRTG core server. If PRTG advises you to manually update your remote probe, open a web browser on the remote computer and download the remote probe installer as described in this section.

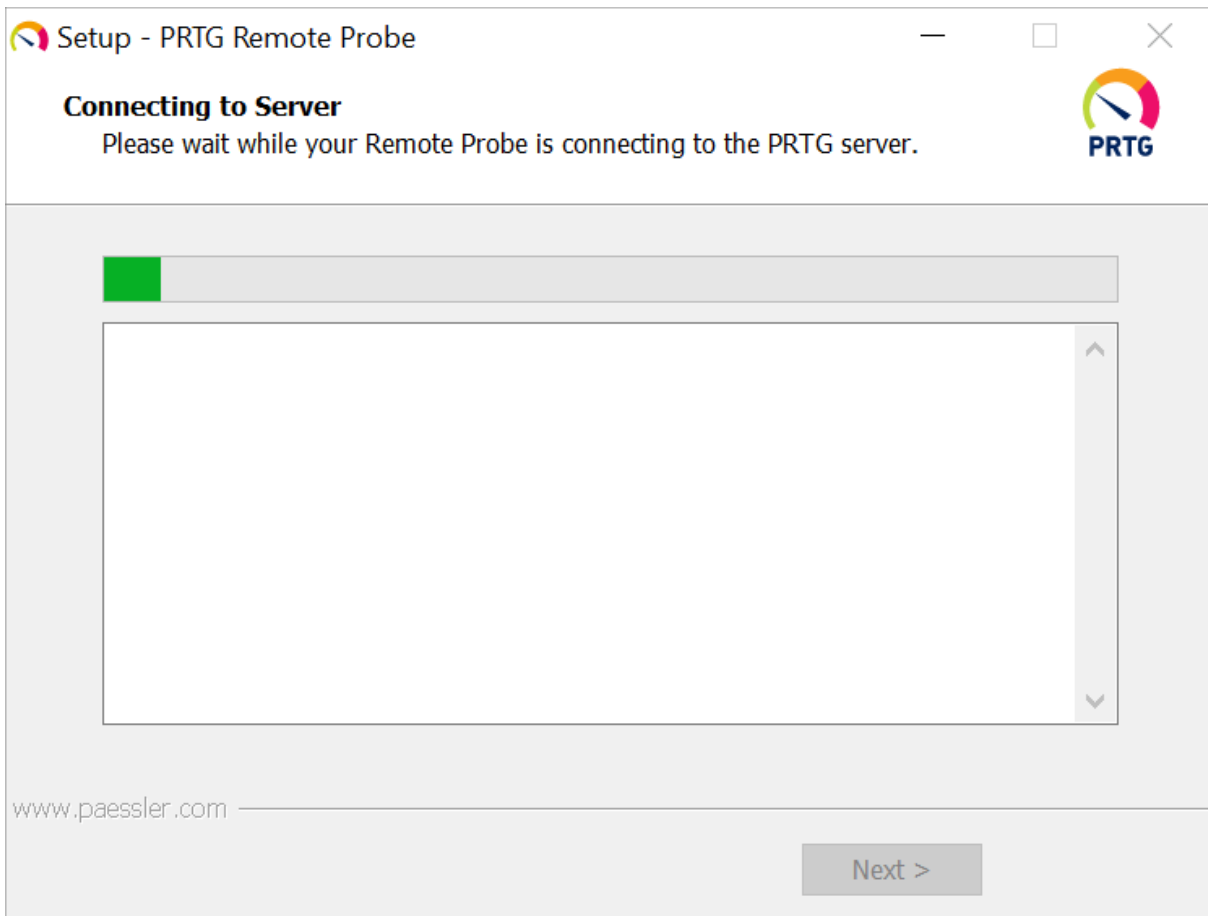

Step 4: Install a New Remote Probe

1. Execute the setup program that you downloaded.
2. Confirm the Windows [User Account Control](#) dialog with Yes to allow the installation. The usual software installation wizard guides you through the installation process.
3. Click Install to start the installation process.

Remote Probe Setup Installing

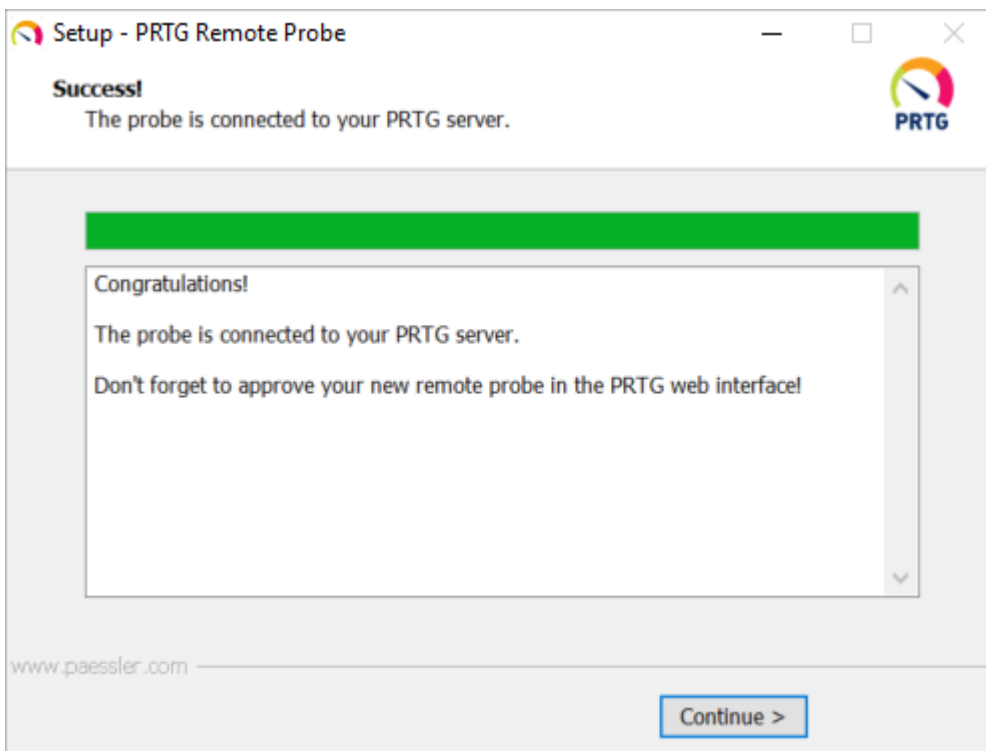

Wait until the installation is complete. The remote probe then automatically connects to your PRTG core server.

Remote Probe Setup Connecting to the PRTG Core Server

If the remote probe successfully connects to your PRTG core server, you can complete the setup of your new remote probe.

i To allow your new remote probe to connect to a PRTG Hosted Monitor instance, PRTG automatically sets the Allow IP Addresses field in [Core & Probes](#) to [any](#). You can also use [any](#) for PRTG on premises, but we recommend that you use this setting in intranets only. If [any](#) is not an option for you, cancel it in the Allow IP Addresses field and enter the IP address of your remote probe instead.

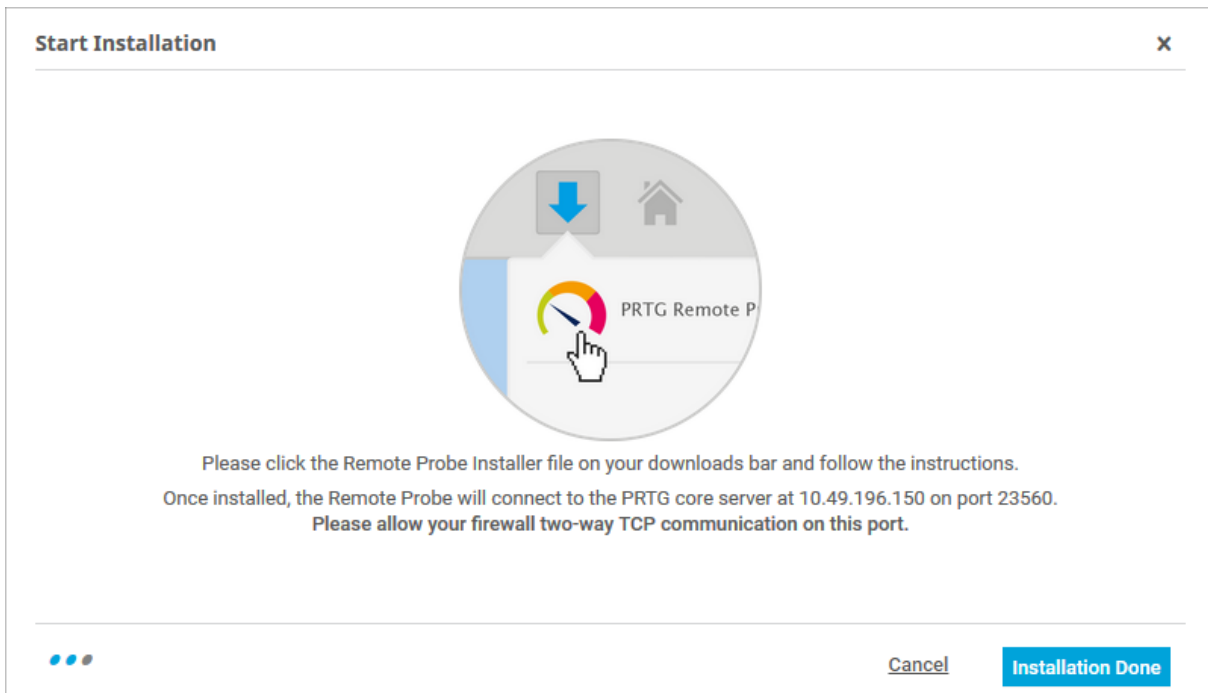

Remote Probe Setup Successful

4. Click Continue to finish the remote probe installation.
5. Click Finish to exit the installation wizard.

The remote probe is now installed on your computer as a Windows service.

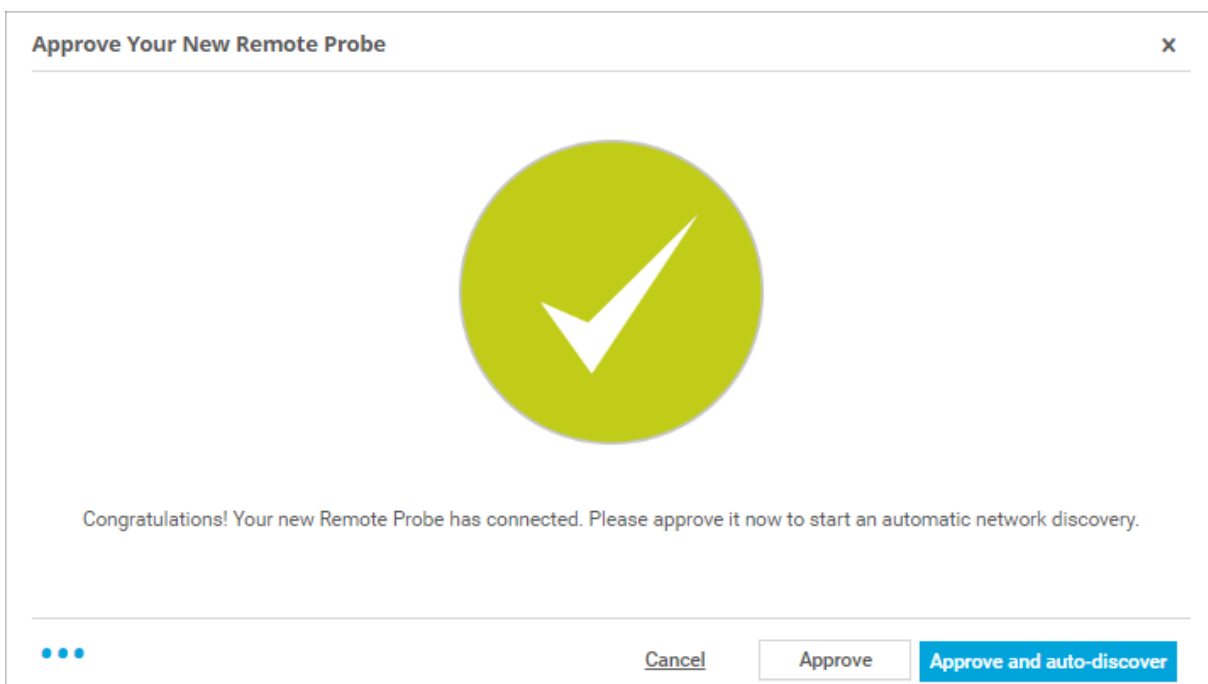

Step 5: Approve the New Remote Probe

In the installation assistant, click Installation Done.

Confirm that Installation is Done

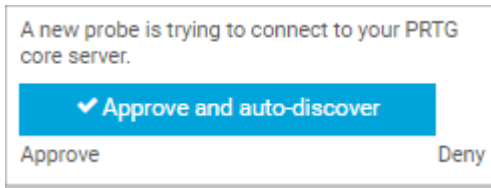

☁ If you successfully installed the remote probe from a PRTG Hosted Monitor installation, you see the following dialog box.

Approve Remote Probe for PRTG Hosted Monitor

Click **Approve and auto-discover** to include the new remote probe and network in your device tree and to start the [auto-discovery](#)^[296]. It discovers devices and automatically creates suitable sensors. Optionally, click **Approve** to only approve the remote probe without the auto-discovery. The remote probe appears in your device tree.

For unwanted remote probe connections, click Cancel. A new window appears in the lower-right corner.

Deny Remote Probe

Click Deny to deny the new remote probe.

i If you deny or remove a remote probe, PRTG automatically adds this device's global ID (GID) to the Deny GIDs list in [Core & Probes](#)⁴²⁰³. PRTG automatically denies future remote probe connections from this device.

i If you deny the remote probe in the device tree, it does **not** uninstall the remote probe, but only denies access to the PRTG core server. The remote probe continues to run on the target system until you uninstall it manually.

Once approved, PRTG automatically opens the new remote probe in the device tree and creates a set of sensors for the remote probe to ensure you can immediately detect bottlenecks on the remote probe system. We recommend that you keep these sensors. You can now create groups, devices, and sensors for monitoring via the new remote probe.

i You do not have to approve remote probes after updates.

When a new remote probe connects to the PRTG core server for the first time, you receive a new ToDo ticket.

Debugging Remote Probe Connection Issues

If you have issues with the connection between the PRTG core server and remote probe, make sure that you meet the following requirements:

- Recheck if you fulfilled all the requirements as described in [step 1](#)¹¹² of this section like the Windows Firewall settings.
- The IP address of the computer on which you want to install a remote probe is not listed in the Deny IP Addresses field in [Core & Probes](#)⁴²⁰³.
- You can also take a look at the remote probe's logfiles. The probe process writes logfiles with a file name in the format PRTG Probe Log (x).log. Open the one with the most recent date.

For a correct connection, the log should look similar to this:

```
11/6/2017 1:21:58 PM PRTG Probe V17.4.36.3253
11/6/2017 1:21:58 PM System time zone: (UTC+01:00) Amsterdam, Berlin, Bern, Rome,
Stockholm, Vienna
11/6/2017 1:21:58 PM libeay32.dll=1.0.2.11
11/6/2017 1:21:58 PM ssleay32.dll=1.0.2.11
11/6/2017 1:21:58 PM PRTG Probe "example-DNS" starting on "example-
DNS" (GID={AAAA1111-22BB-33CC-DD44-EEEEEE555555})
11/6/2017 1:21:58 PM Memory Manager: NexusMM4
11/6/2017 1:21:58 PM OS: Microsoft Windows 10 Enterprise (10.0 Build 15063), 4 CPUs

11/6/2017 1:21:58 PM Data Path: C:\ProgramData\Paessler\PRTG Network Monitor\
11/6/2017 1:21:58 PM System Path: C:\Program Files (x86)\PRTG Network Monitor\
11/6/2017 1:21:58 PM Local IP: 0.0.0.0
11/6/2017 1:21:58 PM Core Server IP: example-DNS.exempldomain.com
11/6/2017 1:21:58 PM Core Server Port: 23560
11/6/2017 1:21:58 PM SSL Enabled
11/6/2017 1:21:58 PM Probe GID: {AAAA1111-22BB-33CC-DD44-EEEEEE555555}
[...]
11/6/2017 1:21:58 PM Start Connection
11/6/2017 1:21:58 PM Start Done
11/6/2017 1:21:58 PM (14608):Initializing WMIConnectionPool
11/6/2017 1:21:58 PM (14608):WMIConnectionPool maximum number of concurrrent
establishings is set to: 20
11/6/2017 1:22:03 PM Connect from to example-DNS.exempldomain.com:23560
11/6/2017 1:22:03 PM TCP connected from 10.49.12.51:55199 to example-
DNS.exempldomain.com:23560
11/6/2017 1:22:03 PM State changed to connected (example-DNS.exempldomain.com:23560)
11/6/2017 1:22:03 PM Reconnect
11/6/2017 1:22:04 PM Connected
11/6/2017 1:22:10 PM Send Login
11/6/2017 1:22:10 PM Local: 11/6/2017 1:22:10 PM UTC: 11/6/2017 12:22:10 PM
11/6/2017 1:22:10 PM MarkUnused
11/6/2017 1:22:10 PM Login OK: Welcome to PRTG
```

If the connection fails, for example because of an incorrect Access Key, or because of incorrect IP address settings (see [step 2](#)¹¹³), you see:

```
11/6/2017 1:42:02 PM Try to connect...
11/6/2017 1:42:02 PM Connected to 10.0.2.167:23560
11/6/2017 1:42:07 PM Login NOT OK: Access key not correct!
```

If you need to adjust any settings for the connection to the PRTG core server, use the [PRTG Administration Tool](#)⁴³⁷¹ on the remote probe system.

Remote Probe Settings in PRTG Administration Tool

Under Connection to PRTG Core Server, you can then edit the following settings:

- **Server:** Enter the IP address or Domain Name System (DNS) name of the PRTG core server that the remote probe is to connect to. If you use network address translation (NAT) rules, you must enter the IP address that is externally visible, because the remote probe connects from outside your network.
- **Probe Access Key and Confirm Access Key:** Enter the access key that the remote probe is to send to the PRTG core server. You have to define this access key on the PRTG core server in [Core & Probes](#)⁴²⁰³. Make sure that the access keys match.

Click **Save & Close** to confirm your settings and to (re)start the PRTG probe service.

For more information about these settings, see section [PRTG Administration Tool](#)⁴³⁷¹.

Installing the Software

- [Download PRTG](#) ⁹³
- [Update From Previous Versions](#) ⁹⁴
- [Install a PRTG Core Server](#) ¹⁰⁰
- [Install a Cluster](#) ¹⁰⁶
- [Enter a License Key](#) ¹⁰⁷
- [Activate the Product](#) ¹¹⁰
- [Install a Remote Probe](#) ¹¹²
- [Uninstall PRTG Products](#) ¹²⁵

4.8 Uninstall PRTG Products

Whether you uninstall an entire PRTG installation or a remote probe installation, take the following steps. Use the Windows uninstall routines to remove the software from your system.

Step 1

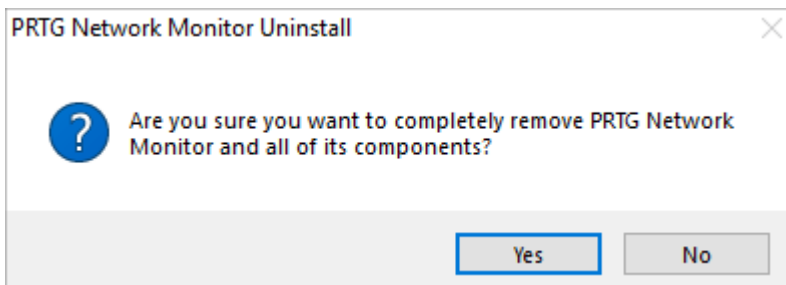

From the Windows Start menu, run Uninstall PRTG Network Monitor or open your Windows Control Panel and select the desired entry in the Programs and Features section. To uninstall a remote probe, only the second option applies. Depending on the installed products, not all uninstall programs are available.

Step 2

If asked, confirm the question of the Windows User Account Control with Yes to allow the program to uninstall. The software uninstall dialog guides you through the uninstall process.

Step 3

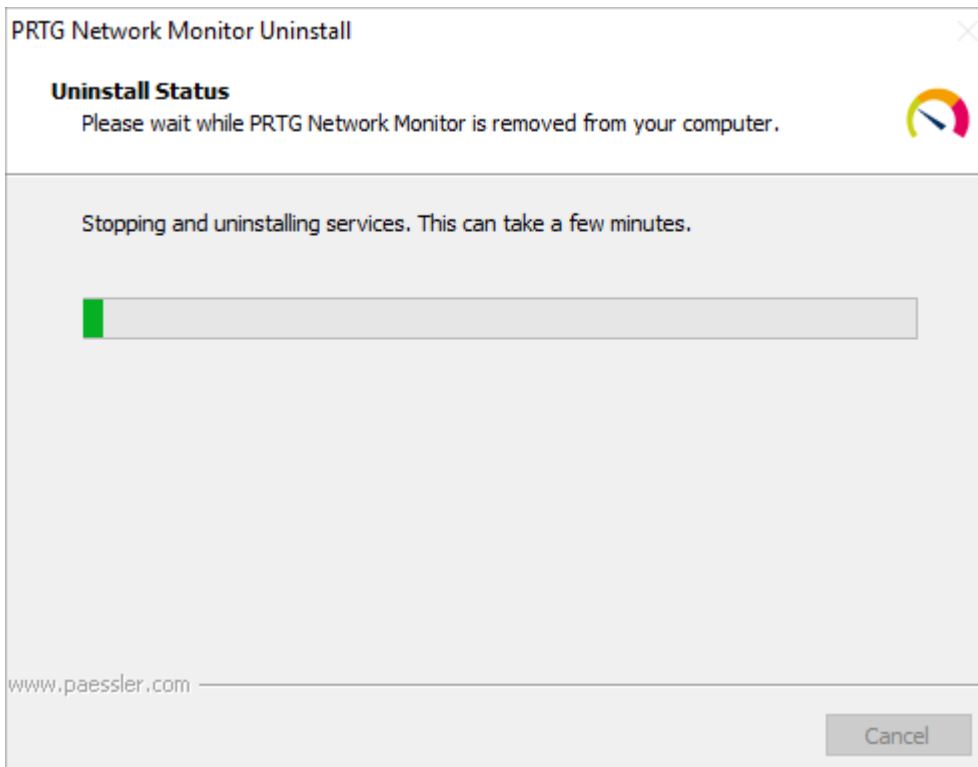

Confirm the removal of the software with Yes.

Uninstall PRTG Network Monitor Step 1

Step 4

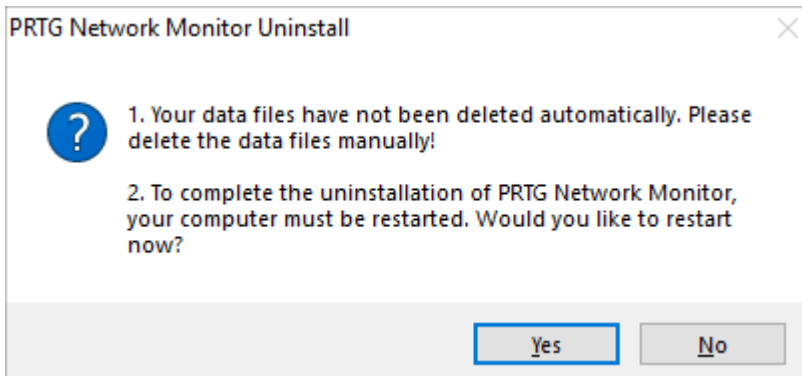

Wait while the software is removed.

Uninstall PRTG Network Monitor Step 2

Step 5

Confirm a system restart with Yes.

Uninstall PRTG Network Monitor Step 3

Step 6

After the system restart, the software is removed, but there is still some custom data in the PRTG program directory. If you have uninstalled an entire PRTG installation or a remote probe installation, your monitoring data is still stored on the system. To completely remove all PRTG data, delete the PRTG Network Monitor folder as well as the Paessler\PRTG Network Monitor folder in the PRTG data directory.

■ For more information, see section [Data Storage](#) ⁴⁵²⁶.

Step 7

During the installation of PRTG, a component called Npcap is also installed on your system. After you uninstall PRTG, you need to manually uninstall this feature. To do so, open your Windows Control Panel and select Npcap 0.9983 in the Programs and Features section. Click Uninstall to remove this feature from your Windows system.

 If you updated to PRTG 19.2.50, you also need to manually [uninstall the Npcap loopback adapter](#)^[94].

Part 5

Understanding Basic Concepts

5 Understanding Basic Concepts

There are a number of basic concepts that are essential for understanding the functionality of PRTG. This includes, for example, the underlying architecture of the monitoring system, the hierarchy of objects, the inheritance of settings, the access rights management, and notifications.

Understanding Basic Concepts

- [Architecture and User Interfaces](#) ^[130]
- [Cluster](#) ^[135]
- [Object Hierarchy](#) ^[138]
- [Inheritance of Settings](#) ^[142]
- [Tags](#) ^[145]
- [Dependencies](#) ^[148]
- [Scheduling](#) ^[150]
- [Notifying](#) ^[152]
- [Access Rights Management](#) ^[155]
- [Data Reporting](#) ^[159]
- [IPv6 Support](#) ^[161]

5.1 Architecture and User Interfaces

In this section, you can find an overview of the components of PRTG and how it works.

Overview

You can classify the components of PRTG into three main categories: system parts, user interfaces, and basic system administration tools.

Category	Components
System Parts	<p>PRTG core server </p> <p>This is the central part of a PRTG installation. The PRTG core server includes the data storage, the web server, the report engine, the notification system, and more. The PRTG core server is configured as a Windows service that permanently runs.</p>
	<p>Probes </p> <p>This is the part of PRTG that performs the actual monitoring. There are local probes, remote probes, and cluster probes in PRTG on premises, and there are hosted probes and remote probes in PRTG Hosted Monitor. Probes forward all monitoring data to the central PRTG core server. Probes are configured as Windows services that permanently run.</p> <p> We assume that all systems on which the PRTG core server with the local probe or any remote probes run are secure. It is every system administrator's responsibility to make sure that only authorized persons can access these systems. For this reason, we highly recommend that you use dedicated machines for your PRTG system parts.</p>
User Interfaces	<p>PRTG web interface</p> <p>With the Asynchronous JavaScript and XML (AJAX) based PRTG web interface, you can configure devices and sensors, review monitoring results, and configure the system administration and user management.</p>
	<p>PRTG Desktop </p> <p>PRTG Desktop is a cross-platform application that you can use as an alternative interface for fast access to data and monitoring management. With PRTG Desktop, you can connect to several independent PRTG core servers or PRTG Hosted Monitor instances to display their data and centrally manage your monitoring.</p>
	<p>PRTG apps for mobile network monitoring </p> <p>With the PRTG apps for iOS and Android, you can monitor your network on the go and receive push notifications in case of alerts.</p>
System Administration Tools	<p>PRTG Administration Tool on PRTG Core Server Systems  </p> <p>With the PRTG Administration Tool on the PRTG core server system, you can configure basic PRTG core server settings in PRTG on premises such as the PRTG System Administrator user login, web server IP addresses and the web server port, probe connection settings, the cluster mode, the system language, and more.</p>

	<p>PRTG Administration Tool on Remote Probe Systems </p> <p>With the PRTG Administration Tool on the remote probe system, you can configure basic remote probe settings such as the name of the remote probe, IP address and server connection settings, and more.</p>

PRTG Core Server

The PRTG core server is the heart of PRTG. It performs the following tasks:

- Configuration management for target devices (for example, servers, workstations, printers, switches, routers, virtual machines (VM), and more)
- Management and configuration of connected probes
- Cluster management
- Database for monitoring results
- Notification management including a mail server for email delivery
- Report generation and scheduling
- User account management
- Data purging (for example, deleting data that is older than 365 days)
- Web server and application programming interface (API) server

 In a [cluster](#) , the master node is responsible for all of these tasks.

The built-in and secure web server, for which you require no additional Microsoft Internet Information Services (IIS) or Apache, supports HTTP as well as HTTPS (secured with Secure Sockets Layer (SSL)/Transport Layer Security (TLS)). It serves the PRTG web interface when you access it via a browser and also answers PRTG API calls.

 The PRTG core server is configured as a Windows service that permanently runs. A logged-in user is not required.

Probes

On the probe, PRTG performs the actual monitoring via the sensors that you created on a device (for example, a computer, a router, a server, a firewall, and more). The probe receives its configuration from the PRTG core server, runs the monitoring processes, and delivers monitoring results back to the PRTG core server.

 For PRTG on premises, there is always a local probe that runs on the PRTG core server system.

 For PRTG Hosted Monitor instances, there is always a hosted probe that runs on the PRTG core server system that Paessler hosts for you.

PRTG Core Server and Local Probe That Monitors a LAN

The actual monitoring is performed by probe processes that run on one or more systems.

- ❶ The probes are configured as a Windows service that permanently runs. A logged-in user is not required.

Probe Type	Description
Local probe 	<p>During the installation, PRTG automatically creates the local probe. In a single-probe installation, which is the default setup, the local probe performs all monitoring.</p> <p>For PRTG on premises, the PRTG core server with the local probe inside the corporate LAN can monitor services and servers in the entire LAN.</p>
Hosted probe 	<p>When you create a PRTG Hosted Monitor instance, the system automatically creates the hosted probe. The hosted probe shows monitoring values of the hosted instance and can monitor devices, servers, and services that are publicly available in the internet like websites.</p>
Remote probes	<p>You can create additional remote probes to monitor multiple locations, to monitor a LAN with PRTG Hosted Monitor, or for several other scenarios. Remote probes use SSL/TLS-secured connections to the PRTG core server. With remote probes, you can securely monitor services and systems inside remote networks that are not publicly available or that are secured by firewalls.</p> <ul style="list-style-type: none">  For more information, see section Add Remote Probe .  For more information, see the video tutorial: Distributed monitoring with PRTG

Probe Type	Description
Cluster probes 	In a cluster, a cluster probe runs on all cluster nodes. All devices that you create on the cluster probe are monitored by all cluster nodes, so data from different perspectives is available and monitoring continues even if one of the cluster nodes fails.
Mini probes 	Mini probes let you create small probes on any device, not only on Windows systems.  For more information, see section Mini Probe API  .

System Health Monitoring

PRTG automatically monitors the system health of the PRTG core server and of each probe to discover overload situations that can distort monitoring results. To monitor the status of the probe system, PRTG automatically creates the [Core Health](#)  and [Probe Health](#)  sensor, the [System Health](#)  sensor, the [Cluster Health](#)  sensor, some [disk free](#)  and [bandwidth](#)  sensors for all installed network cards, as well as a [Common SaaS sensor](#)  that checks the availability of widely used software as a service (SaaS) providers.

We recommend that you keep these sensors. However, you can remove all of them except for the [health](#) sensors.

The health sensors measure various internal system parameters of the probe system hardware and the probe's internal processes and compute the results. Investigate frequent values below 100%.

5.2 Cluster

A **cluster** consists of two or more PRTG core servers that work together to form a high-availability monitoring system.

☁ This feature is not available in PRTG Hosted Monitor.

Cluster Concept

A cluster consists of at least two cluster nodes: one **master node** and one or more **failover nodes**, where up to four failover nodes are possible. Each cluster node is a full PRTG core server installation that can perform all of the monitoring and alerting on its own.

Cluster with Two Cluster Nodes

See the following table for more information on how a cluster works:

Feature	Description
Connection and communication	Cluster nodes are connected to each other with two TCP/IP connections. They communicate in both directions and a single cluster node only needs to connect to one other cluster node to integrate itself into the cluster.
Object configuration	During normal operation, you configure devices, sensors, and all other monitoring objects on the master node. The master node automatically distributes the configuration among all other cluster nodes in real time.
Fail-safe monitoring	All devices that you create on the cluster probe are monitored by all cluster nodes, so data from different perspectives is available and monitoring continues even if one of the cluster nodes fails. If the master node fails, one of the failover nodes takes over and controls the cluster until the master node is back. This ensures continuous data collection.

Feature	Description
Active-active mode	A cluster works in active-active mode. This means that all cluster nodes permanently monitor the network according to the common configuration that they receive from the master node. Each cluster node stores the results in its own database. PRTG also distributes the storage of monitoring results among the cluster.
PRTG updates	You only need to install PRTG updates on one cluster node. This cluster node automatically deploys the new version to all other cluster nodes.
Notification handling	If one or more cluster nodes discover downtime or threshold breaches, only one installation, either the primary master node or the failover master node, sends out notifications, for example, via email, SMS text message, or push message. Because of this, there is no notification flood from all cluster nodes in case of failures.
Data gaps	<p>During the outage of a cluster node, it cannot collect monitoring data. The data of this single cluster node shows gaps. However, monitoring data for the time of the outage is still available on the other cluster nodes.</p> <p>i There is no functionality to fill these gaps with the data of other cluster nodes.</p>
Monitoring results review	Because the monitoring configuration is centrally managed, you can only change it on the primary master node. However, you can review the monitoring results of any of the failover nodes in read-only mode if you log in to the PRTG web interface.
Remote probes	If you use remote probes in a cluster ^[4515] , each remote probe connects to each cluster node and sends the data to all cluster nodes. You can define the Cluster Connectivity of each remote probe in its settings ^[409] , section Administrative Probe Settings.

Performance Considerations for Clusters

Monitoring traffic and load on the network is multiplied by the number of used cluster nodes. Furthermore, the devices on the cluster probe are monitored by all cluster nodes, so the monitoring load increases on these devices as well.

For most usage scenarios, this does not pose a problem, but always keep in mind the [system requirements](#)^[26]. As a rule of thumb, each additional cluster node means that you have to divide the number of sensors that you can use by two.

i PRTG does not officially support more than 5,000 sensors per cluster. Contact the [Paessler Presales team](#) if you exceed this limit. For possible alternatives to a cluster, see the Knowledge Base: [Are there alternatives to the cluster when running a large installation?](#)

- [Access Rights Management](#) ¹⁵⁵
- [Data Reporting](#) ¹⁵⁹
- [IPv6 Support](#) ¹⁶¹

5.3 Object Hierarchy

PRTG arranges all objects in the monitoring configuration in a tree-like hierarchy. You can arrange the objects in groups that monitor similar devices, services, or particular locations. You can also use this hierarchical order to define common settings for larger groups of objects. The settings of the root group, for example, apply to all other objects underneath in the object hierarchy by default

For more information, see section [Inheritance of Settings](#)¹⁴².

Object Hierarchy in PRTG

Root Group

The [root group](#) is the topmost instance in PRTG. It contains all other objects in your setup. We recommend that you [adjust all default settings for the root group](#)³⁶⁶. This is because all other objects in the device tree [inherit](#)¹⁴² these standard settings by default so that you do not have to set up the same configuration for each object anew.

Probe

Each group (except the root group) is part of a **probe**. This is where the actual monitoring takes place. All objects that you add to a probe are monitored via that probe. In PRTG on premises, every PRTG core server installation automatically installs the **local probe**. In PRTG Hosted Monitor, every instance has the **hosted probe**.

In a **cluster**, there is an additional **cluster probe** that runs on all cluster nodes. All devices that you create on the cluster probe are monitored by all cluster nodes, so data from different perspectives is available and monitoring continues even if one of the cluster nodes fails.

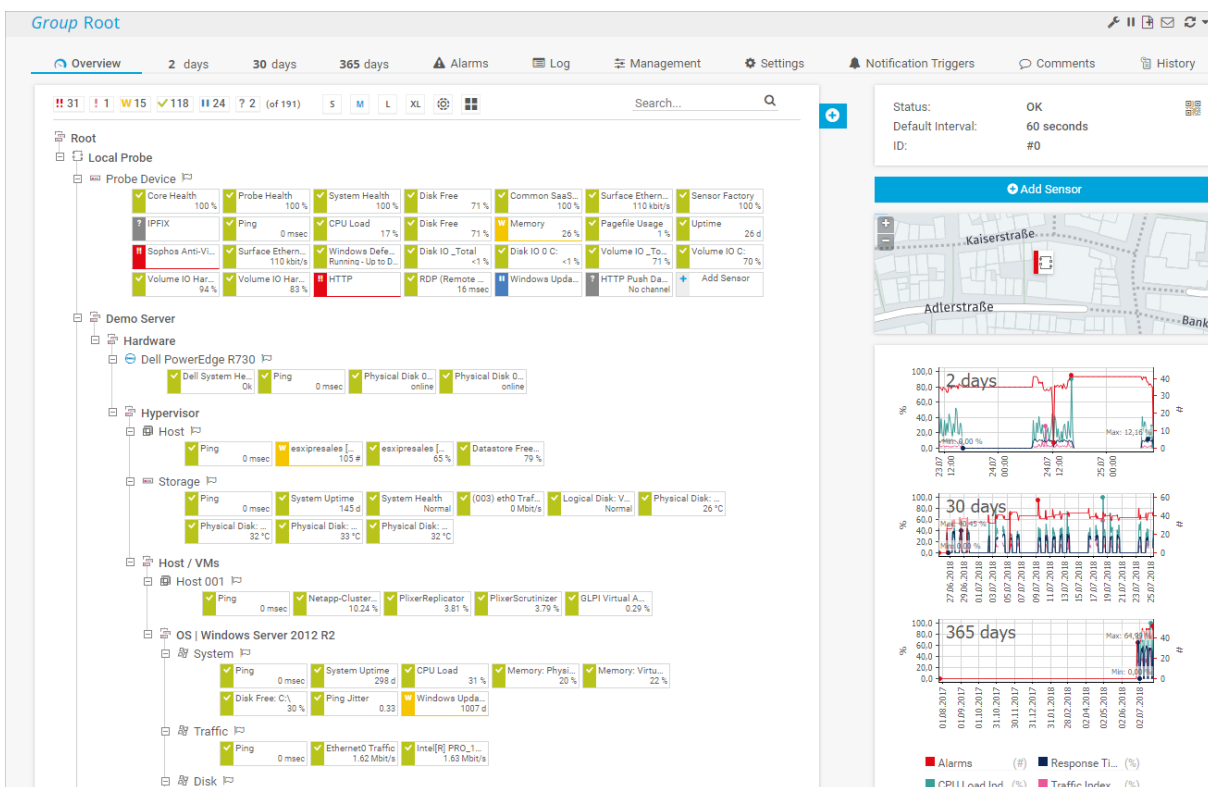

You can add additional probes and remote probes to your configuration to also monitor remote devices from outside your network.

For more information, see section [Add Remote Probe](#).

Group

On each probe, there are one or more **groups** that have structural purposes. Use groups to arrange similar objects so that they inherit the same settings. To a group, you add devices. You can arrange your devices in different nested groups to reflect the structure of your network.

Here you can see a sample configuration of a device tree with the local probe, several groups, devices, and their sensors:

Object Hierarchy in the Device Tree

Device

You can add [devices](#) that you want to monitor to each probe or group. Each device in your configuration represents real hardware or a virtual device in your network, for example:

- Web or file servers
- Client computers (Windows, Linux, or macOS)
- Routers or network switches
- Almost every device in your network that has its own IP address

 You can add devices with the same IP address or Domain Name System (DNS) name multiple times. This way, you can get a more detailed overview when you use a large number of sensors or you can use different device settings for different groups of sensors. The sensors on all of these devices then query the same real hardware device in your network.

PRTG additionally adds the [probe device](#) to the local probe. This is an internal system device with several sensors. It has access to the probe system and monitors the system's health parameters.

PRTG automatically analyzes the devices that you add and recommends appropriate sensors on the device's Overview [tab](#)^[201]. To create recommended sensors, click Add These Sensors in the Recommended Sensors table.

 You can turn off the sensor recommendation in the system administration settings under [Monitoring](#)^[419].

Sensor

On each device, you can create a number of [sensors](#). Every sensor monitors one single aspect of a device, for example:

- A network service like Simple Mail Transfer Protocol (SMTP), File Transfer Protocol (FTP), or HTTP
- The traffic on a network switch
- The CPU load of a device
- The memory usage of a device
- The traffic on one network card
- A NetFlow device
- The system health of a device
- And much more

 For more information, see the video tutorial: [What is a sensor?](#)

Channel

Every sensor has a number of [channels](#) through which it receives the different data streams. The available channels depend on the type of sensor. One channel can contain, for example:

- Downtime and uptime of a device
- Traffic in, Traffic out, or Traffic sum of a bandwidth device (for example, a router)

- Mail traffic of a NetFlow device
- CPU load of a device
- Loading time, Download bandwidth, or Time to first byte of a web page
- Response time of a Ping request to a device
- And much more

More

- [Notifying](#) ^[152]
- [Access Rights Management](#) ^[155]
- [Data Reporting](#) ^[159]
- [IPv6 Support](#) ^[161]

5.4 Inheritance of Settings

The [hierarchically structured](#) ¹³⁸ device tree organizes the devices in your network. This object hierarchy is the basis for the [inheritance of settings](#). Objects in the device tree can inherit their settings from a higher level. For example, you can change the scanning interval of all sensors by editing the interval setting of the root group (if you define no other setting underneath in the object hierarchy).

Inheritance to Child Objects

You can override the inheritance of settings to child objects at any level of the object hierarchy if you set a different value for a specific probe, group, device, or sensor. All objects underneath inherit these new settings. Object settings from higher levels do not inherit the new settings.

Settings that are inherited to all objects include:

- Scanning intervals
 - [Notification triggers](#) ³⁹⁸⁷
 - Credentials for different systems
 - Compatibility settings for specific sensor types
 - Channel and unit configurations
 - [User access rights](#) ¹⁵⁵
 - [Tags](#) ¹⁴⁵
 - Paused [status](#) ¹⁹⁷: If an object is paused by the user or by a schedule, PRTG sets all sensors on this object to the Paused status as well
- i** There is one exception for devices and sensors. Sensors [always](#) inherit the IP address or DNS name of a device and the compatibility settings. You cannot change these settings at sensor level.

Here you can see the Credentials for Windows Systems setting that the object inherits from the parent:

Inherited Credentials for Windows Systems

Click  next to inherit from [\[parent object\]](#) to override the parent object's settings and enter new settings for this object and all objects underneath in the object hierarchy.

Credentials for Windows Systems

inherit from Local Probe

Domain or Computer Name ⓘ myDomain

User ⓘ John Q. Public

Password ⓘ

Credentials for Windows Systems

i Click Save for your settings to take effect. If you click after you enter your settings, the object inherits the parent object's settings again and your object-specific settings do not take effect.

Default Settings in Root Group

For all settings except passwords, PRTG already includes a set of default values. The following settings, for example, are inherited by all sensors from the root group:

- A default scanning interval of one minute
- SNMP v1 with the community string set to public (this is the default setting for most devices)
- The dependency type Use parent
- And more

Before you set up your monitoring, we recommend that you review the root group settings and set the default values to suit your setup. This includes the credentials for the different systems in your network that you want to monitor (Windows, Linux, virtual servers, different vendors, and more).

■ For more information, see section [Root Group Settings](#) ³⁶⁶.

Inheritance of Notification Triggers

If you add notification triggers at probe, group, or device level, these are also inherited to all sensors underneath in the object hierarchy unless you manually disable the inheritance.

■ For more information, see section [Notification Triggers Settings](#) ³⁹⁸⁷.

Part 5: Understanding Basic Concepts | 4 Inheritance of Settings

- [Scheduling](#)  150
- [Notifying](#)  152
- [Access Rights Management](#)  155
- [Data Reporting](#)  159
- [IPv6 Support](#)  161

5.5 Tags

For every object in your setup, you can define tags in the [object settings](#) to additionally categorize these objects. Although some tags are predefined when you [add objects](#), you can add further tags. For example, you can mark all bandwidth sensors that are especially important for you with the tag [bandwidthimportant](#).

View and Edit Tags in Basic Sensor Settings

To confirm a tag, use the **Enter** key, the **Spacebar** key, or a **comma**.

- ① Use the [multi-edit](#) function to simultaneously change tags for several objects.
- ① It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).
- ① For performance reasons, it can take some minutes until you can filter for new tags that you added.

Inheritance of Tags

Tags in object settings are automatically [inherited](#) by all other objects underneath in the [object hierarchy](#). You can view inherited tags in section Parent Tags in the settings of a sensor, device, or group.

For example, a device with the tag [netflow](#) automatically passes on this tag to all sensors that you add to the device. This is useful, for example, if you include sensors by tag in [reports settings](#). PRTG adds all sensors with the tag [netflow](#) to the report so that you do not have to manually tag every single sensor.

 You cannot disable the inheritance of tags.

Filter by Tags

You can use one or more tags to filter [table lists](#)^[246] for specific objects, or to add sensors to [libraries](#)^[4047] and [reports](#)^[4069].

When you filter by tags, you can also use the plus sign (+) or the minus sign (-) to categorize tags as [must have](#) or [must not have](#).

- Use a tag with a leading + to specify that objects with this tag must be included.
- Use a tag with a leading – to specify that objects with this tag must **not** be included.
- Use tags without a leading plus or minus sign to specify that objects need to have at least one of these tags to be included.

The filter only shows an object if all three conditions are met. The order of the tags in a tag field does not matter.

Examples

Here are some examples that show how to filter by tags:

- If you enter [-netflow](#), the table list, library, or report includes all objects that do not have this tag. With the tags [+netflow](#) or [netflow](#), you filter for objects that have this tag.
- If you enter [+netflow -bandwidthimportant](#), the table list, library, or report includes all objects that have the tag 'netflow', but excludes all objects that have the tag 'bandwidthimportant'.
- If you enter [netflow bandwidthimportant](#), the table list, library, or report includes all objects that have either the tag 'netflow' or the tag 'bandwidthimportant' or both tags.

Tag Display Limits

For performance reasons, PRTG has a display limit of 1,000 tags when you select Sensors | By Tag in the [main menu bar](#)^[282]. If you have more than 1,000 tags, PRTG shows no tags here. You can, however, still use tags for filters and searches, for example.

Understanding Basic Concepts

- [Inheritance of Settings](#)^[142]
- [Tags](#)^[145]
- [Dependencies](#)^[148]
- [Scheduling](#)^[150]
- [Notifying](#)^[152]
- [Access Rights Management](#)^[155]

- [Data Reporting](#) ¹⁵⁹
- [IPv6 Support](#) ¹⁶¹

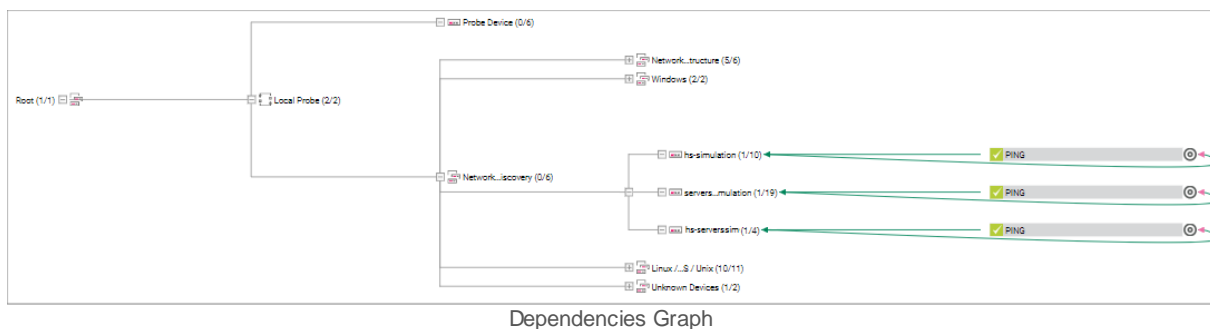

5.6 Dependencies

You can use dependencies to pause sensors based on the [status](#) [197] of a different (master) sensor to avoid false alarms and incorrect downtime recording. A dependency stops the monitoring of one sensor or a set of sensors as soon as another dependency causes a specific sensor to show the Down status or the Paused status. This means, for example, that you can stop monitoring remote network services when the corresponding firewall is down because of connection problems.

When you use the [auto-discovery](#) [296] function, PRTG sets the [Ping sensor](#) [2010] of a device as the **master** object for the device by default. This means that monitoring for the entire device is paused if a dependency causes the Ping sensor to show the Down status or the Paused status. Usually, it makes little sense to monitor any other parameters while the Ping sensor indicates that the device is unavailable.

i You do not trigger a status change by [dependency](#) [148] if you manually pause a master object or if you pause it by [schedule](#) [150]. For more details, see the Knowledge Base: [Why will dependent objects not go into paused status automatically when I pause the master object?](#)

To view the list of dependencies, select Devices | Dependencies and the corresponding dependencies path from the [main menu bar](#) [279]. From there you can also access the [dependencies graph](#) [4023] that visualizes all dependencies in your network.

■ For more information about the dependency settings, see the [settings of the object](#) [226] for which you want to set a dependency, section Schedules, Dependencies, and Maintenance Windows.

- [Notifying](#)  152
- [Access Rights Management](#)  155
- [Data Reporting](#)  159
- [IPv6 Support](#)  161

5.7 Scheduling

With schedules, you can automatically [pause](#)^[256] specific objects for a specific time span, for example, on Sundays between 16:00 and 20:00. A sensor in the Paused [status](#)^[197] does not collect monitoring data, does not change its status, and does not trigger any [notifications](#)^[152]. You can also pause monitoring for planned system maintenance windows to avoid false alarms. You can apply different schedules to every object. PRTG also uses schedules for reports and notifications.

i You do not trigger a status change by [dependency](#)^[148] if you manually pause a master object or if you pause it by [schedule](#)^[150]. For more details, see the Knowledge Base: [Why will dependent objects not go into paused status automatically when I pause the master object?](#)

Schedules, Dependencies, and Maintenance Windows

inherit from Internet

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule **i** None

Maintenance Window **i** None

Dependency Type **i** None

- None
- Saturdays [GMT+0200]
- Sundays [GMT+0200]
- Weekdays [GMT+0200]
- Weekdays Eight-To-Eight (8:00 - 20:00) [GMT+0200]**
- Weekdays Nights (17:00 - 9:00) [GMT+0200]
- Weekdays Nights (20:00 - 8:00) [GMT+0200]
- Weekdays Nine-To-Five (9:00 - 17:00) [GMT+0200]
- Weekends [GMT+0200]

Access Rights

inherit from Internet

Available Default Schedules in Device Settings

Schedules are user account specific. To change the predefined schedules or to add your own schedules, see section [Schedules](#)^[4169].

i If you use a cluster with cluster nodes in different time zones, the schedule applies at the local time of each cluster node. For more information, see section [Failover Cluster Configuration](#)^[4513].

5.8 Notifying

PRTG keeps you or other responsible people informed about the status of the network. There are several methods that you can use to stay up to date.

Internal Sensor Alerts

Alerts are an important part of monitoring that informs you when there are issues, when values exceed limits, or when a sensor status changes, for example. Some sensors display internal alerts in case of errors, for example, disconnected probes or socket and timeout errors. There are also sensors whose internal sensor alerts you can modify. To see if you can modify an alert, check the sensor's settings for customizable options.

Here is an example of a sensor that is in the Down [status](#)^[197] because of an internal sensor alert.

Probe Health Sensor with Disconnected Probe Alert

HTTP sensors, for example, show preconfigured internal alerts based on specific HTTP status codes.

■ For more information, see the Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)

Channel Limits

There are also alerts that are triggered by limits that you can set in the [channel settings](#)^[3977] of a sensor. PRTG triggers a [sensor status](#)^[197] change when a sensor measures values that exceed or fall below a defined limit. For example, you can set an [SNMP CPU Load sensor](#)^[2442] to the Down status when it measures values that you consider critical. This sensor then appears in the [alarms](#)^[228] list as well.

ⓘ This type of alert only applies when a value breaches the configured limits. If the value is normal again in the next sensor scan, the sensor shows the Up status again.

ⓘ The value type that you need to configure for limits depends on the type of data that the channel returns. You can set [absolute values or delta values](#)^[4039].

▶ For more information, see the video tutorial: [How to set channel limits](#)

Lookups for Channels

PRTG also uses lookups for some sensors. In general, lookups make data more human friendly because they map status values that a device returns, usually integers, to more informative expressions in words that show you the status of a monitored device in plain text.

Additionally, lookups can define the sensor status in combination with specific status codes. For example, a sensor can show the Unknown status if a channel value, provided by lookups, indicates that the device is Inactive, instead of displaying a numeric value like -1.

You can also modify preconfigured lookups or create your own custom lookups.

■ For more information, see section [Define Lookups](#)⁴⁴⁸⁵.

Notifications

PRTG can send a [notification](#)⁴⁰³¹ when it discovers, for example, downtime, an overloaded system, threshold breaches, or similar situations. Notifications use various [methods](#)⁴¹³⁸ to notify you of issues. After you create [notification templates](#)⁴¹³¹ in the system settings, you can select the templates on the Notification Triggers tab of probes, groups, devices, and sensors, as well as the root group.

The status or the data of a sensor can also trigger notifications. With this mechanism, you can configure custom external alerts. Which [notification triggers](#)³⁹⁸⁷ are available depends on the kind of object you edit. You can define notification triggers that are activated by an 'on change' event. Some sensors offer the option to trigger a notification whenever sensor values change.

■ For more information, see section [Notifications](#)⁴⁰³¹.

Alarms

The alarms list shows all sensors that are in the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status. Sensors in the Up, Paused, or Unknown states do not appear here.

■ For more information, see section [Alarms](#)²²⁸¹.

Logs

The logs list shows the logfile that includes all monitoring events. PRTG documents the activity of every single object, so you can use this data to check if your setup works as expected.

■ For more information, see section [Logs](#)^[237].

Tickets

The tickets list shows tickets with important system information or actions that you need to take. We recommend that you view every ticket and take appropriate action. By default, PRTG sends an email to the [PRTG System Administrator](#) user for every new ticket that the system or a user creates. If a ticket is assigned to a specific user, this user also receives an email by default.

■ For more information, see section [Tickets](#)^[240].

- [Notifying](#)^[152]
- [Access Rights Management](#)^[155]
- [Data Reporting](#)^[159]
- [IPv6 Support](#)^[161]

5.9 Access Rights Management

With the access rights management, you can define which user in which user group can access which objects in your PRTG installation, and you can manage all user access rights and group access rights.

You can create a nearly unlimited number of other users, which you can organize in a nearly unlimited number of user groups. Each user group can have separate [access rights](#)^[155] for each object in the device tree except channels, as well as for libraries, maps, and reports. Objects can also [inherit](#)^[142] access rights according to the [object hierarchy](#)^[138].

User Access Rights Overview

Each user also has specific access rights. There are administrators who are user group members with administrative rights, read/write users, and read-only users. You can define the user type (read-only user or read/write user) in the user account settings.

■ For more information, see section [User Accounts](#)^[421].

Account Control

User Type ⓘ	<input type="radio"/> Read/write user <input checked="" type="radio"/> Read-only user
Acknowledge Alarms ⓘ	<input type="radio"/> User can acknowledge alarms <input checked="" type="radio"/> User cannot acknowledge alarms (default)
Password Change ⓘ	<input type="radio"/> User can change the account password <input checked="" type="radio"/> User cannot change the account password (default)
Primary Group ⓘ	PRTG Users Group
Status ⓘ	<input checked="" type="radio"/> Active <input type="radio"/> Paused
Last Login ⓘ	(has not logged in yet)

User Access Rights in User Account Settings

Individual user access rights, combined with the access rights of the groups that the user is a member of, determine the access rights for device tree objects, libraries, maps, and reports. In general, group access rights override user access rights unless a user is a read-only user. Read-only users always have only read access.

You can define the group access rights for each object in the device tree via the corresponding [context menus](#)^[259] or in the [object settings](#)^[228].

Group Access Rights Overview

The following classes of group access rights are available, in hierarchical order (from the lowest group access right to the highest group access right).

i The access rights apply to device tree objects and to libraries, maps, and reports.

Group Access Rights	Description
No access	The members of the user group cannot see or access the object. They also cannot see or access logs, tickets, or alarms for the object.
Read access	The members of the user group can only view the object and its settings.
Write access	The members of the user group can view the object and edit its settings. They can also add and delete objects, acknowledge alarms, edit notification templates, notification contacts, and schedules.
Full access	The members of the user group can view the object and edit its settings. They can also add and delete objects, acknowledge alarms, edit notification templates, notification contacts, and schedules. In addition, they can edit group access rights for objects.

If a user group has administrative rights, all user group members always have **full access** to every object in the device tree, library, map, and report, and all other functionalities and features of PRTG.

i Group access rights that you define directly on an object, for example a device, override inherited rights. If you do not define group access rights directly on an object, PRTG checks the next object that is higher up in the object hierarchy for group access rights until there is no higher-level object available.

Current Group Access Rights		
Object ▾	Access ⇅	Comments ⇅
PRTG Administrators	Full access	Administrator User
PRTG Users Group	Write access	Defined in current object
UserGroup	No access	No access rights defined
UserGroupAdmin	Full access	Administrator User
UserGroupNoTicket	Read access	Defined in current object

Different Access Rights Depending on User Groups

i Users are either members of PRTG user groups or of Active Directory groups. They cannot be members of both types of user group. We recommend that you use only one type of user group to minimize administration.

Group Access Rights in Combination with User Access Rights

The following table shows the correlation between group access rights and user access rights. The table applies to both PRTG user groups and Active Directory groups, as well as to both PRTG users and Active Directory users. The column headings show the group access rights to an object. The row headings show the type of user.

	User group has read access to an object	User group has write access to an object	User group has full access to an object	Administrator group
Read-only user	Read access	Read access	Read access	n/a
Read/write user	Read access	Write access	Full access	Full access
Administrator	Full access	Full access	Full access	Full access

The following rules apply:

- **Read-only users**
 - always have only read access, no matter what access rights you define for the user groups they are members of
 - can never see or use the ticket system
 - can acknowledge alarms and change their own password in their user account settings, if an administrator allows them to
 - can never be members of user groups with administrative rights
- **Read/write users**
 - can use the ticket system if the user group they are members of has access to the ticket system
 - can acknowledge alarms
 - can change their own password
 - can have full access to device tree objects, libraries, maps, and reports, if the user group they are members of has full access to the respective object
 - always have administrative rights if they are members of a group with administrative rights
- **Administrators**
 - are members of groups with administrative rights
 - have no access restrictions at all
 - can also manage user accounts, user groups, and cluster setups

- can change the monitoring configuration of PRTG
- ① If a user is a member of more than one user group, the group access rights of the user group with the highest access rights apply.

Understanding Basic Concepts

- [Data Reporting](#) ^[159]
- [IPv6 Support](#) ^[161]

5.10 Data Reporting

With PRTG, you can view, analyze, and review monitoring data for specific time spans. There are several ways to create customized data reporting.

View Historic Sensor Data

To get an overview of a single sensor's historic data, you can generate historic data reports via the sensor's Historic Data tab.

■ For more information, see section [Historic Data Reports](#) ^[208].

Generate Reports

In addition to reports about a single sensor's historic data, you can also create comprehensive and detailed reports for all monitoring data.

■ For more information, see section [Reports](#) ^[406].

Export Data with the PRTG API

You can also export all raw monitoring data to .xml or .csv files and generate your own reports with any third-party software.

■ For more information, see section [Application Programming Interface \(API\) Definition](#) ^[438].

Make Data Available

You can make monitoring data available to others via a specific read-only user, or you can create public HTML pages to display your monitoring data via the Maps feature.

■ For more information, see section [Access Rights Management](#) ^[155] and section [Maps](#) ^[406].

- [Access Rights Management](#) ^[155]
- [Data Reporting](#) ^[159]

- [IPv6 Support](#) ¹⁶¹

5.11 IPv6 Support

PRTG supports the IPv6 protocol for most sensors. You can choose whether you want to query data from your network devices via an IPv4 or IPv6 connection. Specify your preference in the [device settings](#)^[448]. The sensors you add to the device use the protocol that you select.

In the IPv6: Outgoing IP for Monitoring Requests setting of the [PRTG Administration Tool](#)^[4363], you can additionally select the IPv6 address that PRTG uses for outgoing monitoring requests. The same option is also available for IPv4.

 Not all sensors are IPv6 compatible. Incompatible sensors are not selectable on IPv6 devices.

 The hosted probe of a PRTG Hosted Monitor instance does not support the IPv6 protocol. If you want to use sensors that support IPv6, add them to a remote probe device.

 For more information, see section [List of Sensors with IPv6 Support](#)^[4693].

- [Pause](#) ^[256]
- [Context Menus](#) ^[259]
- [Hover Popup](#) ^[275]
- [Main Menu Structure](#) ^[278]

6.1 Login

For PRTG on premises installations, you can log in to the PRTG web interface once the PRTG core server is installed. In your browser, open the IP address or Domain Name System (DNS) name of the PRTG core server system and click Login.

You can look up and change the web server settings of PRTG on premises installations at any time in the [PRTG Administration Tool](#)^[4347] on the PRTG core server system. In particular, when you access PRTG from the internet, you should use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. To secure your connection, click Switch to SSL/TLS under Enable SSL/TLS for the PRTG web interface on the welcome screen.

Load the PRTG Web Interface

In a web browser, enter the IP address or URL of the PRTG core server system. If you use a cluster, connect to the master node. You can also double-click the PRTG Network Monitor desktop icon on the PRTG core server system.

 If you run PRTG on localhost, do not use the DNS name <http://localhost> to log in to the PRTG web server, as this might considerably slow down the PRTG web interface. Use your local IP address or <http://127.0.0.1> instead.

If you see an SSL certificate warning in your browser, you can usually confirm it.

 For more information, see section [SSL Certificate Warning](#)^[169].

The PRTG web interface is your access to PRTG via a web browser. The PRTG web interface is based on Asynchronous JavaScript and XML (AJAX). It uses a responsive design to adjust to the size of your screen.

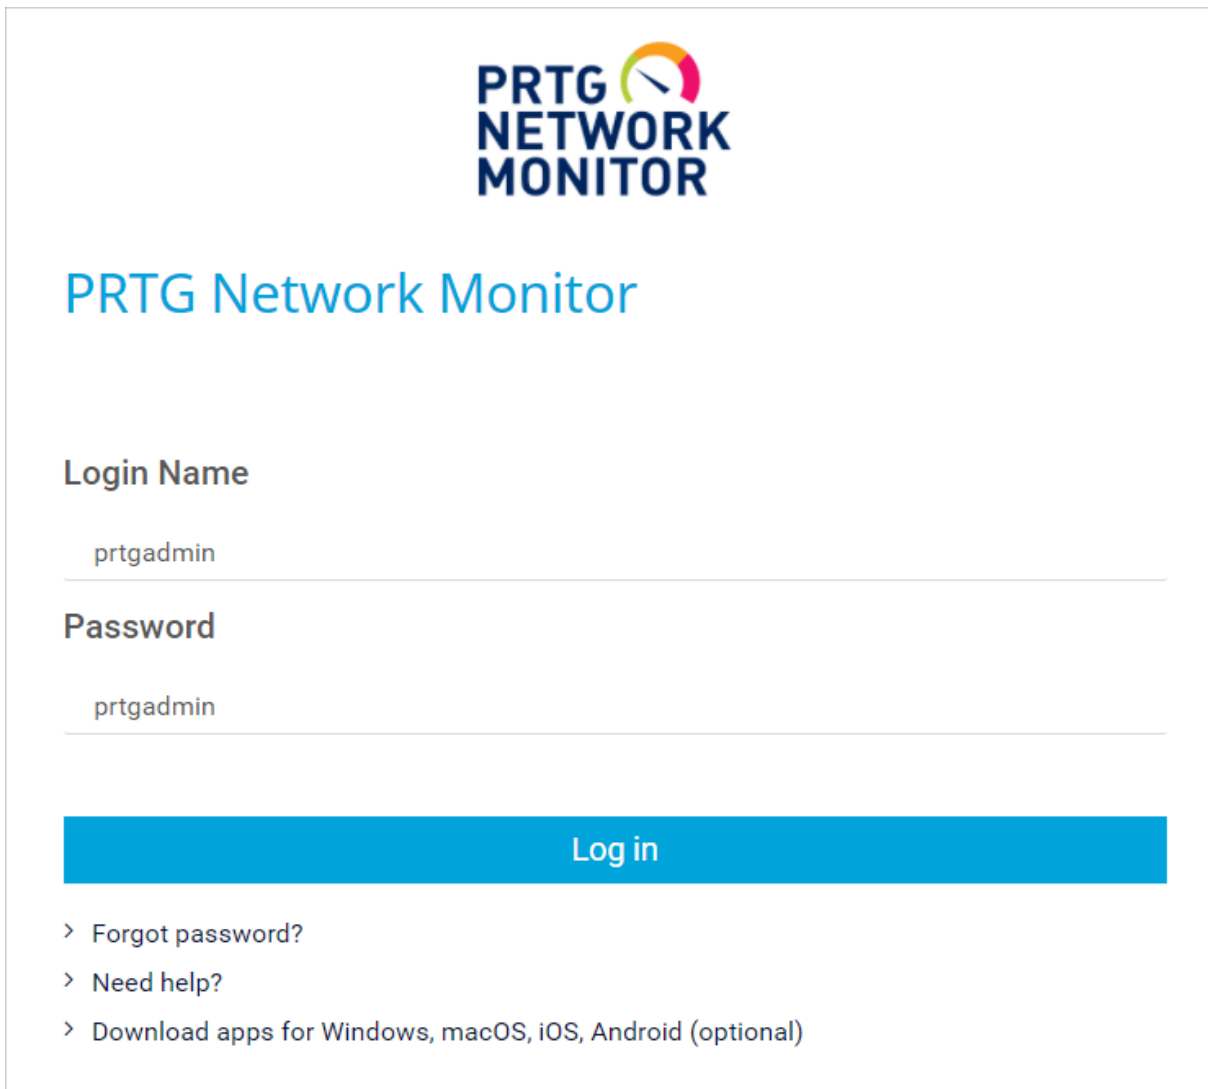

Use the PRTG web interface as the default interface to set up your monitoring. You can use it to configure devices and sensors, to set up notifications, to review monitoring results, to create reports, and to visualize your monitoring on dashboards.

While you are [logged in](#)^[164], the PRTG web interface continuously refreshes the data on the screen via AJAX calls. This way, you are always up to date regarding your monitoring results. You can individually [set](#)^[4215] the refresh interval and method.

With the Single Page Application (SPA) technology, your system stays highly performant because only single page elements are refreshed when necessary.

Login Screen of PRTG on premises

After loading the PRTG web interface, the login screen is visible. You can either log in as the predefined [PRTG System Administrator](#) user or as any other user. As an administrator, you can use all functionalities of the PRTG web interface. Administrators can [create additional users](#)^[4211] with administrative rights or users with more restricted user access rights (for example, read-only users).

PRTG NETWORK MONITOR

PRTG Network Monitor

Login Name

prtgadmin

Password

prtgadmin

Log in

- > [Forgot password?](#)
- > [Need help?](#)
- > [Download apps for Windows, macOS, iOS, Android \(optional\)](#)

PRTG on premises Login Screen

Login as Predefined Administrator (First Time Login)

 This only applies to PRTG on premises installations, not to PRTG Hosted Monitor instances.

When you log in for the first time, the login name and password for the predefined [PRTG System Administrator](#) user account are both `prtgadmin`. PRTG automatically fills in the default credentials and shows the password in plain text.

-  After login, you should change the default password. To do so, go to [Setup | Account Settings | My Account](#) and specify a new password in section [User Account Settings](#).
-  If you are not logged in to the PRTG web interface, you can change the credentials for the predefined user account at any time in the [PRTG Administration Tool](#).
-  If you enter a different login name or change your password, the password is no longer shown in plain text.

Login as User (PRTG on premises)

If you received user credentials from your system administrator, enter them in the PRTG on premises login screen to log in to the PRTG web interface. This also applies if you use other administrator credentials.

Login Options (PRTG on premises)

- Log in: Log in to the fully featured PRTG web interface. We recommend that you use this option for PRTG whenever possible. It offers the full functionality of PRTG. Use Google Chrome 72 or Mozilla Firefox 65 for best performance.
 - ❗ Although you can log in with Microsoft Internet Explorer 11, the PRTG web interface might not be fully compatible with Internet Explorer. If you use Microsoft Internet Explorer 11, set the security level to Medium-high (or lower) and make sure that no Compatibility View is enabled.
 - Download apps for Windows, macOS, iOS, Android (optional): Opens Setup | Optional Downloads in the PRTG web interface. You can optionally [download](#)⁴²⁶² the [PRTG apps](#)⁴²⁷⁸ for iOS or Android or [PRTG Desktop](#)⁴²⁷⁵.
 - ❗ If you use this download option, you require your login name and password (or the default credentials) for login.
- ❗ Only Google Chrome 72 and Mozilla Firefox 65 are fully compatible with the PRTG web interface.

Enter specific credentials or use the default credentials that PRTG fills in automatically. Click Login to proceed to the PRTG web interface.

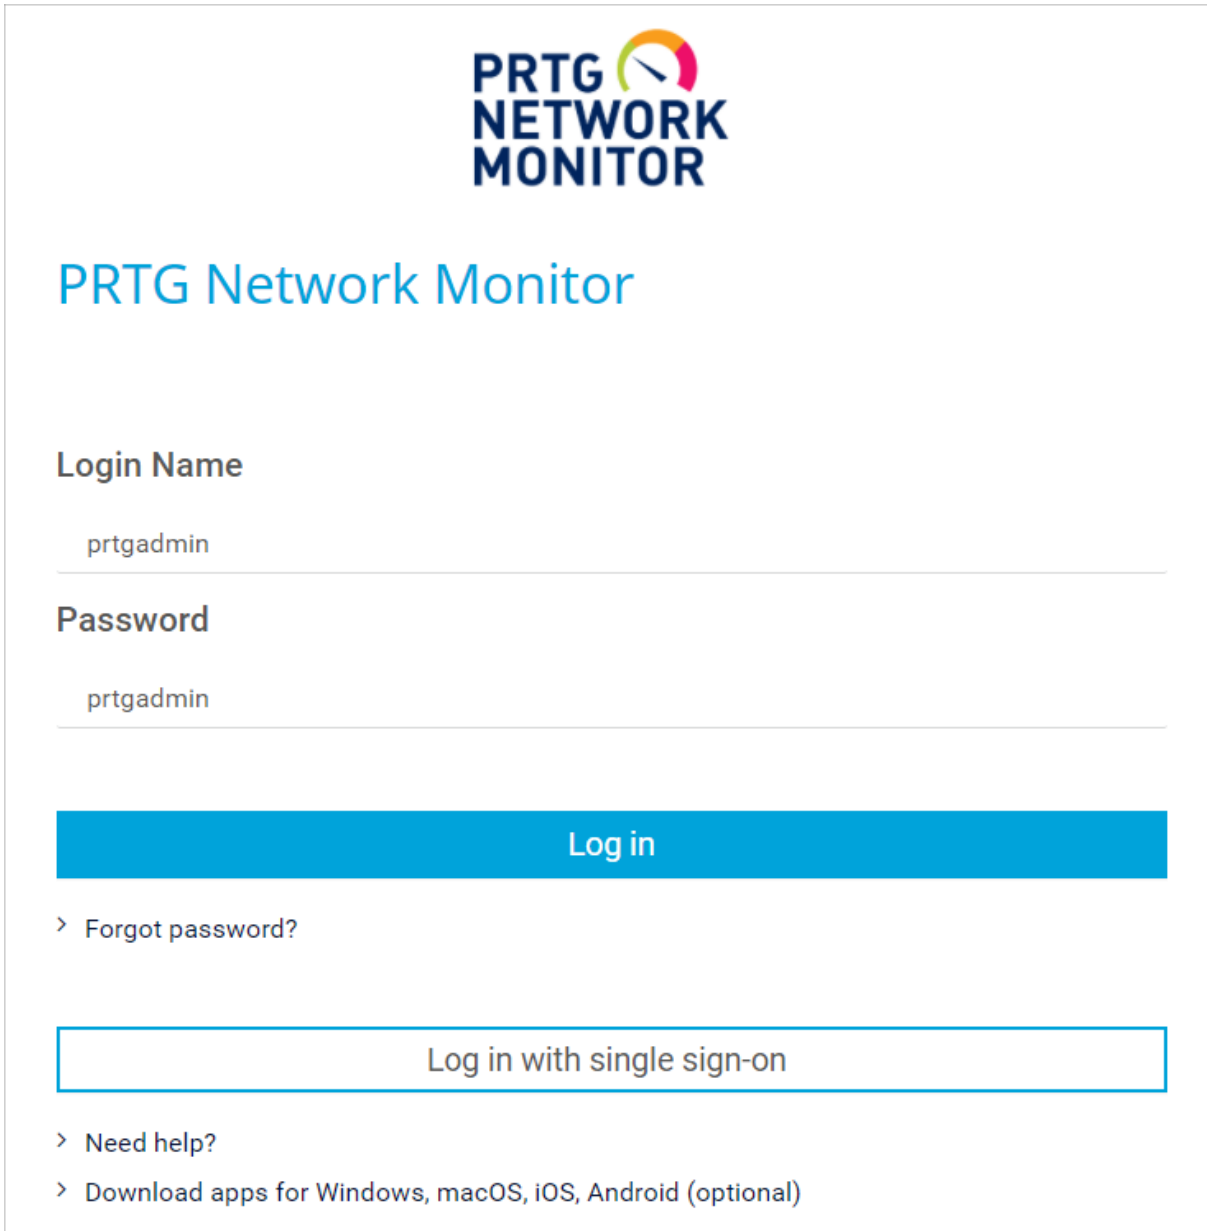

Recover Password (PRTG on premises)

If you cannot remember your PRTG on premises password, click the Forgot password? link. The Password Recovery page opens. Enter your Login Name, click Request a New Password, and PRTG sends an email to the primary email address of your user account. Click the link in the email to set a new password. The link is valid for 60 minutes. Enter a New Password, then enter it again under Confirm Password. Click Set New Password to change your password.

- ❗ The password must be at least 8 characters long and must contain a capital letter and a number.
- ❗ When the password is successfully reset, all active user sessions of this user account are logged out. Log in again with the new password.

Login Screen with Single Sign-On (SSO)

After you [configure SSO](#)⁴²³², you see a new button on the login screen of the PRTG web interface.

PRTG NETWORK MONITOR

- [Similar Sensors](#)  215
- [Recommended Sensors](#)  221
- [Object Settings](#)  226
- [Alarms](#)  228
- [System Information](#)  231
- [Logs](#)  237
- [Tickets](#)  240
- [Working with Table Lists](#)  246
- [Object Selector](#)  251
- [Priority and Favorites](#)  253
- [Pause](#)  256
- [Context Menus](#)  259
- [Hover Popup](#)  275
- [Main Menu Structure](#)  278

6.2 SSL Certificate Warning

If you use PRTG on premises outside your internal LAN, in particular if you use it on the internet, you should set the PRTG web server [to use Secure Sockets Layer \(SSL\)/Transport Layer Security \(TLS\)](#). Your browser then shows an SSL certificate warning because PRTG comes with a self-signed certificate. The connection to your PRTG web server is secured with SSL/TLS anyway and you can confirm the claimed security risk.

Every browser shows a slightly different SSL certificate warning that you need to confirm to proceed:

- [Google Chrome](#)
- [Mozilla Firefox](#)
- [Internet Explorer](#)
- [Other](#)

✂ You can avoid these browser warnings if you [use your own trusted SSL certificate](#) with PRTG. For this purpose, we provide the freeware tool [PRTG Certificate Importer](#).

Google Chrome

In Google Chrome, click Advanced, then click Proceed to [yourPRTGserver] (unsafe) every time you open the PRTG web interface.

Your connection is not private

Attackers might be trying to steal your information from **127.0.0.1** (for example, passwords, messages, or credit cards). [Learn more](#)

NET::ERR_CERT_AUTHORITY_INVALID

Help improve security on the web for everyone by sending [URLs of some pages you visit, limited system information, and some page content](#) to Google. [Privacy policy](#).

Advanced 1 Back to safety

6.3 Welcome Page

After you completed the [smart setup](#)^[48], you see the Welcome page by default when you log in to the PRTG web interface. The collected information about your PRTG installation makes the page a good starting point for your daily monitoring activities. You can set a different homepage in your [account settings](#)^[4127], section Web Interface. Of course, you can also use the [Maps](#)^[4086] feature to create customized dashboards that you can use as your homepage.

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Welcome to PRTG

Sensor Overview

The Welcome page displays various information about your PRTG installation and is similar to a dashboard. It keeps you informed about all sensors and alarms:

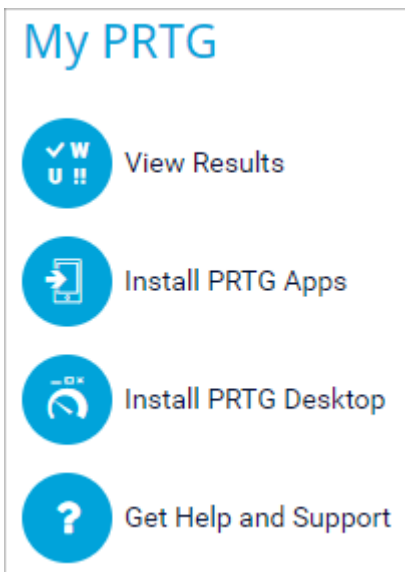

Sensor Overview on the Welcome Page

- Click Sensors to open the [top 10 lists](#) for sensors.
- Click View All Alarms to open a [list of alarms](#) in your installation.
- Click a sensor [status](#) to open a list of all sensors with the corresponding status.

My PRTG Section

In the My PRTG section, you can directly access different pages in the PRTG web interface.

My PRTG Section on the Welcome Page

Option	Description
View Results	Open the device tree that shows your monitoring results.
Install PRTG Apps	Open the download page for the PRTG apps for iOS or Android .
Install PRTG Desktop	Open the download page for PRTG Desktop .

Option	Description
Get Help and Support	Open the Help and Support Center from where you can access the PRTG Manual, the Knowledge Base, and video tutorials. You can also open support tickets and contact our customer service from this page.
Manage Subscription	This option is only visible if you use PRTG Hosted Monitor. Open your PRTG Hosted Monitor dashboard and manage your subscriptions.

Other Sections

Other sections are, for example, the License Status section, the Yesterday's Activity section, the Paessler Blog section, and the Update Available section.

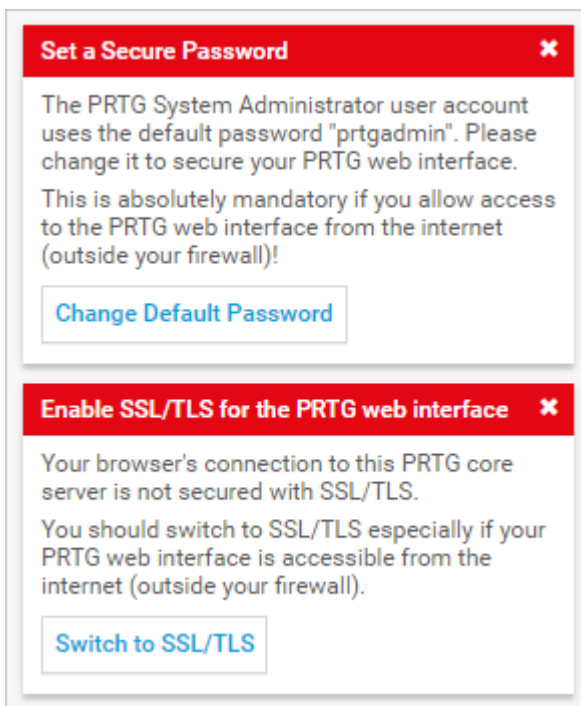

License Status Section and Yesterday's Activity Section on the Welcome Page

Section	Description
License Status	<p>Shows the number of your remaining maintenance days for PRTG on premises and the number of sensors that you can still add with your license. Click Get Maintenance to open the Paessler shop and extend your maintenance for PRTG on premises installations. Click Get More Sensors to open the Paessler shop and upgrade your license. See also section License Information.</p> <p>i For technical reasons, the number of available sensors that is displayed here does not include sensors in the Paused status because they do not count towards the maximum number of sensors that your license allows. Add the number of your sensors that are in the Paused status to the displayed number to know exactly how many sensors are still available on your installation.</p>

Section	Description
	<p>i If you use a PRTG on premises license with an unlimited number of sensors, PRTG takes 10,000 sensors as the starting point to calculate the number of available sensors that is displayed here. Consider the system requirements^[23] for a recommended PRTG core server setup and click Recommended Setup for more information.</p>
Yesterday's Activity	Shows what your PRTG core server or PRTG Hosted Monitor instance did for you on the day before. Hover over the mini graph to show the number of sensor scans on a specific day. See also the Activity History in section System Status ^[4240] . Click Show Tickets under My Open Tickets to display all open tickets that are assigned to you.
Paessler Blog	Shows recent information about PRTG and Paessler. Click the heading of an article to open it on the Paessler website.
Update Available	This section is only visible if an update is available. It shows the version number of your PRTG on premises installation and the version number of the latest available PRTG version. You see the label NEW if a newer version is available. Click Install Update to open the Auto-Update ^[4257] page.

Further options

There are some further options on the Welcome page, for example, you can set a secure password or enable SSL/TLS for the PRTG web interface.

Further Options on the Welcome Page

- If your PRTG on premises installation is not Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured, PRTG asks you to Enable SSL/TLS for the PRTG web interface. Click Switch to SSL/TLS and in the Do you want to switch to SSL/TLS? dialog, click Yes, switch to SSL/TLS to enable SSL/TLS. See also section [User Interface](#)^[4175]. Click  to remove this note.
- If you still use the default password of the **PRTG System Administrator** user (`prtgadmin`) for a PRTG on premises installation, PRTG asks you to Set a Secure Password if your PRTG web interface is publicly available. Click Change Default Password to define a new password. See also section [User Accounts](#)^[4212]. Click  to remove this note.
- In the video section, you find informative videos about monitoring with PRTG. Click a video to open it and play it on the Paessler website.

6.3.1 Customer Service

If you have any questions about license purchases, upgrades, or maintenance extensions, you can directly contact the Paessler Customer Service from the [Help and Support Center](#)  in the PRTG web interface. We readily assist you with quotes or information about licenses and maintenance, and guide you through the purchasing process. Our Customer Service team is also happy to send you the contact information of a knowledgeable PRTG partner in your region or research any technical specifications you might need beforehand.

 PRTG securely transmits your feedback or questions to Paessler via the PRTG Cloud. Make sure that your PRTG core server has access to the internet and can reach the URL <https://api.prtgcloud.com:443> for successful transmission.

6.4 General Layout

This section provides a general overview of the structure of the PRTG web interface. The central focus is the Devices view, which you can select via the [main menu bar](#)^[279]. The Devices view presents the device tree and your monitoring results.

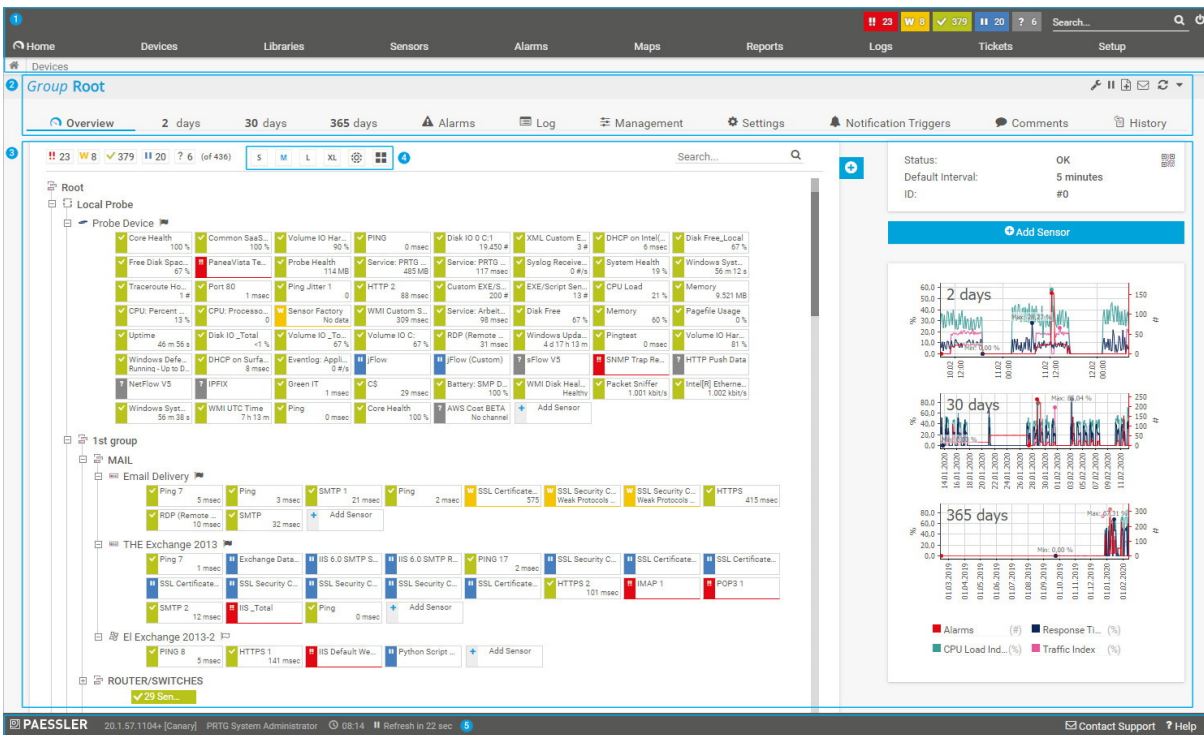

Welcome Page

When you log in to the PRTG web interface, you see the [Welcome page](#)^[174] by default. You can set a different homepage in your [account settings](#)^[4127], section Web Interface.

Click View Results to open the device tree.

Device Tree View Layout

Click View Results on the Welcome page or select Devices from the main menu bar to display the device tree.

Device Tree

From top to bottom, the device tree page has several areas that are covered in further detail in this section. For a general overview of the device tree page, see the table below.

Screen Number	Page Area Name	Description
1	Global header area 	This area contains the main menu bar at the very top, the global status bar, breadcrumbs that show the path to the selected object, a quick search box, and the logout button.
2	Page header bar 	This area contains the page heading with the name of the selected object, several tabs with settings, and quick action buttons.
3	Page content 	This area contains information about the selected object and all other objects underneath in the device tree hierarchy, the object's status bar, a quick search box, the QR code that links to the URL of the selected page, and graphs for different time spans.
4	Viewing options 	These buttons are part of the page content. Here you can adjust how your device tree is displayed.
5	Page footer	<p>This area shows information about the version of PRTG, the logged in user account, and the time (depending on the time zone settings  for the logged in user).</p> <p>A timer counts down how much time remains until the next automatic page refresh. Click  to pause the refresh timer and click  to resume. If you open a different page while the refresh timer is paused, the timer resumes automatically and starts with the defined Refresh Interval (Sec.) that you can configure in your account settings.</p> <p> Long table lists  that are set to display 1000 items at a time are excluded from the automatic refresh to ensure system performance.</p>
	Page footer icons	<p>Click  for quick access to the auto-update  settings if a new version is available. To open the Contact Support form , click . For context-sensitive help, click .</p> <p>If you run PRTG in a cluster, you also see a cluster-related element. It shows the name of the cluster node that you are logged in to and displays whether this is a master node or a failover node. Click the bar to show the cluster status . On a failover node, you can review all data, but PRTG does not save changes in the settings. To change the settings, log in to the master node.</p>

Navigation

To navigate the PRTG web interface, the following options are available:

- The main menu bar provides access to all important aspects of the software.
- The quick search is often the fastest way to find a specific object (for example, a sensor or a device).
- The clickable breadcrumbs show the path to a selected object in the object hierarchy.
- Click an object to see its details. In the page heading of the page header bar, you always see the name of the object that you have selected.
- Use the page tabs to switch between various subpages.
- Right-click objects to open their [context menu](#) ^[259].
- Hover over objects to display tool tips. Hover longer to open a quick-access window ([hover popup](#) ^[275]).
- Drill down into the object hierarchy of probes, groups, devices, and sensors in the device tree. To do so, click a subobject of the displayed object (for example, click a sensor on a device's Overview tab).

These navigation options offer complete access to the functionality of PRTG.

In the following sections, we describe the different areas of the PRTG web interface.

Global Header Area

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Global Header Area

The global header area of the PRTG web interface provides important, very condensed information about your installation and offers access to all content and settings. The following table lists the elements that make up the global header area.

Screen Number	Part	Description
1	Main Menu Bar	<p>To navigate the PRTG web interface, the main menu bar is the best starting point. We recommend that you take a few minutes to familiarize yourself with the main menu bar and its submenus.</p> <p>■ For more information, see section Main Menu Structure^[276].</p>
2	New Alarms, New Log Entries, Updated Tickets	<p>The information boxes show how many new alarms, new log entries, and updated tickets have occurred. Click the respective box to view the lists of alarms^[228], logs^[237], or tickets^[240].</p>
3	Global Sensor Status Symbols	<p>This area shows the accumulated states of all configured sensors, grouped into the different sensor states. You see boxes with numbers that show the amount of sensors that are in the respective status. For example, you can see how many sensors are in the Up, Down, or Warning status. Click a box to view a list of all sensors that are in the respective status.</p> <p>■ For more information, see section Sensor States^[197].</p>
4	Search Box, Logout	<p>You can start a search (🔍) or log out (🔌) via the respective buttons in the top-right corner.</p> <p>To search for an object, enter a name, parts of a name, an IP address, a Domain Name System (DNS) name, or a tag in the search box and confirm with the Enter key. PRTG performs a string search in your entire monitoring setup, including groups, devices, sensors, libraries, maps, reports, tickets, and object comments.</p> <p>A page with items and online help articles that are related to the search term opens.</p>
5	Breadcrumbs	<p>Below the main menu bar, PRTG shows a path that retraces the steps back to the Welcome page (or your defined starting page). Use these breadcrumbs to navigate back to where you came from.</p> <p>If you click ▼ on a breadcrumb item, a dropdown list opens that shows all objects on the same level. You can either search for an object or select one directly. For example, you can directly access all other sensors on a device, other devices within a group, and other groups on the same probe. Other probes in your root group are also available.</p>

Page Header Bar

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Page Header Bar

The page header bar below the global header area consists of the following elements.

Screen Number	Part	Description
1	Page Heading	<p>The page heading displays the selected object's type and name. In the screenshot, this is the group that is called Root. Here you can define the object's priority as well. To do so, click one of the five stars (★★★★★) next to the object's name (this setting is not available for the root group).</p> <p>■ For more information, see section Priority and Favorites ^[253].</p>
2	Quick Action Buttons	<p>On the right side is a row of icons for several actions. Depending on the selected page, you can pause (⏸) and resume (▶) the object. You can also open the settings of the object (⚙), add a ticket (🎫), send a link to the selected page per email (✉), or perform an immediate scan (🔄).</p> <p>Click ▼ to open the context menu of the selected object for further options.</p> <p>■ For more information, see section Context Menus ^[259].</p>
3	Tabs	<p>Via tabs you can navigate to the various subpages of an object, for example, to its monitoring data or settings.</p> <p>■ For more information, see sections Review Monitoring Data ^[201] and Object Settings ^[228].</p>

Page Content

The page content of the general layout varies depending on the selected object. It shows information about the object and all other objects underneath in the object hierarchy. The deeper down in the hierarchy you can find a selected object, the more detailed is the displayed information.

Part 6: Basic Procedures | 4 General Layout

The screenshot displays the PRTG Network Monitor interface. On the left, a tree view shows the hierarchy: Root > Local Probe > Probe Device > Core Health (100%), Business Proc. (Inactive), Common SaaS (100%), Volume IO Har. (22%), PING (0 msec), Disk IO 0 C:1 (512 #), XML Custom E. (2 #), XML Custom E. (2 #), Disk Free_Local (49%), DHCP on Intel... (2 msec), PaneaVista Te... (Free Disk Spac. 49%), Free Disk Spac. (20.929.323.008 #), Probe Health (Service: PRTG ... 42 msec, Common SaaS... 150 #, Service: PRTG ... 453 MB), Service: PRTG (109 MB), Service: PRTG (42 msec), Syslog Receiv... (0 #/s), Ping Jitter 1 (0), System Health (9 %), Windows Syst... (6.4-6.2 m), HTTP Full Web... (421 msec), Traceroute Ho... (1 #), Port 80 (0 msec), QoS (Quality of... (2 msec), HTTP 2 (66 msec), Custom EXE/S... (200 #), EXE/Script Sen... (76 #), CPU Load (6.21 %), Memory (2.900 MB), CPU: Percent U... (2 %), CPU: Process... (0), Sensor Factory (No data), WMI Custom S... (297 msec), Service: Arbit... (49 msec), SSL Certificate... (1), SSL Security C... (6.60 %), CPU Load (6.60 %), Disk Free (RDP (Remote... 49 %), Memory (56 %), Pagefile Usage (4 %), Uptime (6 h 33 m), Disk IO_Total (49 %), Volume IO_Total (49 %), Volume IO C... (49 %), HTTP (RDP (Remote... 15 msec), Windows Upda... (30 #), SNMP CPU Lo... (5 %), Pingtest (0 msec), Pingtest (0 msec), Pingtest (0 msec), Surface Ethern... (Surface Ethern...), Volume IO Har... (Volume IO Har...), DHCP on Surfa... (2 msec), Eventlog: Appl... (0 #/s), Windows Upda... (30 #), C:\ (49 %), D:\ (1), Cloud HTTP (89 msec), and an Add Sensor button.

Below the tree, a 'Test Group' is shown with 'MAIL' and 'Sonicwall Firewall' categories. The 'MAIL' group includes sensors for IMAP 3, POP3 3 (35 msec), SMTP 1 (16 msec), Ping (6 msec), Ping (12 msec), SSL Certificate... (274), and SSL Security C... (Weak Protocols...). The 'Sonicwall Firewall' group lists numerous sensors for various interfaces (LAN, WAN, UI) with their respective data rates.

On the right side, there is a status bar showing 'Status: OK', 'Default Interval: 5 minutes', and 'ID: #0'. Below this is a world map with 'Add Sensor' and 'Add Sensor' buttons. At the bottom right, three time-series graphs are displayed for durations of 2 days, 30 days, and 365 days, showing data points over time.

Page Content

Screen Number	Part	Description
1	Sensor Status Bar	<p>This element is visible when you view a probe, a group (including the root group), or a device. It is not available on a sensor's Overview tab. The sensor status bar shows the accumulated states of all sensors for the selected object, grouped into different sensor states. They show the number of sensors that are in the respective status.</p> <p>For example, you can see how many sensors are in the Up, Down, or Warning status. You can hide sensors that are in a certain status by clicking the respective status icon. To show the sensors again, click the status icon again.</p> <p>■ For more information on sensor states, see section Sensor States^[197]</p>
2	Viewing Options	<p>This element is only visible when you view a probe or a group. It is not available when you view device or sensor details. For a detailed description, see Switch Device Tree View^[190] below.</p>
3	Device Tree Search	<p>In the search box to the right of the viewing options, enter a keyword to search the device tree for matching items. The device tree highlights matching devices and sensors by graying out all others. This gives you a quick overview of sensors that monitor a specific part of your network. For example, you can enter the keyword <code>firewall</code> to highlight devices and sensors that match this string.</p>
4	Add Button	<p>Click  to add new objects to your monitoring setup. For a detailed description, see Add Button^[193] below.</p>
5	Object Status, Scanning Interval, Object ID, QR Code	<p>This element displays the status of the selected object, the interval in which PRTG scans the object, the ID of the object, and the QR code for the selected page. If you use a PRTG app for iOS or Android^[4278], you can scan the code to directly view the object on your mobile device. Click the QR code to enlarge it for scanning.</p> <p>Depending on the object type, this element shows additional information:</p> <ul style="list-style-type: none"> ▪ All objects underneath the root group show their dependency^[148]. ▪ Groups and devices display the time that has elapsed since the last execution of the auto-discovery^[296] on the selected object. ▪ Devices show their DNS name or IP address as defined in the device settings^[446] and the time that has elapsed since the last execution of the sensor recommendation^[227] on this device. ▪ Sensors show additional monitoring statistics as well as their performance impact^[4243].

Switch Device Tree View

Wherever a probe or group is displayed, you can choose between a number of viewing options.

Classic Device Tree View

Via the Switch Device Tree View buttons in the page header bar, you can adjust how much information is included next to each object. Use the buttons to switch from a very condensed view (**S**) to a very spacious view (**L**). Use **XL** to switch the device tree to a list view.

In the classic device tree view, you can collapse devices, groups, and probes. Click left of the object name to summarize the sensors according to their respective status. By default, sensors in the Down, Down (Partial), or Down (Acknowledged) status are summarized if there are more than ten sensors with the same status, otherwise they are displayed individually.

Collapsed Device with Summarized Up and Unusual States and Individual Down States

Extended Device Tree Views

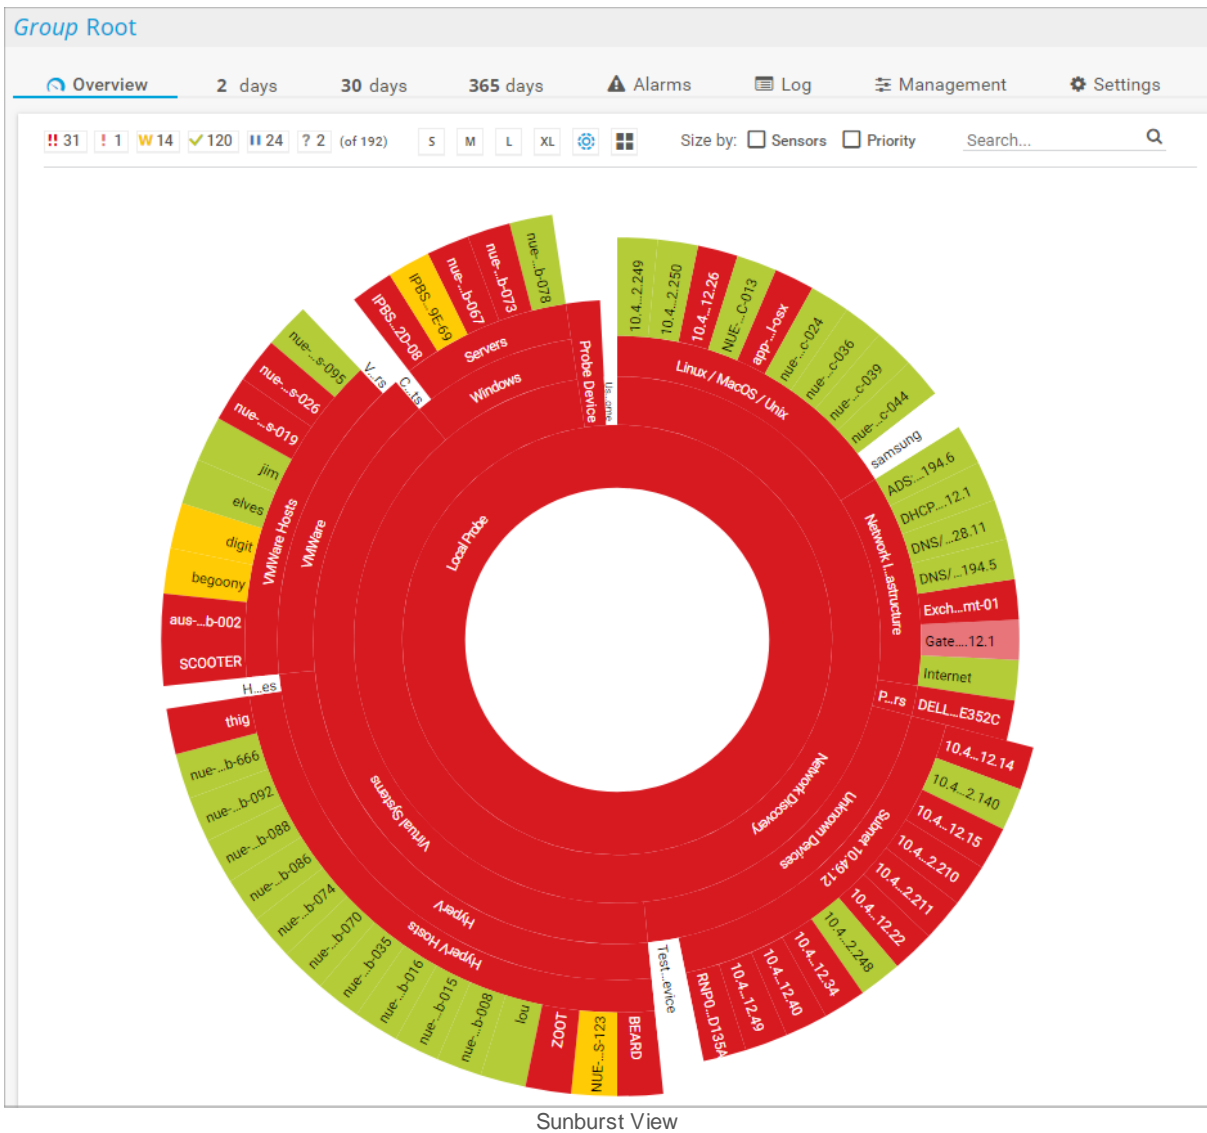

There are two additional options to the classic device tree view with which you can display the status of all sensors of your entire installation in a single overview. Click to change to the sunburst view. To change to the tree map view, click .

Sunburst View

The sunburst view displays your entire installation as a circle diagram. The groups are represented as inner circles, and all devices that belong to a group are shown as 'cake slices' that are attached to the outside of a circle element.

The sunburst is interactive:

- You can click elements to open the Overview tab of your monitoring objects.
- You can zoom in and out with your mouse wheel while pressing the **Ctrl** key.

Tree Map View

The tree map view displays all devices of your entire installation as tiles that are sorted into a square and that are arranged according to the groups they belong to. Each device dynamically changes color to reflect the overall status of the sensors on the device.

Tree Map View

The following aspects apply to both the sunburst view and the tree map view:

Colors

A device or group can have different colors, depending on the states of the sensors that are on the device or in the group. The sensor states are ranked according to their priority, for example, the Down status has a higher priority than the Warning status, which has a higher priority than the Up status.

A tile shows the color of the sensor status with the highest priority. For example, if a device has sensors in the Up (green), Paused (blue), and Warning (yellow) status, the corresponding tile shows a yellow color to indicate that at least one sensor on this device is in the Warning status. If a single sensor changes to the Down status, the corresponding tile turns red.

In the following table, you can find all sensor states sorted by the highest priority to the lowest priority:

Status Icon	Color	Object Status	Meaning
	Red	Down	At least one sensor on this object shows the Down status. Hover over an object's name to view the total number of alarms for this object.
	Light Pink	Down (Acknowledged)	At least one sensor on this object shows the Down (Acknowledged) status. There is no sensor in the Down status.
	Yellow	Warning	At least one sensor on this object shows the Warning status. There is no sensor in the Down or Down (Acknowledged) status.
	Orange	Unusual	At least one sensor on this object shows the Unusual status. There is no sensor in the Down, Down (Acknowledged), or Warning status.
	Green	Up	All sensors on this object show the Up status. There is no sensor in the Down, Down (Acknowledged), Warning, Paused, or Unusual status.
	Blue	Paused	All sensors on this object show the Paused status. There is no sensor in the Down, Down (Acknowledged), Warning, Unusual, or Up status.
	Grey	Unknown	All sensors on this object show the Unknown status. There is no sensor in the Down, Down (Acknowledged), Warning, Unusual, Paused, or Up status.

Size by: Sensors / Size by: Priority

You can adjust the size of the different squares according to the number of sensors that run on a device or in a group, or the sensors' [priority](#) ^[253], or both. Select the check boxes in the page header bar to change the square size.

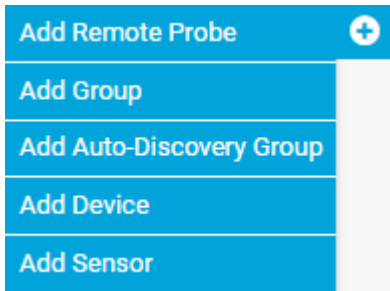

Size by: Sensors Priority

Check Boxes for Adjusting the Square Size

Add Button

Hover over  to add new objects to your monitoring setup. An assistant appears and guides you through the necessary steps.

i The content of the menu varies depending on the selected object.

Add Button Menu

See the following sections for more information:

- [Add Remote Probe](#) 
- [Add an Auto-Discovery Group](#) 
- [Add a Group](#) 
- [Add a Device](#) 
- [Add a Sensor](#)

Default Objects in the Device Tree

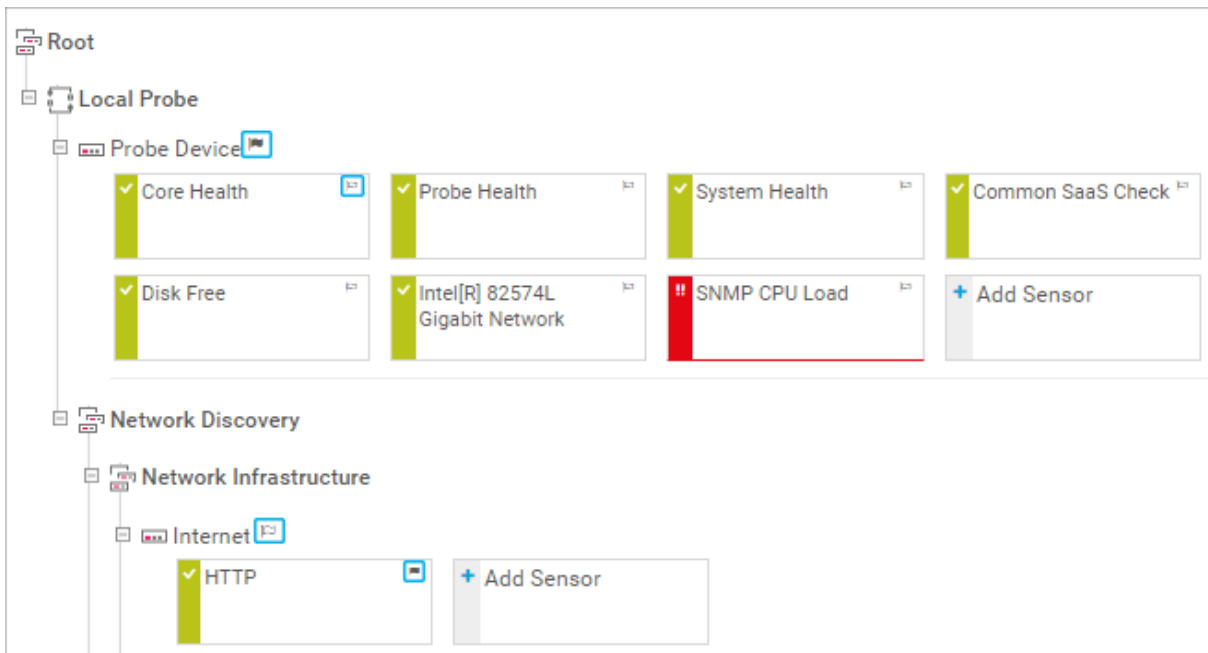

By default, PRTG creates a **probe device** on the local probe (PRTG on premises) or on the hosted probe (PRTG Hosted Monitor). The probe device represents the probe system. PRTG automatically monitors the system health of the PRTG core server and each probe to discover overload that might distort monitoring results. To monitor the status of the probe system, PRTG automatically creates the following sensors:

- [Core Health sensor](#) 
- [Probe Health sensor](#) 
- [System Health sensor](#) 
- Some device-specific sensors for disk usage and bandwidth.

In a cluster, PRTG also creates a **cluster probe device** with a [Cluster Health sensor](#) 

Priority and Favorites

You can mark a device or sensor as a favorite. To do so, click  to the right of the respective object in the device tree. The flag turns dark gray. To remove an object from your favorites, click . The flag turns transparent again.

One-Click Favorites in the Device Tree

i The favorite flag for sensors is available for the **L** or **XL** viewing options.

A quick way to set the priority of an object is via the five stars in the [page header bar](#)¹⁸⁵ next to the object name. Click the stars to adjust the priority. ★★★★★ means top priority, ★☆☆☆☆ means lowest priority.

One-Click Favorite and Priority in the Page Header Bar

You can also add any device or sensor to your favorites in the page header bar of the respective object. To do so, click for a device or for a sensor. Click for a device or for a sensor to remove the respective object from your favorites.

For more information, see section [Priority and Favorites](#)²⁵³.

6.5 Sensor States

The color of a sensor indicates its status. In the table below, you find a list of states that a sensor can show. This list also reflects the priority of the sensor states whenever PRTG shows summarized sensor states, for example, in the [device tree](#)^[183] or on [geographical maps](#)^[4026]. For example, if all sensors on a specific device show the Up status and one of the sensors changes to the Down status, the device shows the Down status as well because this status has a higher priority. The device is then displayed as a red tile in the [extended device tree views](#)^[190].

i The Down and Down (Partial) states are considered to be equal regarding status priority.

Status Icon	Color	Status Name	Meaning
	Red	Down	<ul style="list-style-type: none"> PRTG is unable to reach the device or the sensor has detected an error. For more information, see section Sensor Behavior for the Warning and Down States^[198]. <ul style="list-style-type: none"> i In this case, a sensor does not record any data in its channels while it shows the Down status. There is an error limit in the channel settings^[3977] or the sensor shows the Down status because of a lookup^[4485]. <ul style="list-style-type: none"> i In this case, the sensor continues to record data in all channels although it shows the Down status.
	Green/Red	Down (Partial)	<p>In a cluster, at least one cluster node reports that this sensor shows the Down status, while at least one other cluster node reports that the same sensor shows the Up status.</p> <ul style="list-style-type: none"> i This status is not available for sensors on remote probes in a cluster^[135].
	Light Pink	Down (Acknowledged)	<p>The sensor is down and the status has been acknowledged via the Acknowledge Alarm function. This indicates that an alarm has already been brought to attention. For acknowledged alarms, PRTG does not send further notifications^[4031].</p> <p>To show the Down (Acknowledged) status, right-click the sensor that shows the Down status. From the context menu^[259], select Acknowledge Alarm, then select a time span, optionally enter a message, and click OK.</p>

Status Icon	Color	Status Name	Meaning
	Yellow	Warning	<ul style="list-style-type: none"> The sensor detected an error and shows the Warning status, but PRTG is trying to reach the monitored device again. The sensor might soon change to the Down status. For more information, see Sensor Behavior for the Warning and Down States ¹⁹⁸. There is a warning limit in the channel settings or the sensor shows the Warning status because of a lookup.
	Orange	Unusual	<p>The sensor reports unusual values for this weekday and time of the day. The unusual detection is based on the sensor's historic average data. You can configure or disable the unusual detection in the system administration settings under Monitoring ⁴¹⁸⁸.</p> <p>You can also disable the unusual detection for specific groups.</p> <ul style="list-style-type: none"> For more information, see section Group Settings ⁴⁴³.
	Green	Up	The last scan was okay and the sensor receives data.
	Blue	Paused	The sensor is paused for a specific time span, indefinitely, or because of a dependency ¹⁴⁸ .
	Gray	Unknown	<p>The sensor has not received any data yet or there is an error in (network) communication, likely on the probe system. If sensors continuously show this status, you might need to restart PRTG.</p> <ul style="list-style-type: none"> For extended troubleshooting, see the Knowledge Base: What to check if sensors are gray? and My sensors show an Unknown status after a PRTG core server restart. What can I do?

Sensor Behavior for the Warning and Down States

The Down status indicates that there is an issue with an object, for example, a device. There are various reasons for the Down status, for example, an interruption in the physical connection to the device or an internet connection outage.

After a failed request, PRTG tries to contact the device again before it sets a sensor to the Down status (this is true for almost all sensors):

1. If a request to a device fails for the first time, the sensor changes to the Warning status. PRTG repeats the request and immediately attempts to rescan the device.
2. If the second request also fails, the sensor changes to the Down status by default until the device is reachable again. You can change this behavior in the [scanning interval](#)^[379] settings of any object in the device tree. PRTG tries to reach the device with every scanning interval.

This procedure gives devices and services the chance to recover from a momentary overload and prevents false alarms. Still, you are immediately informed about any network issues.

-  This behavior does **not** apply to the Warning or Down states that result from warning limits or error limits in the channel settings. This behavior also does **not** apply to channels that use lookups.

6.6 Review Monitoring Data

Probe, group, device, and sensor pages have tabs that you can use to navigate between different options. For example, you can view your network's status, view monitoring results, or change settings.

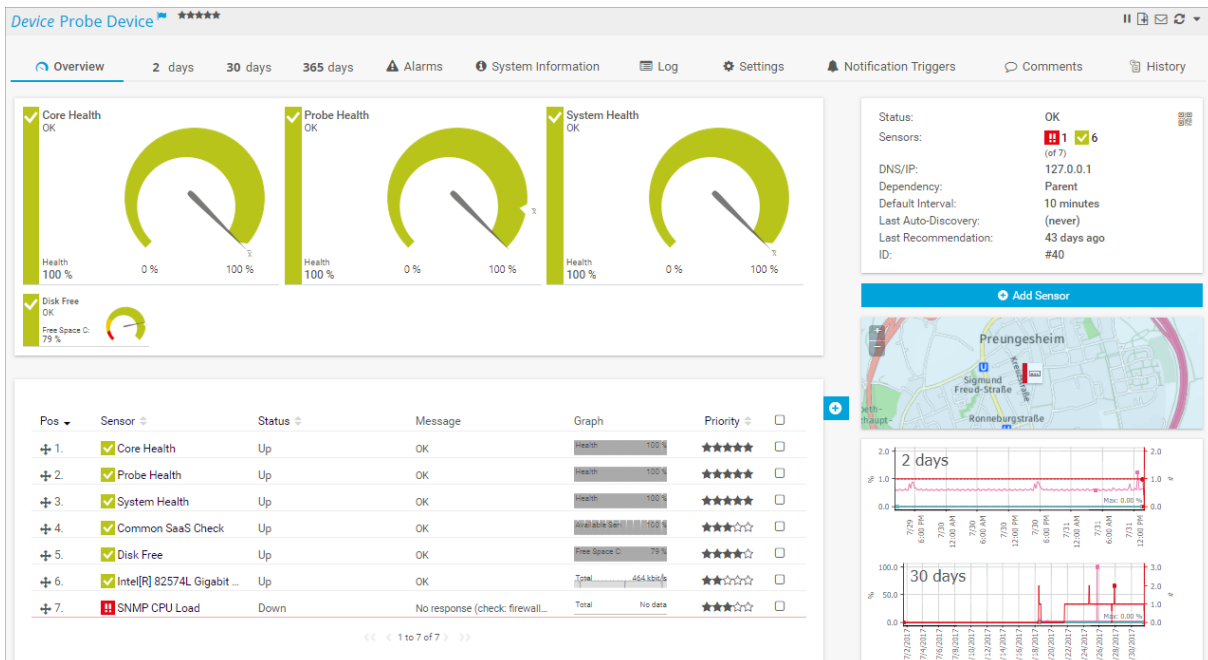

Overview

The Overview tab shows an overview of the selected object and its sensors. The pages share a common structure, but some elements differ depending on the type of object.

Objects	Content
Probes and Groups	The tab shows a tree-like view with devices and sensors, a geographical map ⁴⁰²⁶ , as well as graphs for different time spans of the probe or group.
Devices	The tab shows device details, a geographical map, and graphs for different time spans, gauges, as well as a table list ²⁴⁶ of all sensors on this device, and a table list with recommended sensors ²²¹ . <i>i</i> You can turn off the sensor recommendation and disable the table list in the system administration settings under Monitoring ⁴¹⁹¹ .
Sensors	The tab shows sensor details, the sensor status, gauges, graphs for different time spans, a table list with all channels, as well as similar sensors ²¹⁵ .

i Assign 4-star (★★★★☆) or 5-star (★★★★★) priorities to sensors to display their gauges on your devices' Overview tabs. Sensors with a 5-star priority are represented by larger gauges than sensors with a 4-star priority.

Device Overview Tab with Gauges for High Priority Sensors, the Sensors Table List, a Geographical Map, and Mini Graphs

Gauges

Gauges are the visual representation of channel values that you can use as a quick status indicator.

- Red and yellow sections of gauges correspond to the error and warning limits of the [channel settings](#) ³⁹⁷⁷.
- Device Overview tabs only show gauges of high-priority sensors with 4 stars (★★★★☆) or more.
- Sensor Overview tabs show gauges of all channels except the Downtime channel, regardless of their priority. The primary channel is displayed with a larger gauge.
- Channels that display binary values such as on/off or successful/failing because of their [lookup](#) ⁴⁴⁸⁵ configuration are visualized as [switches](#), not as gauges. Switches only show a gray or a green color for their respective two states.
- The x-bar symbol (\bar{x}) in gauges shows the mean of the returned values.

i For the gauge to remain legible, we recommend that you stay below 120 lookup values for primary channels of sensors with a 5-star priority. For sensors with a priority of 4 stars, the recommended limit is about 40 lookup values.

Toplists

Toplists are only available for [xFlow and Packet Sniffer sensors](#) ⁴⁸⁰⁰. Toplist graphs are displayed directly on the sensor's Overview tab.

For more information, see section [Toplists](#) ⁴⁰⁰².

Live Data and Data By x Days

Select one of the tabs Live Data (only available for sensors), 2 days, 30 days, or 365 days to display an object's live monitoring data (only sensors), or to display data for different time spans and in more or less detail. The time that graph legends and data tables show depends on the [time zone settings](#)⁴²¹⁵ for the logged-in user.

- ❶ The time spans that are mentioned here are the default settings. You can change the shown days for the different graphs in the system administration settings under [User Interface](#)⁴¹⁷⁶.
- ❷ Graphs label the minimum and maximum values of a sensor's primary channel and the minimum and maximum values of the Response Time Index of other objects. A maximum value of 100% is not labeled.

2 Days Tab of a Device with Overview Graph and Sensor Mini Graphs

Live Data and Data By x Days for Probes, Groups, and Devices

For probes, groups, and devices, each of the tabs shows a summary graph for the selected object and mini graphs for all sensors on the object, as well as a data table for the object. For performance reasons, PRTG never displays more than 50 mini graphs. Hover over a mini graph to display the graph legend.

Summary graphs show the number of alarms as well as three [index graphs](#). These graphs indicate the response time, the CPU load, and the bandwidth usage for all sensors. Index graphs are similar to a stock index. The values are based on the readings of all sensors of this object. To compute these values, PRTG uses statistics and compares the values to the highest and lowest readings that have ever been recorded.

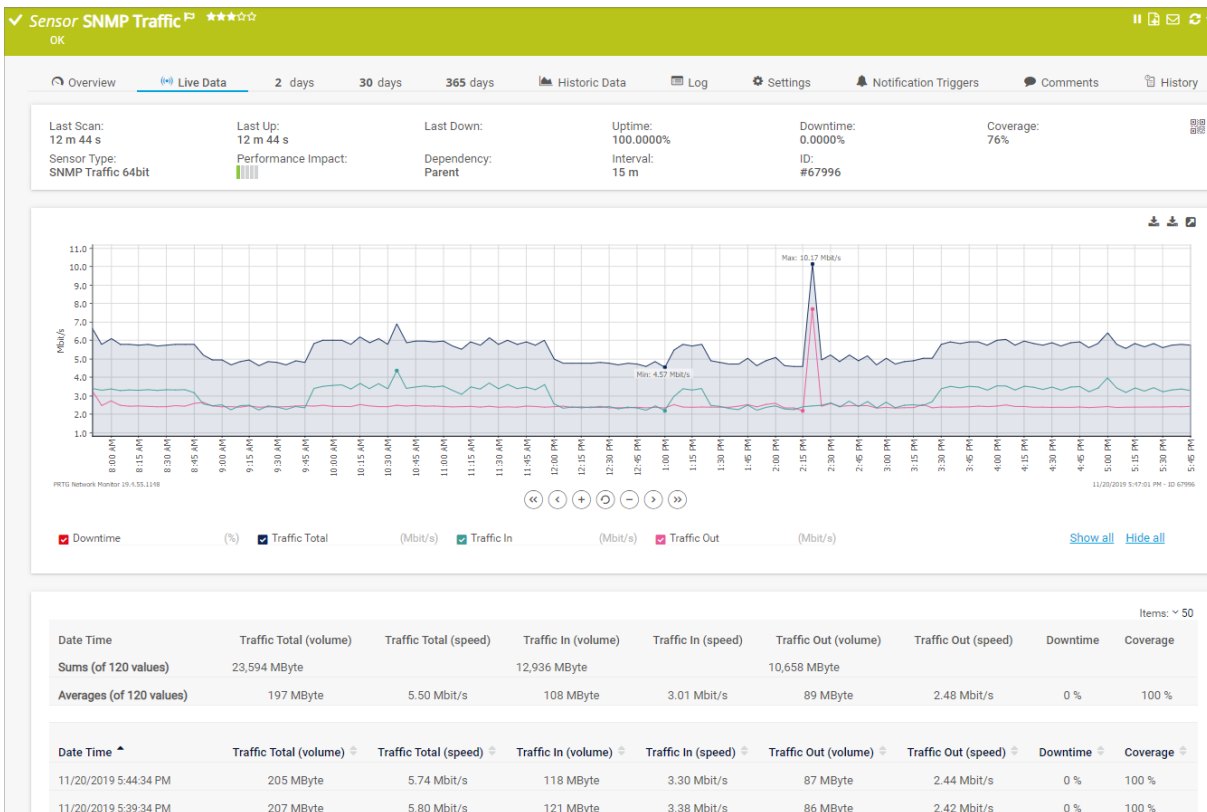

The three index graphs show trends in your network. If the values increase over a certain time span, this means that the CPU load, the bandwidth usage, or the response time have gotten worse during this time. For example, a [CPU Load Index](#) value of 90% means that the average CPU load for all CPU sensors of your configuration is at 90% of the highest ever measured CPU load value.

The following channels are available in the summary graph:

Channel	Description
Alarms	Sums up the number of all Down states of sensors on this object during the specified time span. This graph provides you with a bird's eye view of your network issues.
Response Time Index	Indicates the request times in your network.
CPU Load Index	Indicates the CPU load in your network.
Traffic Index	Indicates the bandwidth usage in your network.

■ For more details about index graphs, see the Knowledge Base: [How does PRTG compute CPU Index, Traffic Index and Response Time Index?](#)

You can individually hide single channels except the [Alarms](#) channel. To do this, disable the check box next to a channel name below the graph, and the corresponding channel's line disappears. You can also click Show all or Hide all in the lower-right corner to show or hide all channels. The graph view is immediately adjusted.

Sensor Live Data Tab for an SNMP Traffic Sensor

Live Data and Data By x Days for Sensors

For sensors, each tab shows a graph and data table for the selected sensor. When you view the data of a sensor that runs on a cluster probe, you can additionally select if you want to show the data of all cluster nodes, or only of one specific cluster node. Use the Show Data of option above the graph.

i PRTG never displays graphs for multiple cluster nodes as filled graphs. These graphs are only displayed with lines. However, historic data reports can have filled graphs for multiple cluster nodes.

When you view a sensor graph, you can individually hide channels. To do so, disable the check box in front of a channel name below the graph, and the according channel's line disappears. You can also click Show all or Hide all in the lower-right corner to show or hide all channels.

Live Data and Data By x Days and Interactive Graphs

Graphs on a sensor's historic data tabs, as well as zoomed graphs in new windows that belong to other monitoring objects are all interactive. You can zoom in and scroll along the time axis via the corresponding buttons.

Graph Buttons

The following actions are available for graphs:

-  scrolls one graph window left and  scrolls one graph window right. The scrolled time depends on the graph that you select, for example, 2 days on a 2-day graph.
-  scrolls left and  scrolls right on the time axis. The scrolled time depends on the graph that you select.
-  zooms in to and  zooms out of the graph. The displayed time depends on the selected graph. For example, you can zoom into a 30-day graph so that it shows data for 6 days.
-  resets the graph to the default view.

In the upper-right corner of each graph, you can find three icons   .

-  : Show a .png or .svg file of the graph in a new browser window. You can then save or copy the file for later use.
- : Open a larger version of the graph in a new browser window.

For each graph, you can also choose which specific channels (only for sensors) or indexes you want to see by enabling the respective check boxes or by clicking Show all or Hide all.

-  [Warning or error limits](#)³⁹⁷⁶ are only shown in graphs if you select exactly one channel with a limit. Warning limits are highlighted in yellow and error limits are highlighted in red.

Historic Data

The Historic Data tab is only available for sensors.

- For more information, see section [Historic Data Reports](#)²⁰⁸.

Alarms

The Alarms tab is not available for sensors. It is only available for probes, groups, and devices.

- For more information, see section [Alarms](#)²²⁸.

System Information

The System Information tab is only available for devices.

- For more information, see section [System Information](#)²³¹.

Log

The Logs tab shows past activities and events of a specific object.

- For more information, see section [Logs](#)²³⁷.

6.7 Historic Data Reports

For quick reviews of a sensor's monitoring data, use historic data reports as an alternative to the comprehensive [reports](#) function. You can run and view a historic data report for each sensor on demand. Additionally, you can export a sensor's historic data as an .xml file or a .csv file to your computer to further process the data with third-party applications.

There are two ways to open historic data reports: Either click the Historic Data tab of a sensor or select Sensors | View Historic Data from the [main menu bar](#).

Historic Data Tab of a Ping Sensor

Historic Data (Sensor Tab)

Probe, group, device, and sensor pages have tabs that you can use to navigate between different options. For example, you can view your network's status, view monitoring results, or change settings.

Tabs Bar for Sensors

The Historic Data tab is only available for sensors, not for probes, groups, or devices. When you open the Historic Data tab of a sensor, no sensor selection is available. If you want to select a different sensor for the report, select Sensors | View Historic Data from the main menu bar.

Historic Monitoring Data (Sensors Main Menu)

When you open historic data reports via Sensors | View Historic Data from the main menu bar, PRTG asks you to select the sensor for which you want to create a report with the [object selector](#).

Historic Data Report Settings

Setting	Description
Sensor	<p>This setting is only visible if you open the View Historic Data option from the main menu bar. To select the sensor for which you want to create the report, click  to open the object selector.</p> <p> For more information, see section Object Selector^[25].</p>
Start	<p>Specify the start date and time for the data that you want to review. Use the date time picker to enter the date and time.</p> <p> You cannot generate the historic data report if monitoring data was deleted^[4206] after the specified start date. Set the start of the report to a date for which data is available.</p>
End	<p>Specify the end date and time for the data that you want to review. Use the date time picker to enter the date and time.</p>
Quick Range	<p>You can use several buttons to select start and end dates more quickly. Click any of these buttons to change the Start and End values:</p> <ul style="list-style-type: none"> 1 Day, 2 Days, 7 Days, or 14 Days: Set the date range^[249] to the respective day or days. The current time of the current day is the end date.

Setting	Description
Averaging Interval	<ul style="list-style-type: none"> ▪ Today, Yesterday, Last Week (Mo-Su), Last Week (Su-Sa), Last Month, 2 Months, 6 Months, 12 Months: Set the date range to the last matching period. It starts at 00:00 and ends at 00:00 of the following day. <p>With this option, you can activate and configure averaging. Select an interval for which PRTG calculates the average value. You can choose from:</p> <ul style="list-style-type: none"> ▪ No Interval (Display Raw Data): PRTG performs no averaging and displays only raw data. ▪ 15 Seconds, 30 Seconds, or 60 Seconds/1 Minute ▪ 2 Minutes, 5 Minutes, 10 Minutes, 15 Minutes, 20 Minutes, or 60 Minutes/1 Hour ▪ 2 Hours, 4 Hours, 6 Hours, 12 Hours, or 24 Hours/1 Day <p>i A shorter interval results in a more detailed historic data report for the sensor.</p> <p>The best settings for you depend on the scanning interval of the sensor, the selected time period, and the intended use for the historic data report. Try different settings and compare the results. See also Automatic Averaging^[213] in this section.</p>
Channels in Graph	<p>This setting is only visible if you view historic data via the Historic Data tab of a sensor. Select the channels that you want to include in the graph of the historic data report. You can select individual channels via the respective check boxes, and show or hide all channels via the Show all or Hide all buttons. In the graph, PRTG then only shows the data of selected channels.</p> <p>i The historic data report table always shows the data of all channels.</p>
Cluster Node	<p>This setting is only visible if the sensor runs on a cluster probe. Select the cluster node's data that PRTG includes in the historic data report:</p> <ul style="list-style-type: none"> ▪ All nodes: Include the data of all cluster nodes in the report. ▪ [Several specific nodes]: Use a specific cluster node's data for the report. The cluster nodes you see are specific to your setup.
File Format	<p>Select the output format for the report:</p> <ul style="list-style-type: none"> ▪ HTML web page: Display the result directly as an HTML web page. This is also a good option if you want to check the results before you export them to a different file format. ▪ .xml file: Export the data as an .xml file. Your browser usually shows a download dialog when you use this option.

Setting	Description
	<ul style="list-style-type: none">▪ .csv file: Export the data as a .csv file, for example, to import it into Microsoft Excel. Your browser usually shows a download dialog when you use this option.

Percentile Handling

Percentile Handling

Percentile Results ⓘ Do not show percentiles
 Show percentiles

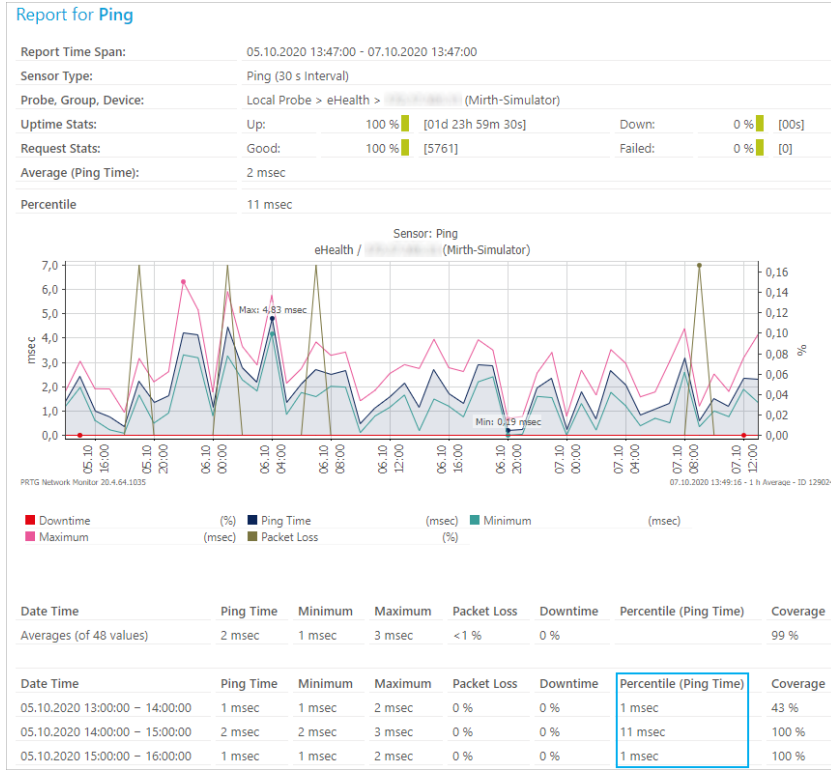

Historic Data Percentile Handling

Setting	Description
Percentile Results	<p>Define if you want to include an additional percentile calculation ⁴⁴⁹⁹ of your data in the historic report:</p> <ul style="list-style-type: none">▪ Do not show percentiles: PRTG does not use a percentile formula to calculate your monitoring results. It only shows the standard values.

Setting

Description

- **Show percentiles:** PRTG displays an additional percentile calculation for the **primary** channel in the value table for each scanning interval.

Example of a Historic Data Report with Percentile Calculation for the Primary Channel

Percentile Type

This setting is only visible if you enable Show percentiles above. Enter the percentile type that you want PRTG to use for the calculation. If you choose, for example, to calculate the 95th percentile, enter 95 here and 5% of peak values are discarded. Enter an integer value.

Percentile Averaging Interval

This setting is only visible if you enable Show percentiles above. Enter a value to define the averaging interval on which PRTG bases the percentile calculation. The default value is 300 seconds (5 minutes). This means that PRTG takes 5-minute averages as basic values for the percentile calculation. Enter an integer value.

Percentile Mode

This setting is only visible if you enable Show percentiles above. Select the mode for percentile calculation:

- **Discrete:** PRTG takes discrete values to calculate percentile results.
- **Continuous:** PRTG interpolates between discrete values and bases the calculation on interpolated values.

Click Start to generate a historic data report.

i You cannot generate the historic data report if monitoring data was [deleted](#)⁴²⁰⁸ after the specified start date. Set the start of the report to a date for which data is available.

Remarks for Reports

- Any sensor graph in your report only shows channels that you enable via the Show in graphs option in the [channel settings](#)³⁹⁷⁷.
- Reports show statistics for the uptime (the Up and Down [states](#)¹⁹⁷ in percent) and for requests (Good and Failed in percent). PRTG rounds values between 5% and 95%, as well as 100% and 0%, to whole numbers without decimal places. Other values are shown with 3 decimal places.
- Because PRTG rounds values, the statistics in the report section Sensor Status History can differ from the values in the report section Uptime Stats by a few seconds.
- PRTG limits data reporting to 5 requests per minute.
- Reports cannot show uptime or downtime data for the [Sensor Factory sensor](#)²¹⁷⁸.
- Create reports that include an appropriate amount of data. Reports might not work as expected if PRTG has to process too many sensors with short scanning intervals. Adjust your report size and the time span that the report covers, if necessary.

Automatic Averaging

For performance reasons, PRTG automatically averages monitoring data when it calculates data for large periods of time.

Period of Time in Report	Minimum Level of Detail (Averaging Interval)
Up to 40 days	Any
40 to 500 days	60 minutes/1 hour or longer

i Reports for periods that are longer than 500 days are not possible. If you enter a longer period, PRTG automatically shortens it to 365 days.

i In some cases, the generated report might contain a period of time that differs from the defined start and end date for the report because of internal averaging processes. When averaging intervals are longer than 1 hour and do not equal 24 hours, and when they are combined with specific periods of time, the resulting data points might be asynchronous to the periods of time. Consider this behavior particularly if you use [application programming interface \(API\) calls](#)⁴³⁸⁵ to generate reports.

6.8 Similar Sensors

With PRTG, you can detect relationships between different components in your network. For example, you can detect extraordinarily high CPU load that correlates with extraordinarily high traffic at a specific time of a day or week. This can give you a hint to further investigate that part of your network.

What Is Similarity?

The similarity calculation is based on the values that are saved in the sensor history. If measured values change in the same way, the [Similar Sensors Detection](#) feature detects it and shows you the sensors for which it found similar data relations. PRTG shows all sensors that reach 85% to 100% similarity.

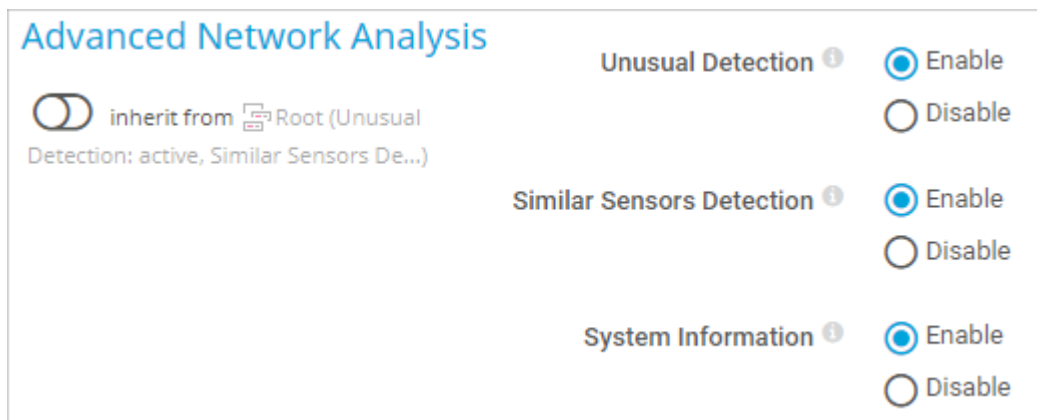

The analysis of similar sensors is a heuristic calculation that shows interconnections and correlations in your network. The analysis is completely automated. It is based on mathematics and fuzzy logic and optimizes your sensor usage by tracking redundant monitoring of some aspects of your system.

Similar Sensors Detection

You can adjust the depth of the Similar Sensors Detection or turn it off under Setup | System Administration | Monitoring.

You can also enable or disable the Similar Sensors Detection for specific probes, groups, and devices, and specify [inheritance](#)^[142] in the [object's settings](#)^[226], section Advanced Network Analysis.

There are two options to view similar sensors:

- Via the Overview tab of sensors that includes a [Similar Sensors section](#)^[216] where PRTG lists channels that show similarities to channels of the selected sensor.
- Via Sensors | Similar Sensors Overview in the main menu bar where you get an [overview](#)^[217] of all similar sensors.

To edit the list of similar sensors results, use the [available filters](#) ²¹⁸.

Similar Sensors (Sensor Overview Tab)

Probe, group, device, and sensor pages have tabs that you can use to navigate between different options. For example, you can view your network's status, view monitoring results, or change settings.

On the Overview tab of a sensor, PRTG lists channels that show similarities to channels of the selected sensor. The table is empty if PRTG detects no similarities to the selected sensor.

- ❶ PRTG shows similar sensors here when channels have 85% similarity or more. The Similar Sensors Detection saves up to 15 entries per sensor.

Similar Sensors

Similarity	Channel	Similar Channel
100 %	(011) Local Area Connection Traffic (Traffic To)	(016) Local Area Connection-WFP LightWeight ...
99 %	(011) Local Area Connection Traffic (Traffic To)	(015) Local Area Connection-QoS Packet Sched.
85 %	(011) Local Area Connection Traffic (Traffic To)	Intel[R] PRO_1000 MT Network Connection (To

Similar Sensors Section on a Sensor's Overview Tab

The Similar Sensors section provides the following information.

Column Header	Description
Similarity	Shows the similarity between two channels in percent.
Channel	Shows a channel of the selected sensor.
Similar Channel	Shows a channel of a sensor that is similar to the channel of the selected sensor that you can see in the Channel column in the same row.

i PRTG does not show the Similar Sensors section when the analysis is disabled or when you exceeded 1,000 sensors and selected the Manage automatically based on sensor count (recommended) option as Analysis Depth under Setup | System Administration | Monitoring, section Similar Sensors Detection. In this case, you see the following notice:

The Similar Sensors Detection is a heuristic calculation that analyzes similar values in the sensor data of your entire PRTG installation. This way, PRTG can detect unexpected correlations between different components in your network and help optimize your sensor usage.

Why can't I see any sensor similarities here?

- The Similar Sensors Detection is currently turned off. To enable the analysis of similar sensors, open Setup | System Administration | Monitoring and set your preferred analysis depth in section **Similar Sensors Detection**.
- For more information about the Similar Sensors Detection in PRTG, see the PRTG Manual: Similar Sensors.

Similar Sensors Detection Notice

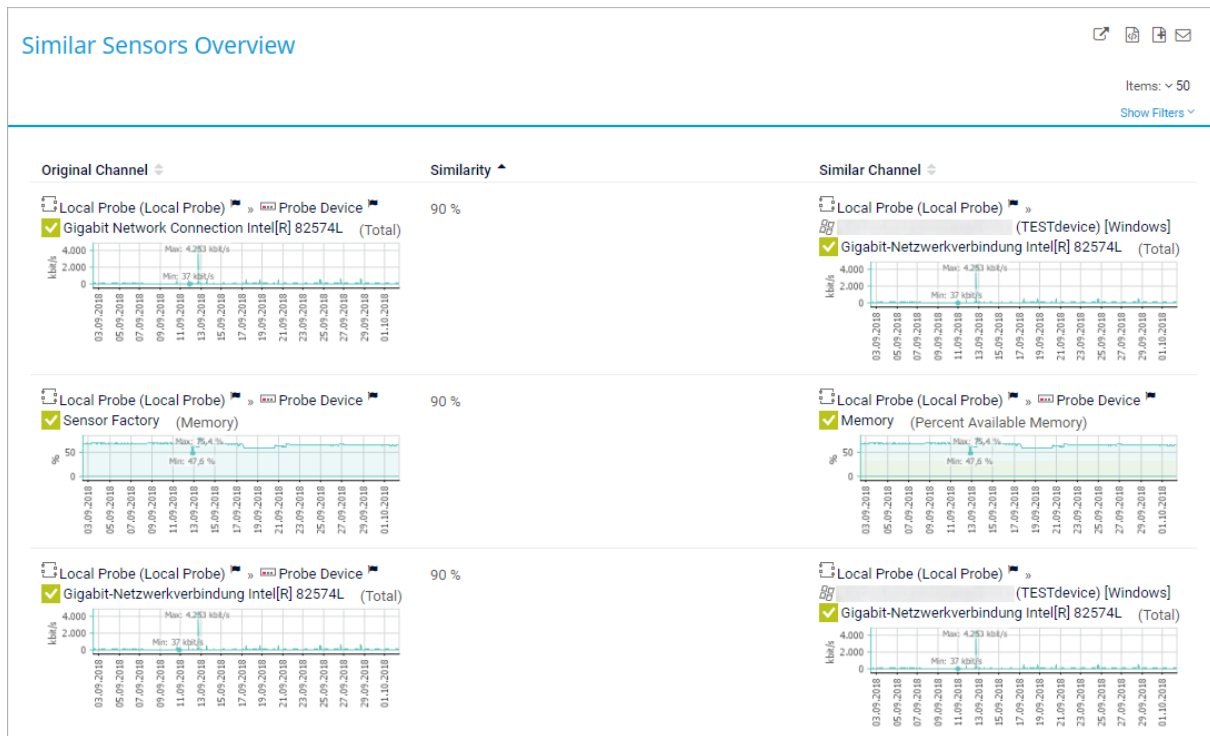

Similar Sensors Overview (Sensors Menu)

This page shows the results of the Similar Sensors Detection from the entire monitoring database. PRTG lists all channels with similarities here. Above the table, there are several filter options to display similar sensors as required. Select the object of interest, the degree of similarity, and display back references.

i For more information, see also section [Working with Table Lists](#) ²⁴⁶.

i The analysis of similar sensors requires sensor data from at least seven days to have enough data for comparison. If not enough data is available, no data is shown on the Similar Sensors Overview or in the Similar Sensors section on a sensor's Overview tab.

i PRTG shows similar sensors here when channels have at least 85% similarity. Furthermore, the analysis saves up to 15 entries per sensor.

Similar Sensors Overview

You can click the column headers to sort the list. The Similar Sensors Overview provides the following information.

Column Header	Description
Original Channel	Shows channels that other channels are compared to. Click the column header to sort the list according to the order in the device tree in ascending or descending order.
Similarity	Shows the similarity between two channels in percent. Click the column header to sort the list according to the similarities in ascending or descending order.
Similar Channel	Shows a channel that is similar compared to the original channel. Click the column header to sort the list according to the order in the device tree in ascending or descending order.

i PRTG does not show the Similar Sensors Overview item in the main menu bar if you disabled the analysis or if you exceeded 1,000 sensors and selected the Manage automatically based on sensor count (recommended) option as Analysis Depth under Setup | System Administration | Monitoring, section Similar Sensors Detection.

Adjust the Similar Sensors Overview to Your Needs

You can use various filters to adjust the results in the Similar Sensors Overview. Click Show Filters and edit the filters that appear.

Filters for the Similar Sensors Analysis

Filter	Description
Filter By Object	Select the device, probe, or group that you want the Similar Sensors Detection to cover. This way, you can apply the analysis to the parts of your network that you are interested in.
Filter By Maximum Similarity	Select a degree of similarity from 85% to 100%.
Inverted Relationships	<p>If you select Show, PRTG shows all similarity relationships, that is, A matches B and B matches A.</p> <p>If you select Hide, PRTG only shows A matches B relationships. This reduces the number of displayed similar sensors.</p>

6.9 Recommended Sensors

With the [Recommended Sensors Detection](#) feature, PRTG can explore any device and check which sensors you have already created. If it finds useful sensors that you have not created yet, you see a list of recommended sensors for your device.

☁ You cannot use this feature on the hosted probe of a PRTG Hosted Monitor instance. You can use this feature on remote probes.

ⓘ The Recommended Sensors Detection does not apply to the [user group setting](#) ⁴²¹⁹ Allowed Sensors. Therefore, read/write users can also add all recommended sensors.

The screenshot shows the PRTG interface for a device named 'Device Internet'. At the top, there are navigation tabs: Overview (selected), 2 days, 30 days, 365 days, Alarms, System Information, Log, and Settings. A message box states: 'To see sensor gauges here, please change the priority of one or more sensors to ★★★★★ / ★★★★★.' Below this is a table of sensors:

Pos	Sensor	Status	Message	Graph	Priority	
1.	HTTP	Up	OK	Loading time 110 msec	★★★★☆	<input type="checkbox"/>

Below the sensor table is a 'Recommended Sensors' section with the following data:

Priority	Sensors	Total Sensors	Links
★★★★★	1xPing	1	Add These Sensors
★★★★☆	1xSSL Security Check (Port 4...	2	Add These Sensors

At the bottom left of the recommended sensors section is a 'Recommend Now' button.

Recommended Sensors on Device Overview Tab

Get Sensor Recommendations

By default, PRTG recommends sensors for any device that you add and shows the suggested sensors for the device on its Overview tab, as long as your installation includes less than 5,000 sensors in total. To add the recommended sensors, click Add These Sensors.

You can see the time that has passed since the last sensor recommendation in the [page header bar](#) ¹⁸⁶ on the Overview tab of a device.

If you want to manually start the Recommended Sensors Detection on any device, follow the steps below.

Step 1: Select the Device

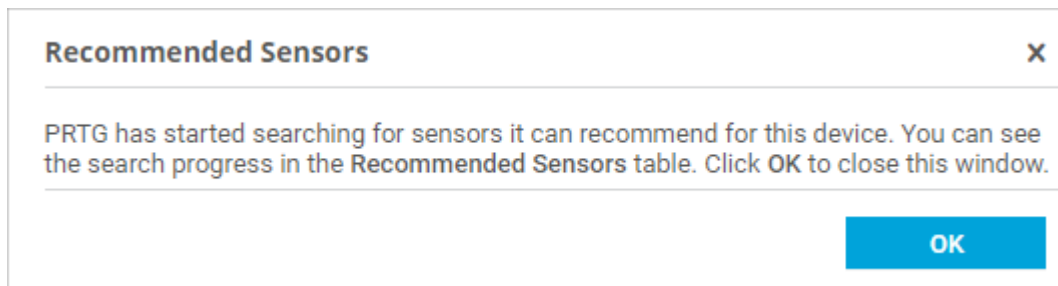

Open the Overview tab of the device that you want to analyze.

Step 2: Recommend Now

To start the analysis of your device, click Recommend Now or right-click the device and select Recommend Now from the [context menu](#)^[266].

i If you do not see the Recommend Now option, make sure that the Recommended Sensors Detection is enabled under Setup | System Administration | Monitoring. Probe devices do not support this option.

Depending on the complexity of your device, it can take some time until you see the results of the analysis.

Recommended Sensors Investigation

PRTG runs the Recommended Sensors Detection with low priority in the background to prevent potential performance issues. Because of this, the Recommended Sensors Detection can take more time than expected if PRTG needs resources to ensure the gapless monitoring of your network. By default, the Recommended Sensors Detection starts automatically when you add a new device, when you do not have more than 5,000 sensors, or when the last analysis was executed more than 30 days ago. You can change these settings under Setup | System Administration | Monitoring, section Recommended Sensors Detection.

i To recommend [Simple Network Management Protocol \(SNMP\) sensors](#)^[4615] for a device, the detection engine uses the SNMP version that you defined in the Credentials for SNMP Devices section of the [device settings](#)^[455].

Step 3: Get the Results

After PRTG analyzed your device, it suggests a list of sensors that are useful for a more comprehensive monitoring.

Priority	Sensors	Total Sensors	Links
★★★★★	1xPING	1	Add These Sensors
★★★★☆	1xSSL Security Check (Port 443), 1xSSL Certificate Sensor (Port ...	2	Add These Sensors

[Recommend Now](#)

What is this?
PRTG can inspect your devices to recommend useful sensors.

List of Recommended Sensors

The list of recommended sensors provides the following information.

Column Header	Description
Priority	Shows which priority [253] the suggested sensors have when you add them. The recommended sensors table is sorted by priority, beginning with the top priority (★★★★★) in the first row. ⓘ You can manually change the priority of a sensor after you add it.
Sensors	Shows the suggested sensors and the number of sensors of one type that PRTG recommends for this device. For example, you might want to add an SNMP Traffic sensor [3094] multiple times for several network interfaces.
Total Sensors	Shows the total number of suggested sensors per table row. These sensors have the same priority.
Links	Displays an Add These Sensors button for every table row. Click to automatically add the sensors in this table row to the device.

ⓘ The Recommended Sensors Detection checks if a certain sensor exists on your device and recommends that you add this sensor if it does not exist. If this sensor existed previously on the device, but you deleted it, PRTG suggests this sensor again. In this case, ignore the recommendation of this sensor or follow [step 4](#) [223].

Step 4: Add Recommended Sensors

Click Add These Sensors in a table row to add all sensors in this row to the analyzed device.

ⓘ If you want to add **all** suggested sensors regardless of their priority, click every Add These Sensors button in the Recommended Sensors table. If you want to add only **some** of the sensors of a certain priority, click Add These Sensors, then [delete](#) [270] or [pause](#) [256] the sensors you do not need afterward.

Settings for the Recommended Sensors Detection

You can also adjust the settings for the Recommended Sensors Detection or disable it under Setup | System Administration | Monitoring.

Recommended Sensors Detection

Detection Handling ⓘ Manage automatically based on sensor count (recommended)

Always show recommended sensors

Disable sensor recommendation

Recommended Sensors Detection Settings

If you use the Manage automatically based on sensor count (recommended) setting, PRTG uses an intelligent assistant to count the number of sensors you have and decides whether to start the detection of recommended sensors or not. The detection does not start if your PRTG installation includes 5,000 sensors or more to prevent performance issues. We recommend that you use this option so that you do not miss any important monitoring data about your network and so that you do not risk performance issues.

- ⓘ Disable the Recommended Sensors Detection if you encounter performance issues or if you do not want to display this information on device Overview tabs.

Auto-discovery

You can also use the auto-discovery to find suitable sensors. You can start the auto-discovery when you [add a new device](#)^[343], you can [manually start](#)^[297] it at any time, or you can choose if you want PRTG to [analyze a whole section](#)^[296] of your network, for example, devices that are covered by a certain IP address range.

- ⓘ The auto-discovery has a higher priority than the detection of recommended sensors. If both are active, PRTG queues the sensor recommendation and executes the auto-discovery first.

6.10 Object Settings

Probe, group, device, and sensor pages have tabs that you can use to navigate between different options. For example, you can view your network's status, view monitoring results, or change settings.

Tabs Bar for Sensors

General Settings

On the Settings tab, you can define all settings for the selected object. The available options vary depending on the kind of object that you select. See the following sections for information about the object types:

- [Root Group Settings](#) ³⁶⁶
- [Probe Settings](#) ³⁸⁵
- [Group Settings](#) ⁴¹³
- [Device Settings](#) ⁴⁴⁶
- [Sensor Settings](#) ⁴⁷⁶

i You cannot open [channel settings](#) ³⁹⁷ via tabs. Go to a sensor's Overview tab to edit the channel settings.

Notification Triggers Settings

On the Notification Triggers tab, you can set notification triggers for every object. If you use these settings for a probe, group, or device, they are inherited to all sensors on these objects. The available notification trigger options are the same for all objects.

■ For more information, see section [Notification Triggers Settings](#) ³⁹⁸.

Comments

On the Comments tab, you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

History

On the History tab, all changes in the settings of an object are logged with a time stamp, the name of the user who made the change, and a message. The history log retains the last 100 entries.

i On some pages, you can click  in the [page header bar](#) ¹⁸⁶ to access the history of subordinate objects. This includes [system administration](#) ⁴¹⁷ settings and [account settings](#) ⁴¹², [reports](#) ⁴⁰⁶, [libraries](#) ⁴⁰⁴, and [maps](#) ⁴⁰⁵. For more information, see section [Logs](#) ²³⁷.

!! PING		Down	8 d 19 h		Host not found. This message in...	Ping Time No data	★★★★★

Alarms List

There are two ways to display the alarms list. Either click the Alarms tab of a probe, group, or device, or click Alarms in the [main menu bar](#)^[278].

Alarms (Object Tab)

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

Click the Alarms tab of a probe, group, or device to show a table list of all sensors [on the selected object](#) that show the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual [status](#)^[197]. This list is a subset of the entries that are available via the Alarms | All option in the main menu bar.

i The Alarms tab is not available for sensors.

Alarms (Main Menu Bar)

Click Alarms in the main menu bar to show a table list of **all** sensors in your installation that show the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status. You can also show these sensors as gauges or only show a subset of sensors in specific states. Hover over Alarms to show further options:

Option	Description
All	Open a list of all sensors that are in the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status.
Show as Gauges	Open a page with the gauges of all sensors that are in the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status. The size of the gauges corresponds to the sensor's priority.
Errors Only	Open a list of all sensors that are in the Down, Down (Partial), or Down (Acknowledged) status.
Warnings Only	Open a list of all sensors that are in the Warning status.
Unusuals Only	Open a list of all sensors that are in the Unusual status.

Acknowledge Alarm

An acknowledged alarm shows the Down (Acknowledged) status. It does not [trigger](#)³⁹⁸⁷ any more [notifications](#)⁴⁰³¹.

i If the alarm condition clears, the sensor usually returns to the Up status with the next sensor scan.

To acknowledge an alarm, right-click a sensor that shows the Down status. From the [context menu](#)²⁵⁹¹, select Acknowledge Alarm, then select a time span, optionally enter a message, and click OK. The message appears in the last message value of the sensor.

The time spans that you can select are: Acknowledge Indefinitely, acknowledge For 5 Minutes, For 15 Minutes, For 1 Hour, For 3 Hours, For 1 Day, or Until. If you select Until, provide the following information:

Field	Description
Selected Objects	Shows the sensors for which you want to acknowledge the alarm. You can acknowledge alarms for more than one sensor using multi-edit ⁴⁰¹⁴ .
Message	Enter a text, for example, the reason why you acknowledge the alarm. Enter a string or leave the field empty.
Until	<p>Select the date when the Down (Acknowledged) status ends. Use the date time picker to enter the date and time.</p> <p>i If the alarm condition still exists after the specified date, the sensor shows the Down status again.</p> <p>i To return the sensor to the Down status before the specified date, you can Pause and then Resume the sensor via the context menu²⁷⁰¹.</p>

 By default, only read/write [users](#) ^[421] or administrators may acknowledge alarms. However, you can give read-only users the right to acknowledge alarms, too. See the system administration settings, section [User Accounts](#) ^[412].

6.12 System Information

With the [System Information](#) feature, you can see what is going on in the systems that you have in your network. To see the system information for a device, click the device's System Information tab.

System Information Tab on a Windows Device

The system information shows

- basic system data of your device like the BIOS serial number or MAC and IP addresses,
- all connected hardware types and their properties,
- the software you have installed, including version and vendor information,
- the users that are connected to your system and their domains,
- a list of all active or stopped Windows system services including their properties, and
- a list of all processes that are running on your system, including their ID and start time.

System information is available for all devices that run with an [officially supported Windows operating system](#). You can also retrieve system information from devices that run with Linux or Unix, and from all other devices that have the Simple Network Management Protocol (SNMP) enabled.

You cannot use this feature on the hosted probe of a PRTG Hosted Monitor instance. You can use this feature on remote probes.

Prerequisites

You already meet the main prerequisites for retrieving system information if you already monitor a device with sensors that use Windows Management Instrumentation (WMI) or the Simple Network Management Protocol (SNMP). PRTG automatically displays the data on the respective device's System Information tab. To retrieve all available system information, enable **both** WMI and SNMP on the device.

i The System Information feature is enabled by default. To retrieve the data, PRTG automatically uses the [credentials for Windows systems](#)^[452] and the [credentials for SNMP devices](#)^[455] that you entered in the device settings or that the device [inherits](#)^[138] from a parent object like the root group. Consider this when you monitor devices that are outside of your local network, especially when you use [SNMP v1](#) or [SNMP v2c](#), which do not provide encryption.

Meet the following prerequisites if you do not yet use WMI or SNMP sensors:

Option	Description
Valid credentials	Specify valid credentials for Windows systems and for SNMP devices in the device settings ^[446] .
Remote Registry Windows service	Enable the Remote Registry service on the target computer, for example, via services.msc , and set the Startup Type to Automatic.
Remote Procedure Call (RPC) Windows service	Enable the RPC Windows service on the target computer, for example, via services.msc , and set the Startup Type to Automatic.
WMI	<p>Enable WMI on both the probe system and the target system. In particular, configure the firewall of the target system to allow WMI.</p> <ul style="list-style-type: none"> For more information, see section Monitoring via WMI^[428] and the Knowledge Base: My WMI sensors don't work. What can I do?
SNMP	<p>Enable SNMP on the target system. PRTG automatically uses the SNMP Compatibility Options as defined in the device settings^[446] or as inherited from a parent object like the root group.</p> <ul style="list-style-type: none"> For more information, see section Monitoring via SNMP^[428] and the Knowledge Base: My SNMP sensors don't work. What can I do?

i It is not necessary to meet every single prerequisite but then some tables do not show all data or they can even remain empty. For example, if you do not enable SNMP on the target device, you get less information for the System table.

The first data usually comes in after a few minutes. If PRTG cannot retrieve some data, for example, because of a misconfiguration, the respective System Information table shows an error message.

■ For more information, see the Knowledge Base: [How can PRTG get data for System Information tables?](#)

i System information for your devices is only for informational purposes. We cannot guarantee that the data displayed in PRTG fully corresponds to the device parameters.

Software
31 S Ago

No Data Available

- *Error: The sensor could not connect to the Remote Registry Windows service of the target system. To resolve this issue, make sure that the service is running. Also make sure that you entered correct Credentials for Windows Systems in the device settings. For more information, see <https://kb.paessler.com/en/topic/67824>. (code: PE255)*
- *Error: SNMP No Response*

Error Messages: No Data Available

System Information (Device Tab)

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

Tabs Bar for Devices

Select a device and click the System Information tab.

i The System Information feature is enabled by default. If you do not see the System Information tab, you need to enable System Information in the device settings under Advanced Network Analysis. You can also inherit the setting from an object that is higher in the [object hierarchy](#) [138].

Advanced Network Analysis

inherit from Root (Unusual Detection: active, Similar Sensors De...)

Unusual Detection **i** Enable Disable

Similar Sensors Detection **i** Enable Disable

System Information **i** Enable Disable

Advanced Network Analysis

Analyze Your Systems

On the System Information tab, PRTG displays a table for each system information category for the device.

Category	System Information	Request Method (WMI or SNMP)
System	Shows system data of the device like the BIOS serial number, IP addresses, MAC addresses, and the Windows version.	WMI and SNMP
Hardware	Shows hardware that is connected to the device like disk drives, CD/DVD, video controllers, processors, network adapters, sound devices, printers, and memory. You can see the Class and the Caption of a hardware device. In the Properties column, you get more information about the hardware, for example, the description.	WMI and SNMP
Software	Shows the installed software and the Version number of the device. In the Properties column, you get more information about the software, for example, the size. <i>i</i> PRTG uses Uninstall registry keys to retrieve the list of installed software, so the displayed software might differ from the software that the target Windows system shows under Programs and Features . <i>i</i> The System Information scan for software on the probe device uses the credentials of the probe system and ignores credentials that you specified on the Settings tab.	WMI and SNMP
Users	Shows the user accounts that are connected to the device and their Domain.	WMI
Services	Shows the available Windows services on the device. You can see the State of the service (running, stopped) and the start type (Startup Type automatic, manual, or disabled). In the Properties column, you can get more information about a service, for example, the description.	WMI
Processes	Shows the processes that are running on the device as listed on the Processes tab of the Windows Task Manager. You can also see the Start Time (only WMI) and Process ID of a process.	WMI and SNMP

You can sort each [table list](#) ²⁴⁶ via the column headers.

Click  in the upper-right corner of a table to retrieve new information for this System Information category. The time stamp shows the time that has passed since the last table refresh.

31 S Ago 

Table Refresh

PRTG automatically retrieves data for the tables System, Hardware, and Software once every 24 hours. The tables Users, Services, and Processes refresh each time you open the System Information tab. PRTG also updates all system information tables when the PRTG core server is restarted, for example, after an update.

-  PRTG can perform up to 24 system information scans at the same time, so it can take some time until you see data in the tables after a server restart.

Data Storage

PRTG stores data files with the retrieved system information in the corresponding \System Information Database subfolders of the [PRTG data directory](#) .

-  If you delete a device, the system information files of this device remain in these subfolders unless you manually delete them.

PRTG uses the following subfolders for System Information data.

Subfolder	Description
hardware	Data for the Hardware table
loggedonusers	Data for the Users table
processes	Data for the Processes table
services	Data for the Services table
software	Data for the Software table
system	Data for the System table

6.13 Logs

Logs show all past activities and events in your monitoring setup. With the logs, you can, for example, review past user activities, system events, or check whether messages were sent. In a typical setup, a huge amount of log data is produced. Because PRTG records the activity of every single object, you can use this information to check if your setup works as required.

You can choose from several filters to navigate the log entries.

For more information, see section [Working with Table Lists](#) ^[246].

Log Entries					
Date Time	Parent	Type	Object	Status	Message
8/8/2017 9:22:32 AM	None	Web Server Options		Edited	See history for details.

6.14 Tickets

PRTG has its own ticket system. A ticket includes information about recent events in your PRTG installation that need a closer look. Each ticket is a task for a particular user or user group.

Last modified	Priority	Ticket ID	Subject	Assigned to	Status	Object	
6/28/2017 8:52:32 AM	★★★★★	#5	Web server is slowing down...	PRTG Administrators	○	System	<input type="checkbox"/>
6/24/2017 1:18:54 PM	★★★★☆	#4	We recommend Windows 2...	PRTG Administrators	○	System	<input type="checkbox"/>
6/23/2017 1:18:41 PM	★★★☆☆	#3	We recommend Windows 2...	PRTG Administrators	○	System	<input type="checkbox"/>
6/19/2017 1:16:22 PM	★★☆☆☆	#1	Welcome to PRTG!	PRTG Administrators	○	Root	<input type="checkbox"/>

List of Tickets

Each task has a life cycle in the ticket system. The task's life cycle starts when a ticket is created. The users who are responsible then take care of this issue. Once the issue has been resolved, the ticket can be closed and the life cycle of the task ends. PRTG automatically creates tickets, for example, when the [auto-discovery](#) has finished, and you can create tickets for every kind of issue as well. In addition, you can set up [notifications](#) that open a ticket when an issue occurs.

Every ticket has a unique ID, a priority, and a status. You can open, resolve, or close a ticket.

PRTG can also [send an email](#) to you whenever a ticket is assigned to you or if one of your tickets has been changed.

i Except for administrator groups, you can disable the ticket system for particular user groups under Setup | System Administration | User Groups. You can also [disable ticket emails](#) for every user account.

Ticket Types

There are three types of tickets:

Type	Description
User Tickets	User tickets are created by users, for example, to assign monitoring-related tasks to a particular user account or user group .
ToDo Tickets	ToDo tickets are created by PRTG to show important system information and to inform you about specific system events. ToDo tickets are assigned to the predefined PRTG Administrators group. You cannot change the user group to which PRTG assigns ToDo tickets and you cannot disable ToDo tickets.

Type	Description
	<p>i Users that belong to an administrator group do not receive new ToDo tickets and notifications about changes by default, only the predefined PRTG System Administrator user does. You cannot change this behavior.</p> <p>See the following examples for cases in which PRTG creates a ToDo ticket:</p> <ul style="list-style-type: none"> ▪ The auto-discovery created new devices or sensors. <ul style="list-style-type: none"> i In the ticket, PRTG only lists the device templates that it used to create the sensors. ▪ A new probe has connected to the PRTG core server and you must acknowledge it. ▪ A new cluster node has connected to the cluster and you must acknowledge it. ▪ A new version of the software is available. ▪ A new report is ready for review. ▪ In a few other situations, for example, the system is running out of disk space, there are license issues, or an error occurs. <p>i The related object of ToDo tickets is System.</p>
Notification Tickets	Notification tickets are created via notifications that you set in the notification template settings .

Ticket States

Tickets can have three different states:

Sym	State	Description
	Open	New tickets are open as long as the issue that is described in the ticket exists.
	Resolved	The issue that is described in the ticket does not persist any longer because a user resolved it.
	Closed	A user resolved the ticket, the solution to the issue was reviewed for correctness, and the ticket does not require any other action.

Tickets (Main Menu)

i This option is only available in the main menu bar if the user group to which the logged in user belongs is allowed to use the ticket system. You can disable a user group's access to the ticket system in the user group settings under Setup | System Administration | User Groups. **Read-only** users never have access to the ticket system and cannot see the Tickets option in the main menu bar.

You have several options to display a list of tickets that is filtered to your needs. In the main menu bar, click Tickets to show all open tickets that are assigned to you. Hover over Tickets to show other available filter options:

Option	Description
My Tickets	Click to show all open tickets that are assigned to you. Hover over My Tickets to show other options to filter these tickets according to their status: Open, Resolved, Closed, or All.
All Tickets	Click to show all open tickets of all users. Hover over All Tickets to show other options to filter these tickets according to their status: Open, Resolved, Closed, or All.
ToDo Tickets	Click to show all open tickets of the ToDo type ^[240] . Hover over ToDo Tickets to show other options to filter these tickets according to their status: Open, Resolved, Closed, or All. Click Open to show all open ToDo tickets. Hover over Open to show other options to filter these tickets according to their event type: All, Report Related, Auto-Discovery Related, Probe Related, Cluster Related, System Errors, or New Software Version.

Add a User Ticket

From the main menu bar, select Tickets | Add Ticket, or hover over  and click Add Ticket. This opens the Add Ticket dialog.

Step 1: Select the object to which the new ticket is related via the [object selector](#)^[251]. Click OK.

 You can skip step 1 if you use an object's [context menu](#)^[259] in the device tree to open the ticket.

Step 2: Provide the following information and click OK to create a user ticket:

- Subject: Enter a meaningful subject for the ticket that indicates the topic of the issue.
- Assigned to: From the dropdown list, select a user or a user group that is responsible for this issue.
- Priority: Define a [priority](#)^[253] from the lowest priority (    ).
- Comments: Enter a message. This message should describe the issue in detail.

After you open a new user ticket, a corresponding list of tickets appears. In this [table list](#)^[246], you can sort the items by clicking the column headers. Additionally, several search options are available in the filter directly above the table:

Option	Description
Status	all, open, resolved, closed

Option	Description
Type	Tickets, User Tickets, ToDo Tickets, Notification Tickets
Assigned To	Show only tickets that are assigned to a specific user or user group: <ul style="list-style-type: none"> anyone: Apply no user filter and show all tickets. me: Show tickets that are assigned to you (the user who is logged in). Groups: Show tickets that are assigned to a specific user group. The displayed user groups are specific to your setup. Users: Show tickets that are assigned to a specific user. The displayed users are specific to your setup. Disallowed: Display users or user groups that do not have access rights to the selected object. This is for your information only. You cannot select disallowed users or user groups.
Related To	Specify the relationship to a monitoring object. Select groups, probes, devices, or sensors with the object selector. <p>i ToDo tickets are related to System.</p>
Changed Between	Define a time span to view tickets that changed during this time. Use the date time picker to enter the date and time.

Click the subject of a ticket to open the ticket. There you can find all related information and take several actions.

ToDo Ticket #986 ★★☆☆☆ ✉

[Software update is available](#)

Status: open Assigned to: PRTG Administrators Related Object: System Type: ToDo (New Software Version) ID: #986 ✎ Edit 👤 Assign ✓ Resolve 🔒 Close

Last Update

Opened by PRTG System Administrator + Assigned to PRTG Administrators 04.12.2018 11:36:34

[04.12.2018 11:36:34] Version 18.4.48.1279 has been downloaded and will be installed at: 8h 00m

An Open ToDo Ticket with Instructions

Actions

The following actions are available for a specific ticket:

Action	Description
Edit (✎)	Open a dialog where you can change the subject and the priority of the ticket, as well as assign the ticket to a different user. You can optionally add a message to this ticket. Click OK to apply your changes.
Assign (👤)	Open a dialog where you can give the ticket to a different user or user group. Select a user or a user group via the dropdown list. You can optionally add a message to this ticket. Click OK to apply your changes.
Resolve (✔)	Open a dialog where you can resolve the ticket. The status resolved indicates that the issue that is described in this ticket does not persist anymore. You can optionally add a message to this ticket that indicates, for example, what was done to resolve the issue. Click OK to apply your changes.
Close (🔒)	Open a dialog where you can close the ticket after the issue was resolved and reviewed. You can optionally add a message to this ticket. Click OK to apply your changes.
Reopen (🔄)	Open a dialog where you can reopen a ticket after it was resolved or closed. Do so, for example, if the solution to the issue was not correct. You can optionally add a message to this ticket that indicates, for example, why you have opened the ticket again. Click OK to apply your changes.

❗ Only user group members that have the respective [access rights](#) ^[155] can view and edit tickets that are related to a certain monitoring object.

Tickets as Emails

You can receive all tickets that are assigned to you or to your user group as emails. PRTG also notifies you via email each time a ticket that is assigned to you or to your user group is edited. This way, you are always informed about new notifications (if you enabled this setting), important system information (if you are an administrator), or the communication between other users.

You can disable the setting Email Notifications in the user account settings under Setup | System Administration | User Accounts. If you select Do not receive any emails from the ticket system for a specific user account, this particular user does not receive ticket emails anymore.

❗ If you defined to receive tickets as emails and you are the predefined **PRTG System Administrator** user, you receive emails for ToDo tickets as well, although ToDo tickets are usually opened by the **PRTG System Administrator** user.

✓ Ping		Up	1 msec	OK	Ping Time 1 msec	★★★★☆	🔖	🟢	<input type="checkbox"/>

Example of a Table List

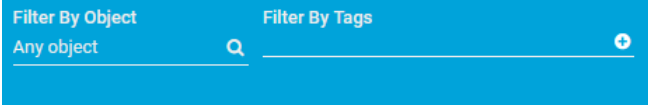

Table List Options

See the following table for ways to work with table lists:

Feature	Display	Description
Paging	⏪ ⏩ ⏴ ⏵	The content of a table list is displayed on several pages. Click the respective paging button at the end of a list to view other pages or to go to the beginning or the end of the list.
New Window	🔖	Click the respective button to open the table list in a new window.

Feature	Display	Description
Date Range		<p>Use the date and time picker to show table list entries within a specific time period. Click the first field to select a start date and the second field to select an end date. Click Done to apply the selected date and time.</p>
Select Range		<p>When you view log lists, click Select Range in the upper-left corner of the table list to select the time period for which you want to show log entries. Choose from Today, Yesterday, and several other time periods. Select Unlimited to disable this filter again.</p>
Items		<p>Click Items in the upper-right corner of a table list to select how many rows are shown on each page. You can choose between 50, 100, 500, and 1000.</p>

■ For more information, see [Date Ranges](#) ²⁴⁹.

Feature	Display	Description
Sorting		<p>Click a column header to sort the list items by the respective category. You can click all column headers that include arrow icons to sort the list, for example, by Status, Last Value, Priority, and more. The sorting options vary depending on the content of the table list.</p>
Show XML		<p>Click the respective button to download the selected page in XML format. Your browser usually shows a download dialog.</p>
Filtering		<p>You can filter table lists via the Show Filters option directly above a list. The filter options vary depending on the content of the table list.</p> <p>Use the filter options, for example, to show specific objects in the list. Click Any object in the Filter By Object section to select an object from the device tree with the object selector^[25].</p>

Feature	Display	Description
		<p>Enter one or more tags^[145] into the field Filter By Tags to filter the list for corresponding objects. You can use the plus sign (+) and the minus sign (-) to categorize tags as must have this tag or does not need this tag.</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Date Ranges

Range	Description	Example (Based on 14.01.2019)
Today	Start: 00:00 of today End: 00:00 of tomorrow	2019-01-14 (00:00) - 2019-01-15 (00:00)
Yesterday	Start: 00:00 of yesterday End: 00:00 of today	2019-01-13 (00:00) - 2019-01-14 (00:00)
7 days	Start: 00:00 of 7 days ago End: 00:00 of tomorrow	2019-01-07 (00:00) - 2019-01-15 (00:00)
30 days	Start: 00:00 of the same day last month End: 00:00 of tomorrow	2018-12-14 (00:00) - 2019-01-15 (00:00)
6 months	Start: 00:00 of the same day 6 months ago End: 00:00 of tomorrow	2018-07-14 (00:00) - 2019-01-15 (00:00)

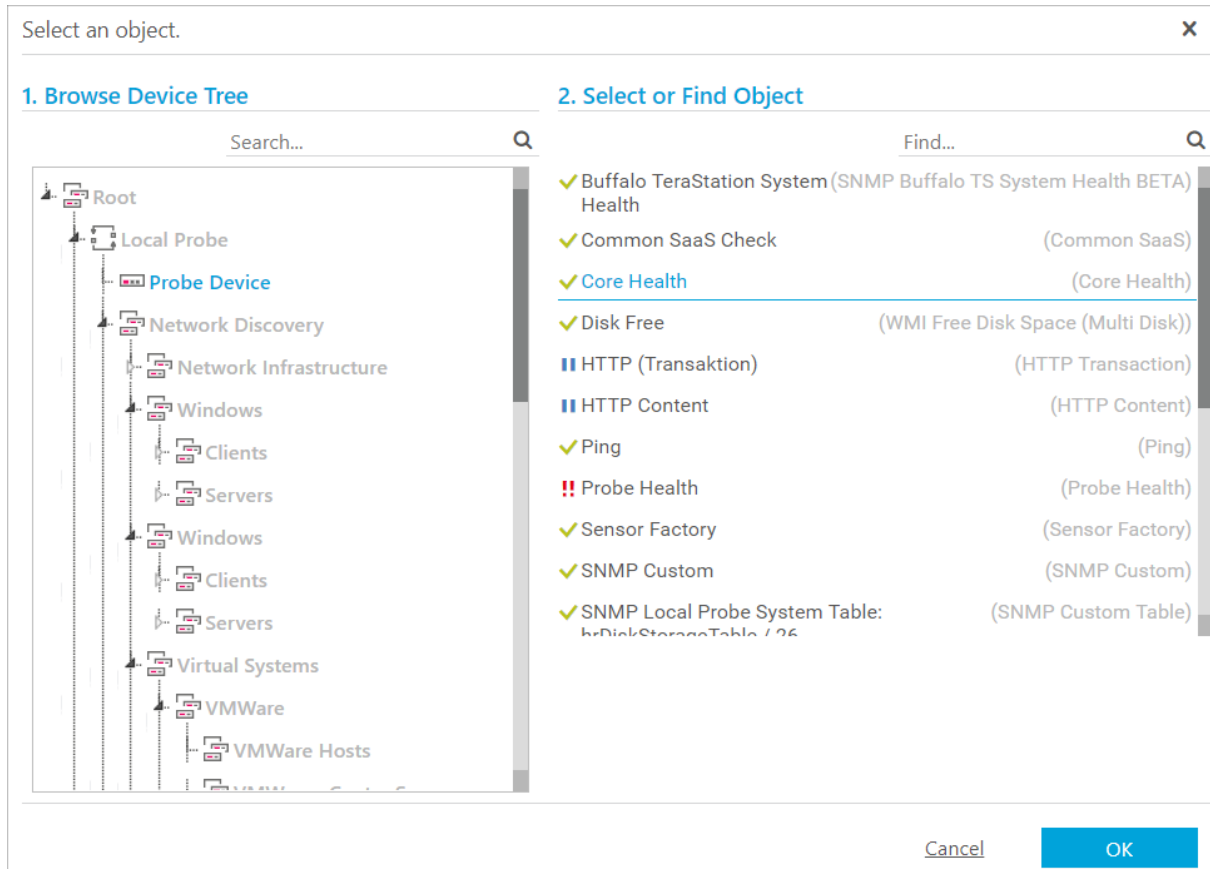

Range	Description	Example (Based on 14.01.2019)
12 months	Start: 00:00 of the same day 12 months ago End: 00:00 of tomorrow	2018-01-14 (00:00) - 2019-01-15 (00:00)
Unlimited	Start: 00:00 of the same day 7 years ago (historic data ^[208] for logs is limited to 750 days) End: 00:00 of tomorrow	2012-01-14 (00:00) - 2019-01-15 (00:00)

6.16 Object Selector

For some features, you need to select an object, for example, when you want to create historic data reports. In this case, PRTG uses the object selector with which you can browse all objects in your installation to select an object in two steps.

Object Selector

Step 1: Browse Device Tree

On the left-hand side, you see your specific device tree setup with all probes, groups, and devices. Click **▲** to collapse an object. Click **▶** to expand the object again and show its subobjects.

Click a device to view its sensors on the right-hand side.

You can also directly search for an object in the device tree. To do so, enter a probe name, group name, or device name into the Search box on the left-hand side. You can also use a substring for the search.

Step 2: Select or Find Object

Select a device on the left-hand side to see the sensors on this device on the right-hand side. PRTG displays the name of the sensor as well as the sensor type. Hover over a sensor to view its parent objects.

You can also directly search for a sensor in the sensor list. To do so, enter the sensor name, group name, device name, or tag into the Find box on the right-hand side.

Select a sensor and click OK.

- [Hover Popup](#) ^[275]
- [Main Menu Structure](#) ^[278]

6.17 Priority and Favorites

You can set priorities for all your monitoring objects and also mark devices or sensors as favorites. Both settings affect how PRTG displays your objects.

- ❶ PRTG stores priority and favorites settings for the entire installation. The settings are not user specific.

Priority for All Objects

The priority setting affects the order by which PRTG lists your objects in [table lists](#)^[246]. PRTG lists objects with a higher priority first. Furthermore, a device displays [gauges](#)^[201] for sensors with a high priority on its Overview tab.

To change the priority settings, right-click an object to open its [context menu](#)^[259] and select Priority/Favorite. You can choose from the top priority with 5 stars (★★★★★) to the lowest priority with one star (★☆☆☆☆). By default, PRTG sets all objects to the medium priority with 3 stars (★★★☆☆). In the [page header bar](#)^[186] and in table lists, you can directly set a priority via the star icons.

Context Menu: Priority

- ❶ For a sensor, select a priority of 4 or 5 stars to display its the gauge of its primary channel on the Overview tab of its parent device.
- ❶ For a map, select a priority of 5 stars to display it as a menu item under Home in the [main menu bar](#)^[278].

Favorites for Devices and Sensors

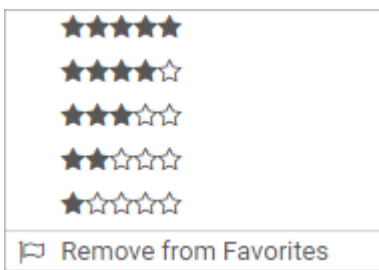

To open a list of all your favorite devices or sensors, select Devices | Favorite Devices or Sensors | Favorite Sensors from the main menu bar. These lists are sorted by priority as well.

You can mark any device or sensor as a favorite to add it to the favorites list. Right-click an object to open its context menu. Select Priority/Favorite | Add to Favorites. PRTG adds a dark gray flag icon (🚩) next to the object's name in the device tree to mark the object as a favorite.

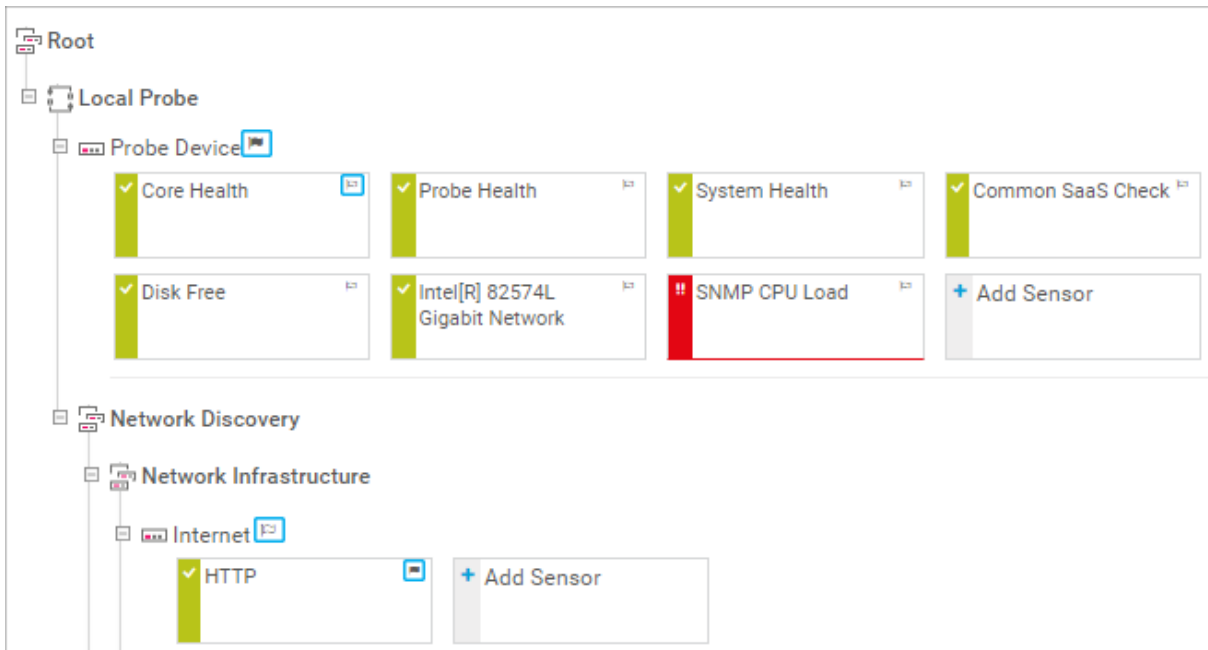

Context Menu:
Priority/Favorites (Add)

To remove an object from the favorites list, select Priority/Favorite | Remove from Favorites from the context menu. The flag icon turns transparent ().

Context Menu: Priority/Favorites
(Remove)

There is also the option to add a device or sensor to your favorites with one click in the device tree. Click the flag icon to the right of the respective object name. To make an object a favorite, click . The flag turns dark gray. To remove an object from your favorites, click . The flag turns transparent.

One-Click Adding to Favorites in the Device Tree

Priority and Favorites in the Page Header Bar

You can also add any device or sensor to your favorites on the respective object's Overview tab. To do so, click  in the page header bar of a device or  in the page header bar of a sensor. Click  for a device or  for a sensor to remove the respective object from your favorites.

One-Click Favorite and Priority in the Page Header Bar

It is also possible to set the priority of an object via the five stars in the page header bar.  means top priority,  means lowest priority.

6.18 Pause

Several options are available to pause monitoring. You can pause monitoring for a single sensor or for an entire device, group, or probe.

Pause by Intention (Manually or by Schedule)

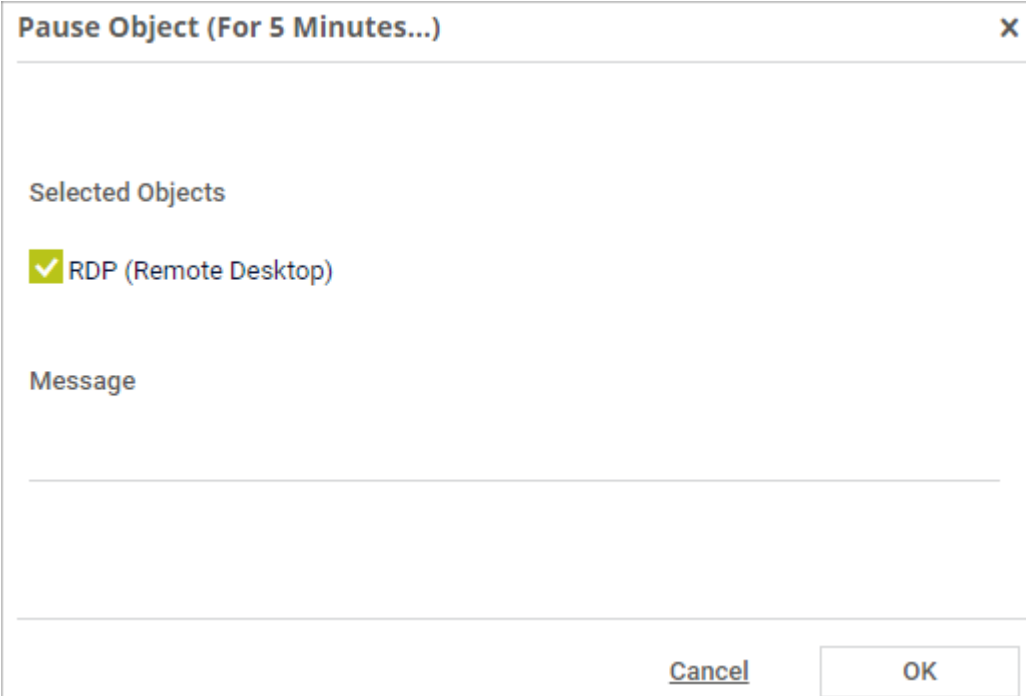

Navigate to an object in the [device tree](#)^[183] and select Pause from the [context menu](#)^[259].

You can select Pause Indefinitely, or you can pause the object For 5 Minutes, For 15 Minutes, For 1 Hour, For 3 Hours, For 1 Day, or Until a specific date. If you select Until, you can additionally define a time period. Use the date time picker to enter the date and time. The object automatically resumes monitoring after this time period.

You can also set up a One-time Maintenance Window to automatically pause an object at a specified time. In the dialog that appears, define the start and end date of the maintenance window. Use the date time picker to enter the date and time.

- ❶ To cancel an active maintenance window before the defined end date, change the time entry under Maintenance Ends to a date in the past.
- ❷ If you select  from an object's [hover popup](#)^[275], the object is paused indefinitely until you resume monitoring again.

When you select a pause option, a dialog appears in which you can optionally enter a message. PRTG shows the message in the object's status message as long as the object is in the Paused status. Confirm with OK to pause the object.

Pause Object (For 5 Minutes...) X

Selected Objects

RDP (Remote Desktop)

Message

Cancel OK

Pause Message Prompt

You can also pause monitoring via [schedules](#)^[4169]. If you pause a master sensor by schedule or manually, you do not trigger a status change by [dependency](#)^[257].

■ For more information, see the Knowledge Base: [Why will dependent objects not go into paused status automatically when I pause the master object?](#)

i While a sensor is in the Paused [status](#)^[197], it does not collect any monitoring data, it does not change its status, and it does not trigger any [notifications](#)^[152]. An object also keeps the Paused status after a restart of PRTG.

Pause by Hierarchy

If you pause monitoring for an object in the device tree, PRTG pauses all objects underneath in the [object hierarchy](#)^[138] as well. For example, if you pause a group, PRTG also pauses all sensors on all devices in this group. After you pause an object, you can resume monitoring at any time by selecting Resume from the context menu.

i You cannot resume monitoring for single child objects that are paused by a parent object. You can only resume the object that you originally set to the Paused status.

Pause by Dependency

There is a way to automatically pause objects by dependency. If you have a master sensor, for example, a master [Ping sensor](#)^[2010] for a device, PRTG can automatically pause all dependent sensors on the device if the master sensor shows the Down status.

■ For more information, see section [Dependencies](#)^[148].

More

■ KNOWLEDGE BASE

Why will dependent objects not go into paused status automatically when I pause the master object?

6.19 Context Menus

Right-click an object to view a context menu with many options for direct access to monitoring data and functions.

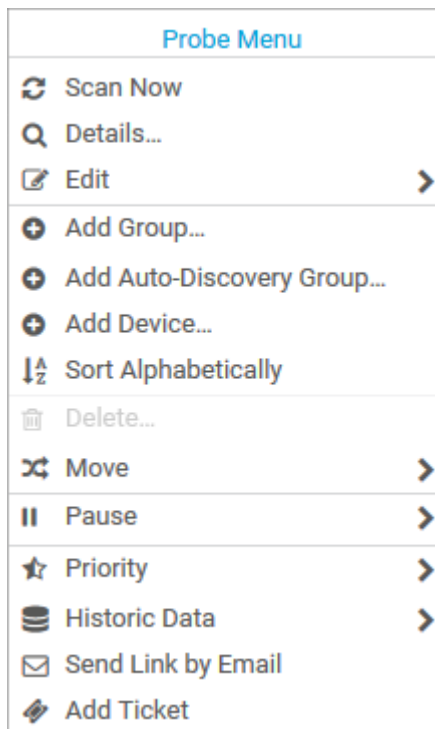

i To view your browser's context menu, press the **Ctrl** key (Chrome) or the **Shift** key (Firefox) while right-clicking. You then see the context menu of your browser instead of the context menu of PRTG. This is not possible with Internet Explorer.

The content of the context menu varies depending on the type of object. See the following subsections for an overview of the available options.

- [Probe Menu](#) ²⁵⁹
- [Group Menu](#) ²⁶²
- [Device Menu](#) ²⁶⁶
- [Sensor Menu](#) ²⁷⁰

Probe Menu

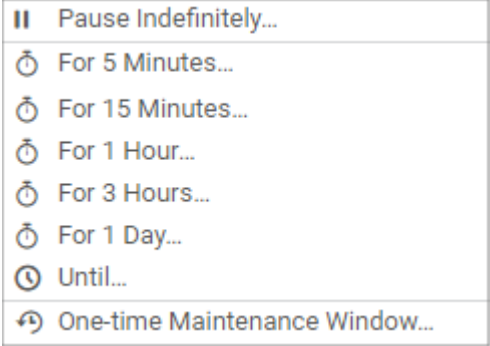

The Probe Menu contains actions for your [local probe, hosted probe, cluster probe, or remote probe](#) ¹³⁹.

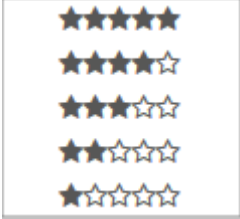

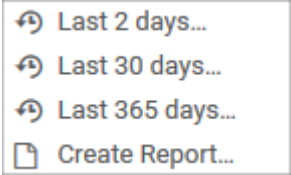

Probe Context Menu

Action	Description

The following actions are available:</p> <ul style="list-style-type: none"> ▪ Top: Move the object to the top of the parent object. ▪ Up: Move the object one entry up. ▪ Down: Move the object one entry down. ▪ Bottom: Move the object to the bottom of the parent object. ▪ To Other Group: Move the object to a different group.
Pause or Resume	<p>Hover over Pause to open the Pause menu. The following actions are available:</p> <ul style="list-style-type: none"> ▪ Pause monitoring for the object and for all objects underneath in the object hierarchy. You can select Pause Indefinitely, or you can pause the object For 5 Minutes, For 15 Minutes, For 1 Hour, For 3 Hours, For 1 Day, or Until a specific time. If you select Until, you can additionally define a time period. Use the date time picker to enter the date and time. The object automatically resumes monitoring after this time period. ▪ You can also set up a One-time Maintenance Window to automatically pause the object at a specified time. In the dialog that appears, define the start and end date of the maintenance window. Use the date time picker to enter the date and time. <ul style="list-style-type: none">  To cancel an active maintenance window before the defined end date, change the time entry under Maintenance Ends to a date in the past.

Action	Description
	<ul style="list-style-type: none"> If the object already shows the Paused status^[197] or if it shows the Down status because of a simulated error, the Resume option appears. Click Resume to restart monitoring on the object.
Priority/Favorite	<p>Hover over Priority/Favorite to open the Priority/Favorite menu. Define the priority of the object, add the object to the favorites list, or remove it from the favorites list.</p> <p>■ For more information, see section Priority and Favorites^[253].</p>
Historic Data	<p>Hover over Historic Data to open the Historic Data menu. The following actions are available:</p> <ul style="list-style-type: none"> Open the historic data tabs^[203] for the specified time interval: Last 2 days, Last 30 days, or Last 365 days. Create Report: Open a dialog to add a new report. <ul style="list-style-type: none"> ⓘ When you create a report via the context menu, PRTG automatically includes the selected probe in the report. <p>■ For more information, see section Reports Step by Step^[4075].</p>
Device Tools	<p>Hover over Device Tools to open the Device Tools menu.</p> <p>☁ This option is not available on the hosted probe of a PRTG Hosted Monitor instance.</p> <div data-bbox="480 1263 908 1570" data-label="Image"> </div> <p style="text-align: center;">Device Tools Menu</p> <p>The following actions are available:</p> <ul style="list-style-type: none"> Go to Service URL: Open the service page that you defined in the device settings^[446]. If no service URL is available for the device, you can enter an address in the dialog that appears. New Window with HTTP: Open a new browser window with HTTP and the IP address or Domain Name System (DNS) name of the device. New Window with HTTPS: Open a new browser window with HTTPS and the IP address or DNS name of the device.

Action	Description
	<ul style="list-style-type: none"> ▪ New Window with FTP: Open a new browser window with the File Transfer Protocol (FTP) and the IP address or DNS name of the device. ▪ Remote Desktop: Download an .rdp file. When you execute this file, a remote desktop starts with the IP address or DNS name of the device. <ul style="list-style-type: none"> ① In Firefox, you have to use mstsc.exe (Microsoft Terminal Service) to open the file. ▪ Traceroute: Start a traceroute on the device. PRTG displays the route and measures transit delays of packets across the IP network. ▪ Install Remote Probe: Open a dialog to install a remote probe on the device. For more details, see Remote Probe Setup via Device Tools⁴⁵⁰⁷. <ul style="list-style-type: none"> ① This option is only available on devices on local probes. <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Find Duplicates	In your configuration, search for devices with the same IP address or DNS name as the selected device.
Send Link by Email	Send a link to the object by email. Click to create a new email with your system's standard email client. The email contains a direct link to the Overview tab of the object.
Add Ticket	Open the Add Ticket dialog. <ul style="list-style-type: none"> ■ For more information, see section Tickets²⁴².

Sensor Menu

The Sensor Menu contains actions for your [sensors](#)¹⁴⁰.

Sensor Context Menu

Action	Description
Scan Now	Perform an immediate scan of the object.
Details	Show the Overview tab of the object.
Edit	<p>Hover over Edit to show the Edit menu. The following actions are available:</p> <ul style="list-style-type: none"> Settings: Open a dialog to edit sensor settings for the sensor. Notification Triggers: Open the Notification Triggers tab of the object. Access Rights: Open a dialog to edit user access rights for the object. Rename: Open a dialog to edit the name of the object.
Acknowledge Alarm	<p>This option is only available in the sensor context menu when you select a sensor in the Down or Down (Partial) status.</p> <p>You can acknowledge an alarm for the sensor. A sensor with an acknowledged alarm shows the Down (Acknowledged) status and does not trigger any more notifications.</p> <div data-bbox="481 1680 896 1975" style="border: 1px solid gray; padding: 5px; margin: 10px 0;"> <ul style="list-style-type: none"> ✓ Acknowledge Indefinitely... 🕒 For 5 Minutes... 🕒 For 15 Minutes... 🕒 For 1 Hour... 🕒 For 3 Hours... 🕒 For 1 Day... 🕒 Until... </div> <p>Acknowledge Alarm Context Menu</p>

Action	Description
	<p>The following actions are available:</p> <p>You can select Acknowledge Indefinitely, or you can acknowledge the alarm For 5 Minutes, For 15 Minutes, For 1 Hour, For 3 Hours, For 1 Day, or Until a specific time. If you select Until, you can additionally define a time period. Use the date time picker to enter the date and time. If the alarm condition still exists after this time period, the sensor shows the Down status again.</p> <p> When the alarm condition clears, the sensor usually returns to the Up status immediately with the next sensor scan.</p> <p> For details about acknowledging an alarm, see section Alarms ²²⁹.</p>
Delete	Delete the object. PRTG asks for confirmation before it actually deletes an object.
Clone	<p>Open a dialog that guides you through the process of cloning the object.</p> <p> For more information, see section Clone Object ⁴⁰¹⁰.</p>
Move	<p>Hover over Move to open the Move menu. The following actions are available:</p> <ul style="list-style-type: none"> ▪ Top: Move the object to the top of the parent object. ▪ Up: Move the object one entry up. ▪ Down: Move the object one entry down. ▪ Bottom: Move the object to the bottom of the parent object.
Pause or Resume	<p>Hover over Pause to open the Pause menu. The following actions are available:</p> <ul style="list-style-type: none"> ▪ Pause monitoring for the object and for all objects underneath in the object hierarchy. You can select Pause Indefinitely, or you can pause the object For 5 Minutes, For 15 Minutes, For 1 Hour, For 3 Hours, For 1 Day, or Until a specific time. If you select Until, you can additionally define a time period. Use the date time picker to enter the date and time. The object automatically resumes monitoring after this time period. ▪ You can also set up a One-time Maintenance Window to automatically pause the object at a specified time. In the dialog that appears, define the start and end date of the maintenance window. Use the date time picker to enter the date and time. <ul style="list-style-type: none">  To cancel an active maintenance window before the defined end date, change the time entry under Maintenance Ends to a date in the past.

Action	Description
	<ul style="list-style-type: none"> ▪ If the object already shows the Paused status^[197] or if it shows the Down status because of a simulated error, the Resume option appears. Click Resume to restart monitoring on the object.
Simulate Error Status	<p>Manually set the sensor to the Down status. If the sensor already shows the Down status because of a simulated error, the Resume option appears. Click Resume to restart monitoring.</p> <p> The Simulate Error Status option does not work for sensors that run on mini probes.</p>
Priority/Favorite	<p>Hover over Priority/Favorite to open the Priority/Favorite menu. Define the priority of the object, add the object to the favorites list, or remove it from the favorites list.</p> <p> For more information, see section Priority and Favorites^[253].</p>
Historic Data	<p>Hover over Historic Data to open the Historic Data menu. The following actions are available:</p> <ul style="list-style-type: none"> ▪ Open the historic data tabs^[203] for the specified time interval: Last 2 days, Last 30 days, or Last 365 days. ▪ View Historic Data: Open the Historic Data^[208] tab. ▪ Create Report: Open a dialog to add a new report. <ul style="list-style-type: none">  When you create a report via the context menu, PRTG automatically includes the selected probe in the report. <p> For more information, see section Reports Step by Step^[4075].</p>
Send Link by Email	<p>Send a link to the object by email. Click to create a new email with your system's standard email client. The email contains a direct link to the Overview tab of the object.</p>
Add Ticket	<p>Open the Add Ticket dialog.</p> <p> For more information, see section Tickets^[242].</p>

6.20 Hover Popup

When you rest the mouse pointer over an object's icon in the [device tree](#)^[183] or in [table lists](#)^[246], for example, a hover popup window appears and shows details about this object. The hover popup contains information from the object's Overview [tab](#)^[207] as well as several graphs. The exact information that PRTG provides depends on the type of object.

Hover Popup Example: Core Health Sensor

- ⓘ The hover popup only appears if your browser window that shows the PRTG web interface is the active window on your desktop. The hover popup disappears with every (automatic) page refresh.

Quick Action Buttons

In the top-right corner of the hover popup window, you can see several quick action buttons with which you can view or edit the object. These are the most important options from the object's [context menu](#)^[259].

- ⓘ The available buttons depend on the type of object that you hover over.

Action	Description
Details (🔍)	Show the Overview tab of the object.
Settings (🔧)	Open the object's settings.

Action	Description
Notification Triggers (🔔)	Show the Notification Triggers tab of the object.
Rename (📄)	Open a dialog to edit the name of the object.
Pause Indefinitely (⏸)	Indefinitely pause the object and all objects underneath in the object hierarchy ^[138] . If you want to resume monitoring, you have to manually resume the paused object.
Resume (▶)	Resume monitoring for the object and all objects underneath in the object hierarchy.
Delete (🗑)	Delete the object. PRTG asks for confirmation before it actually deletes an object.
Scan Now (🔄)	Perform an immediate scan of the object. This queries data for all objects underneath in the object hierarchy.
Add to Favorites (🔖)	Make the object a favorite ^[253] and add it to your favorites list.
Remove from Favorites (🚫)	Remove the object from your favorites list.

6.21 Main Menu Structure

You can access all functions via the main menu bar. In this section, you find information about the most important menu items. You can either directly click a menu item or you can hover over it to show more options.

Main Menu Bar

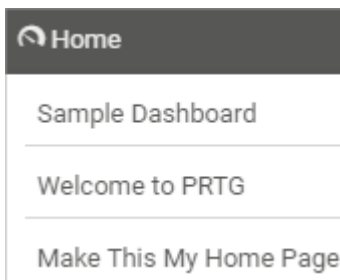

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

The following menu items are available:

- [Home](#) ²⁷⁸
- [Devices](#) ²⁷⁹
- [Libraries](#) ²⁸¹
- [Sensors](#) ²⁸²
- [Alarms](#) ²⁸⁵
- [Maps](#) ²⁸⁵
- [Reports](#) ²⁸⁶
- [Logs](#) ²⁸⁷
- [Tickets](#) ²⁸⁸
- [Setup](#) ²⁸⁹
- [Search Box](#) ²⁹²
- [Logout](#)

Home

Click to open your homepage. The default homepage is the [Welcome](#) ¹⁸³ page. Hover over Home to show other options.

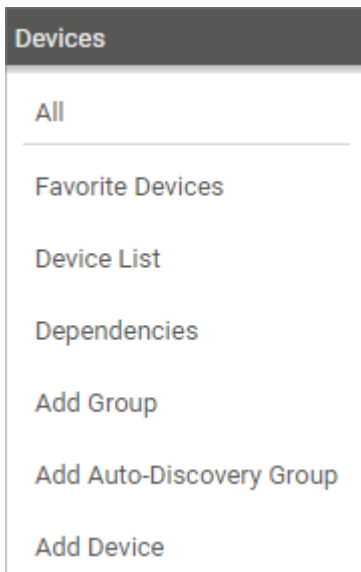

Main Menu: Home

Option	Description
Sample Dashboard	<p>Open a preconfigured dashboard to view monitoring data in a different layout. This dashboard is one of the default maps that PRTG automatically creates with a new installation.</p> <p>i The Home menu shows maps that have a 5-star priority (★★★★★) To show a map here, give it 5 stars on the Maps overview via the main menu bar. You can include up to 10 map entries in the menu. For more information, see section Maps in Home Menu.</p> <p>i You can change the appearance of the default dashboard with the Map Designer. To not show the sample dashboard in the menu, define a priority that is lower than 5 stars for this map.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Switch Cluster Node	<p>This option is only available if PRTG runs in a cluster.</p> <p>Show available cluster nodes. Hover over Switch Cluster Node to show other options. Follow the menu path that is specific to your setup to select a different cluster node. The current master node is shown in bold letters. Click a cluster node's name to leave the current cluster node, to connect to the other cluster node, and to show the same page there.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Welcome to PRTG	<p>Open the Welcome page that shows the Paessler news feed and various information about your PRTG installation. It also provides links to major sections of the PRTG web interface.</p> <p>i This is the default homepage of the PRTG web interface.</p>
Make This My Home Page	<p>Change the page that is loaded when you click Home in the main menu bar. Select this option on any page to set its URL as your home page. This setting is user sensitive. The default home page is /welcome.htm.</p> <p>i You can also change the home page under Home Page URL in the My Account settings.</p>

Devices

Click to show the device tree. Hover over Devices to show other options.

Main Menu: Devices

Option	Description
All	Open the Overview tab of the root group [138] that shows the device tree [183].
Favorite Devices	Open a table list [246] of all devices that you marked as favorites [253]. Click  to show a printable list of the QR codes of all your favorite devices. ⓘ To mark any device as a favorite device, select Priority/Favorite Add to Favorites from its context menu, or click  on a device's Overview tab.
Device List	Open a list of all devices in your setup.
Dependencies	Open an overview list of the dependencies [148] configured for the objects in your setup. You can select dependencies and define master dependencies in the Schedules, Dependencies, and Maintenance Windows object settings [226] (not available for the root group).
Add Group	Start a dialog that guides you through the process of adding a new group to your setup. ■ For more information, see section Create Objects Manually [299]. ⓘ You can also create new groups by selecting Add Group from a probe's or group's context menu.
Add Auto-Discovery Group	Start a dialog that guides you through the process of adding a new auto-discovery group to your setup. PRTG creates a new group and runs an auto-discovery in your network to automatically add devices and sensors to this group. ■ For more information, see section Add an Auto-Discovery Group [300].

Option	Description
	<p>i You can also create new auto-discovery groups by selecting Add Auto-Discovery Group from a probe's or group's context menu.</p> <p>☁ This option is not available on the hosted probe of a PRTG Hosted Monitor instance.</p>
Add Device	<p>Start a dialog that guides you through the process of adding a new device to a group. During the process, you can choose if PRTG runs an auto-discovery for the new device to automatically add sensors.</p> <p>■ For more information, see section Create Objects Manually ²⁹⁹.</p> <p>i You can also create new devices by selecting Add Device from a group's context menu.</p>

Libraries

Click to open the Libraries list where you can view or add custom device tree views of your network status and monitoring data. Hover over Libraries to show other options.

■ For more information, see section [Libraries](#) ⁴⁰⁴⁷.

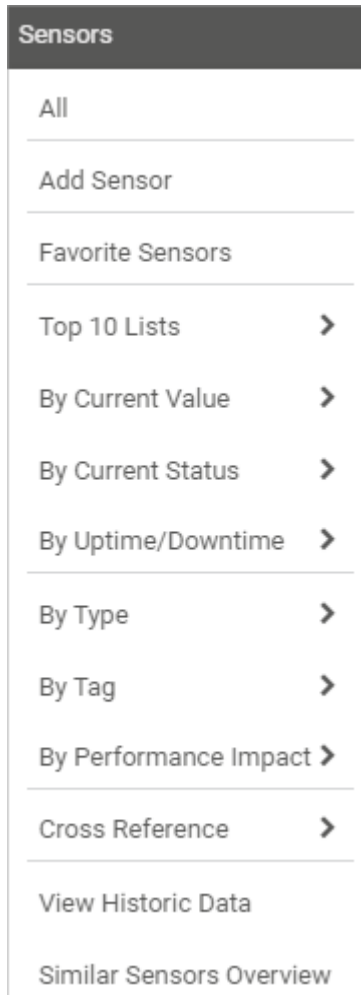

Main Menu: Libraries

Option	Description
All	Open the Libraries list where you can view or add custom device tree views of your network status and monitoring data.
Add Library	Open a dialog to create ⁴⁰⁵¹ a new library.
Select Library	Open a library. Hover over Select Library to show more options. Follow the alphabetical menu path that is specific to your setup to view your libraries. Click a library to open it.

Sensors

Click to open a list of all [sensors](#)^[140]. Hover over Sensors in the main menu bar to show other options.

Main Menu: Sensors

Option	Description
All	<p>Open a table list of all sensors^[140]. In list, you can sort the items via the column headers.</p> <p>i The column Last Value shows only the last value of the sensor's primary channel.</p>
Add Sensor	<p>Start a dialog that guides you through the process of adding a new sensor to a device. For more information, see section Add a Sensor^[361]. During the process, you can also choose to create a new device via the Add a Device^[340] dialog, which you can also open directly from the Devices menu^[279].</p>
Favorite Sensors	<p>Open a list of all sensors that you marked as favorites.</p>

Option	Description
Top 10 Lists	<p> To mark any sensor as a favorite sensor, select Priority/Favorite Add to Favorites from its context menu or click  on a sensor's Overview tab.</p> <p>Open a dashboard view with different top 10 lists that show the highest uptime or downtime, Ping response times, the bandwidth usage, website response times, the CPU usage, the disk usage, the memory usage, and the system uptime. Click to show top 10 lists for all sensors. Hover over Top 10 Lists to show other options. Follow the menu path that is specific to your setup to only view top 10 lists for a specific probe or group.</p> <p> The shown sensors are selected by default tags.</p>
By Current Value	<p>Open a list of sensors filtered by value. Hover over By Current Value to show other options. Follow the menu path to view lists of sensors with the Fastest Value or the Slowest Value for</p> <ul style="list-style-type: none"> ▪ Ping ▪ Port ▪ Webpages ▪ IMAP/POP3/SMTP ▪ FTP <p>as well as a list of sensors with the Highest Value or the Lowest Value regarding</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ CPU ▪ Disk ▪ Memory <p> The shown sensors are selected by default tags.</p>
By Current Status	<p>Open a list of sensors filtered by status. Hover over By Current Status to show other options. Follow the menu path to view lists of all sensors in a specific status.</p> <p> For more information, see section Sensor States¹⁹⁷.</p>
By Uptime/Downtime	<p>Open a list of sensors filtered by different parameters. Hover over By Uptime/Downtime to show other options. Follow the menu path to view lists of all sensors sorted by</p> <ul style="list-style-type: none"> ▪ Best Uptime (%) ▪ Highest Uptime (Time)

Option	Description
By Type	<ul style="list-style-type: none"> ▪ Worst Downtime (%) ▪ Highest Downtime (Time) <p>Open a list of sensors filtered by sensor type^[458]. Hover over By Type to show other options. Follow the alphabetical menu path that is specific to your setup to view a sensor list that contains only sensors of one specific sensor type.</p>
By Tag	<p>Open a list of sensors filtered by tag^[145]. Hover over By Tag to show other options. Follow the alphabetical menu path that is specific to your setup to see available tags. Select a tag to view a list that contains only sensors marked with this tag.</p> <p>i If you have more than 1,000 tags, no tags are shown here. For more information, see section Tags^[146].</p>
By Performance Impact	<p>Open a list of sensors filtered by performance impact^[424]. Follow the menu path to view a sensor list that contains only sensors with a specific level of impact on the performance of the probe. You can choose between the following levels of impact:</p> <ul style="list-style-type: none"> ▪ Very High ▪ High ▪ Medium ▪ Low ▪ Very Low <p>■ For an overview list of sensors sorted by performance impact, see also section List of Sensors by Performance Impact^[467].</p>
Cross Reference	<p>Open the sensor cross reference to show information about all sensors including priority and favorite^[253] status, scanning interval^[379], access rights^[155], notification trigger settings^[226], schedules^[150], and dependencies^[148]. Click to show a sensor cross reference for all sensors. Hover over Cross Reference to show other options. Follow the menu path that is specific to your setup to view cross reference information for sensors by type or tag.</p>
View Historic Data	<p>Open a dialog to generate historic sensor data reports.</p> <p>■ For more information, see section Historic Data Reports^[208].</p>
Similar Sensors Overview	<p>Open an overview with a list of similar sensors.</p> <p>■ For more information, see section Similar Sensors^[215].</p>

Alarms

Click to open a list of all sensors that show the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status. Hover over Alarms to show other options.

Main Menu: Alarms

Option	Description
All	Open a list of all sensors that are in the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status.
Show as Gauges	Open a page with the gauges of all sensors that are in the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status. The size of the gauges corresponds to the sensor's priority.
Errors Only	Open a list of all sensors that are in the Down, Down (Partial), or Down (Acknowledged) status.
Warnings Only	Open a list of all sensors that are in the Warning status.
Unusals Only	Open a list of all sensors that are in the Unusual status.

Maps

Click to open the Maps overview where you can view or add custom views of your network status and monitoring data. Hover over Maps to show other options.

For more information, see section [Maps](#) .

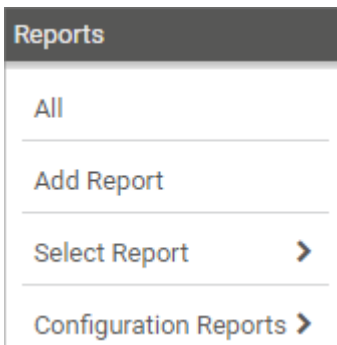

Main Menu: Maps

Option	Description
All	Open the Maps list where you can view or add custom views of your network status and monitoring data.
Add Map	Open a dialog to create  a new map.
Select Map	Hover over Select Map to show a list of your maps. Click a map to open it.

Reports

Click to open the Reports overview where you can view or add reports about your monitoring data. Hover over Reports to show other options.

 For more information, see section [Reports](#) .

Main Menu: Reports

Option	Description
All	Open the Reports list where you can view or add reports about your monitoring data.
Add Report	Open a dialog to create  a new report.

Option	Description
Select Report	Hover over Select Report to show a list of your reports about monitoring data. Click a report to open it.
Configuration Reports	Hover over Configuration Reports to see the available configuration reports ⁴⁰⁷² . Select an item to create reports for maps, reports, users and user groups, and system configuration to document changes to the configuration.

Logs

Click to show log information for all objects in your configuration. Hover over Logs to show other options.

 For more information, see section [Logs](#)²³⁷.

 Logs for monitoring objects (for example, sensors) are available as long as you define Log File Records in the Historic Data Purging settings under Setup | System Administration | Core & Probes.

Main Menu: Logs

Option	Description
All	Open a list with log information about all objects in your installation. The list begins with the most recent log entry.
Status Changes	Open a list with log information about specific status changes. Hover over Status Changes to show the following sensor states: <ul style="list-style-type: none"> ▪ Up & Down ▪ Down ▪ Warning ▪ Unusual ▪ Up ▪ Paused/Resumed

Option	Description
System Events	<ul style="list-style-type: none"> ▪ Acknowledged Alarms <p>Open a list with log information about specific system event types. Hover over System Events to show the following event types:</p> <ul style="list-style-type: none"> ▪ Probe Related ▪ Cluster Related ▪ Auto-Discovery Related ▪ Notifications Related ▪ Status Message Related
Object History	<p>Open a list with log information about changes to the PRTG setup and deletions of subordinate system objects. The Object History has several tabs. To view the changes to all related settings and deletions of objects, use the following tabs:</p> <ul style="list-style-type: none"> ▪ My Account ▪ System Administration ▪ Notification Templates ▪ Schedules ▪ User Accounts ▪ User Groups ▪ Reports ▪ Libraries ▪ Maps <p> You can also navigate to a corresponding page, for example, you can select Setup Account Settings My Account from the main menu bar, and click  in the page header bar ¹⁸⁶ to directly go to the related object history tab.</p>

Tickets

Click to show all open tickets that are assigned to you. Hover over Tickets to show other options.

 For more information, see section [Tickets](#) ²⁴⁰.

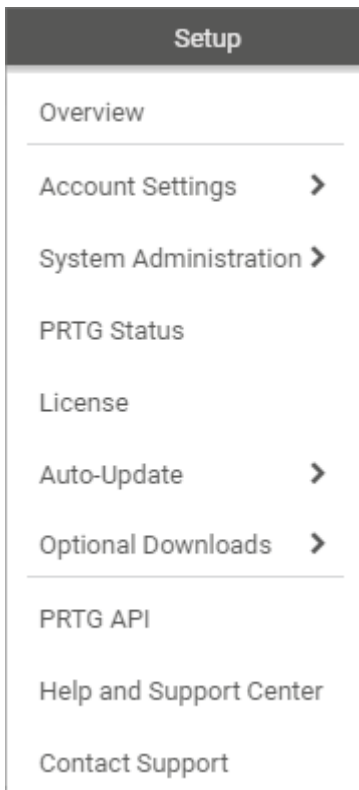

Main Menu: Tickets

Option	Description
My Tickets	Open a list of all open tickets that are assigned to you. Hover over My Tickets to show other options to filter these tickets according to their status.
All Tickets	Open a list of all open tickets of all users. Hover over All Tickets to show other options to filter these tickets according to their status.
ToDo Tickets	Open a list of open tickets of the type ToDo . Hover over ToDo Tickets to show other options to filter these tickets according to their status.
Add Ticket	Open the Add Ticket dialog to create a user ticket . ■ For more information about available options, see section Tickets ²⁴⁰ .

Setup

Click to show the setup page. Hover over Setup to show other options.

■ For more information, see section [Setup](#)⁴¹²¹.

Main Menu: Setup

Option	Description
Overview	Open the setup page ⁴¹²¹ .
Account Settings	Open the My Account ⁴¹²³ settings. Hover over Account Settings to directly show and open the the account settings tabs: <ul style="list-style-type: none"> ▪ My Account ⁴¹²³ ▪ Notification Templates ⁴¹³¹ ▪ Notification Contacts ⁴¹⁶³ ▪ Schedules ⁴¹⁶⁹
System Administration	Open the System Administration ⁴¹⁷⁵ settings. Hover over System Administration to directly show and open the system administration tabs: <ul style="list-style-type: none"> ▪ Manage Subscriptions ⁷⁰  (PRTG Hosted Monitor only) ▪ User Interface ⁴¹⁷⁵ ▪ Monitoring ⁴¹⁸⁷ ▪ Notification Delivery ⁴¹⁹⁴ ▪ Core & Probes ⁴²⁰² ▪ Cluster ⁴²²⁹  (PRTG on premises only)

Option	Description
	<ul style="list-style-type: none"> ▪ User Accounts  ▪ User Groups  ▪ Administrative Tools  ▪ Single Sign-On 
PRTG Status	<p>Open the System Status  page. If you run PRTG in a cluster, hover over PRTG Status to show other options:</p> <ul style="list-style-type: none"> ▪ System Status  ▪ Cluster Status 
License Information	<p>Open the license information  page.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
Auto-Update	<p>Open information about the Software Auto-Update  status of your PRTG installation. On this page, you can also download and install available updates. Hover over Auto-Update to show other options:</p> <ul style="list-style-type: none"> ▪ Status : View the update status and manually check for the latest update. ▪ Settings : Define your update settings. <p> This option is not available in PRTG Hosted Monitor.</p>
Optional Downloads	<p>Open the download page  for additional downloads. Hover over Optional Downloads to show other options:</p> <ul style="list-style-type: none"> ▪ PRTG Apps  ▪ PRTG Desktop  ▪ Remote Probe Installer 
PRTG API	<p>Open the Application Programming Interface (API) Definition .</p>
Help and Support Center	<p>Open the Help and Support Center  from where you can access the PRTG Manual, the Knowledge Base, and video tutorials. You can also open support tickets  and contact our customer service  from this page.</p>
Contact Support	<p>Open the Contact Paessler Support / Send Your Feedback to Paessler  form.</p>

Search Box

Main Menu: Search Box

Click the Search box to find objects in your monitoring setup. Enter your search term and press the **Enter** key. PRTG performs a string search in your entire monitoring setup, including groups, devices, sensors, libraries, maps, reports, tickets, and object comments, as well as in the PRTG Manual. You see all search results on a new page.

- i** You can only search for names that are actually displayed. To search for a specific user, for example, use their display name. You cannot search for the user's login name or email address.
- i** PRTG uses different logical operators for the search in tickets and for the search in other objects. For the ticket search, PRTG uses the logical operator **OR**. If you search for a string like 'operating system', for example, you receive results for all tickets that contain either 'operating' or 'system' or both. For all other objects, PRTG uses the logical operator **AND**. So you receive results for all other objects that contain both 'operating' and 'system'.

Logout

Click  to log out of PRTG and return to the [login screen](#)^[164].

Device and Sensor Setup

7 Device and Sensor Setup

The PRTG web interface is your access to PRTG via a web browser. The PRTG web interface is based on Asynchronous JavaScript and XML (AJAX). It uses a responsive design to adjust to the size of your screen.

Use the PRTG web interface as the default interface to set up your monitoring. You can use it to configure devices and sensors, to set up notifications, to review monitoring results, to create reports, and to visualize your monitoring on dashboards.

While you are [logged in](#)¹⁶⁴, the PRTG web interface continuously refreshes the data on the screen via AJAX calls. This way, you are always up to date regarding your monitoring results. You can individually [set](#)⁴²¹⁵ the refresh interval and method.

With the Single Page Application (SPA) technology, your system stays highly performant because only single page elements are refreshed when necessary.

The following sections introduce how to set up devices and sensors in the PRTG web interface.

Device and Sensor Setup

- [Auto-Discovery](#)²⁹⁶
- [Create Objects Manually](#)²⁹⁹
- [Manage Device Tree](#)³⁶⁴
- [Root Group Settings](#)³⁶⁶
- [Probe Settings](#)³⁸⁵
- [Group Settings](#)⁴¹³

7.1 Auto-Discovery

The auto-discovery automatically creates a set of sensors for all of the devices that are in your network. The auto-discovery is primarily intended for devices that are in the same network as your probes.

i PRTG runs an initial auto-discovery as soon as you finish the installation of PRTG. It automatically shows you several devices that are available in your network as well as suitable sensors for monitoring.

How the Auto-Discovery Works

The auto-discovery has three steps:

1. Scan a network segment for devices via Ping (at the group level only).
2. Assess the device type for all of the devices that it discovered in step 1 (via the Simple Network Management Protocol (SNMP), Windows Management Instrumentation (WMI), and other protocols).
3. Create sensor sets that match the discovered device types from step 2. It does this based on built-in device templates that have recommended sensors for many device types. Optionally, it can also create sensor sets via device templates that users [created](#)^[4019].

You can use [auto-discovery groups](#)^[300] to use the auto-discovery for a range of IP addresses or for individual devices that you manually created. You can run the auto-discovery one time, on demand via the context menu, or via schedule at every hour, day, or week. If you run the auto-discovery at group level daily or weekly, it automatically creates new devices when they connect to the network and it adds suitable sensors.

i PRTG creates a notifying [ticket](#)^[240] when it discovers at least one new device or sensor. You also receive a ticket if an error occurs. By default, PRTG also sends tickets via email. You can change this in the [My Account](#)^[4123] settings.

i HTTP sensors' names indicate the protocol that they use to access the target device ([HTTP](#), [HTTP \(8080\)](#), and [HTTPS](#)). This distinguishes HTTP sensors from each other if the auto-discovery adds more than one HTTP sensor to a device.

Restrictions

Note the following restrictions of the auto-discovery:

- PRTG cannot discover devices that are not reachable via Ping. This is because step 1 scans for devices via Ping. If, for example, a firewall blocks echo requests, PRTG cannot discover a device behind the firewall.
- Define credentials for objects that are higher in the [object hierarchy](#)^[138], for example, in the settings of the parent device. If possible, we recommend that you define these settings in the [root group](#)^[366].
- If a device has more than one IP address, it may show up more than once in the auto-discovery results, even though PRTG tries to identify these situations.
- Auto-discovery on group level does not create new sensors on devices that already exist, but only on newly discovered devices. If you want to automatically add sensors to a device, run the auto-discovery on the device via its [context menu](#)^[266].

- Frequent auto-discoveries of large network segments can lead to performance issues. Because of this we recommend that you only schedule regular auto-discoveries where necessary.
 - For more information, see the Knowledge Base: [Why can automatic auto-discoveries evoke performance issues?](#)
- PRTG automatically adds suitable device icons to discovered devices. PRTG uses a device's MAC address for this purpose, which it determines via the Address Resolution Protocol (ARP). This only works via IPv4 and not via IPv6. Usually, ARP works only in the local network unless your router supports ARP and you configure it accordingly.
- The auto-discovery does not apply the [user group setting](#)^[4219] Allowed Sensors. Therefore, the auto-discovery adds all sensors that are defined in the used device templates.

Run the Auto-Discovery Now

You can run an auto-discovery at any time for a group or a device. To do so, right-click the respective object and select Run Auto-Discovery from the context menu. PRTG immediately starts to search for new objects to add to the device tree. If you use the auto-discovery for an auto-discovery group (not available on hosted probes), PRTG adds devices with suitable sensors, if it finds any. If you use it for a device, PRTG adds new sensors, if found. In the corresponding [page header bar](#)^[186], you can always see when PRTG ran the last auto-discovery on a selected group or device.

- ⓘ The auto-discovery also adds manually deleted devices or sensors again. If you do not want this to happen, you have to always create objects [manually](#)^[299].

Auto-Discovery in Progress

While the auto-discovery is in progress, you might experience a lower system performance than usual, because PRTG is working in the background to discover your network. Depending on the IP address ranges defined (up to 65,536 addresses), the discovery might run for up to several days before it is complete. You can review the status of the discovery process as follows:

- In the device tree, next to the group or device name, you can see a percentage value that shows the progress of the auto-discovery.
- During the auto-discovery, the PRTG web interface displays a box in the lower-right corner that shows the number of active auto-discovery tasks.
- To stop an auto-discovery, right-click the group or device, and select Pause | For 5 minutes from the context menu. PRTG [pauses](#)^[256] monitoring for 5 minutes and stops the auto-discovery tasks.

Disable Initial Auto-Discovery

To disable the initial auto-discovery for a fresh PRTG installation, run the installer in a command prompt and add `/NoInitialAutoDisco=1` as parameter. This may be useful for performance reasons or if you prefer to manually add devices and sensors to your installation.

7.2 Create Objects Manually

We recommend that you use the [auto-discovery](#)^[296] function to create a basic monitoring setup for your network. Afterward, you can manually add devices that were not discovered, or [arrange](#)^[4007] detected devices in groups.

The procedure depends on the kind of object that you want to add:

- [Add an Auto-Discovery Group](#)^[300]
- [Add a Group](#)^[323]
- [Add a Device](#)^[340]
- [Add a Sensor](#)^[361]

Add a Remote Probe

■ For more information, see section [Add Remote Probe](#)^[4501].

7.2.1 Add an Auto-Discovery Group

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

 You cannot use this feature on the hosted probe of a PRTG Hosted Monitor instance. You can use this feature on remote probes.

There are several ways to manually add an auto-discovery group:

- Select Devices | Add Auto-Discovery Group from the [main menu bar](#)^[279]. A dialog appears that guides you through the process of starting an automatic detection of devices and sensors in your network.
- Hover over  and select Add Auto-Discovery Group from the menu.
- Select Add Auto-Discovery Group from the [context menu](#)^[259] of the probe or group to which you want to add the new auto-discovery group. This skips step 1 and leads you directly to [step 2](#)^[302].

Add an Auto-Discovery Group

The Add an Auto-Discovery Group dialog appears when you add a new auto-discovery group to a parent group. It only shows the settings that are required to create the auto-discovery group. Therefore, you do not see all settings in this dialog.

 You can change all settings on the Settings tab of the auto-discovery group later. For more information, see section [Group Settings](#)^[413].

Step 1: Select a Parent

Add an Auto-Discovery Group (Step 1 of 2)

Select a Parent
Select a parent object for the auto-discovery group.

PRTG Manual: Add an Auto-Discovery Group

Add a New Auto-Discovery Group
To automate the monitoring setup, define an auto-discovery level and a list of device IP addresses/DNS names. PRTG will automatically create devices and add suitable sensors.

Select a Probe or Group to Add the New Auto-Discovery Group to

Select a probe or group from the list. You can add a new auto-discovery group faster by right-clicking a probe or group in the device tree and selecting **Add Auto-Discovery Group** from the context menu.

Search...

- Root
 - Local Probe
 - 1st group
 - MAIL
 - Group
 - ROUTER/SWITCHES
 - VMWARE
 - SNMP
 - Servers
 - DATABASES
 - MISC
 - CLOUD
 - Services
 - WINDOWS
 - eHealth

Add Auto-Discovery Group Assistant Step 1

Select the probe or group that you want to add the new auto-discovery group to. Click OK.

Step 2: Define Auto-Discovery Group Settings

Add an Auto-Discovery Group to Local Probe
✕

Set your auto-discovery preferences and provide the IP addresses/DNS names of your devices. PRTG then automatically creates devices and adds suitable sensors. If necessary, specify credentials and access rights for the auto-discovery group. All devices in this group inherit these settings by default.

Add Auto-Discovery Group Assistant Step 2

Basic Group Settings

Setting	Description
Group Name	Enter a meaningful name to identify the group. By default, PRTG shows this name in the device tree ¹⁸³¹ , as well as in alarms ²²⁸¹ , logs ²³⁷¹ , notifications ⁴⁰³¹ , reports ⁴⁰⁶⁹ , maps ⁴⁰⁹⁵ , libraries ⁴⁰⁴⁷ , and tickets ²⁴⁰¹ .

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited¹⁴⁵.</p> <ul style="list-style-type: none"> i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include? i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). i For performance reasons, it can take some minutes until you can filter for new tags that you added.

Device Identification and Auto-Discovery

Setting	Description
Auto-Discovery Level	<p>Select the level of detail for the auto-discovery²⁹⁶:</p> <ul style="list-style-type: none"> ▪ No auto-discovery: Select this option if you only want to manually create devices and sensors. ▪ Standard auto-discovery (recommended): Create a set of standard sensors for standard monitoring. This option works fine for most installations. ▪ Detailed auto-discovery: Create all standard sensors and additional sensors from detailed variants of device templates. As a result, you might get many sensors. This option is suitable for small network segments and whenever you want to monitor the maximum number of sensors available. ▪ Auto-discovery with specific device templates: Customize the auto-discovery and select or combine standard, detailed, and custom device templates. Select one or more templates from the Devices Templates list. <p>i Auto-discoveries can be resource intensive. They are primarily intended for devices on the same network as your probes.</p>
Device Templates	<p>This setting is only visible if you select Auto-discovery with specific device templates above. Select one or more device templates by adding a check mark in front of the template name.</p> <p>i You can also select all items or cancel the selection by using the check box in the table header.</p>

Setting	Description
	<p>PRTG uses the device templates that you select for the auto-discovery on the device. Choose from:</p>
	<ul style="list-style-type: none">▪ ADSL▪ Amazon CloudWatch▪ Buffalo TeraStation NAS▪ Cisco ASA VPN▪ Cisco Device (Generic)▪ Dell EqualLogic▪ Dell MDi Disk▪ DNS Server▪ Environment Jakarta▪ Environment Poseidon▪ FTP Server▪ Generic Device (Ping Only)▪ Generic Device (SNMP Enabled)▪ Generic Device (SNMP Enabled, Detailed)▪ HTTP Web Server▪ Hyper-V Host Server▪ IPMI-enabled Device▪ Juniper NS Device▪ Linux/UNIX Device (SNMP or SSH Enabled)▪ Mail Server (Generic)▪ Mail Server (MS Exchange)▪ Microsoft SharePoint 2010▪ NAS LenovoEMC▪ NAS QNAP▪ NAS Synology▪ NetApp▪ NTP Server▪ Printer (HP)▪ Printer (Generic)▪ RDP Server

Setting	Description
	<ul style="list-style-type: none"> ▪ RMON-compatible Device ▪ Server (Cisco UCS) ▪ Server (Compaq/HP Agents) ▪ Server (Dell) ▪ Server (Fujitsu) ▪ Server (IBM) ▪ SonicWall ▪ SSL Security Check ▪ Switch (Cisco Catalyst) ▪ Switch (Cisco IOS Based) ▪ Switch (HP Procurve) ▪ UNIX/Linux Device ▪ UPS Health (APC) ▪ UPS Health (Generic) ▪ UPS Health (Liebert) ▪ VMware ESXi / vCenter Server ▪ Web Server ▪ Windows (Detailed via WMI) ▪ Windows (via Remote PowerShell) ▪ Windows (via WMI) ▪ Windows IIS (via SNMP) ▪ XenServer Hosts ▪ XenServer Virtual Machines
	<p>Once the auto-discovery is finished, PRTG creates a new ticket^[240] and lists the device templates that it used to create new sensors.</p>
Schedule	<p>Select when PRTG runs the auto-discovery:</p> <ul style="list-style-type: none"> ▪ Once: Run the auto-discovery only once. PRTG adds new devices and sensors once. If you select this option, you have to manually start the auto-discovery^[297]. ▪ Hourly: Run the auto-discovery for new devices and sensors every 60 minutes. <ul style="list-style-type: none"> i Use this option with caution. Frequent auto-discoveries might cause performance issues, in particular when PRTG scans large network segments every hour.

Setting	Description
	<ul style="list-style-type: none"> ▪ Daily: Run the auto-discovery for new devices and sensors every 24 hours. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the Monitoring settings, section Auto-Discovery. ▪ Weekly: Run the auto-discovery for new devices and sensors every 7 days. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the Monitoring settings, section Auto-Discovery. <p>i For performance reasons, PRTG sets Schedule to Once on all devices that the scheduled auto-discovery creates.</p>
<p>IP Address Selection Method</p>	<p>Select how you want to define the IP address range for the auto-discovery:</p> <ul style="list-style-type: none"> ▪ Class C base IP address with start/end (IPv4): Enter an IPv4 class C address range. ▪ List of individual IP addresses and DNS names (IPv4): Enter a list of individual IPv4 addresses or Domain Name System (DNS) names. ▪ IP address and subnet (IPv4): Enter an IPv4 address and subnet mask. ▪ IP address with octet range (IPv4): Enter an IPv4 address range for every IP octet individually. With this, you can define very customizable IP address ranges. ▪ List of individual IP addresses and DNS names (IPv6): Enter a list of individual IPv6 addresses or DNS names. ▪ Use computers from the Active Directory (maximum 1000 computers): Search in the Active Directory for computers to perform the auto-discovery. <p>i Make sure that you specify your Active Directory domain in the Core & Probes settings.</p> <p>i PRTG can only discover subnets with up to 65,536 IP addresses. If you define a range with a higher number of addresses, the discovery stops before it is completed.</p>
<p>IPv4 Base</p>	<p>This setting is only visible if you enable Class C base IP address with start/end (IPv4) above. Enter a class C network as the IP base for the auto-discovery. Enter the first three octets of an IPv4 address, for example, 192.168.0.</p>
<p>IPv4 Range Start</p>	<p>This setting is only visible if you enable Class C base IP address with start/end (IPv4) above. Enter the IP octet of the class C network (specified above) from which PRTG starts the auto-discovery. This completes the IP base to an IPv4 address. For example, enter 1 to discover from 192.168.0.1 onwards.</p>

Setting	Description
IPv4 Range End	This setting is only visible if you enable Class C base IP address with start/end (IPv4) above. Enter the IP octet of the class C network (specified above) at which PRTG stops the auto-discovery. This completes the IP base to an IPv4 address. For example, enter 254 to discover up to 192.168.0.254 .
IPv4/DNS Name List IPv6/DNS Name List	This setting is only visible if you select on of the List of individual IP addresses and DNS names options above. Enter a list of IP addresses or DNS names that the auto-discovery scans. Enter each address on a separate line.
IPv4 and Subnet (IPv4)	This setting is only visible if you enable IP address and subnet (IPv4) above. Enter an expression in the format address/subnet, for example, 192.168.3.0/255.255.255.0 . You can also use the short form like 192.168.3.0/24 . PRTG scans the complete host range (without network and broadcast address) that is defined by the IP address and the subnet mask.
IP Address with Octet Range	This setting is only visible if you enable IP address with octet range (IPv4) above. Enter an expression in the format a1.a2.a3.a4, where a1 , a2 , a3 , and a4 are each a number between 0-255, or a range with two numbers and a hyphen like 1-127 . PRTG calculates all permutations of all ranges. For example, 10.0.1-10.1-100 results in 1,000 addresses that PRTG scans during the auto-discovery.
Organizational Unit	<p>This setting is only visible if you enable Use computers from the Active Directory (maximum 1000 computers) above. Enter an organizational unit (OU) to restrict the Active Directory search to computers that are part of this OU. For top-level OUs, use the distinguished name (DN) format without OU= and without the domain components (DCS). If you leave this field empty, there are not any restrictions.</p> <p>Example:</p> <ul style="list-style-type: none"> For the DN OU=Domain Controllers,DC=example,DC=com, enter only Domain Controllers. <p>If you have sub-OUs, use the DN format without the leading OU= and without the DCs.</p> <p>Examples:</p> <ul style="list-style-type: none"> For the DN OU=webserver,OU=production,DC=example,DC=com, enter only webserver,OU=production. For the DN OU=intranet,OU=webserver,OU=production,DC=example,DC=com, enter only intranet,OU=webserver,OU=production. <p>i Make sure that the OU contains computer accounts. If the OU is empty, you receive an error message.</p>

Setting	Description
	<p> Do not enter the domain components. PRTG automatically uses the domain components from the domain name you enter in the Core & Probes settings.</p>
Name Resolution	<p>Select how to monitor newly discovered devices. This only affects new devices. This does not change the setting for other devices. Depending on your selection, the IP Address/DNS Name field of an added device shows the DNS name or IP address that PRTG uses to access the target device. Choose between:</p> <ul style="list-style-type: none"> ▪ Use DNS names (recommended): Monitor newly discovered devices via their DNS names (if available). We recommend that you use this option. ▪ Use IP addresses: Monitor newly discovered devices via their IP addresses. <p> This setting does not affect how PRTG shows the devices in the device tree.</p>
Device Rescan	<p>Select how to handle known devices:</p> <ul style="list-style-type: none"> ▪ Skip auto-discovery for existing devices/IP addresses (recommended): Do not rescan existing devices or IP addresses. PRTG only adds devices with new IP addresses or DNS names. PRTG does not add devices that already exist in your configuration for example, in other groups. We recommend that you use this option. ▪ Perform auto-discovery for existing devices/IP addresses: Rescan devices that have existing IP addresses with every auto-discovery. PRTG adds devices that already exist in other groups to this group and runs the auto-discovery on the newly added devices. <ul style="list-style-type: none">  The auto-discovery does not run on devices that already exist in the group. If you want to run the auto-discovery for these devices, you have to manually start the auto-discovery on them. <p> In certain cases, the IP resolution might not work and might result in PRTG not adding a device if it has the same local IP address as it does in a different LAN.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

Credentials for Windows Systems

Click  to interrupt the [inheritance](#).

Setting	Description
Domain or Computer Name	<p>Enter the domain or computer name of the user account with which you want to access the Windows system. PRTG uses this account for Windows Management Instrumentation (WMI) sensors and other Windows sensors.</p> <p>If you want to use a Windows local user account on the target device, enter the computer name. If you want to use a Windows domain user account (recommended), enter the domain name. PRTG automatically adds a prefix to use the NT LAN Manager (NTLM) protocol if you do not explicitly define it. Do not leave this field empty.</p>
User Name	Enter the user name for access to the Windows system. Usually, you use credentials with administrator rights.
Password	Enter the password for access to the Windows system. Usually, you use credentials with administrator rights.

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User Name	Enter the user name for access to the Linux/Solaris/macOS system via Secure Shell (SSH) and Web-based Enterprise Management (WBEM). Usually, you use credentials with administrator rights.
Authentication Method	<p>Select the authentication method for login:</p> <ul style="list-style-type: none"> ▪ Password: Provide the password for the login. ▪ Private key: Provide an RSA private key for authentication. <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For details, see section Monitoring via SSH⁴³⁰¹.</p>
Password	This setting is only visible if you select Password above. Enter a password for access to the Linux/Solaris/macOS system via SSH and WBEM. Usually, you use credentials with administrator rights.
Private Key	This setting is only visible if you select Private key above. Paste the entire RSA private key, including the BEGIN and END lines. Make sure that a corresponding public key exists on the target device.

Setting	Description
	<ul style="list-style-type: none"> ❗ PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys. ❗ PRTG only supports RSA keys. It does not support DSA keys. ■ For details, see section Monitoring via SSH⁴³⁰¹. ❗ If you do not insert a private key for the first time but if you want to change the private key, you need to restart the PRTG core server service⁴²²⁵ for the private key change to take effect.
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unsecure connection for WBEM. ▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM. <p>❗ This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	<p>Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:</p> <ul style="list-style-type: none"> ▪ Default: Use one of the default ports. The default port for unsecure connections is 5988 and the default port for secure connections is 5989. ▪ Custom: Use a custom port. <p>❗ This setting is only relevant if you use WBEM sensors.</p>
Custom WBEM Port	<p>This setting is only visible if you select Custom above. Enter a custom WBEM port. Enter an integer value.</p>
SSH Port	<p>Enter the port for SSH connections. Enter an integer value. The default port is 22.</p> <p>❗ By default, PRTG automatically uses this setting for all SSH sensors⁴⁶¹² unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Select the rights that you want to use to run the command on the target system:</p> <ul style="list-style-type: none"> ▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection. ▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for sudo to run commands on the target system, for example, as a root user. ▪ Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for sudo to run commands on the target system, for example, as a root user.

Setting	Description
	<ul style="list-style-type: none"> Run the command as a different user using 'su': Use the rights of a different user with su to run commands on the target system.
Target User Name	This setting is only visible if you select an option that includes sudo or su above. Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.
Password	This setting is only visible if you select an option that includes sudo or su with password above. Enter the password to run the sudo command or the su command.
SSH Connection Mode	<p>Select the connection mode that you want to use to access data with SSH sensors ⁴³⁰¹:</p> <ul style="list-style-type: none"> Default (recommended): This is the default monitoring method for SSH sensors. It provides the best performance and security. Compatibility mode (deprecated): Use this mode only if the default mode does not work on the target system. The compatibility mode is the SSH engine that PRTG used in previous versions and it is deprecated. <p>i We strongly recommend that you use the default SSH connection mode.</p> <p>i You can also individually select the SSH connection mode for each SSH sensor in the sensor settings.</p>

Credentials for VMware/XenServer

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
User Name	Enter the user name for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.
Password	<p>Enter the password for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.</p> <p>i Single sign-on (SSO) passwords for vSphere do not support special characters. For details, see the VMware sensors sections.</p>
VMware Protocol	Select the protocol for the connection to VMware ESXi, vCenter Server, or Citrix XenServer:

Setting	Description
	<ul style="list-style-type: none"> ▪ HTTPS (recommended): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. ▪ HTTP: Use an unsecure connection.
Session Handling	<p>Select if you want to reuse a session for VMware sensors:</p> <ul style="list-style-type: none"> ▪ Reuse a session for multiple scans (recommended): Select this option if you want a VMware sensor to reuse a single session for multiple sensor scans to query data. With this option, the sensor does not need to log in and out for each sensor scan. We recommend that you use this option because it reduces network load and log entries on the target device. This can increase performance. ▪ Create a new session for each scan: If you select this option, PRTG does not reuse a session and a VMware sensor has to log in and out for each sensor scan. This can decrease performance.

Credentials for SNMP Devices

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> ▪ SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none">  SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP. ▪ SNMP v2c (recommended): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters. ▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption. <ul style="list-style-type: none">  SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in Interval Delay or Open Requests with the Probe Health sensor ²⁰⁸³, distribute the load over multiple probes ⁴⁶⁰³. SNMP v1 and SNMP v2c do not have this limitation.

Setting	Description
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c above. Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>i We recommend that you use the default value.</p>
Authentication Method	<p>This setting is only visible if you select SNMP v3 above. Select the authentication method:</p> <ul style="list-style-type: none"> ▪ MD5: Use message-digest algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>i If you do not want to use authentication but you need SNMP v3, for example, because your device requires context, you can leave the Password field empty. In this case, PRTG uses SNMP_SEC_LEVEL_NOAUTH and it entirely deactivates authentication.</p> <p>i The authentication method you select must match the authentication method of your device.</p>
User Name	<p>This setting is only visible if you select SNMP v3 above. Enter the user name for access to the target SNMP device.</p> <p>i The user name that you enter must match the user name of your device.</p>
Password	<p>This setting is only visible if you select SNMP v3 above. Enter the password for access to the target SNMP device.</p> <p>i The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above. Select an encryption type:</p> <ul style="list-style-type: none"> ▪ DES: Use Data Encryption Standard (DES) as the encryption algorithm. ▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm. <p>i Net-SNMP does not support AES-192 and AES-256. They do not have RFC specifications.</p> <p>i The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above. Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p>

Setting	Description
	<p> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above. Enter a context name only if the configuration of the device requires it. Context is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer value. The default port is 161.</p> <p> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for Database Management Systems

Click  to interrupt the [inheritance](#)¹⁴².

The settings you define in this section apply to the following sensors:

- [ADO SQL v2 sensor](#)⁴⁹⁰
- [Microsoft SQL v2 sensor](#)¹⁶⁰⁷
- [MySQL v2 sensor](#)¹⁶⁷⁴
- [Oracle SQL v2 sensor](#)¹⁹²³
- [PostgreSQL sensor](#)²⁰⁶⁴

Setting	Description
Port	<p>Select the port that PRTG uses for connections to the monitored databases:</p> <ul style="list-style-type: none"> ▪ Default (recommended): PRTG automatically determines the type of the database and uses the corresponding default port to connect. PRTG uses the following default ports: <ul style="list-style-type: none"> ▫ Microsoft SQL: 1433 ▫ MySQL: 3306 ▫ Oracle SQL: 1521 ▫ PostgreSQL: 5432

Setting	Description
	<ul style="list-style-type: none"> Custom port for all database sensors: Select this option if your database management systems do not use the default ports. Enter a custom port for database connections below. <p>i PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Custom Port	<p>Enter a custom port for database connections. Enter an integer value.</p> <p>i PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Authentication Method	<p>Select the authentication method for the connection to the Structured Query Language (SQL) database:</p> <ul style="list-style-type: none"> Windows authentication with impersonation: PRTG uses the Windows credentials that you define in settings that are higher in the object hierarchy¹³⁸, for example, in the settings of the parent device; for the database connection. i The user whose credentials PRTG uses needs to have permission to log in to the probe system with a database sensor. This is necessary for the impersonation. SQL server authentication: Use explicit credentials for database connections. Enter a user name and password below.
User Name	<p>This setting is only visible if you select SQL server authentication above. Enter the user name for the database connection.</p>
Password	<p>This setting is only visible if you select SQL server authentication above. Enter the password for the database connection.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for AWS

Click  to interrupt the [inheritance](#)¹⁴².

■ For more information about the permissions that are necessary to query the AWS API, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)

Setting	Description
Access Key	Enter the Amazon Web Services (AWS) access key.

Setting	Description
Secret Key	Enter the AWS secret key.

Credentials for Dell EMC

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User	Enter the user name for access to the Dell EMC system.
Password	Enter the password for access to the Dell EMC system.
Port	Enter the port for the connection to the Dell EMC system. The default port for secure connections is 443 .

Credentials for Microsoft 365

 The [Microsoft 365 Service Status sensor](#)¹⁵⁴⁶ and the [Microsoft 365 Service Status Advanced sensor](#)¹⁵⁵⁷ use the following credentials to authenticate with Azure Active Directory (Azure AD).

 For more information about the credentials and the permissions that are necessary to use the Microsoft 365 sensors, see the Knowledge Base: [How do I obtain credentials and set permissions for the Microsoft 365 sensors?](#)

Setting	Description
Tenant ID	Enter the Azure AD tenant ID.  A tenant ID must be a 32-digit sequence in hexadecimal notation.
Client ID	Enter the Azure AD client ID.
Client Secret	Enter the Azure AD client secret.

Credentials for Microsoft Azure

 The [Microsoft Azure Subscription Cost sensor](#)¹⁵⁶⁰ and the [Microsoft Azure Virtual Machine sensor](#)¹⁵⁸² use the following credentials to authenticate with Azure AD.

 For more information about the credentials and permissions that are necessary use the Microsoft Azure sensors, see the Knowledge Base: [How do I obtain credentials and create custom roles for the Microsoft Azure sensors?](#)

Setting	Description
Tenant ID	Enter the Azure AD tenant ID.  A tenant ID must be a 32-digit sequence in hexadecimal notation.
Client ID	Enter the Azure AD client ID.
Client Secret	Enter the Azure AD client secret.
Subscription ID	Enter the Azure AD subscription ID.

Credentials for MQTT

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
Authentication Method	Select if you want to connect without credentials or define credentials for access to the MQTT broker. <ul style="list-style-type: none"> None (default): Connect without credentials. User name and password: Define credentials for the connection.
User	This setting is only visible if you select User name and password above. Enter the user name for access to the Message Queue Telemetry Transport (MQTT) broker.
Password	This setting is only visible if you select User name and password above. Enter the password for access to the MQTT broker.
Port	Enter the port for the connection to the MQTT broker. The default port for secure connections is 8883 and the default port for unsecure connections is 1883 .
Transport-Level Security	Select if you want to use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection: <ul style="list-style-type: none"> Do not use transport-level security: Establish the connection without connection security. Use transport-level security: Establish the connection with the strongest SSL/TLS method that the target device provides.
Server Authentication	This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for server authentication. <ul style="list-style-type: none"> Disable (default): Do not use a certificate for server authentication.

Setting	Description
	<ul style="list-style-type: none"> ▪ Enable: Use a certificate for server authentication.
CA Certificate	<p>Paste the certificate authority (CA) certificate for the verification of the MQTT broker.</p> <p> The certificate must be in Privacy-Enhanced Mail (PEM) format.</p>
Client Authentication	<p>This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for client authentication.</p> <ul style="list-style-type: none"> ▪ Disable (default): Do not use a certificate for client authentication. ▪ Enable: Use a certificate for client authentication.
Client Certificate	<p>Paste the certificate that you created for authenticating the sensor against the MQTT broker.</p> <p> The certificate must be in PEM format.</p>
Client Key	<p>Enter the client key for access to the MQTT broker.</p> <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	<p>Enter the password for the client key.</p>

Credentials for OPC UA

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
Port	<p>Enter the port for the connection to the OPC Unified Architecture (OPC UA) server. The default port for secure connections is 4840.</p>
Server Path	<p>Enter the path of the OPC UA server endpoint if you run more than one server under the same IP address or DNS name.</p>
Security Mode	<p>Select if you want to use encryption:</p> <ul style="list-style-type: none"> ▪ None (default): Do not use encryption. ▪ Sign: Sign messages between the sensor and the OPC UA server. ▪ Sign & Encrypt: Sign and encrypt messages between the sensor and the OPC UA server.

Setting	Description
Security Policy	<p>This setting is only visible if you select Sign or Sign & Encrypt above. Select if you want to use a security policy and define which policy you want to use:</p> <ul style="list-style-type: none"> ▪ None (default): Do not use a security policy. ▪ Basic256Sha256: Use the Basic256Sha256 security policy. ▪ Basic256: Use the Basic256 security policy.
Client Certificate	<p>Paste the certificate that you created for authenticating the sensor against the OPC UA server.</p> <p> The certificate must meet the following requirements:</p> <ul style="list-style-type: none"> ▪ The key size must be 2048-bit. ▪ The secure hash algorithm must be SHA256. ▪ DataEncipherment must be part of the KeyUsage certificate extension. ▪ A uniform resource indicator (URI) must be set in subjectAltName. ▪ The certificate must be in Privacy-Enhanced Mail (PEM) format.
Client Key	<p>Enter the client key for access to the OPC UA server.</p> <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	<p>Enter the password for the client key.</p>
Authentication Method	<p>Select if you want to connect without credentials or define credentials for access to the OPC UA server:</p> <ul style="list-style-type: none"> ▪ Anonymous (default): Connect without credentials. ▪ Username/Password: Define credentials for the connection. <p> Most OPC UA servers do not support Username/Password authentication without a client certificate. To use Username/Password authentication, select Sign or Sign & Encrypt under Security Mode and Basic256Sha256 or Basic256 under Security Policy and enter the Client Certificate, Client Key, and Client Key Password that you want to use.</p>
User	<p>This setting is only visible if you select Username/Password above. Enter the user name for access to the OPC UA server.</p>
Password	<p>This setting is only visible if you select Username/Password above. Enter the password for access to the OPC UA server.</p>

Credentials for Soffico Orchestra

Click  to interrupt the [inheritance](#) .

Setting	Description
Authentication Method	Select if you want to connect without credentials or define credentials for access to the Orchestra platform: <ul style="list-style-type: none"> ▪ None (default): Connect without credentials. ▪ Username/Password: Define credentials for the connection.
User	This setting is only visible if you select Username/Password above. Enter the user name for access to the Orchestra platform.
Password	This setting is only visible if you select Username/Password above. Enter the password for access to the Orchestra platform.
Timeout (Sec.)	Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).
Port	Enter the port for the connection to the Orchestra platform. The default port for secure connections is 8443 and the default port for unsecure connections is 8019.
Protocol	Select the protocol that you want to use for the connection to the Orchestra platform: <ul style="list-style-type: none"> ▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. ▪ HTTP: Use an unsecure connection.

Credentials for Veeam

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User	Enter the user name for access to the Veeam Backup Enterprise Manager.
Password	Enter the password for access to the Veeam Backup Enterprise Manager.
Port	Enter the port for the connection to the Veeam Backup Enterprise Manager. The default port for secure connections is 9398.

Access Rights

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User Group Access	<p>Select the user groups ⁴²¹⁹ that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the object. The object neither shows up in lists nor in the device tree. <ul style="list-style-type: none"> ⓘ There is one exception: If a user in this user group has access to a child object, the parent object is visible in the device tree but users in this user group cannot access it. ▪ Read access: Users in this group can see the object and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the object, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the object, view its monitoring results, edit its settings, and edit its access rights settings. <p>To automatically set all child objects to inherit this object's access rights, enable the Revert children's access rights to inherited option.</p> <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

ⓘ Click OK to save your settings. If you close the dialog without saving, all changes to the settings are lost.

Create Objects Manually

- [Add an Auto-Discovery Group](#) ³⁰⁰

Part 7: Device and Sensor Setup | 2 Create Objects Manually
1 Add an Auto-Discovery Group

- [Add a Group](#)  323
- [Add a Device](#)  340
- [Add a Sensor](#)  361

7.2.2 Add a Group

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

There are several ways to manually add a group:

- Select Devices | Add Group from the [main menu bar](#)^[279]. A dialog appears that guides you through the process of adding a new group.
- Hover over  and select Add Group from the menu.
- Select Add Group from the [context menu](#)^[259] of the probe or group to which you want to add the new group. This skips step 1 and leads you directly to [step 2](#)^[325].

Add a Group

The Add a Group dialog appears when you add a new group to a parent group. It only shows the settings that are required to create the group. Therefore, you do not see all settings in this dialog.

 You can change all settings on the Settings tab of the group later. For more information, see section [Group Settings](#)^[413].

Step 1: Select a Parent

Add a Group ✕

Select a Parent

Select a parent object for the group.

PRTG Manual: Add a Group

Add a New Group

Organize your network devices in PRTG using **groups**. You can create as many groups and subgroups as you like.

If you want to automate the monitoring setup for a group of network devices, add an **auto-discovery group** to your group or probe. To do so, use the context menu of groups or probes or select **Devices | Add Auto-Discovery Group** from the main menu bar.

Select a Probe or Group to Add the New Group to

Select a probe or group from the list. You can create new groups faster by right-clicking a probe or group in the device tree and selecting **Add Group** from the context menu.

Search...

- Root
 - Local Probe
 - 1st group
 - MAIL
 - Group
 - ROUTER/SWITCHES
 - VMWARE
 - SNMP
 - Servers
 - DATABASES
 - MISC
 - CLOUD
 - Services
 - WINDOWS

Cancel **OK**

Add Group Assistant Step 1

Select the probe or group that you want to add the new group to. Click OK.

Step 2: Define Group Settings

Add a Group to Local Probe
✕

Define Group Settings

Specify credentials and access rights for your group, if necessary. All devices in this group will inherit these settings.

PRTG Manual: Add a Group

Add a New Group

Organize your network devices in PRTG using **groups**. You can create as many groups and subgroups as you like.

If you want to automate the monitoring setup for a group of network devices, add an **auto-discovery group** to your group or probe. To do so, use the context menu of groups or probes or select **Devices | Add Auto-Discovery Group** from the main menu bar.

Basic Group Settings

Group Name ⓘ

Group

Tags ⓘ

Credentials for Windows Systems

inherit from (Domain or Computer Name: paesslergmbh, User: ...)

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems

inherit from (User: <empty>, Login: 0, For WBEM Use Port: 0...)

Credentials for VMware/XenServer

inherit from (User: <empty>)

Add Group Assistant Step 2

Basic Group Settings

Setting	Description
Group Name	Enter a meaningful name to identify the group. By default, PRTG shows this name in the device tree [183], as well as in alarms [228], logs [237], notifications [403], reports [406], maps [406], libraries [407], and tickets [240].

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ¹⁴⁵.</p> <ul style="list-style-type: none">  It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).  For performance reasons, it can take some minutes until you can filter for new tags that you added.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁸ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Credentials for Windows Systems

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
Domain or Computer Name	<p>Enter the domain or computer name of the user account with which you want to access the Windows system. PRTG uses this account for Windows Management Instrumentation (WMI) sensors and other Windows sensors.</p> <p>If you want to use a Windows local user account on the target device, enter the computer name. If you want to use a Windows domain user account (recommended), enter the domain name. PRTG automatically adds a prefix to use the NT LAN Manager (NTLM) protocol if you do not explicitly define it. Do not leave this field empty.</p>
User Name	Enter the user name for access to the Windows system. Usually, you use credentials with administrator rights.
Password	Enter the password for access to the Windows system. Usually, you use credentials with administrator rights.

Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User Name	Enter the user name for access to the Linux/Solaris/macOS system via Secure Shell (SSH) and Web-based Enterprise Management (WBEM). Usually, you use credentials with administrator rights.
Authentication Method	<p>Select the authentication method for login:</p> <ul style="list-style-type: none"> ▪ Password: Provide the password for the login. ▪ Private key: Provide an RSA private key for authentication. <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For details, see section Monitoring via SSH⁴³⁰¹.</p>
Password	This setting is only visible if you select Password above. Enter a password for access to the Linux/Solaris/macOS system via SSH and WBEM. Usually, you use credentials with administrator rights.
Private Key	<p>This setting is only visible if you select Private key above. Paste the entire RSA private key, including the BEGIN and END lines. Make sure that a corresponding public key exists on the target device.</p> <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For details, see section Monitoring via SSH⁴³⁰¹.</p> <p> If you do not insert a private key for the first time but if you want to change the private key, you need to restart the PRTG core server service⁴²²⁵ for the private key change to take effect.</p>
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unsecure connection for WBEM. ▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM. <p> This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:

Setting	Description
	<ul style="list-style-type: none"> ▪ Default: Use one of the default ports. The default port for unsecure connections is 5988 and the default port for secure connections is 5989. ▪ Custom: Use a custom port. <p>i This setting is only relevant if you use WBEM sensors.</p>
Custom WBEM Port	This setting is only visible if you select Custom above. Enter a custom WBEM port. Enter an integer value.
SSH Port	Enter the port for SSH connections. Enter an integer value. The default port is 22 . i By default, PRTG automatically uses this setting for all SSH sensors unless you define a different port number in the sensor settings.
SSH Rights Elevation	Select the rights that you want to use to run the command on the target system: <ul style="list-style-type: none"> ▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection. ▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for sudo to run commands on the target system, for example, as a root user. ▪ Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for sudo to run commands on the target system, for example, as a root user. ▪ Run the command as a different user using 'su': Use the rights of a different user with su to run commands on the target system.
Target User Name	This setting is only visible if you select an option that includes sudo or su above. Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.
Password	This setting is only visible if you select an option that includes sudo or su with password above. Enter the password to run the sudo command or the su command.
SSH Connection Mode	Select the connection mode that you want to use to access data with SSH sensors . <ul style="list-style-type: none"> ▪ Default (recommended): This is the default monitoring method for SSH sensors. It provides the best performance and security.

Setting	Description
	<ul style="list-style-type: none"> Compatibility mode (deprecated): Use this mode only if the default mode does not work on the target system. The compatibility mode is the SSH engine that PRTG used in previous versions and it is deprecated. <p> We strongly recommend that you use the default SSH connection mode.</p> <p> You can also individually select the SSH connection mode for each SSH sensor in the sensor settings.</p>

Credentials for VMware/XenServer

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
User Name	Enter the user name for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.
Password	<p>Enter the password for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.</p> <p> Single sign-on (SSO) passwords for vSphere do not support special characters. For details, see the VMware sensors sections.</p>
VMware Protocol	<p>Select the protocol for the connection to VMware ESXi, vCenter Server, or Citrix XenServer:</p> <ul style="list-style-type: none"> HTTPS (recommended): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. HTTP: Use an unsecure connection.
Session Handling	<p>Select if you want to reuse a session for VMware sensors:</p> <ul style="list-style-type: none"> Reuse a session for multiple scans (recommended): Select this option if you want a VMware sensor to reuse a single session for multiple sensor scans to query data. With this option, the sensor does not need to log in and out for each sensor scan. We recommend that you use this option because it reduces network load and log entries on the target device. This can increase performance. Create a new session for each scan: If you select this option, PRTG does not reuse a session and a VMware sensor has to log in and out for each sensor scan. This can decrease performance.

Credentials for SNMP Devices

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> ▪ SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> ❗ SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP. ▪ SNMP v2c (recommended): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters. ▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption. <ul style="list-style-type: none"> ❗ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in Interval Delay or Open Requests with the Probe Health sensor²⁰⁸³, distribute the load over multiple probes⁴⁵⁰³. SNMP v1 and SNMP v2c do not have this limitation.
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c above. Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>❗ We recommend that you use the default value.</p>
Authentication Method	<p>This setting is only visible if you select SNMP v3 above. Select the authentication method:</p> <ul style="list-style-type: none"> ▪ MD5: Use message-digest algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>❗ If you do not want to use authentication but you need SNMP v3, for example, because your device requires context, you can leave the Password field empty. In this case, PRTG uses SNMP_SEC_LEVEL_NOAUTH and it entirely deactivates authentication.</p> <p>❗ The authentication method you select must match the authentication method of your device.</p>
User Name	<p>This setting is only visible if you select SNMP v3 above. Enter the user name for access to the target SNMP device.</p> <p>❗ The user name that you enter must match the user name of your device.</p>
Password	<p>This setting is only visible if you select SNMP v3 above. Enter the password for access to the target SNMP device.</p>

Setting	Description
	<p> The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above. Select an encryption type:</p> <ul style="list-style-type: none"> ▪ DES: Use Data Encryption Standard (DES) as the encryption algorithm. ▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm. <p> Net-SNMP does not support AES-192 and AES-256. They do not have RFC specifications.</p> <p> The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above. Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above. Enter a context name only if the configuration of the device requires it. Context is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer value. The default port is 161.</p> <p> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for Database Management Systems

Click  to interrupt the [inheritance](#) .

The settings you define in this section apply to the following sensors:

- [ADO SQL v2 sensor](#) 
- [Microsoft SQL v2 sensor](#) 
- [MySQL v2 sensor](#) 
- [Oracle SQL v2 sensor](#) 

▪ [PostgreSQL sensor](#) 

Setting	Description
Port	<p>Select the port that PRTG uses for connections to the monitored databases:</p> <ul style="list-style-type: none"> ▪ Default (recommended): PRTG automatically determines the type of the database and uses the corresponding default port to connect. PRTG uses the following default ports: <ul style="list-style-type: none"> ▫ Microsoft SQL: 1433 ▫ MySQL: 3306 ▫ Oracle SQL: 1521 ▫ PostgreSQL: 5432 ▪ Custom port for all database sensors: Select this option if your database management systems do not use the default ports. Enter a custom port for database connections below. <p> PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Custom Port	<p>Enter a custom port for database connections. Enter an integer value.</p> <p> PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Authentication Method	<p>Select the authentication method for the connection to the Structured Query Language (SQL) database:</p> <ul style="list-style-type: none"> ▪ Windows authentication with impersonation: PRTG uses the Windows credentials that you define in settings that are higher in the object hierarchy¹³⁸, for example, in the settings of the parent device; for the database connection. <p> The user whose credentials PRTG uses needs to have permission to log in to the probe system with a database sensor. This is necessary for the impersonation.</p> <ul style="list-style-type: none"> ▪ SQL server authentication: Use explicit credentials for database connections. Enter a user name and password below.
User Name	<p>This setting is only visible if you select SQL server authentication above. Enter the user name for the database connection.</p>
Password	<p>This setting is only visible if you select SQL server authentication above. Enter the password for the database connection.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for AWS

Click  to interrupt the [inheritance](#)^[142].

For more information about the permissions that are necessary to query the AWS API, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)

Setting	Description
Access Key	Enter the Amazon Web Services (AWS) access key.
Secret Key	Enter the AWS secret key.

Credentials for Dell EMC

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
User	Enter the user name for access to the Dell EMC system.
Password	Enter the password for access to the Dell EMC system.
Port	Enter the port for the connection to the Dell EMC system. The default port for secure connections is 443 .

Credentials for Microsoft 365

 The [Microsoft 365 Service Status sensor](#)^[1546] and the [Microsoft 365 Service Status Advanced sensor](#)^[1557] use the following credentials to authenticate with Azure Active Directory (Azure AD).

For more information about the credentials and the permissions that are necessary to use the Microsoft 365 sensors, see the Knowledge Base: [How do I obtain credentials and set permissions for the Microsoft 365 sensors?](#)

Setting	Description
Tenant ID	Enter the Azure AD tenant ID.  A tenant ID must be a 32-digit sequence in hexadecimal notation.
Client ID	Enter the Azure AD client ID.

Setting	Description
Client Secret	Enter the Azure AD client secret.

Credentials for Microsoft Azure

 The [Microsoft Azure Subscription Cost sensor](#)¹⁵⁶⁰ and the [Microsoft Azure Virtual Machine sensor](#)¹⁵⁸² use the following credentials to authenticate with Azure AD.

 For more information about the credentials and permissions that are necessary use the Microsoft Azure sensors, see the Knowledge Base: [How do I obtain credentials and create custom roles for the Microsoft Azure sensors?](#)

Setting	Description
Tenant ID	Enter the Azure AD tenant ID.  A tenant ID must be a 32-digit sequence in hexadecimal notation.
Client ID	Enter the Azure AD client ID.
Client Secret	Enter the Azure AD client secret.
Subscription ID	Enter the Azure AD subscription ID.

Credentials for MQTT

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
Authentication Method	Select if you want to connect without credentials or define credentials for access to the MQTT broker. <ul style="list-style-type: none"> None (default): Connect without credentials. User name and password: Define credentials for the connection.
User	This setting is only visible if you select User name and password above. Enter the user name for access to the Message Queue Telemetry Transport (MQTT) broker.
Password	This setting is only visible if you select User name and password above. Enter the password for access to the MQTT broker.

Setting	Description
Port	Enter the port for the connection to the MQTT broker. The default port for secure connections is 8883 and the default port for unsecure connections is 1883 .
Transport-Level Security	Select if you want to use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection: <ul style="list-style-type: none"> Do not use transport-level security: Establish the connection without connection security. Use transport-level security: Establish the connection with the strongest SSL/TLS method that the target device provides.
Server Authentication	This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for server authentication. <ul style="list-style-type: none"> Disable (default): Do not use a certificate for server authentication. Enable: Use a certificate for server authentication.
CA Certificate	Paste the certificate authority (CA) certificate for the verification of the MQTT broker. <p> The certificate must be in Privacy-Enhanced Mail (PEM) format.</p>
Client Authentication	This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for client authentication. <ul style="list-style-type: none"> Disable (default): Do not use a certificate for client authentication. Enable: Use a certificate for client authentication.
Client Certificate	Paste the certificate that you created for authenticating the sensor against the MQTT broker. <p> The certificate must be in PEM format.</p>
Client Key	Enter the client key for access to the MQTT broker. <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	Enter the password for the client key.

Credentials for OPC UA

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
Port	Enter the port for the connection to the OPC Unified Architecture (OPC UA) server. The default port for secure connections is 4840 .
Server Path	Enter the path of the OPC UA server endpoint if you run more than one server under the same IP address or DNS name.
Security Mode	Select if you want to use encryption: <ul style="list-style-type: none"> None (default): Do not use encryption. Sign: Sign messages between the sensor and the OPC UA server. Sign & Encrypt: Sign and encrypt messages between the sensor and the OPC UA server.
Security Policy	This setting is only visible if you select Sign or Sign & Encrypt above. Select if you want to use a security policy and define which policy you want to use: <ul style="list-style-type: none"> None (default): Do not use a security policy. Basic256Sha256: Use the Basic256Sha256 security policy. Basic256: Use the Basic256 security policy.
Client Certificate	Paste the certificate that you created for authenticating the sensor against the OPC UA server. <p> The certificate must meet the following requirements:</p> <ul style="list-style-type: none"> The key size must be 2048-bit. The secure hash algorithm must be SHA256. DataEncipherment must be part of the KeyUsage certificate extension. A uniform resource indicator (URI) must be set in subjectAltName. The certificate must be in Privacy-Enhanced Mail (PEM) format.
Client Key	Enter the client key for access to the OPC UA server. <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	Enter the password for the client key.
Authentication Method	Select if you want to connect without credentials or define credentials for access to the OPC UA server: <ul style="list-style-type: none"> Anonymous (default): Connect without credentials. Username/Password: Define credentials for the connection.

Setting	Description
	<p> Most OPC UA servers do not support Username/Password authentication without a client certificate. To use Username/Password authentication, select Sign or Sign & Encrypt under Security Mode and Basic256Sha256 or Basic256 under Security Policy and enter the Client Certificate, Client Key, and Client Key Password that you want to use.</p>
User	This setting is only visible if you select Username/Password above. Enter the user name for access to the OPC UA server.
Password	This setting is only visible if you select Username/Password above. Enter the password for access to the OPC UA server.

Credentials for Soffico Orchestra

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
Authentication Method	<p>Select if you want to connect without credentials or define credentials for access to the Orchestra platform:</p> <ul style="list-style-type: none"> None (default): Connect without credentials. Username/Password: Define credentials for the connection.
User	This setting is only visible if you select Username/Password above. Enter the user name for access to the Orchestra platform.
Password	This setting is only visible if you select Username/Password above. Enter the password for access to the Orchestra platform.
Timeout (Sec.)	Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).
Port	Enter the port for the connection to the Orchestra platform. The default port for secure connections is 8443 and the default port for unsecure connections is 8019 .
Protocol	<p>Select the protocol that you want to use for the connection to the Orchestra platform:</p> <ul style="list-style-type: none"> HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. HTTP: Use an unsecure connection.

Credentials for Veeam

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
User	Enter the user name for access to the Veeam Backup Enterprise Manager.
Password	Enter the password for access to the Veeam Backup Enterprise Manager.
Port	Enter the port for the connection to the Veeam Backup Enterprise Manager. The default port for secure connections is 9398 .

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
User Group Access	<p>Select the user groups^[4219] that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the object. The object neither shows up in lists nor in the device tree. <ul style="list-style-type: none"> ⓘ There is one exception: If a user in this user group has access to a child object, the parent object is visible in the device tree but users in this user group cannot access it. ▪ Read access: Users in this group can see the object and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the object, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the object, view its monitoring results, edit its settings, and edit its access rights settings. <p>To automatically set all child objects to inherit this object's access rights, enable the Revert children's access rights to inherited option.</p> <p> For more details on access rights, see section Access Rights Management^[153].</p>

ⓘ Click OK to save your settings. If you close the dialog without saving, all changes to the settings are lost.

Create Objects Manually

- [Add an Auto-Discovery Group](#)  ³⁰⁰
- [Add a Group](#)  ³²³
- [Add a Device](#)  ³⁴⁰
- [Add a Sensor](#)  ³⁶¹

7.2.3 Add a Device

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

There are several ways to manually add a device:

- Select Devices | Add Device from the [main menu bar](#)^[279]. A dialog appears that guides you through the process of adding a new device.
- Hover over  and select Add Device from the menu.
- Select Add Device from the [context menu](#)^[262] of the group to which you want to add the new device. This skips step 1 and leads you directly to [step 2](#)^[342].

Add a Device

The Add a Device dialog appears when you add a new device to a group. It only shows the settings that are required to create the device. Therefore, you do not see all settings in this dialog.

 You can change all settings on the Settings tab of the device later. For more information, see section [Device Settings](#)^[446].

Step 1: Select a Parent

Add a Device [X]

Select a Parent

Select parent object for the device.

PRTG Manual: Add a Device

Add a New Device

In PRTG, devices have one or more sensors. Devices are organized in groups. Devices and their sensors can use various inherited settings, such as scanning intervals or credentials.

Select a Group from the List

Select a group from the list. You can create new devices faster by right-clicking a group in the device tree and selecting **Add Device** from the context menu.

Search... [Q]

- Root
 - Local Probe
 - 1st group
 - MAIL
 - Group
 - ROUTER/SWITCHES
 - VMWARE
 - SNMP
 - Servers
 - DATABASES
 - MISC
 - CLOUD
 - Services
 - WINDOWS

Cancel **OK**

Add Device Assistant Step 1

Select the group that you want to add the new device to. Click OK.

Step 2: Define Device Settings

Add Device to Group Local Probe
✕

Add a New Device

Define a device name and IP address, options for auto-discovery, and credential settings for Windows, Linux, VMware/XenServer, SNMP, and specific vendors, if necessary.

Add Device Assistant Step 2

Device Name and Address

Setting	Description
Device Name	Enter a meaningful name to identify the device. By default, PRTG shows this name in the device tree ^[183] , as well as in alarms ^[228] , logs ^[237] ,

Setting	Description
	<p>notifications^[4031], reports^[4030], maps^[4036], libraries^[4047], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
IP Version	<p>Select the IP protocol that PRTG uses to connect to the device:</p> <ul style="list-style-type: none"> ▪ IPv4: Use IP version 4 for all requests to the device. ▪ IPv6: Use IP version 6 for all requests to the device. <p>i The setting is valid for all sensors that you create on the device.</p>
IPv4 Address/DNS Name	<p>This setting is only visible if you select IPv4 above. Enter the IP address or Domain Name System (DNS) name for the device. Most sensors that you create on this device inherit this setting and try to connect to this address for monitoring.</p> <p>i Some sensors have their own setting for the IP address/DNS name to which they connect.</p>
IPv6 Address/DNS Name	<p>This setting is only visible if you select IPv6 above. Enter the IP address or Domain Name System (DNS) name for the device. Most sensors that you create on this device inherit this setting and try to connect to this address for monitoring.</p> <p>i Some sensors have their own setting for the IP address/DNS name to which they connect.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>
Device Icon	Select a device icon. PRTG shows it in the device tree.

Device Identification and Auto-Discovery

Setting	Description
Auto-Discovery Level	Select the level of detail for the auto-discovery ^[296] :

Setting	Description
	<ul style="list-style-type: none"> ▪ No auto-discovery: Select this option if you only want to manually create devices and sensors. ▪ Standard auto-discovery (recommended): Create a set of standard sensors for standard monitoring. This option works fine for most installations. ▪ Detailed auto-discovery: Create all standard sensors and additional sensors from detailed variants of device templates. As a result, you might get many sensors. This option is suitable for small network segments and whenever you want to monitor the maximum number of sensors available. ▪ Auto-discovery with specific device templates: Customize the auto-discovery and select or combine standard, detailed, and custom device templates. Select one or more templates from the Devices Templates list. <p>i Auto-discoveries can be resource intensive. They are primarily intended for devices on the same network as your probes.</p>
Schedule	<p>This setting is only visible if you select one of the standard, detailed, or custom auto-discovery options above. Define when the auto-discovery runs:</p> <ul style="list-style-type: none"> ▪ Once: Perform the auto-discovery only once. For existing devices, this initiates a one-time sensor update for the selected device. If you select this option, you have to start the auto-discovery manually^[297]. ▪ Hourly: Perform the auto-discovery for new sensors every 60 minutes. ▪ Daily: Perform the auto-discovery for new sensors every 24 hours. The first auto-discovery runs immediately, all other discoveries start at the time defined in the Auto-Discovery settings section under Setup System Administration Monitoring. ▪ Weekly: Perform the auto-discovery for new sensors every 7 days. The first auto-discovery runs immediately, all other discoveries start at the time defined in the Auto-Discovery settings section under Setup System Administration Monitoring.
Device Templates	<p>This setting is only visible if you select Auto-discovery with specific device templates above. Select one or more device templates by adding a check mark in front of the template name.</p> <p>i You can also select all items or cancel the selection by using the check box in the table header.</p> <p>PRTG uses the device templates that you select for the auto-discovery on the device. Choose from:</p> <ul style="list-style-type: none"> ▪ ADSL ▪ Amazon CloudWatch

Setting	Description
	<ul style="list-style-type: none">▪ Buffalo TeraStation NAS▪ Cisco ASA VPN▪ Cisco Device (Generic)▪ Dell EqualLogic▪ Dell MDi Disk▪ DNS Server▪ Environment Jakarta▪ Environment Poseidon▪ FTP Server▪ Generic Device (Ping Only)▪ Generic Device (SNMP Enabled)▪ Generic Device (SNMP Enabled, Detailed)▪ HTTP Web Server▪ Hyper-V Host Server▪ IPMI-enabled Device▪ Juniper NS Device▪ Linux/UNIX Device (SNMP or SSH Enabled)▪ Mail Server (Generic)▪ Mail Server (MS Exchange)▪ Microsoft SharePoint 2010▪ NAS LenovoEMC▪ NAS QNAP▪ NAS Synology▪ NetApp▪ NTP Server▪ Printer (HP)▪ Printer (Generic)▪ RDP Server▪ RMON-compatible Device▪ Server (Cisco UCS)▪ Server (Compaq/HP Agents)▪ Server (Dell)

Setting	Description
	<ul style="list-style-type: none"> ▪ Server (Fujitsu) ▪ Server (IBM) ▪ SonicWall ▪ SSL Security Check ▪ Switch (Cisco Catalyst) ▪ Switch (Cisco IOS Based) ▪ Switch (HP Procurve) ▪ UNIX/Linux Device ▪ UPS Health (APC) ▪ UPS Health (Generic) ▪ UPS Health (Liebert) ▪ VMware ESX / vCenter Server ▪ Web Server ▪ Windows (Detailed via WMI) ▪ Windows (via Remote PowerShell) ▪ Windows (via WMI) ▪ Windows IIS (via SNMP) ▪ XenServer Hosts ▪ XenServer Virtual Machines
	<p>Once the auto-discovery is finished, PRTG creates a new ticket^[240] and lists the device templates that it used to create new sensors.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[368] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Credentials for Windows Systems

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
Domain or Computer Name	<p>Enter the domain or computer name of the user account with which you want to access the Windows system. PRTG uses this account for Windows Management Instrumentation (WMI) sensors and other Windows sensors.</p> <p>If you want to use a Windows local user account on the target device, enter the computer name. If you want to use a Windows domain user account (recommended), enter the domain name. PRTG automatically adds a prefix to use the NT LAN Manager (NTLM) protocol if you do not explicitly define it. Do not leave this field empty.</p>
User Name	Enter the user name for access to the Windows system. Usually, you use credentials with administrator rights.
Password	Enter the password for access to the Windows system. Usually, you use credentials with administrator rights.

Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User Name	Enter the user name for access to the Linux/Solaris/macOS system via Secure Shell (SSH) and Web-based Enterprise Management (WBEM). Usually, you use credentials with administrator rights.
Authentication Method	<p>Select the authentication method for login:</p> <ul style="list-style-type: none"> ▪ Password: Provide the password for the login. ▪ Private key: Provide an RSA private key for authentication. <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For details, see section Monitoring via SSH⁴³⁰¹.</p>
Password	This setting is only visible if you select Password above. Enter a password for access to the Linux/Solaris/macOS system via SSH and WBEM. Usually, you use credentials with administrator rights.
Private Key	This setting is only visible if you select Private key above. Paste the entire RSA private key, including the BEGIN and END lines. Make sure that a corresponding public key exists on the target device.

Setting	Description
	<ul style="list-style-type: none">  PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.  PRTG only supports RSA keys. It does not support DSA keys.  For details, see section Monitoring via SSH.  If you do not insert a private key for the first time but if you want to change the private key, you need to restart the PRTG core server service for the private key change to take effect.
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unsecure connection for WBEM. ▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM. <p> This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	<p>Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:</p> <ul style="list-style-type: none"> ▪ Default: Use one of the default ports. The default port for unsecure connections is 5988 and the default port for secure connections is 5989. ▪ Custom: Use a custom port. <p> This setting is only relevant if you use WBEM sensors.</p>
Custom WBEM Port	<p>This setting is only visible if you select Custom above. Enter a custom WBEM port. Enter an integer value.</p>
SSH Port	<p>Enter the port for SSH connections. Enter an integer value. The default port is 22.</p> <p> By default, PRTG automatically uses this setting for all SSH sensors unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Select the rights that you want to use to run the command on the target system:</p> <ul style="list-style-type: none"> ▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection. ▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for sudo to run commands on the target system, for example, as a root user. ▪ Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for sudo to run commands on the target system, for example, as a root user.

Setting	Description
	<ul style="list-style-type: none"> Run the command as a different user using 'su': Use the rights of a different user with su to run commands on the target system.
Target User Name	This setting is only visible if you select an option that includes sudo or su above. Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.
Password	This setting is only visible if you select an option that includes sudo or su with password above. Enter the password to run the sudo command or the su command.
SSH Connection Mode	<p>Select the connection mode that you want to use to access data with SSH sensors ⁴³⁰¹:</p> <ul style="list-style-type: none"> Default (recommended): This is the default monitoring method for SSH sensors. It provides the best performance and security. Compatibility mode (deprecated): Use this mode only if the default mode does not work on the target system. The compatibility mode is the SSH engine that PRTG used in previous versions and it is deprecated. <p>i We strongly recommend that you use the default SSH connection mode.</p> <p>i You can also individually select the SSH connection mode for each SSH sensor in the sensor settings.</p>

Credentials for VMware/XenServer

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
User Name	Enter the user name for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.
Password	<p>Enter the password for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.</p> <p>i Single sign-on (SSO) passwords for vSphere do not support special characters. For details, see the VMware sensors sections.</p>
VMware Protocol	Select the protocol for the connection to VMware ESXi, vCenter Server, or Citrix XenServer:

Setting	Description
	<ul style="list-style-type: none"> ▪ HTTPS (recommended): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. ▪ HTTP: Use an unsecure connection.
Session Handling	<p>Select if you want to reuse a session for VMware sensors:</p> <ul style="list-style-type: none"> ▪ Reuse a session for multiple scans (recommended): Select this option if you want a VMware sensor to reuse a single session for multiple sensor scans to query data. With this option, the sensor does not need to log in and out for each sensor scan. We recommend that you use this option because it reduces network load and log entries on the target device. This can increase performance. ▪ Create a new session for each scan: If you select this option, PRTG does not reuse a session and a VMware sensor has to log in and out for each sensor scan. This can decrease performance.

Credentials for SNMP Devices

Click  to interrupt the [inheritance](#) ^[142].

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> ▪ SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none">  SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP. ▪ SNMP v2c (recommended): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters. ▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption. <ul style="list-style-type: none">  SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in Interval Delay or Open Requests with the Probe Health sensor ^[2083], distribute the load over multiple probes ^[4503]. SNMP v1 and SNMP v2c do not have this limitation.

Setting	Description
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c above. Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>i We recommend that you use the default value.</p>
Authentication Method	<p>This setting is only visible if you select SNMP v3 above. Select the authentication method:</p> <ul style="list-style-type: none"> ▪ MD5: Use message-digest algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>i If you do not want to use authentication but you need SNMP v3, for example, because your device requires context, you can leave the Password field empty. In this case, PRTG uses SNMP_SEC_LEVEL_NOAUTH and it entirely deactivates authentication.</p> <p>i The authentication method you select must match the authentication method of your device.</p>
User Name	<p>This setting is only visible if you select SNMP v3 above. Enter the user name for access to the target SNMP device.</p> <p>i The user name that you enter must match the user name of your device.</p>
Password	<p>This setting is only visible if you select SNMP v3 above. Enter the password for access to the target SNMP device.</p> <p>i The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above. Select an encryption type:</p> <ul style="list-style-type: none"> ▪ DES: Use Data Encryption Standard (DES) as the encryption algorithm. ▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm. <p>i Net-SNMP does not support AES-192 and AES-256. They do not have RFC specifications.</p> <p>i The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above. Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p>

Setting	Description
	<p> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above. Enter a context name only if the configuration of the device requires it. Context is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer value. The default port is 161.</p> <p> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for Database Management Systems

Click  to interrupt the [inheritance](#)¹⁴².

The settings you define in this section apply to the following sensors:

- [ADO SQL v2 sensor](#)⁴⁹⁰
- [Microsoft SQL v2 sensor](#)¹⁶⁰⁷
- [MySQL v2 sensor](#)¹⁶⁷⁴
- [Oracle SQL v2 sensor](#)¹⁹²³
- [PostgreSQL sensor](#)²⁰⁶⁴

Setting	Description
Port	<p>Select the port that PRTG uses for connections to the monitored databases:</p> <ul style="list-style-type: none"> ▪ Default (recommended): PRTG automatically determines the type of the database and uses the corresponding default port to connect. PRTG uses the following default ports: <ul style="list-style-type: none"> ▫ Microsoft SQL: 1433 ▫ MySQL: 3306 ▫ Oracle SQL: 1521 ▫ PostgreSQL: 5432

Setting	Description
	<ul style="list-style-type: none"> Custom port for all database sensors: Select this option if your database management systems do not use the default ports. Enter a custom port for database connections below. <p>i PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Custom Port	<p>Enter a custom port for database connections. Enter an integer value.</p> <p>i PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Authentication Method	<p>Select the authentication method for the connection to the Structured Query Language (SQL) database:</p> <ul style="list-style-type: none"> Windows authentication with impersonation: PRTG uses the Windows credentials that you define in settings that are higher in the object hierarchy¹³⁸, for example, in the settings of the parent device; for the database connection. <ul style="list-style-type: none"> i The user whose credentials PRTG uses needs to have permission to log in to the probe system with a database sensor. This is necessary for the impersonation. SQL server authentication: Use explicit credentials for database connections. Enter a user name and password below.
User Name	<p>This setting is only visible if you select SQL server authentication above. Enter the user name for the database connection.</p>
Password	<p>This setting is only visible if you select SQL server authentication above. Enter the password for the database connection.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for AWS

Click  to interrupt the [inheritance](#)¹⁴².

■ For more information about the permissions that are necessary to query the AWS API, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)

Setting	Description
Access Key	Enter the Amazon Web Services (AWS) access key.

Setting	Description
Secret Key	Enter the AWS secret key.

Credentials for Dell EMC

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
User	Enter the user name for access to the Dell EMC system.
Password	Enter the password for access to the Dell EMC system.
Port	Enter the port for the connection to the Dell EMC system. The default port for secure connections is 443 .

Credentials for Microsoft 365

 The [Microsoft 365 Service Status sensor](#)^[1546] and the [Microsoft 365 Service Status Advanced sensor](#)^[1557] use the following credentials to authenticate with Azure Active Directory (Azure AD).

 For more information about the credentials and the permissions that are necessary to use the Microsoft 365 sensors, see the Knowledge Base: [How do I obtain credentials and set permissions for the Microsoft 365 sensors?](#)

Setting	Description
Tenant ID	Enter the Azure AD tenant ID.  A tenant ID must be a 32-digit sequence in hexadecimal notation.
Client ID	Enter the Azure AD client ID.
Client Secret	Enter the Azure AD client secret.

Credentials for Microsoft Azure

 The [Microsoft Azure Subscription Cost sensor](#)^[1560] and the [Microsoft Azure Virtual Machine sensor](#)^[1582] use the following credentials to authenticate with Azure AD.

 For more information about the credentials and permissions that are necessary use the Microsoft Azure sensors, see the Knowledge Base: [How do I obtain credentials and create custom roles for the Microsoft Azure sensors?](#)

Setting	Description
Tenant ID	Enter the Azure AD tenant ID.  A tenant ID must be a 32-digit sequence in hexadecimal notation.
Client ID	Enter the Azure AD client ID.
Client Secret	Enter the Azure AD client secret.
Subscription ID	Enter the Azure AD subscription ID.

Credentials for MQTT

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
Authentication Method	Select if you want to connect without credentials or define credentials for access to the MQTT broker. <ul style="list-style-type: none"> None (default): Connect without credentials. User name and password: Define credentials for the connection.
User	This setting is only visible if you select User name and password above. Enter the user name for access to the Message Queue Telemetry Transport (MQTT) broker.
Password	This setting is only visible if you select User name and password above. Enter the password for access to the MQTT broker.
Port	Enter the port for the connection to the MQTT broker. The default port for secure connections is 8883 and the default port for unsecure connections is 1883 .
Transport-Level Security	Select if you want to use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection: <ul style="list-style-type: none"> Do not use transport-level security: Establish the connection without connection security. Use transport-level security: Establish the connection with the strongest SSL/TLS method that the target device provides.
Server Authentication	This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for server authentication. <ul style="list-style-type: none"> Disable (default): Do not use a certificate for server authentication.

Setting	Description
	<ul style="list-style-type: none"> ▪ Enable: Use a certificate for server authentication.
CA Certificate	<p>Paste the certificate authority (CA) certificate for the verification of the MQTT broker.</p> <p> The certificate must be in Privacy-Enhanced Mail (PEM) format.</p>
Client Authentication	<p>This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for client authentication.</p> <ul style="list-style-type: none"> ▪ Disable (default): Do not use a certificate for client authentication. ▪ Enable: Use a certificate for client authentication.
Client Certificate	<p>Paste the certificate that you created for authenticating the sensor against the MQTT broker.</p> <p> The certificate must be in PEM format.</p>
Client Key	<p>Enter the client key for access to the MQTT broker.</p> <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	<p>Enter the password for the client key.</p>

Credentials for OPC UA

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
Port	<p>Enter the port for the connection to the OPC Unified Architecture (OPC UA) server. The default port for secure connections is 4840.</p>
Server Path	<p>Enter the path of the OPC UA server endpoint if you run more than one server under the same IP address or DNS name.</p>
Security Mode	<p>Select if you want to use encryption:</p> <ul style="list-style-type: none"> ▪ None (default): Do not use encryption. ▪ Sign: Sign messages between the sensor and the OPC UA server. ▪ Sign & Encrypt: Sign and encrypt messages between the sensor and the OPC UA server.

Setting	Description
Security Policy	<p>This setting is only visible if you select Sign or Sign & Encrypt above. Select if you want to use a security policy and define which policy you want to use:</p> <ul style="list-style-type: none"> ▪ None (default): Do not use a security policy. ▪ Basic256Sha256: Use the Basic256Sha256 security policy. ▪ Basic256: Use the Basic256 security policy.
Client Certificate	<p>Paste the certificate that you created for authenticating the sensor against the OPC UA server.</p> <p> The certificate must meet the following requirements:</p> <ul style="list-style-type: none"> ▪ The key size must be 2048-bit. ▪ The secure hash algorithm must be SHA256. ▪ DataEncipherment must be part of the KeyUsage certificate extension. ▪ A uniform resource indicator (URI) must be set in subjectAltName. ▪ The certificate must be in Privacy-Enhanced Mail (PEM) format.
Client Key	<p>Enter the client key for access to the OPC UA server.</p> <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	<p>Enter the password for the client key.</p>
Authentication Method	<p>Select if you want to connect without credentials or define credentials for access to the OPC UA server:</p> <ul style="list-style-type: none"> ▪ Anonymous (default): Connect without credentials. ▪ Username/Password: Define credentials for the connection. <p> Most OPC UA servers do not support Username/Password authentication without a client certificate. To use Username/Password authentication, select Sign or Sign & Encrypt under Security Mode and Basic256Sha256 or Basic256 under Security Policy and enter the Client Certificate, Client Key, and Client Key Password that you want to use.</p>
User	<p>This setting is only visible if you select Username/Password above. Enter the user name for access to the OPC UA server.</p>
Password	<p>This setting is only visible if you select Username/Password above. Enter the password for access to the OPC UA server.</p>

Credentials for Soffico Orchestra

Click  to interrupt the [inheritance](#)  ¹⁴².

Setting	Description
Authentication Method	Select if you want to connect without credentials or define credentials for access to the Orchestra platform: <ul style="list-style-type: none"> ▪ None (default): Connect without credentials. ▪ Username/Password: Define credentials for the connection.
User	This setting is only visible if you select Username/Password above. Enter the user name for access to the Orchestra platform.
Password	This setting is only visible if you select Username/Password above. Enter the password for access to the Orchestra platform.
Timeout (Sec.)	Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).
Port	Enter the port for the connection to the Orchestra platform. The default port for secure connections is 8443 and the default port for unsecure connections is 8019.
Protocol	Select the protocol that you want to use for the connection to the Orchestra platform: <ul style="list-style-type: none"> ▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. ▪ HTTP: Use an unsecure connection.

Credentials for Veeam

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User	Enter the user name for access to the Veeam Backup Enterprise Manager.
Password	Enter the password for access to the Veeam Backup Enterprise Manager.
Port	Enter the port for the connection to the Veeam Backup Enterprise Manager. The default port for secure connections is 9398.

Access Rights

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User Group Access	<p>Select the user groups ⁴²¹⁹ that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the object. The object neither shows up in lists nor in the device tree. <ul style="list-style-type: none"> ⓘ There is one exception: If a user in this user group has access to a child object, the parent object is visible in the device tree but users in this user group cannot access it. ▪ Read access: Users in this group can see the object and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the object, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the object, view its monitoring results, edit its settings, and edit its access rights settings. <p>To automatically set all child objects to inherit this object's access rights, enable the Revert children's access rights to inherited option.</p> <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

ⓘ Click OK to save your settings. If you close the dialog without saving, all changes to the settings are lost.

3 Add a Device

- [Add a Group](#)  323
- [Add a Device](#)  340
- [Add a Sensor](#)  361

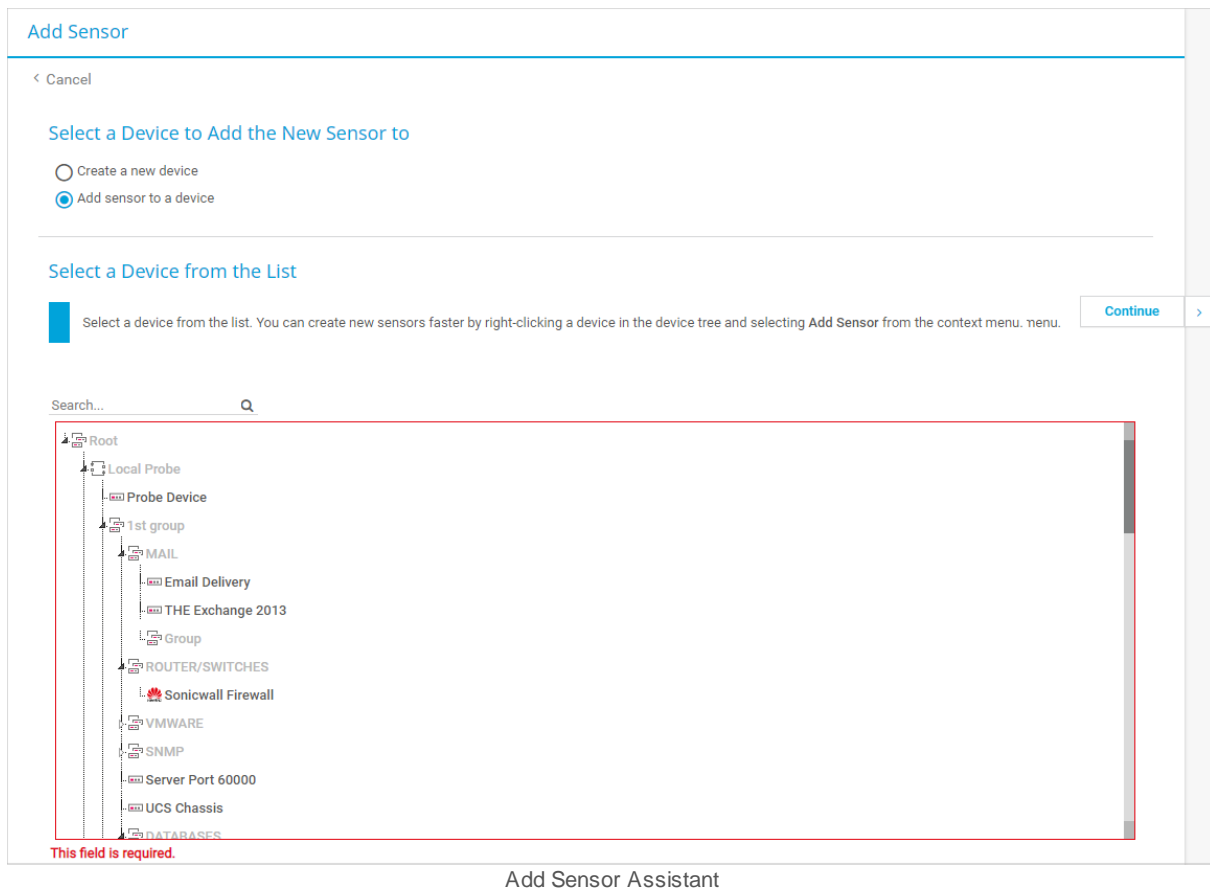

7.2.4 Add a Sensor

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

There are several ways to manually add a sensor:

- Select Sensors | Add Sensor from the [main menu bar](#)^[282]. A dialog appears that guides you through the process of adding a new sensor.
- Hover over  and select Add Sensor from the menu.
- Select Add Sensor from the [context menu](#)^[266] of a device to which you want to add the new sensor. This skips step 1 and leads you directly to [step 2](#)^[362].
- Click the Add Sensor button at the end of a device's sensor list on the device tree screen or above the geographical map on the right.

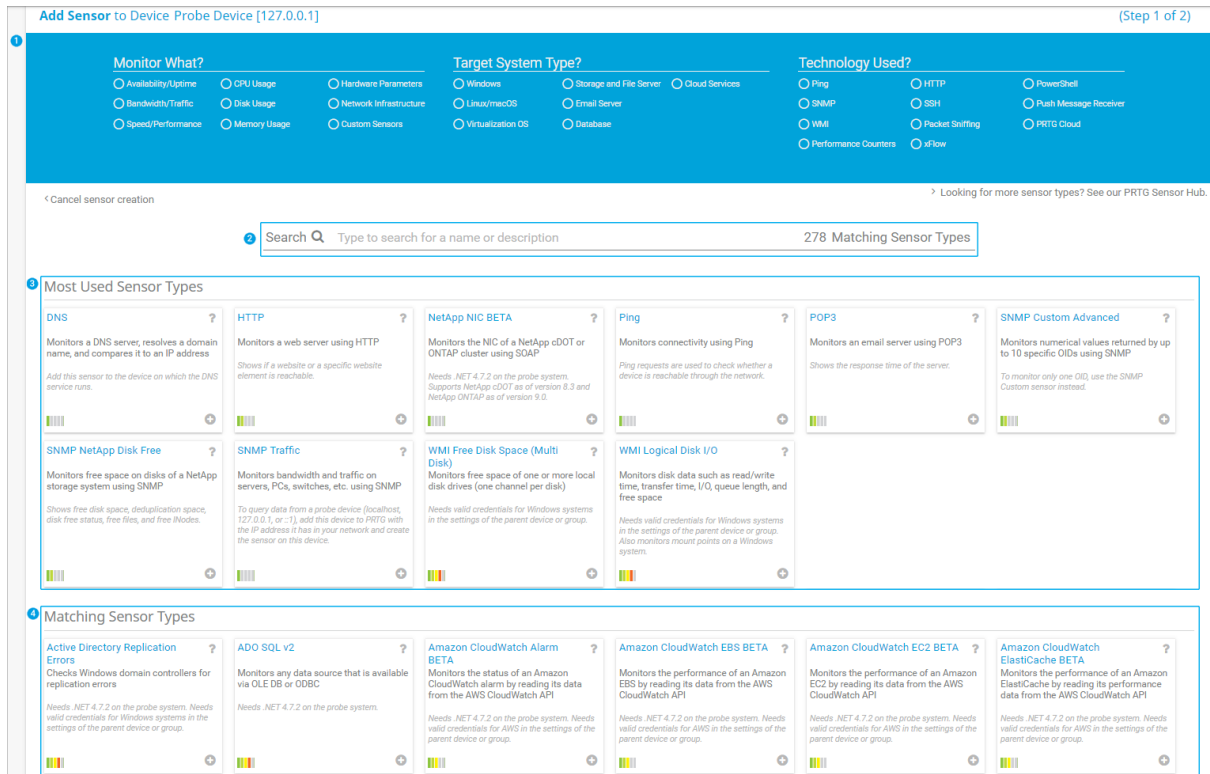

Preparation: Select a Device

- Select Add sensor to a device.
- Select the device you want to add the new sensor to.
- Click Continue.

The Add Sensor dialog appears.

Step 1: Choose Sensor

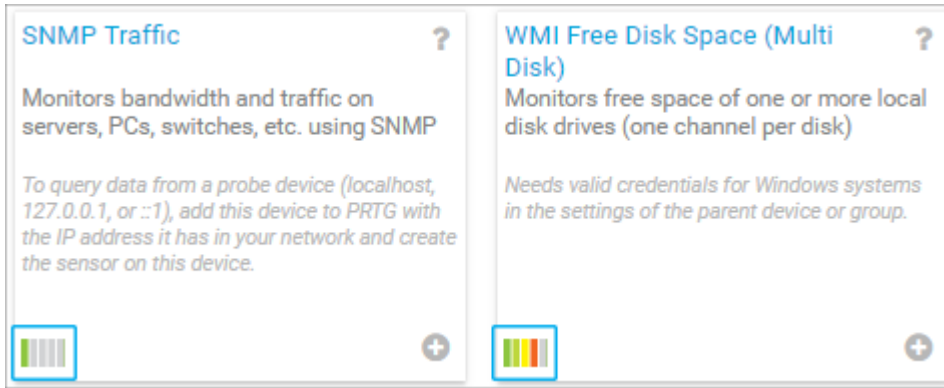

Add Sensor Dialog

In the Add Sensor dialog, you can:

- Choose appropriate criteria to filter the sensors **1**.
 - Select the type of parameter that you want to monitor via Monitor What?
 - Specify the type of target system that you want to monitor and see what sensors are available for this type of hardware via Target System Type?
 - Select the technology that you want to use for monitoring (for example SNMP or WMI) via Technology Used?
- Enter (parts of) the name into the search box **2**.
- Go through the list of the most used sensor types **3**.
 - i** PRTG suggests sensors for the selected device. This recommendation is automatically calculated based on the current user's sensor usage. It shows the ten most commonly used sensors if there are already enough sensors for the recommendation to use.
- Go through the list of all matching sensor types **4**.
 - If you cannot find a suitable sensor, search for custom sensors in our [PRTG Sensor Hub](#). To do so, click Looking for more sensor types? above the search box or below the list of sensors.
 - i** For more information, see section [List of Available Sensor Types](#) ⁴⁶¹⁵, section PRTG Sensor Hub Sensors.
- Click the sensor box to select the sensor.
- i** If you are unsure which sensor provides the information that you need, we recommend that you use the filter categories to reduce the amount of matching sensor types.

❶ Also consider whether a sensor's [performance impact](#)^[4243] is high or low. To do so, check the bar in the lower-left corner of the sensor box. For further information, see the Knowledge Base: [How can I speed up PRTG—especially for large installations?](#) (especially section 4 - Sensor Type and Monitoring).

■ For an overview list of sensors sorted by performance impact, see section [List of Sensors by Performance Impact](#)^[4672].

Sensor with Very Low Performance Impact and with High Performance Impact

■ For more information about a sensor, click [?](#) to see the section of the respective sensor. You can also go to the [List of Available Sensor Types](#)^[4581] section to find a comprehensive overview of sensors.

Step 2: Define Sensor Settings

The sensor settings dialog opens where you can define the [sensor settings](#)^[476] and create the sensor.

Create Objects Manually

- [Add an Auto-Discovery Group](#)^[300]
- [Add a Group](#)^[323]
- [Add a Device](#)^[340]
- [Add a Sensor](#)^[361]

7.3 Manage Device Tree

In the device tree, click the Management tab to enter a different view of your devices and sensors. While in this view, you can move monitoring objects via drag-and-drop. You can also select objects to view and edit their settings. Any changes that you make in this view immediately take effect. To arrange objects in the tree, you have the following options.

Move or Clone a Sensor

You can change the position of a sensor on the same device or you can clone a sensor to a different device.

- On the same device, drag any sensor and drop it where you want it. The sensor moves to this position and the other sensors line up underneath it.
- Drag any sensor from a device and drop it on a different device to clone a sensor. This creates the same sensor with the same settings on the new device. The original sensor does not change.
 - ① Cloned sensors initially show the Paused [status](#)^[256] to give you the chance to change any settings before monitoring starts. Check the settings and [resume](#)^[256] monitoring.
 - ① You cannot clone **fixed** objects such as the root group, a probe device, or PRTG system-internal sensors.
 - ① To clone entire groups or devices, use the [clone object](#)^[4010] functionality in the object's [context menu](#)^[259].

Move a Group or Device

You can change the position of a group or a device via drag-and-drop.

- On the same probe or group, drag any group or device and move it up or down the device tree. A small red arrow appears that shows the future position. When you drop the group or device, it moves to this position and the other probes, groups, and devices line up underneath it.
- Drag any group or device from one probe or group and drop it on a different probe or group. A small red arrow appears that shows the future position. When you drop the group or device, it moves to the new probe or group and the other groups and devices line up underneath it. This way, you can change the probe that a group or device is part of or you can add groups or devices to other groups.
- ① You cannot move the local probe, the hosted probe, or remote probes.

Multi-Edit Object Settings

You can use multi-edit for object settings:

- Hold down the **Ctrl** key and select multiple objects of the same type, for example, multiple groups, devices, or sensors.
- In the dialog that appears, select the properties that you want to edit, change the respective settings, and click Save. The changes are applied to all selected objects.

The dialog is the same as described in section [Multi-Edit](#)^[4015].

7.4 Root Group Settings

The root group is the highest instance in the object hierarchy and it is the parent to most other objects. Therefore, most objects inherit settings from the root group. So, before you create your own sensors, it is a good idea to review the root group's settings to make sure that they suit your needs.

i If necessary, you can override every setting for every single child object. To do so, disable the respective Inherit option of an object.

Root Group Settings

The following settings are available on the Settings tab. All of the settings that you define here can be inherited to all other objects in your setup.

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Basic Group Settings

Setting	Description
Group Name	<p>Enter a meaningful name to identify the group. By default, PRTG displays it in the device tree^[183].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Status	<p>Select the monitoring status of the group:</p> <ul style="list-style-type: none"> Started: Monitor the group. Paused: Pause monitoring for the group. All sensors on all devices in the group are in the Paused status^[258] until you change this setting.

Location

Setting	Description
Location (for Geo Maps)	<p>If you want to use Geo Maps^[4026], enter a location in the first line. Geographical maps then display objects like devices or groups with a status icon using a color code similar to the sensor status icons^[197] (green–yellow–orange–red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, as PRTG automatically parses latitude and longitude, for example, enter 49.452778 11.077778, or enter 49.452778 any 11.077778 text.</p> <p>A minus sign (-) in the first line hides an object from a geographical map. In this case, you can enter location information in line two and following.</p> <p>You can define a specific label for each location. Enter a string denoting the label in the first line and provide the coordinates in the second line. This geographical marker then shows the object with the label in the geographical map.</p> <p>i The preview map always has a road map layout regardless of the map layout you set in User Interface^[4175].</p>

Credentials for Windows Systems

Setting	Description
Domain or Computer Name	<p>Enter the domain or computer name of the user account with which you want to access the Windows system. PRTG uses this account for Windows Management Instrumentation (WMI) sensors and other Windows sensors.</p> <p>If you want to use a Windows local user account on the target device, enter the computer name. If you want to use a Windows domain user account (recommended), enter the domain name. PRTG automatically adds a prefix to use the NT LAN Manager (NTLM) protocol if you do not explicitly define it. Do not leave this field empty.</p>
User Name	Enter the user name for access to the Windows system. Usually, you use credentials with administrator rights.
Password	Enter the password for access to the Windows system. Usually, you use credentials with administrator rights.

Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems

Setting	Description
User Name	Enter the user name for access to the Linux/Solaris/macOS system via Secure Shell (SSH) and Web-based Enterprise Management (WBEM). Usually, you use credentials with administrator rights.
Authentication Method	<p>Select the authentication method for login:</p> <ul style="list-style-type: none"> ▪ Password: Provide the password for the login. ▪ Private key: Provide an RSA private key for authentication. <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For details, see section Monitoring via SSH⁴³⁰¹.</p>
Password	This setting is only visible if you select Password above. Enter a password for access to the Linux/Solaris/macOS system via SSH and WBEM. Usually, you use credentials with administrator rights.
Private Key	This setting is only visible if you select Private key above. Paste the entire RSA private key, including the BEGIN and END lines. Make sure that a corresponding public key exists on the target device.

Setting	Description
	<ul style="list-style-type: none"> ❗ PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys. ❗ PRTG only supports RSA keys. It does not support DSA keys. ■ For details, see section Monitoring via SSH⁴³⁰¹. ❗ If you do not insert a private key for the first time but if you want to change the private key, you need to restart the PRTG core server service⁴²²⁵ for the private key change to take effect.
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unsecure connection for WBEM. ▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM. <p>❗ This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	<p>Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:</p> <ul style="list-style-type: none"> ▪ Default: Use one of the default ports. The default port for unsecure connections is 5988 and the default port for secure connections is 5989. ▪ Custom: Use a custom port. <p>❗ This setting is only relevant if you use WBEM sensors.</p>
Custom WBEM Port	<p>This setting is only visible if you select Custom above. Enter a custom WBEM port. Enter an integer value.</p>
SSH Port	<p>Enter the port for SSH connections. Enter an integer value. The default port is 22.</p> <p>❗ By default, PRTG automatically uses this setting for all SSH sensors⁴⁶¹² unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Select the rights that you want to use to run the command on the target system:</p> <ul style="list-style-type: none"> ▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection. ▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for sudo to run commands on the target system, for example, as a root user. ▪ Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for sudo to run commands on the target system, for example, as a root user.

Setting	Description
	<ul style="list-style-type: none"> Run the command as a different user using 'su': Use the rights of a different user with su to run commands on the target system.
Target User Name	This setting is only visible if you select an option that includes sudo or su above. Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.
Password	This setting is only visible if you select an option that includes sudo or su with password above. Enter the password to run the sudo command or the su command.
SSH Connection Mode	<p>Select the connection mode that you want to use to access data with SSH sensors ⁴³⁰⁷:</p> <ul style="list-style-type: none"> Default (recommended): This is the default monitoring method for SSH sensors. It provides the best performance and security. Compatibility mode (deprecated): Use this mode only if the default mode does not work on the target system. The compatibility mode is the SSH engine that PRTG used in previous versions and it is deprecated. <p>i We strongly recommend that you use the default SSH connection mode.</p> <p>i You can also individually select the SSH connection mode for each SSH sensor in the sensor settings.</p>

Credentials for VMware/XenServer

Setting	Description
User Name	Enter the user name for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.
Password	<p>Enter the password for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.</p> <p>i Single sign-on (SSO) passwords for vSphere do not support special characters. For details, see the VMware sensors sections.</p>
VMware Protocol	Select the protocol for the connection to VMware ESXi, vCenter Server, or Citrix XenServer:

Setting	Description
	<ul style="list-style-type: none"> ▪ HTTPS (recommended): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. ▪ HTTP: Use an unsecure connection.
Session Handling	<p>Select if you want to reuse a session for VMware sensors:</p> <ul style="list-style-type: none"> ▪ Reuse a session for multiple scans (recommended): Select this option if you want a VMware sensor to reuse a single session for multiple sensor scans to query data. With this option, the sensor does not need to log in and out for each sensor scan. We recommend that you use this option because it reduces network load and log entries on the target device. This can increase performance. ▪ Create a new session for each scan: If you select this option, PRTG does not reuse a session and a VMware sensor has to log in and out for each sensor scan. This can decrease performance.

Credentials for SNMP Devices

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> ▪ SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> ❗ SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP. ▪ SNMP v2c (recommended): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters. ▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption. <ul style="list-style-type: none"> ❗ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in Interval Delay or Open Requests with the Probe Health sensor²⁰⁸³, distribute the load over multiple probes⁴⁶⁰³. SNMP v1 and SNMP v2c do not have this limitation.
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c above. Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>❗ We recommend that you use the default value.</p>

Setting	Description
Authentication Method	<p>This setting is only visible if you select SNMP v3 above. Select the authentication method:</p> <ul style="list-style-type: none"> ▪ MD5: Use message-digest algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>i If you do not want to use authentication but you need SNMP v3, for example, because your device requires context, you can leave the Password field empty. In this case, PRTG uses SNMP_SEC_LEVEL_NOAUTH and it entirely deactivates authentication.</p> <p>i The authentication method you select must match the authentication method of your device.</p>
User Name	<p>This setting is only visible if you select SNMP v3 above. Enter the user name for access to the target SNMP device.</p> <p>i The user name that you enter must match the user name of your device.</p>
Password	<p>This setting is only visible if you select SNMP v3 above. Enter the password for access to the target SNMP device.</p> <p>i The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above. Select an encryption type:</p> <ul style="list-style-type: none"> ▪ DES: Use Data Encryption Standard (DES) as the encryption algorithm. ▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm. <p>i Net-SNMP does not support AES-192 and AES-256. They do not have RFC specifications.</p> <p>i The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above. Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p>i The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above. Enter a context name only if the configuration of the device requires it. Context is a collection of management information that is accessible by an SNMP device. Enter a string.</p>

Setting	Description
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer value. The default port is 161.</p> <p>i We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for Database Management Systems

The settings you define in this section apply to the following sensors:

- [ADO SQL v2 sensor](#) 
- [Microsoft SQL v2 sensor](#) 
- [MySQL v2 sensor](#) 
- [Oracle SQL v2 sensor](#) 
- [PostgreSQL sensor](#) 

Setting	Description
Port	<p>Select the port that PRTG uses for connections to the monitored databases:</p> <ul style="list-style-type: none"> ▪ Default (recommended): PRTG automatically determines the type of the database and uses the corresponding default port to connect. PRTG uses the following default ports: <ul style="list-style-type: none"> ▫ Microsoft SQL: 1433 ▫ MySQL: 3306 ▫ Oracle SQL: 1521 ▫ PostgreSQL: 5432 ▪ Custom port for all database sensors: Select this option if your database management systems do not use the default ports. Enter a custom port for database connections below. <p>i PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Custom Port	<p>Enter a custom port for database connections. Enter an integer value.</p> <p>i PRTG uses this custom port for all database sensors and for connections to all your databases.</p>

Setting	Description
Authentication Method	<p>Select the authentication method for the connection to the Structured Query Language (SQL) database:</p> <ul style="list-style-type: none"> Windows authentication with impersonation: PRTG uses the Windows credentials that you define in settings that are higher in the object hierarchy¹³⁸, for example, in the settings of the parent device; for the database connection. <ul style="list-style-type: none"> i The user whose credentials PRTG uses needs to have permission to log in to the probe system with a database sensor. This is necessary for the impersonation. SQL server authentication: Use explicit credentials for database connections. Enter a user name and password below.
User Name	This setting is only visible if you select SQL server authentication above. Enter the user name for the database connection.
Password	This setting is only visible if you select SQL server authentication above. Enter the password for the database connection.
Timeout (Sec.)	Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).

Credentials for AWS

■ For more information about the permissions that are necessary to query the AWS API, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)

Setting	Description
Access Key	Enter the Amazon Web Services (AWS) access key.
Secret Key	Enter the AWS secret key.

Windows Compatibility Options

If you experience problems when you monitor via Windows sensors, use the following compatibility options for troubleshooting.

Setting	Description
Preferred Data Source	i This setting only applies to hybrid sensors that use both performance counters and Windows Management Instrumentation (WMI). The

Setting	Description
	<p>setting does not apply to other sensors.</p> <p>Define the method that Windows sensors use to query data:</p> <ul style="list-style-type: none"> ▪ Performance counters and WMI as fallback: Try to query data via performance counters. If this is not possible, establish a connection via WMI. ▪ Performance counters only: Query data via performance counters only. If this is not possible, the sensor returns no data. ▪ WMI only (recommended): Query data via WMI only. If this is not possible, the sensor returns no data. We recommend that you use this option.
Timeout Method	<p>Select the time that the sensor waits for the return of the WMI query before the sensor cancels the query and shows an error message:</p> <ul style="list-style-type: none"> ▪ Use 1.5x scanning interval (recommended): Multiply the scanning interval of the sensor by 1.5 and use the resulting value. ▪ Set manually: Manually enter a timeout value. <p>i We recommend that you use the default value.</p> <p>i If you experience ongoing timeout errors, try increasing the timeout value.</p>
Timeout (Sec.)	<p>This setting is only visible if you select Set manually above. Enter the time the sensor waits for the return of its WMI query before it cancels it and shows an error message. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p>

SNMP Compatibility Options

If you experience problems when you monitor via Simple Network Management Protocol (SNMP) sensors, use the following compatibility options for troubleshooting.

Setting	Description
SNMP Delay (ms)	<p>Enter the time in milliseconds (ms) that PRTG waits between two SNMP requests. This can increase device compatibility. Enter an integer value. You can define a delay between 0 and 100. PRTG does not support higher delays.</p> <p>i We recommend that you use the default value.</p> <p>i If you experience SNMP connection failures, try increasing the delay.</p>
Failed Requests	<p>Select if an SNMP sensor tries again after a request fails:</p>

Setting	Description
Overflow Values	<ul style="list-style-type: none"> ▪ Retry (recommended): Try again if an SNMP request fails. This can prevent false error messages because of temporary timeout failures. ▪ Do not retry: Do not retry if an SNMP request fails. If you select this option, an SNMP sensor shows a Down status earlier. <p>Select how PRTG handles overflow values. Some devices do not correctly handle internal buffer overflows. This can cause false peaks.</p> <ul style="list-style-type: none"> ▪ Ignore overflow values: Ignore overflow values and do not include them in the monitoring data. We recommend that you use this option. ▪ Handle overflow values as valid results: Regard all overflow values as regular data and include them in the monitoring data. <p>i If you experience problems because of strange peaks in your data graphs, change this option. Peaks might indicate that the monitored device resets counters without an overflow. PRTG interprets such behavior as overflow that results in data peaks. Select the option Ignore overflow values in this case. For more details, see the Knowledge Base: What is the Overflow Values setting in the SNMP Compatibility Options?</p>
Zero Values	<p>Select how PRTG handles zero values. Some devices send incorrect zero values. This can cause false peaks.</p> <ul style="list-style-type: none"> ▪ Ignore zero values for delta sensors (recommended): Ignore zero values and do not include them in the monitoring data. We recommend that you use this option. <p>i If you experience problems, try changing this option.</p> <ul style="list-style-type: none"> ▪ Handle zero values as valid results for delta sensors: Regard all zero values as regular data and include them in the monitoring data.
32-bit/64-bit Counters	<p>Select the type of traffic counters that PRTG searches for on a device:</p> <ul style="list-style-type: none"> ▪ Use 64-bit counters if available (recommended): The interface scan uses 64-bit traffic counters, if available. This can avoid buffer overflows in the devices <p>i We recommend that you use the default value.</p> <p>i If you experience problems, try changing this option.</p> <ul style="list-style-type: none"> ▪ Use 32-bit counters only: The interface scan always uses 32-bit traffic counters, even if 64-bit counters are available. This can make monitoring more reliable for some devices.
Request Mode	<p>Select the request method that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> ▪ Use multi get (recommended): Bundle multiple SNMP requests into one request. We recommend that you use this option. <p>i If you experience problems, try changing this option.</p> <ul style="list-style-type: none"> ▪ Use single get: Use one request for each SNMP value. This can increase compatibility with older devices.

Setting	Description
Walk Mode	<p data-bbox="488 360 1342 456">  PRTG uses paging for SNMP requests. This means that if a sensor has to query more than 20 object identifiers (OID), it automatically polls the OIDs in packages of 20 OIDs each. </p> <p data-bbox="488 506 1342 533">Select the kind of SNMP walk that PRTG uses for SNMP sensors:</p> <ul data-bbox="488 555 1342 891" style="list-style-type: none"> <li data-bbox="488 555 1342 779"> <p data-bbox="488 555 1342 645">  Use GETBULK requests (recommended): Request the next x OIDs in one SNMP request. The default value is 10. It is dynamic based on the response size. </p> <p data-bbox="488 645 1342 779">  This option only works with devices that support SNMP version v2c or higher. Make sure that you set the correct SNMP Version in the Credentials for SNMP Devices settings of the parent device or inherit it from objects that are higher in the object hierarchy^[138]. </p> <li data-bbox="488 801 1342 891"> <p data-bbox="488 801 1342 891">  Use GETNEXT requests: Request one OID at a time. This can increase compatibility with older devices or with devices that have insufficient SNMP BULKWALK support. </p>
Port Name Template	<p data-bbox="488 943 1342 1256"> Select how PRTG displays the name of SNMP sensors. Enter a template that uses several variables. When you add new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID, several fields with interface descriptions are usually available. They are different for every device and OID. PRTG uses the information in these fields to name the sensors. If a field is empty or if it is not available, PRTG adds an empty string to the name. By default, the port name template is ([port]) [ifalias] [ifsensor], which creates a name like (001) Ethernet1 Traffic. You can use and combine any field names that are available at an OID of your device, for example: </p> <ul data-bbox="488 1279 1342 1765" style="list-style-type: none"> <li data-bbox="488 1279 1342 1312"> <p data-bbox="488 1279 1342 1312">  [port]: The port number of the monitored interface. </p> <li data-bbox="488 1335 1342 1391"> <p data-bbox="488 1335 1342 1391">  [ifalias]: The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling. </p> <li data-bbox="488 1413 1342 1469"> <p data-bbox="488 1413 1342 1469">  [ifname]: The textual name of the monitored interface as assigned by the local device. </p> <li data-bbox="488 1491 1342 1592"> <p data-bbox="488 1491 1342 1592">  [ifdescr]: A textual string containing information about the monitored device or interface, for example, manufacturer, product name, or version. </p> <li data-bbox="488 1615 1342 1671"> <p data-bbox="488 1615 1342 1671">  [ifspeed]: An estimate of the monitored interface's current bandwidth (Kbit/s). </p> <li data-bbox="488 1693 1342 1765"> <p data-bbox="488 1693 1342 1765">  [ifsensor]: The type of the sensor, this is Traffic or RMON. This helps to differentiate between SNMP Traffic^[3094] and SNMP RMON^[3021] sensors. </p> <p data-bbox="488 1787 1342 1877">  For more information about SNMP sensor names, see the Knowledge Base: How can I change the defaults for names automatically generated for new SNMP sensors? </p>
Port Name Update	<p data-bbox="488 1921 1342 1989"> Select how PRTG reacts if you change the names of ports in your physical device (for example, a switch or router): </p>

Setting	Description
Port Identification	<ul style="list-style-type: none"> ▪ Keep port names (use this if you edit the names in PRTG): Do not automatically adjust sensor names. This is the best option if you want to manually change names in PRTG. ▪ Automatically update sensor names if port names change in the device: If PRTG detects port name changes in your physical device, it tries to automatically adjust the sensor names accordingly. <p> For more information about automatic name updates, see the Knowledge Base: Automatically update port name and number for SNMP Traffic sensors when the device changes them</p>
Start Interface Index	<p>Select the field that PRTG uses for SNMP interface identification:</p> <ul style="list-style-type: none"> ▪ Automatic identification (recommended): Try the ifAlias field first to identify an SNMP interface and then try ifDescr. <ul style="list-style-type: none">  PRTG does not automatically try ifName. ▪ Use ifAlias: For most devices, ifAlias is the best field to use for unique interface names. ▪ Use ifDescr: Use this option if the port order of your device changes after a restart, and if no ifAlias field is available. For example, this is the best option for Cisco ASA devices. <ul style="list-style-type: none">  If you use this option, it is important that your device returns unique interface names in the ifDescr field. ▪ Use ifName: You can also use this option if no unique ifAlias is available. <ul style="list-style-type: none">  If you use this option, it is important that your device returns unique interface names in the ifName field. ▪ Do not update ports: Use this option to disable the automatic port identification. <p> This setting only applies to SNMP Traffic sensors^[3094] and to Cisco IP SLA sensors^[658].</p> <p>Enter the index at which PRTG starts to query the interface range during sensor creation. Enter 0 for the automatic mode.</p> <p> We recommend that you use the default value.</p>
End Interface Index	<p> This setting only applies to SNMP Traffic sensors^[3094] and to Cisco IP SLA sensors^[658].</p> <p>Enter the index at which PRTG stops querying the interface range during sensor creation. Enter 0 for the automatic mode.</p> <p> We recommend that you use the default value.</p>

Proxy Settings for HTTP Sensors

The proxy settings determine how a sensor connects to a URL. You can enter data for an HTTP proxy server that sensors use when they connect via HTTP or HTTPS.

- i This setting only applies to HTTP sensors and how they monitor. To change the proxy settings for the PRTG core server, see section [Core & Probes](#)⁴²⁰³.
- i The [SSL Certificate sensor](#)³³⁰² and the [SSL Security Check sensor](#)³³¹⁵ do not support HTTP proxies but you can configure connections via SOCKS proxies in the sensors' settings.

Setting	Description
IP Address/DNS Name	Enter the IP address or Domain Name System (DNS) name of the proxy server. If you leave this field empty, HTTP sensors do not use a proxy.
Port	Enter the port number of the proxy. The default is 8080. Enter an integer value.
User Name	<p>If the proxy requires authentication, enter the user name for the proxy login.</p> <p>i Only basic authentication is available. Enter a string or leave the field empty.</p>
Password	<p>If the proxy requires authentication, enter the password for the proxy login.</p> <p>i Only basic authentication is available. Enter a string or leave the field empty.</p>

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To close an active one-time maintenance window before the end date, select Do not set up a one-time maintenance window.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>

Access Rights

Setting	Description
User Group Access	<p>Select the user groups ⁴²¹⁹ that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the object. The object neither shows up in lists nor in the device tree. <ul style="list-style-type: none"> ⓘ There is one exception: If a user in this user group has access to a child object, the parent object is visible in the device tree but users in this user group cannot access it. ▪ Read access: Users in this group can see the object and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the object, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the object, view its monitoring results, edit its settings, and edit its access rights settings. <p>To automatically set all child objects to inherit this object's access rights, enable the Revert children's access rights to inherited option.</p> <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>ⓘ Custom channel types are only available on sensor level.</p>

Advanced Network Analysis

Setting	Description
Unusual Detection	<p>Select if you want to use the unusual detection^[4188] for sensors:</p> <ul style="list-style-type: none"> ▪ Enabled: Activate the unusual detection for this object and, by default, for all objects underneath in the object hierarchy^[138]. Sensors that are affected by this setting show the Unusual status if PRTG detects unusual activity. ▪ Disabled: Do not activate the unusual detection. PRTG ignores unusual values for sensors that are affected by this setting. These sensors do not show the Unusual status. <p>i You can configure the behavior of the unusual detection or completely disable it in the system settings^[4188].</p>
Similar Sensors Detection	<p>Select if you want to activate the similar sensors^[215] analysis:</p> <ul style="list-style-type: none"> ▪ Enabled: Activate the similar sensors detection for this object and, by default, for all objects underneath in the object hierarchy. PRTG considers all sensors that are affected by this setting during the similarity analysis. ▪ Disabled: Do not activate the similar sensors detection. PRTG does not consider sensors that are affected by this setting during the similarity analysis. <p>i You can configure the depth of the analysis of the similar sensors detection or completely disable it in the system settings^[4190].</p>
System Information	<p>Select if you want to retrieve and show system information^[231] for your devices:</p> <ul style="list-style-type: none"> ▪ Enabled: Activate the system information feature for this object and, by default, for all objects underneath in the hierarchy. ▪ Disabled: Do not activate the system information feature. <p>i The System Information feature is enabled by default. To retrieve the data, PRTG automatically uses the credentials for Windows systems^[452] and the credentials for SNMP devices^[453] that you entered in the device settings or that the device inherits^[138] from a parent object like the root group. Consider this when you monitor devices that are outside of your local network, especially when you use SNMP v1 or SNMP v2c, which do not provide encryption.</p> <p> This setting is not available on the hosted probe of a PRTG Hosted Monitor instance.</p>

i Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

Basic Probe Settings

Setting	Description
Probe Name	<p>Enter a meaningful name to identify the probe. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[4031], reports^[4069], maps^[4095], libraries^[4047], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>
Status	<p>Select the monitoring status of the probe:</p> <ul style="list-style-type: none"> ▪ Started: Monitor the probe. ▪ Paused: Pause monitoring for the probe. All sensors on all devices on the probe are in the Paused status^[256] until you change this setting.
Priority	<p>Select a priority^[253] for the probe. This setting determines the position of the probe in lists. The highest priority is at the top of a list. You can choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

- For more information, see section [Inheritance of Settings](#)^[142].

Location

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
Location (for Geo Maps)	<p>If you want to use Geo Maps⁴⁰²⁶, enter a location in the first line. Geographical maps then display objects like devices or groups with a status icon using a color code similar to the sensor status icons¹⁹⁷ (green–yellow–orange–red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, as PRTG automatically parses latitude and longitude, for example, enter 49.452778 11.077778, or enter 49.452778 any 11.077778 text.</p> <p>A minus sign (-) in the first line hides an object from a geographical map. In this case, you can enter location information in line two and following.</p> <p>You can define a specific label for each location. Enter a string denoting the label in the first line and provide the coordinates in the second line. This geographical marker then shows the object with the label in the geographical map.</p> <p> The preview map always has a road map layout regardless of the map layout you set in User Interface⁴¹⁷⁵.</p>

Credentials for Windows Systems

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
Domain or Computer Name	<p>Enter the domain or computer name of the user account with which you want to access the Windows system. PRTG uses this account for Windows Management Instrumentation (WMI) sensors and other Windows sensors.</p> <p>If you want to use a Windows local user account on the target device, enter the computer name. If you want to use a Windows domain user account (recommended), enter the domain name. PRTG automatically adds a prefix to use the NT LAN Manager (NTLM) protocol if you do not explicitly define it. Do not leave this field empty.</p>
User Name	Enter the user name for access to the Windows system. Usually, you use credentials with administrator rights.
Password	Enter the password for access to the Windows system. Usually, you use credentials with administrator rights.

Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User Name	Enter the user name for access to the Linux/Solaris/macOS system via Secure Shell (SSH) and Web-based Enterprise Management (WBEM). Usually, you use credentials with administrator rights.
Authentication Method	<p>Select the authentication method for login:</p> <ul style="list-style-type: none"> ▪ Password: Provide the password for the login. ▪ Private key: Provide an RSA private key for authentication. <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For details, see section Monitoring via SSH⁴³⁰¹.</p>
Password	This setting is only visible if you select Password above. Enter a password for access to the Linux/Solaris/macOS system via SSH and WBEM. Usually, you use credentials with administrator rights.
Private Key	<p>This setting is only visible if you select Private key above. Paste the entire RSA private key, including the BEGIN and END lines. Make sure that a corresponding public key exists on the target device.</p> <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For details, see section Monitoring via SSH⁴³⁰¹.</p> <p> If you do not insert a private key for the first time but if you want to change the private key, you need to restart the PRTG core server service⁴²²⁵ for the private key change to take effect.</p>
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unsecure connection for WBEM. ▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM. <p> This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	<p>Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:</p> <ul style="list-style-type: none"> ▪ Default: Use one of the default ports. The default port for unsecure connections is 5988 and the default port for secure connections is 5989. ▪ Custom: Use a custom port. <p> This setting is only relevant if you use WBEM sensors.</p>

Setting	Description
Custom WBEM Port	This setting is only visible if you select Custom above. Enter a custom WBEM port. Enter an integer value.
SSH Port	<p>Enter the port for SSH connections. Enter an integer value. The default port is 22.</p> <p>i By default, PRTG automatically uses this setting for all SSH sensors ⁴⁶¹² unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Select the rights that you want to use to run the command on the target system:</p> <ul style="list-style-type: none"> ▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection. ▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for sudo to run commands on the target system, for example, as a root user. ▪ Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for sudo to run commands on the target system, for example, as a root user. ▪ Run the command as a different user using 'su': Use the rights of a different user with su to run commands on the target system.
Target User Name	This setting is only visible if you select an option that includes sudo or su above. Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.
Password	This setting is only visible if you select an option that includes sudo or su with password above. Enter the password to run the sudo command or the su command.
SSH Connection Mode	<p>Select the connection mode that you want to use to access data with SSH sensors ⁴³⁰¹:</p> <ul style="list-style-type: none"> ▪ Default (recommended): This is the default monitoring method for SSH sensors. It provides the best performance and security. ▪ Compatibility mode (deprecated): Use this mode only if the default mode does not work on the target system. The compatibility mode is the SSH engine that PRTG used in previous versions and it is deprecated. <p>i We strongly recommend that you use the default SSH connection mode.</p>

Setting	Description
	<p> You can also individually select the SSH connection mode for each SSH sensor in the sensor settings.</p>

Credentials for VMware/XenServer

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User Name	Enter the user name for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.
Password	<p>Enter the password for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.</p> <p> Single sign-on (SSO) passwords for vSphere do not support special characters. For details, see the VMware sensors sections.</p>
VMware Protocol	<p>Select the protocol for the connection to VMware ESXi, vCenter Server, or Citrix XenServer:</p> <ul style="list-style-type: none"> ▪ HTTPS (recommended): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. ▪ HTTP: Use an unsecure connection.
Session Handling	<p>Select if you want to reuse a session for VMware sensors:</p> <ul style="list-style-type: none"> ▪ Reuse a session for multiple scans (recommended): Select this option if you want a VMware sensor to reuse a single session for multiple sensor scans to query data. With this option, the sensor does not need to log in and out for each sensor scan. We recommend that you use this option because it reduces network load and log entries on the target device. This can increase performance. ▪ Create a new session for each scan: If you select this option, PRTG does not reuse a session and a VMware sensor has to log in and out for each sensor scan. This can decrease performance.

Credentials for SNMP Devices

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> ▪ SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> ❗ SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP. ▪ SNMP v2c (recommended): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters. ▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption. <ul style="list-style-type: none"> ❗ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in Interval Delay or Open Requests with the Probe Health sensor²⁰⁸³, distribute the load over multiple probes⁴⁶⁰³. SNMP v1 and SNMP v2c do not have this limitation.
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c above. Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>❗ We recommend that you use the default value.</p>
Authentication Method	<p>This setting is only visible if you select SNMP v3 above. Select the authentication method:</p> <ul style="list-style-type: none"> ▪ MD5: Use message-digest algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>❗ If you do not want to use authentication but you need SNMP v3, for example, because your device requires context, you can leave the Password field empty. In this case, PRTG uses SNMP_SEC_LEVEL_NOAUTH and it entirely deactivates authentication.</p> <p>❗ The authentication method you select must match the authentication method of your device.</p>
User Name	<p>This setting is only visible if you select SNMP v3 above. Enter the user name for access to the target SNMP device.</p> <p>❗ The user name that you enter must match the user name of your device.</p>
Password	<p>This setting is only visible if you select SNMP v3 above. Enter the password for access to the target SNMP device.</p>

Setting	Description
	<p> The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above. Select an encryption type:</p> <ul style="list-style-type: none"> ▪ DES: Use Data Encryption Standard (DES) as the encryption algorithm. ▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm. <p> Net-SNMP does not support AES-192 and AES-256. They do not have RFC specifications.</p> <p> The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above. Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above. Enter a context name only if the configuration of the device requires it. Context is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer value. The default port is 161.</p> <p> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for Database Management Systems

Click  to interrupt the [inheritance](#) .

The settings you define in this section apply to the following sensors:

- [ADO SQL v2 sensor](#) 
- [Microsoft SQL v2 sensor](#) 
- [MySQL v2 sensor](#) 
- [Oracle SQL v2 sensor](#) 

▪ [PostgreSQL sensor](#) 

Setting	Description
Port	<p>Select the port that PRTG uses for connections to the monitored databases:</p> <ul style="list-style-type: none"> ▪ Default (recommended): PRTG automatically determines the type of the database and uses the corresponding default port to connect. PRTG uses the following default ports: <ul style="list-style-type: none"> ▫ Microsoft SQL: 1433 ▫ MySQL: 3306 ▫ Oracle SQL: 1521 ▫ PostgreSQL: 5432 ▪ Custom port for all database sensors: Select this option if your database management systems do not use the default ports. Enter a custom port for database connections below. <p> PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Custom Port	<p>Enter a custom port for database connections. Enter an integer value.</p> <p> PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Authentication Method	<p>Select the authentication method for the connection to the Structured Query Language (SQL) database:</p> <ul style="list-style-type: none"> ▪ Windows authentication with impersonation: PRTG uses the Windows credentials that you define in settings that are higher in the object hierarchy^[138], for example, in the settings of the parent device; for the database connection. <p> The user whose credentials PRTG uses needs to have permission to log in to the probe system with a database sensor. This is necessary for the impersonation.</p> <ul style="list-style-type: none"> ▪ SQL server authentication: Use explicit credentials for database connections. Enter a user name and password below.
User Name	<p>This setting is only visible if you select SQL server authentication above. Enter the user name for the database connection.</p>
Password	<p>This setting is only visible if you select SQL server authentication above. Enter the password for the database connection.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for AWS

Click  to interrupt the [inheritance](#)¹⁴².

■ For more information about the permissions that are necessary to query the AWS API, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)

Setting	Description
Access Key	Enter the Amazon Web Services (AWS) access key.
Secret Key	Enter the AWS secret key.

Credentials for Dell EMC

Setting	Description
User	Enter the user name for access to the Dell EMC system.
Password	Enter the password for access to the Dell EMC system.
Port	Enter the port for the connection to the Dell EMC system. The default port for secure connections is 443 .

Credentials for Microsoft 365

 The [Microsoft 365 Service Status sensor](#)¹⁵⁴⁶ and the [Microsoft 365 Service Status Advanced sensor](#)¹⁵⁵⁷ use the following credentials to authenticate with Azure Active Directory (Azure AD).

■ For more information about the credentials and the permissions that are necessary to use the Microsoft 365 sensors, see the Knowledge Base: [How do I obtain credentials and set permissions for the Microsoft 365 sensors?](#)

Setting	Description
Tenant ID	Enter the Azure AD tenant ID.  A tenant ID must be a 32-digit sequence in hexadecimal notation.
Client ID	Enter the Azure AD client ID.
Client Secret	Enter the Azure AD client secret.

Credentials for Microsoft Azure

i The [Microsoft Azure Subscription Cost sensor](#)¹⁵⁶⁸ and the [Microsoft Azure Virtual Machine sensor](#)¹⁵⁸² use the following credentials to authenticate with Azure AD.

■ For more information about the credentials and permissions that are necessary use the Microsoft Azure sensors, see the Knowledge Base: [How do I obtain credentials and create custom roles for the Microsoft Azure sensors?](#)

Setting	Description
Tenant ID	Enter the Azure AD tenant ID. i A tenant ID must be a 32-digit sequence in hexadecimal notation.
Client ID	Enter the Azure AD client ID.
Client Secret	Enter the Azure AD client secret.
Subscription ID	Enter the Azure AD subscription ID.

Credentials for MQTT

Setting	Description
Authentication Method	Select if you want to connect without credentials or define credentials for access to the MQTT broker. <ul style="list-style-type: none"> None (default): Connect without credentials. User name and password: Define credentials for the connection.
User	This setting is only visible if you select User name and password above. Enter the user name for access to the Message Queue Telemetry Transport (MQTT) broker.
Password	This setting is only visible if you select User name and password above. Enter the password for access to the MQTT broker.
Port	Enter the port for the connection to the MQTT broker. The default port for secure connections is 8883 and the default port for unsecure connections is 1883 .
Transport-Level Security	Select if you want to use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection: <ul style="list-style-type: none"> Do not use transport-level security: Establish the connection without connection security.

Setting	Description
	<ul style="list-style-type: none"> Use transport-level security: Establish the connection with the strongest SSL/TLS method that the target device provides.
Server Authentication	<p>This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for server authentication.</p> <ul style="list-style-type: none"> Disable (default): Do not use a certificate for server authentication. Enable: Use a certificate for server authentication.
CA Certificate	<p>Paste the certificate authority (CA) certificate for the verification of the MQTT broker.</p> <p> The certificate must be in Privacy-Enhanced Mail (PEM) format.</p>
Client Authentication	<p>This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for client authentication.</p> <ul style="list-style-type: none"> Disable (default): Do not use a certificate for client authentication. Enable: Use a certificate for client authentication.
Client Certificate	<p>Paste the certificate that you created for authenticating the sensor against the MQTT broker.</p> <p> The certificate must be in PEM format.</p>
Client Key	<p>Enter the client key for access to the MQTT broker.</p> <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	<p>Enter the password for the client key.</p>

Credentials for OPC UA

Setting	Description
Port	<p>Enter the port for the connection to the OPC Unified Architecture (OPC UA) server. The default port for secure connections is 4840.</p>
Server Path	<p>Enter the path of the OPC UA server endpoint if you run more than one server under the same IP address or DNS name.</p>
Security Mode	<p>Select if you want to use encryption:</p> <ul style="list-style-type: none"> None (default): Do not use encryption. Sign: Sign messages between the sensor and the OPC UA server.

Setting	Description
	<ul style="list-style-type: none"> ▪ Sign & Encrypt: Sign and encrypt messages between the sensor and the OPC UA server.
Security Policy	<p>This setting is only visible if you select Sign or Sign & Encrypt above. Select if you want to use a security policy and define which policy you want to use:</p> <ul style="list-style-type: none"> ▪ None (default): Do not use a security policy. ▪ Basic256Sha256: Use the Basic256Sha256 security policy. ▪ Basic256: Use the Basic256 security policy.
Client Certificate	<p>Paste the certificate that you created for authenticating the sensor against the OPC UA server.</p> <p> The certificate must meet the following requirements:</p> <ul style="list-style-type: none"> ▪ The key size must be 2048-bit. ▪ The secure hash algorithm must be SHA256. ▪ DataEncipherment must be part of the KeyUsage certificate extension. ▪ A uniform resource indicator (URI) must be set in subjectAltName. ▪ The certificate must be in Privacy-Enhanced Mail (PEM) format.
Client Key	<p>Enter the client key for access to the OPC UA server.</p> <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	<p>Enter the password for the client key.</p>
Authentication Method	<p>Select if you want to connect without credentials or define credentials for access to the OPC UA server:</p> <ul style="list-style-type: none"> ▪ Anonymous (default): Connect without credentials. ▪ Username/Password: Define credentials for the connection. <p> Most OPC UA servers do not support Username/Password authentication without a client certificate. To use Username/Password authentication, select Sign or Sign & Encrypt under Security Mode and Basic256Sha256 or Basic256 under Security Policy and enter the Client Certificate, Client Key, and Client Key Password that you want to use.</p>
User	<p>This setting is only visible if you select Username/Password above. Enter the user name for access to the OPC UA server.</p>
Password	<p>This setting is only visible if you select Username/Password above. Enter the password for access to the OPC UA server.</p>

Credentials for Soffico Orchestra

Setting	Description
Authentication Method	Select if you want to connect without credentials or define credentials for access to the Orchestra platform: <ul style="list-style-type: none"> None (default): Connect without credentials. Username/Password: Define credentials for the connection.
User	This setting is only visible if you select Username/Password above. Enter the user name for access to the Orchestra platform.
Password	This setting is only visible if you select Username/Password above. Enter the password for access to the Orchestra platform.
Timeout (Sec.)	Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).
Port	Enter the port for the connection to the Orchestra platform. The default port for secure connections is 8443 and the default port for unsecure connections is 8019.
Protocol	Select the protocol that you want to use for the connection to the Orchestra platform: <ul style="list-style-type: none"> HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. HTTP: Use an unsecure connection.

Credentials for Veeam

Setting	Description
User	Enter the user name for access to the Veeam Backup Enterprise Manager.
Password	Enter the password for access to the Veeam Backup Enterprise Manager.
Port	Enter the port for the connection to the Veeam Backup Enterprise Manager. The default port for secure connections is 9398.

Windows Compatibility Options

Click  to interrupt the [inheritance](#)^[142].

If you experience problems when you monitor via Windows sensors, use the following compatibility options for troubleshooting.

Setting	Description
Preferred Data Source	<p>i This setting only applies to hybrid sensors that use both performance counters and Windows Management Instrumentation (WMI). The setting does not apply to other sensors.</p> <p>Define the method that Windows sensors use to query data:</p> <ul style="list-style-type: none"> ▪ Performance counters and WMI as fallback: Try to query data via performance counters. If this is not possible, establish a connection via WMI. ▪ Performance counters only: Query data via performance counters only. If this is not possible, the sensor returns no data. ▪ WMI only (recommended): Query data via WMI only. If this is not possible, the sensor returns no data. We recommend that you use this option.
Timeout Method	<p>Select the time that the sensor waits for the return of the WMI query before the sensor cancels the query and shows an error message:</p> <ul style="list-style-type: none"> ▪ Use 1.5x scanning interval (recommended): Multiply the scanning interval of the sensor by 1.5 and use the resulting value. ▪ Set manually: Manually enter a timeout value. <p>i We recommend that you use the default value. i If you experience ongoing timeout errors, try increasing the timeout value.</p>
Timeout Value (Sec.)	<p>This setting is only visible if you select Set manually above. Enter the time the sensor waits for the return of its WMI query before it cancels it and shows an error message. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p>

SNMP Compatibility Options

Click  to interrupt the [inheritance](#)¹⁴².

If you experience problems when you monitor via Simple Network Management Protocol (SNMP) sensors, use the following compatibility options for troubleshooting.

Setting	Description
SNMP Delay (ms)	<p>Enter the time in milliseconds (ms) that PRTG waits between two SNMP requests. This can increase device compatibility. Enter an integer value. You can define a delay between 0 and 100. PRTG does not support higher delays.</p>

Setting	Description
	<ul style="list-style-type: none"> ❗ We recommend that you use the default value. ❗ If you experience SNMP connection failures, try increasing the delay.
Failed Requests	<p>Select if an SNMP sensor tries again after a request fails:</p> <ul style="list-style-type: none"> ▪ Retry (recommended): Try again if an SNMP request fails. This can prevent false error messages because of temporary timeout failures. ▪ Do not retry: Do not retry if an SNMP request fails. If you select this option, an SNMP sensor shows a Down status earlier.
Overflow Values	<p>Select how PRTG handles overflow values. Some devices do not correctly handle internal buffer overflows. This can cause false peaks.</p> <ul style="list-style-type: none"> ▪ Ignore overflow values: Ignore overflow values and do not include them in the monitoring data. We recommend that you use this option. ▪ Handle overflow values as valid results: Regard all overflow values as regular data and include them in the monitoring data. <p>❗ If you experience problems because of strange peaks in your data graphs, change this option. Peaks might indicate that the monitored device resets counters without an overflow. PRTG interprets such behavior as overflow that results in data peaks. Select the option Ignore overflow values in this case. For more details, see the Knowledge Base: What is the Overflow Values setting in the SNMP Compatibility Options?</p>
Zero Values	<p>Select how PRTG handles zero values. Some devices send incorrect zero values. This can cause false peaks.</p> <ul style="list-style-type: none"> ▪ Ignore zero values for delta sensors (recommended): Ignore zero values and do not include them in the monitoring data. We recommend that you use this option. ❗ If you experience problems, try changing this option. ▪ Handle zero values as valid results for delta sensors: Regard all zero values as regular data and include them in the monitoring data.
32-bit/64-bit Counters	<p>Select the type of traffic counters that PRTG searches for on a device:</p> <ul style="list-style-type: none"> ▪ Use 64-bit counters if available (recommended): The interface scan uses 64-bit traffic counters, if available. This can avoid buffer overflows in the devices <p>❗ We recommend that you use the default value.</p> <p>❗ If you experience problems, try changing this option.</p> <ul style="list-style-type: none"> ▪ Use 32-bit counters only: The interface scan always uses 32-bit traffic counters, even if 64-bit counters are available. This can make monitoring more reliable for some devices.
Request Mode	<p>Select the request method that PRTG uses for SNMP sensors:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ Use multi get (recommended): Bundle multiple SNMP requests into one request. We recommend that you use this option. <ul style="list-style-type: none"> ❗ If you experience problems, try changing this option. ▪ Use single get: Use one request for each SNMP value. This can increase compatibility with older devices. <p>❗ PRTG uses paging for SNMP requests. This means that if a sensor has to query more than 20 object identifiers (OID), it automatically polls the OIDs in packages of 20 OIDs each.</p>
Walk Mode	<p>Select the kind of SNMP walk that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> ▪ Use GETBULK requests (recommended): Request the next <i>x</i> OIDs in one SNMP request. The default value is 10. It is dynamic based on the response size. <ul style="list-style-type: none"> ❗ This option only works with devices that support SNMP version v2c or higher. Make sure that you set the correct SNMP Version in the Credentials for SNMP Devices settings of the parent device or inherit it from objects that are higher in the object hierarchy ¹³⁸. ▪ Use GETNEXT requests: Request one OID at a time. This can increase compatibility with older devices or with devices that have insufficient SNMP BULKWALK support.
Port Name Template	<p>Select how PRTG displays the name of SNMP sensors. Enter a template that uses several variables. When you add new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID, several fields with interface descriptions are usually available. They are different for every device and OID. PRTG uses the information in these fields to name the sensors. If a field is empty or if it is not available, PRTG adds an empty string to the name. By default, the port name template is ([port]) [ifalias] [ifsensor], which creates a name like (001) Ethernet1 Traffic. You can use and combine any field names that are available at an OID of your device, for example:</p> <ul style="list-style-type: none"> ▪ [port]: The port number of the monitored interface. ▪ [ifalias]: The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling. ▪ [ifname]: The textual name of the monitored interface as assigned by the local device. ▪ [ifdescr]: A textual string containing information about the monitored device or interface, for example, manufacturer, product name, or version. ▪ [ifspeed]: An estimate of the monitored interface's current bandwidth (Kbit/s). ▪ [ifsensor]: The type of the sensor, this is Traffic or RMON. This helps to differentiate between SNMP Traffic ³⁰⁹⁴ and SNMP RMON ³⁰²¹ sensors.

Setting	Description
Port Name Update	<p> For more information about SNMP sensor names, see the Knowledge Base: How can I change the defaults for names automatically generated for new SNMP sensors?</p> <p>Select how PRTG reacts if you change the names of ports in your physical device (for example, a switch or router):</p> <ul style="list-style-type: none"> ▪ Keep port names (use this if you edit the names in PRTG): Do not automatically adjust sensor names. This is the best option if you want to manually change names in PRTG. ▪ Automatically update sensor names if port names change in the device: If PRTG detects port name changes in your physical device, it tries to automatically adjust the sensor names accordingly. <p> For more information about automatic name updates, see the Knowledge Base: Automatically update port name and number for SNMP Traffic sensors when the device changes them</p>
Port Identification	<p>Select the field that PRTG uses for SNMP interface identification:</p> <ul style="list-style-type: none"> ▪ Automatic identification (recommended): Try the ifAlias field first to identify an SNMP interface and then try ifDescr. <ul style="list-style-type: none">  PRTG does not automatically try ifName. ▪ Use ifAlias: For most devices, ifAlias is the best field to use for unique interface names. ▪ Use ifDescr: Use this option if the port order of your device changes after a restart, and if no ifAlias field is available. For example, this is the best option for Cisco ASA devices. <ul style="list-style-type: none">  If you use this option, it is important that your device returns unique interface names in the ifDescr field. ▪ Use ifName: You can also use this option if no unique ifAlias is available. <ul style="list-style-type: none">  If you use this option, it is important that your device returns unique interface names in the ifName field. ▪ Do not update ports: Use this option to disable the automatic port identification.
Start Interface Index	<p> This setting only applies to SNMP Traffic sensors³⁰⁹⁴ and to Cisco IP SLA sensors⁶⁵⁸¹.</p> <p>Enter the index at which PRTG starts to query the interface range during sensor creation. Enter 0 for the automatic mode.</p> <p> We recommend that you use the default value.</p>
End Interface Index	<p> This setting only applies to SNMP Traffic sensors³⁰⁹⁴ and to Cisco IP SLA sensors⁶⁵⁸¹.</p>

Setting	Description
	<p>Enter the index at which PRTG stops querying the interface range during sensor creation. Enter 0 for the automatic mode.</p> <p> We recommend that you use the default value.</p>

Proxy Settings for HTTP Sensors

Click  to interrupt the [inheritance](#) .

The proxy settings determine how a sensor connects to a URL. You can enter data for an HTTP proxy server that sensors use when they connect via HTTP or HTTPS.

-  This setting only applies to HTTP sensors and how they monitor. To change the proxy settings for the PRTG core server, see section [Core & Probes](#) .
-  The [SSL Certificate sensor](#)  and the [SSL Security Check sensor](#)  do not support HTTP proxies but you can configure connections via SOCKS proxies in the sensors' settings.

Setting	Description
IP Address/DNS Name	Enter the IP address or Domain Name System (DNS) name of the proxy server. If you leave this field empty, HTTP sensors do not use a proxy.
Port	Enter the port number of the proxy. The default is 8080. Enter an integer value.
User	<p>If the proxy requires authentication, enter the user name for the proxy login.</p> <p> Only basic authentication is available. Enter a string or leave the field empty.</p>
Password	<p>If the proxy requires authentication, enter the password for the proxy login.</p> <p> Only basic authentication is available. Enter a string or leave the field empty.</p>

Scanning Interval

Click  to interrupt the [inheritance](#) .

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails.

Setting	Description
	<p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Cluster Monitoring Exclusion

Click  to interrupt the [inheritance](#).

Setting	Description
Exclude Cluster Nodes	<p>This setting is only visible if you have a cluster.</p> <p>Sometimes you want to keep a cluster node from monitoring the sensors that run on this probe, group, or device, for example, if a device is not reachable from every cluster node. Select the cluster nodes that you do not want to include in sensor scans. By default, all objects underneath the probe inherit this setting.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To close an active one-time maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. <p>i You do not trigger a status change by dependency if you manually pause a master sensor or if you pause it by schedule.</p> <p>i To test your dependencies ⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>

Setting	Description
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
User Group Access	<p>Select the user groups^[4219] that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the object. The object neither shows up in lists nor in the device tree. <ul style="list-style-type: none">  There is one exception: If a user in this user group has access to a child object, the parent object is visible in the device tree but users in this user group cannot access it. ▪ Read access: Users in this group can see the object and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the object, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the object, view its monitoring results, edit its settings, and edit its access rights settings. <p>To automatically set all child objects to inherit this object's access rights, enable the Revert children's access rights to inherited option.</p> <p> For more details on access rights, see section Access Rights Management^[153].</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Advanced Network Analysis

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
Unusual Detection	<p>Select if you want to use the unusual detection^[4188] for sensors:</p> <ul style="list-style-type: none"> ▪ Enabled: Activate the unusual detection for this object and, by default, for all objects underneath in the object hierarchy^[138]. Sensors that are affected by this setting show the Unusual status if PRTG detects unusual activity. ▪ Disabled: Do not activate the unusual detection. PRTG ignores unusual values for sensors that are affected by this setting. These sensors do not show the Unusual status. <p> You can configure the behavior of the unusual detection or completely disable it in the system settings^[4188].</p>
Similar Sensors Detection	<p>Select if you want to activate the similar sensors^[215] analysis:</p> <ul style="list-style-type: none"> ▪ Enabled: Activate the similar sensors detection for this object and, by default, for all objects underneath in the object hierarchy. PRTG considers all sensors that are affected by this setting during the similarity analysis. ▪ Disabled: Do not the activate the similar sensors detection. PRTG does not consider sensors that are affected by this setting during the similarity analysis.

Setting	Description
	<p>i You can configure the depth of the analysis of the similar sensors detection or completely disable it in the system settings ⁴¹⁹⁰.</p>
System Information	<p>Select if you want to retrieve and show system information ²³¹ for your devices:</p> <ul style="list-style-type: none"> ▪ Enabled: Activate the system information feature for this object and, by default, for all objects underneath in the hierarchy. ▪ Disabled: Do not activate the system information feature. <p>i The System Information feature is enabled by default. To retrieve the data, PRTG automatically uses the credentials for Windows systems ⁴⁵² and the credentials for SNMP devices ⁴⁵⁵ that you entered in the device settings or that the device inherits ¹³⁸ from a parent object like the root group. Consider this when you monitor devices that are outside of your local network, especially when you use SNMP v1 or SNMP v2c, which do not provide encryption.</p> <p> This setting is not available on the hosted probe of a PRTG Hosted Monitor instance.</p>

Administrative Probe Settings

Define the IP address to use for outgoing monitoring requests.

- If more than one IP is available on the system, you can specify the IP address that PRTG uses for the outgoing monitoring requests of certain sensors.
 - This setting is for sensors that use the following connection types: HTTP, Domain Name System (DNS), File Transfer Protocol (FTP), Internet Message Access Protocol (IMAP), Post Office Protocol version 3 (POP3), port, remote desktop, Simple Mail Transfer Protocol (SMTP), and Simple Network Management Protocol (SNMP).
 - The setting is valid for all monitoring requests that this probe sends.
 - This setting is useful for devices that expect a certain IP address when they are queried.
 - The default setting is auto. PRTG automatically selects an IP address.
- i** This feature does not support all sensors for technical reasons.
- i** If you change this setting, some sensors might stop working. For example, sensors might show the Down status if the selected IP address is blocked on the way to or directly on the monitored device.

Setting	Description
Outgoing IPv4	Define the IP address for outgoing requests that use the IPv4 protocol. The list shows all available IP addresses on the system. Choose a specific IP address or select auto.

Setting	Description
Outgoing IPv6	<p>Define the IP address for outgoing requests that use the IPv6 protocol. The list shows all available IP addresses on the system. Choose a specific IP address or select auto.</p> <p>■ For more information, see section IPv6 Support^[161].</p>
Cluster Connectivity	<p>This setting is only visible if you have a cluster^[135].</p> <p>Define if the remote probe connects to all cluster nodes or only to the primary master node:</p> <ul style="list-style-type: none"> ▪ Remote probe sends data only to primary master node: The remote probe only connects to the primary master node. You are not able to review monitoring data on failover nodes. Consider this option if you have bandwidth limitations in your network or if the remote probe cannot access your failover nodes. ▪ Remote probe sends data to all cluster nodes: The remote probe connects to all cluster nodes and sends monitoring data to the failover nodes in addition to the primary master node. The remote probe is visible on all of your cluster nodes as soon as it automatically connects to the correct IP addresses and ports of the failover nodes. If the primary master node fails, you can still see monitoring data of the remote probe. <p>i PRTG does not notify you if a remote probe is disconnected from a cluster node. Therefore, explicitly check on a cluster node if remote probes are connected (for example, via the device tree in the PRTG web interface on a cluster node).</p>

Scheduled Restart Settings

☁ This setting is not available on the hosted probe of a PRTG Hosted Monitor instance.

Setting	Description
Restart Options	<p>Define if you want to schedule an automatic restart:</p> <ul style="list-style-type: none"> ▪ No scheduled system or service restart: Do not automatically perform a scheduled restart of services. We recommend that you manually restart the PRTG core server system every few weeks. You can initiate a restart of the PRTG probe service in the Administrative Tools^[422] in the PRTG web interface. ▪ Scheduled restart of PRTG services: Restart the PRTG probe service on the probe system. If you select this option on the local probe, the PRTG core server service restarts as well. Define a schedule under Restart Schedule.

Setting	Description
	<ul style="list-style-type: none"> ▪ Scheduled system restart (recommended): Define a schedule under Restart Schedule. We recommend that you restart probe systems once a month for best performance.
Restart Schedule	<p>This setting is only visible if you select a schedule option above. Choose how often you want to restart the PRTG probe service or the probe system:</p> <ul style="list-style-type: none"> ▪ Once per week: Select a day and a time below. ▪ Once per month (recommended): Select a day of the month and a time below.
Specify Day	<p>This setting is only visible if you select a schedule option above. Select a day of the week (Monday to Sunday) or month (1st to 30th or Last). If you select Last, PRTG restarts the PRTG core server system on the last day of the month, regardless of how many days the month has.</p>
Specify Hour	<p> You get a Windows warning message 10 minutes before the restart to inform you about the restart if you are logged in to PRTG. The actual restart time can differ by up to 30 minutes from the time you enter here.</p>

 Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

Basic Group Settings

Setting	Description
Group Name	<p>Enter a meaningful name to identify the group. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Status	<p>Select the monitoring status of the group:</p> <ul style="list-style-type: none"> ▪ Started: Monitor the group. ▪ Paused: Pause monitoring for the group. All sensors on all devices in the group are in the Paused status^[256] until you change this setting.
Parent Tags	<p>Shows the tags^[145] that this group inherits^[145] from its parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>
Priority	<p>Select a priority^[253] for the group. This setting determines the position of the group in lists. The highest priority is at the top of a list. You can choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

Device Identification and Auto-Discovery

Setting	Description
Auto-Discovery Level	Select the level of detail for the auto-discovery ^[296] :

Setting	Description
	<ul style="list-style-type: none"> ▪ No auto-discovery: Select this option if you only want to manually create devices and sensors. ▪ Standard auto-discovery (recommended): Create a set of standard sensors for standard monitoring. This option works fine for most installations. ▪ Detailed auto-discovery: Create all standard sensors and additional sensors from detailed variants of device templates. As a result, you might get many sensors. This option is suitable for small network segments and whenever you want to monitor the maximum number of sensors available. ▪ Auto-discovery with specific device templates: Customize the auto-discovery and select or combine standard, detailed, and custom device templates. Select one or more templates from the Devices Templates list. <p>i Auto-discoveries can be resource intensive. They are primarily intended for devices on the same network as your probes.</p>
Device Templates	<p>This setting is only visible if you select Auto-discovery with specific device templates above. Select one or more device templates by adding a check mark in front of the template name.</p> <p>i You can also select all items or cancel the selection by using the check box in the table header.</p> <p>PRTG uses the device templates that you select for the auto-discovery on the device. Choose from:</p> <ul style="list-style-type: none"> ▪ ADSL ▪ Amazon CloudWatch ▪ Buffalo TeraStation NAS ▪ Cisco ASA VPN ▪ Cisco Device (Generic) ▪ Dell EqualLogic ▪ Dell MDi Disk ▪ DNS Server ▪ Environment Jakarta ▪ Environment Poseidon ▪ FTP Server ▪ Generic Device (Ping Only) ▪ Generic Device (SNMP Enabled) ▪ Generic Device (SNMP Enabled, Detailed)

Setting	Description
	<ul style="list-style-type: none">▪ HTTP Web Server▪ Hyper-V Host Server▪ IPMI-enabled Device▪ Juniper NS Device▪ Linux/UNIX Device (SNMP or SSH Enabled)▪ Mail Server (Generic)▪ Mail Server (MS Exchange)▪ Microsoft SharePoint 2010▪ NAS LenovoEMC▪ NAS QNAP▪ NAS Synology▪ NetApp▪ NTP Server▪ Printer (HP)▪ Printer (Generic)▪ RDP Server▪ RMON-compatible Device▪ Server (Cisco UCS)▪ Server (Compaq/HP Agents)▪ Server (Dell)▪ Server (Fujitsu)▪ Server (IBM)▪ SonicWall▪ SSL Security Check▪ Switch (Cisco Catalyst)▪ Switch (Cisco IOS Based)▪ Switch (HP Procurve)▪ UNIX/Linux Device▪ UPS Health (APC)▪ UPS Health (Generic)▪ UPS Health (Liebert)▪ VMware ESXi / vCenter Server

Setting	Description
	<ul style="list-style-type: none"> ▪ Web Server ▪ Windows (Detailed via WMI) ▪ Windows (via Remote PowerShell) ▪ Windows (via WMI) ▪ Windows IIS (via SNMP) ▪ XenServer Hosts ▪ XenServer Virtual Machines <p>Once the auto-discovery is finished, PRTG creates a new ticket^[240] and lists the device templates that it used to create new sensors.</p>
Schedule	<p>Select when PRTG runs the auto-discovery:</p> <ul style="list-style-type: none"> ▪ Once: Run the auto-discovery only once. PRTG adds new devices and sensors once. If you select this option, you have to manually start the auto-discovery^[297]. ▪ Hourly: Run the auto-discovery for new devices and sensors every 60 minutes. <ul style="list-style-type: none"> ⓘ Use this option with caution. Frequent auto-discoveries might cause performance issues, in particular when PRTG scans large network segments every hour. ▪ Daily: Run the auto-discovery for new devices and sensors every 24 hours. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the Monitoring^[4182] settings, section Auto-Discovery. ▪ Weekly: Run the auto-discovery for new devices and sensors every 7 days. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the Monitoring settings, section Auto-Discovery. <p>ⓘ For performance reasons, PRTG sets Schedule to Once on all devices that the scheduled auto-discovery creates.</p>
IP Address Selection Method	<p>Select how you want to define the IP address range for the auto-discovery:</p> <ul style="list-style-type: none"> ▪ Class C base IP address with start/end (IPv4): Enter an IPv4 class C address range. ▪ List of individual IP addresses and DNS names (IPv4): Enter a list of individual IPv4 addresses or Domain Name System (DNS) names. ▪ IP address and subnet (IPv4): Enter an IPv4 address and subnet mask. ▪ IP address with octet range (IPv4): Enter an IPv4 address range for every IP octet individually. With this, you can define very customizable IP address ranges.

Setting	Description
	<ul style="list-style-type: none"> ▪ List of individual IP addresses and DNS names (IPv6): Enter a list of individual IPv6 addresses or DNS names. ▪ Use computers from the Active Directory (maximum 1000 computers): Search in the Active Directory for computers to perform the auto-discovery. <ul style="list-style-type: none"> ⓘ Make sure that you specify your Active Directory domain in the Core & Probes settings. ⓘ PRTG can only discover subnets with up to 65,536 IP addresses. If you define a range with a higher number of addresses, the discovery stops before it is completed.
IPv4 Base	This setting is only visible if you enable Class C base IP address with start/end (IPv4) above. Enter a class C network as the IP base for the auto-discovery. Enter the first three octets of an IPv4 address, for example, 192.168.0 .
IPv4 Range Start	This setting is only visible if you enable Class C base IP address with start/end (IPv4) above. Enter the IP octet of the class C network (specified above) from which PRTG starts the auto-discovery. This completes the IP base to an IPv4 address. For example, enter 1 to discover from 192.168.0.1 onwards.
IPv4 Range End	This setting is only visible if you enable Class C base IP address with start/end (IPv4) above. Enter the IP octet of the class C network (specified above) at which PRTG stops the auto-discovery. This completes the IP base to an IPv4 address. For example, enter 254 to discover up to 192.168.0.254 .
IPv4/DNS Name List IPv6/DNS Name List	This setting is only visible if you select on of the List of individual IP addresses and DNS names options above. Enter a list of IP addresses or DNS names that the auto-discovery scans. Enter each address on a separate line.
IPv4 and Subnet (IPv4)	This setting is only visible if you enable IP address and subnet (IPv4) above. Enter an expression in the format address/subnet, for example, 192.168.3.0/255.255.255.0 . You can also use the short form like 192.168.3.0/24 . PRTG scans the complete host range (without network and broadcast address) that is defined by the IP address and the subnet mask.
IP Address with Octet Range	This setting is only visible if you enable IP address with octet range (IPv4) above. Enter an expression in the format a1.a2.a3.a4, where a1 , a2 , a3 , and a4 are each a number between 0-255, or a range with two numbers and a hyphen like 1-127 . PRTG calculates all permutations of all ranges. For example, 10.0.1-10.1-100 results in 1,000 addresses that PRTG scans during the auto-discovery.

Setting	Description
Organizational Unit	<p>This setting is only visible if you enable Use computers from the Active Directory (maximum 1000 computers) above. Enter an organizational unit (OU) to restrict the Active Directory search to computers that are part of this OU. For top-level OUs, use the distinguished name (DN) format without OU= and without the domain components (DCs). If you leave this field empty, there are not any restrictions.</p> <p>Example:</p> <ul style="list-style-type: none"> For the DN OU=Domain Controllers,DC=example,DC=com, enter only Domain Controllers. <p>If you have sub-OUs, use the DN format without the leading OU= and without the DCs.</p> <p>Examples:</p> <ul style="list-style-type: none"> For the DN OU=webserver,OU=production,DC=example,DC=com, enter only webserver,OU=production. For the DN OU=intranet,OU=webserver,OU=production,DC=example,DC=com, enter only intranet,OU=webserver,OU=production. <p>i Make sure that the OU contains computer accounts. If the OU is empty, you receive an error message.</p> <p>i Do not enter the domain components. PRTG automatically uses the domain components from the domain name you enter in the Core & Probes ⁴²⁰⁷ settings.</p>
Name Resolution	<p>Select how to monitor newly discovered devices. This only affects new devices. This does not change the setting for other devices. Depending on your selection, the IP Address/DNS Name field of an added device ⁴⁴⁷ shows the DNS name or IP address that PRTG uses to access the target device. Choose between:</p> <ul style="list-style-type: none"> Use DNS names (recommended): Monitor newly discovered devices via their DNS names (if available). We recommend that you use this option. Use IP addresses: Monitor newly discovered devices via their IP addresses. <p>i This setting does not affect how PRTG shows the devices in the device tree.</p>
Device Rescan	<p>Select how to handle known devices:</p> <ul style="list-style-type: none"> Skip auto-discovery for existing devices/IP addresses (recommended): Do not rescan existing devices or IP addresses. PRTG only adds devices with new IP addresses or DNS names. PRTG does not add devices that that already exist in your configuration for example, in other groups. We recommend that you use this option.

Setting	Description
	<ul style="list-style-type: none"> Perform auto-discovery for existing devices/IP addresses: Rescan devices that have existing IP addresses with every auto-discovery. PRTG adds devices that already exist in other groups to this group and runs the auto-discovery on the newly added devices. <ul style="list-style-type: none">  The auto-discovery does not run on devices that already exist in the group. If you want to run the auto-discovery for these devices, you have to manually start the auto-discovery on them.  In certain cases, the IP resolution might not work and might result in PRTG not adding a device if it has the same local IP address as it does in a different LAN.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Location

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
Location (for Geo Maps)	<p>If you want to use Geo Maps^[4026], enter a location in the first line. Geographical maps then display objects like devices or groups with a status icon using a color code similar to the sensor status icons^[197] (green–yellow–orange–red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, as PRTG automatically parses latitude and longitude, for example, enter 49.452778 11.077778, or enter 49.452778 any 11.077778 text.</p> <p>A minus sign (-) in the first line hides an object from a geographical map. In this case, you can enter location information in line two and following.</p> <p>You can define a specific label for each location. Enter a string denoting the label in the first line and provide the coordinates in the second line. This geographical marker then shows the object with the label in the geographical map.</p> <ul style="list-style-type: none">  The preview map always has a road map layout regardless of the map layout you set in User Interface^[4175].

Credentials for Windows Systems

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
Domain or Computer Name	<p>Enter the domain or computer name of the user account with which you want to access the Windows system. PRTG uses this account for Windows Management Instrumentation (WMI) sensors and other Windows sensors.</p> <p>If you want to use a Windows local user account on the target device, enter the computer name. If you want to use a Windows domain user account (recommended), enter the domain name. PRTG automatically adds a prefix to use the NT LAN Manager (NTLM) protocol if you do not explicitly define it. Do not leave this field empty.</p>
User Name	Enter the user name for access to the Windows system. Usually, you use credentials with administrator rights.
Password	Enter the password for access to the Windows system. Usually, you use credentials with administrator rights.

Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
User Name	Enter the user name for access to the Linux/Solaris/macOS system via Secure Shell (SSH) and Web-based Enterprise Management (WBEM). Usually, you use credentials with administrator rights.
Authentication Method	<p>Select the authentication method for login:</p> <ul style="list-style-type: none"> ▪ Password: Provide the password for the login. ▪ Private key: Provide an RSA private key for authentication. <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For details, see section Monitoring via SSH ⁴³⁰¹.</p>
Password	This setting is only visible if you select Password above. Enter a password for access to the Linux/Solaris/macOS system via SSH and WBEM. Usually, you use credentials with administrator rights.

Setting	Description
Private Key	<p>This setting is only visible if you select Private key above. Paste the entire RSA private key, including the BEGIN and END lines. Make sure that a corresponding public key exists on the target device.</p> <ul style="list-style-type: none">  PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.  PRTG only supports RSA keys. It does not support DSA keys.  For details, see section Monitoring via SSH⁴³⁰¹.  If you do not insert a private key for the first time but if you want to change the private key, you need to restart the PRTG core server service⁴²²⁵ for the private key change to take effect.
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unsecure connection for WBEM. ▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM. <p> This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	<p>Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:</p> <ul style="list-style-type: none"> ▪ Default: Use one of the default ports. The default port for unsecure connections is 5988 and the default port for secure connections is 5989. ▪ Custom: Use a custom port. <p> This setting is only relevant if you use WBEM sensors.</p>
Custom WBEM Port	<p>This setting is only visible if you select Custom above. Enter a custom WBEM port. Enter an integer value.</p>
SSH Port	<p>Enter the port for SSH connections. Enter an integer value. The default port is 22.</p> <p> By default, PRTG automatically uses this setting for all SSH sensors⁴⁶¹² unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Select the rights that you want to use to run the command on the target system:</p> <ul style="list-style-type: none"> ▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection. ▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for sudo to run commands on the target system, for example, as a root user.

Setting	Description
	<ul style="list-style-type: none"> Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for sudo to run commands on the target system, for example, as a root user. Run the command as a different user using 'su': Use the rights of a different user with su to run commands on the target system.
Target User Name	This setting is only visible if you select an option that includes sudo or su above. Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.
Password	This setting is only visible if you select an option that includes sudo or su with password above. Enter the password to run the sudo command or the su command.
SSH Connection Mode	<p>Select the connection mode that you want to use to access data with SSH sensors ⁴³⁰⁷:</p> <ul style="list-style-type: none"> Default (recommended): This is the default monitoring method for SSH sensors. It provides the best performance and security. Compatibility mode (deprecated): Use this mode only if the default mode does not work on the target system. The compatibility mode is the SSH engine that PRTG used in previous versions and it is deprecated. <p> We strongly recommend that you use the default SSH connection mode.</p> <p> You can also individually select the SSH connection mode for each SSH sensor in the sensor settings.</p>

Credentials for VMware/XenServer

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
User Name	Enter the user name for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.
Password	Enter the password for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.

Setting	Description
	<p> Single sign-on (SSO) passwords for vSphere do not support special characters. For details, see the VMware sensors sections.</p>
VMware Protocol	<p>Select the protocol for the connection to VMware ESXi, vCenter Server, or Citrix XenServer:</p> <ul style="list-style-type: none"> ▪ HTTPS (recommended): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. ▪ HTTP: Use an unsecure connection.
Session Handling	<p>Select if you want to reuse a session for VMware sensors:</p> <ul style="list-style-type: none"> ▪ Reuse a session for multiple scans (recommended): Select this option if you want a VMware sensor to reuse a single session for multiple sensor scans to query data. With this option, the sensor does not need to log in and out for each sensor scan. We recommend that you use this option because it reduces network load and log entries on the target device. This can increase performance. ▪ Create a new session for each scan: If you select this option, PRTG does not reuse a session and a VMware sensor has to log in and out for each sensor scan. This can decrease performance.

Credentials for SNMP Devices

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> ▪ SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none">  SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP. ▪ SNMP v2c (recommended): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters.

Setting	Description
	<ul style="list-style-type: none"> ▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption. <ul style="list-style-type: none"> ⓘ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in Interval Delay or Open Requests with the Probe Health sensor, distribute the load over multiple probes. SNMP v1 and SNMP v2c do not have this limitation.
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c above. Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <ul style="list-style-type: none"> ⓘ We recommend that you use the default value.
Authentication Method	<p>This setting is only visible if you select SNMP v3 above. Select the authentication method:</p> <ul style="list-style-type: none"> ▪ MD5: Use message-digest algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <ul style="list-style-type: none"> ⓘ If you do not want to use authentication but you need SNMP v3, for example, because your device requires context, you can leave the Password field empty. In this case, PRTG uses SNMP_SEC_LEVEL_NOAUTH and it entirely deactivates authentication. ⓘ The authentication method you select must match the authentication method of your device.
User Name	<p>This setting is only visible if you select SNMP v3 above. Enter the user name for access to the target SNMP device.</p> <ul style="list-style-type: none"> ⓘ The user name that you enter must match the user name of your device.
Password	<p>This setting is only visible if you select SNMP v3 above. Enter the password for access to the target SNMP device.</p> <ul style="list-style-type: none"> ⓘ The password that you enter must match the password of your device.
Encryption Type	<p>This setting is only visible if you select SNMP v3 above. Select an encryption type:</p> <ul style="list-style-type: none"> ▪ DES: Use Data Encryption Standard (DES) as the encryption algorithm. ▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm.

Setting	Description
	<ul style="list-style-type: none">  Net-SNMP does not support AES-192 and AES-256. They do not have RFC specifications.  The encryption type that you select must match the encryption type of your device.
Encryption Key	<p>This setting is only visible if you select SNMP v3 above. Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <ul style="list-style-type: none">  The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.
Context Name	<p>This setting is only visible if you select SNMP v3 above. Enter a context name only if the configuration of the device requires it. Context is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer value. The default port is 161.</p> <ul style="list-style-type: none">  We recommend that you use the default value.
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for Database Management Systems

Click  to interrupt the [inheritance](#) .

The settings you define in this section apply to the following sensors:

- [ADO SQL v2 sensor](#) 
- [Microsoft SQL v2 sensor](#) 
- [MySQL v2 sensor](#) 
- [Oracle SQL v2 sensor](#) 
- [PostgreSQL sensor](#) 

Setting	Description
Port	Select the port that PRTG uses for connections to the monitored databases:

Setting	Description
	<ul style="list-style-type: none"> ▪ Default (recommended): PRTG automatically determines the type of the database and uses the corresponding default port to connect. PRTG uses the following default ports: <ul style="list-style-type: none"> ▫ Microsoft SQL: 1433 ▫ MySQL: 3306 ▫ Oracle SQL: 1521 ▫ PostgreSQL: 5432 ▪ Custom port for all database sensors: Select this option if your database management systems do not use the default ports. Enter a custom port for database connections below. <p>i PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Custom Port	<p>Enter a custom port for database connections. Enter an integer value.</p> <p>i PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Authentication Method	<p>Select the authentication method for the connection to the Structured Query Language (SQL) database:</p> <ul style="list-style-type: none"> ▪ Windows authentication with impersonation: PRTG uses the Windows credentials that you define in settings that are higher in the object hierarchy¹³⁸, for example, in the settings of the parent device; for the database connection. <p>i The user whose credentials PRTG uses needs to have permission to log in to the probe system with a database sensor. This is necessary for the impersonation.</p> <ul style="list-style-type: none"> ▪ SQL server authentication: Use explicit credentials for database connections. Enter a user name and password below.
User Name	<p>This setting is only visible if you select SQL server authentication above. Enter the user name for the database connection.</p>
Password	<p>This setting is only visible if you select SQL server authentication above. Enter the password for the database connection.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for AWS

Click  to interrupt the [inheritance](#)¹⁴².

For more information about the permissions that are necessary to query the AWS API, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)

Setting	Description
Access Key	Enter the Amazon Web Services (AWS) access key.
Secret Key	Enter the AWS secret key.

Credentials for Dell EMC

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
User	Enter the user name for access to the Dell EMC system.
Password	Enter the password for access to the Dell EMC system.
Port	Enter the port for the connection to the Dell EMC system. The default port for secure connections is 443 .

Credentials for Microsoft 365

Click  to interrupt the [inheritance](#)^[142].

 The [Microsoft 365 Service Status sensor](#)^[1546] and the [Microsoft 365 Service Status Advanced sensor](#)^[1557] use the following credentials to authenticate with Azure Active Directory (Azure AD).

For more information about the credentials and the permissions that are necessary to use the Microsoft 365 sensors, see the Knowledge Base: [How do I obtain credentials and set permissions for the Microsoft 365 sensors?](#)

Setting	Description
Tenant ID	Enter the Azure AD tenant ID.  A tenant ID must be a 32-digit sequence in hexadecimal notation.
Client ID	Enter the Azure AD client ID.
Client Secret	Enter the Azure AD client secret.

Credentials for Microsoft Azure

Click  to interrupt the [inheritance](#)¹⁴².

 The [Microsoft Azure Subscription Cost sensor](#)¹⁵⁶⁰ and the [Microsoft Azure Virtual Machine sensor](#)¹⁵⁸² use the following credentials to authenticate with Azure AD.

 For more information about the credentials and permissions that are necessary use the Microsoft Azure sensors, see the Knowledge Base: [How do I obtain credentials and create custom roles for the Microsoft Azure sensors?](#)

Setting	Description
Tenant ID	Enter the Azure AD tenant ID.  A tenant ID must be a 32-digit sequence in hexadecimal notation.
Client ID	Enter the Azure AD client ID.
Client Secret	Enter the Azure AD client secret.
Subscription ID	Enter the Azure AD subscription ID.

Credentials for MQTT

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
Authentication Method	Select if you want to connect without credentials or define credentials for access to the MQTT broker. <ul style="list-style-type: none"> None (default): Connect without credentials. User name and password: Define credentials for the connection.
User	This setting is only visible if you select User name and password above. Enter the user name for access to the Message Queue Telemetry Transport (MQTT) broker.
Password	This setting is only visible if you select User name and password above. Enter the password for access to the MQTT broker.
Port	Enter the port for the connection to the MQTT broker. The default port for secure connections is 8883 and the default port for unsecure connections is 1883 .

Setting	Description
Transport-Level Security	<p>Select if you want to use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection:</p> <ul style="list-style-type: none"> Do not use transport-level security: Establish the connection without connection security. Use transport-level security: Establish the connection with the strongest SSL/TLS method that the target device provides.
Server Authentication	<p>This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for server authentication.</p> <ul style="list-style-type: none"> Disable (default): Do not use a certificate for server authentication. Enable: Use a certificate for server authentication.
CA Certificate	<p>Paste the certificate authority (CA) certificate for the verification of the MQTT broker.</p> <p> The certificate must be in Privacy-Enhanced Mail (PEM) format.</p>
Client Authentication	<p>This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for client authentication.</p> <ul style="list-style-type: none"> Disable (default): Do not use a certificate for client authentication. Enable: Use a certificate for client authentication.
Client Certificate	<p>Paste the certificate that you created for authenticating the sensor against the MQTT broker.</p> <p> The certificate must be in PEM format.</p>
Client Key	<p>Enter the client key for access to the MQTT broker.</p> <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	<p>Enter the password for the client key.</p>

Credentials for OPC UA

Click  to interrupt the [inheritance](#) .

Setting	Description
Port	<p>Enter the port for the connection to the OPC Unified Architecture (OPC UA) server. The default port for secure connections is 4840.</p>

Setting	Description
Server Path	Enter the path of the OPC UA server endpoint if you run more than one server under the same IP address or DNS name.
Security Mode	Select if you want to use encryption: <ul style="list-style-type: none"> ▪ None (default): Do not use encryption. ▪ Sign: Sign messages between the sensor and the OPC UA server. ▪ Sign & Encrypt: Sign and encrypt messages between the sensor and the OPC UA server.
Security Policy	This setting is only visible if you select Sign or Sign & Encrypt above. Select if you want to use a security policy and define which policy you want to use: <ul style="list-style-type: none"> ▪ None (default): Do not use a security policy. ▪ Basic256Sha256: Use the Basic256Sha256 security policy. ▪ Basic256: Use the Basic256 security policy.
Client Certificate	Paste the certificate that you created for authenticating the sensor against the OPC UA server. <p>i The certificate must meet the following requirements:</p> <ul style="list-style-type: none"> ▪ The key size must be 2048-bit. ▪ The secure hash algorithm must be SHA256. ▪ DataEncipherment must be part of the KeyUsage certificate extension. ▪ A uniform resource indicator (URI) must be set in subjectAltName. ▪ The certificate must be in Privacy-Enhanced Mail (PEM) format.
Client Key	Enter the client key for access to the OPC UA server. <p>i The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	Enter the password for the client key.
Authentication Method	Select if you want to connect without credentials or define credentials for access to the OPC UA server: <ul style="list-style-type: none"> ▪ Anonymous (default): Connect without credentials. ▪ Username/Password: Define credentials for the connection. <p>i Most OPC UA servers do not support Username/Password authentication without a client certificate. To use Username/Password authentication, select Sign or Sign & Encrypt under Security Mode and Basic256Sha256 or Basic256 under Security Policy and enter the Client Certificate, Client Key, and Client Key Password that you want to use.</p>

Setting	Description
User	This setting is only visible if you select Username/Password above. Enter the user name for access to the OPC UA server.
Password	This setting is only visible if you select Username/Password above. Enter the password for access to the OPC UA server.

Credentials for Soffico Orchestra

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
Authentication Method	Select if you want to connect without credentials or define credentials for access to the Orchestra platform: <ul style="list-style-type: none"> None (default): Connect without credentials. Username/Password: Define credentials for the connection.
User	This setting is only visible if you select Username/Password above. Enter the user name for access to the Orchestra platform.
Password	This setting is only visible if you select Username/Password above. Enter the password for access to the Orchestra platform.
Timeout (Sec.)	Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).
Port	Enter the port for the connection to the Orchestra platform. The default port for secure connections is 8443 and the default port for unsecure connections is 8019.
Protocol	Select the protocol that you want to use for the connection to the Orchestra platform: <ul style="list-style-type: none"> HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. HTTP: Use an unsecure connection.

Credentials for Veeam

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User	Enter the user name for access to the Veeam Backup Enterprise Manager.
Password	Enter the password for access to the Veeam Backup Enterprise Manager.
Port	Enter the port for the connection to the Veeam Backup Enterprise Manager. The default port for secure connections is 9398 .

Windows Compatibility Options

Click  to interrupt the [inheritance](#) ¹⁴².

If you experience problems when you monitor via Windows sensors, use the following compatibility options for troubleshooting.

Setting	Description
Preferred Data Source	<p> This setting only applies to hybrid sensors that use both performance counters and Windows Management Instrumentation (WMI). The setting does not apply to other sensors.</p> <p>Define the method that Windows sensors use to query data:</p> <ul style="list-style-type: none"> ▪ Performance counters and WMI as fallback: Try to query data via performance counters. If this is not possible, establish a connection via WMI. ▪ Performance counters only: Query data via performance counters only. If this is not possible, the sensor returns no data. ▪ WMI only (recommended): Query data via WMI only. If this is not possible, the sensor returns no data. We recommend that you use this option.
Timeout Method	<p>Select the time that the sensor waits for the return of the WMI query before the sensor cancels the query and shows an error message:</p> <ul style="list-style-type: none"> ▪ Use 1.5x scanning interval (recommended): Multiply the scanning interval of the sensor by 1.5 and use the resulting value. ▪ Set manually: Manually enter a timeout value. <p> We recommend that you use the default value.</p> <p> If you experience ongoing timeout errors, try increasing the timeout value.</p>

Setting	Description
Timeout Value (Sec.)	This setting is only visible if you select Set manually above. Enter the time the sensor waits for the return of its WMI query before it cancels it and shows an error message. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).

SNMP Compatibility Options

Click  to interrupt the [inheritance](#) ¹⁴².

If you experience problems when you monitor via Simple Network Management Protocol (SNMP) sensors, use the following compatibility options for troubleshooting.

Setting	Description
SNMP Delay (ms)	<p>Enter the time in milliseconds (ms) that PRTG waits between two SNMP requests. This can increase device compatibility. Enter an integer value. You can define a delay between 0 and 100. PRTG does not support higher delays.</p> <p>i We recommend that you use the default value.</p> <p>i If you experience SNMP connection failures, try increasing the delay.</p>
Failed Requests	<p>Select if an SNMP sensor tries again after a request fails:</p> <ul style="list-style-type: none"> ▪ Retry (recommended): Try again if an SNMP request fails. This can prevent false error messages because of temporary timeout failures. ▪ Do not retry: Do not retry if an SNMP request fails. If you select this option, an SNMP sensor shows a Down status earlier.
Overflow Values	<p>Select how PRTG handles overflow values. Some devices do not correctly handle internal buffer overflows. This can cause false peaks.</p> <ul style="list-style-type: none"> ▪ Ignore overflow values: Ignore overflow values and do not include them in the monitoring data. We recommend that you use this option. ▪ Handle overflow values as valid results: Regard all overflow values as regular data and include them in the monitoring data. <p>i If you experience problems because of strange peaks in your data graphs, change this option. Peaks might indicate that the monitored device resets counters without an overflow. PRTG interprets such behavior as overflow that results in data peaks. Select the option Ignore overflow values in this case. For more details, see the Knowledge Base: What is the Overflow Values setting in the SNMP Compatibility Options?</p>
Zero Values	<p>Select how PRTG handles zero values. Some devices send incorrect zero values. This can cause false peaks.</p>

Setting	Description
32-bit/64-bit Counters	<ul style="list-style-type: none"> ▪ Ignore zero values for delta sensors (recommended): Ignore zero values and do not include them in the monitoring data. We recommend that you use this option. <ul style="list-style-type: none"> ⓘ If you experience problems, try changing this option. ▪ Handle zero values as valid results for delta sensors: Regard all zero values as regular data and include them in the monitoring data. <p>Select the type of traffic counters that PRTG searches for on a device:</p> <ul style="list-style-type: none"> ▪ Use 64-bit counters if available (recommended): The interface scan uses 64-bit traffic counters, if available. This can avoid buffer overflows in the devices <ul style="list-style-type: none"> ⓘ We recommend that you use the default value. <ul style="list-style-type: none"> ⓘ If you experience problems, try changing this option. ▪ Use 32-bit counters only: The interface scan always uses 32-bit traffic counters, even if 64-bit counters are available. This can make monitoring more reliable for some devices.
Request Mode	<p>Select the request method that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> ▪ Use multi get (recommended): Bundle multiple SNMP requests into one request. We recommend that you use this option. <ul style="list-style-type: none"> ⓘ If you experience problems, try changing this option. ▪ Use single get: Use one request for each SNMP value. This can increase compatibility with older devices. <p>ⓘ PRTG uses paging for SNMP requests. This means that if a sensor has to query more than 20 object identifiers (OID), it automatically polls the OIDs in packages of 20 OIDs each.</p>
Walk Mode	<p>Select the kind of SNMP walk that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> ▪ Use GETBULK requests (recommended): Request the next x OIDs in one SNMP request. The default value is 10. It is dynamic based on the response size. <ul style="list-style-type: none"> ⓘ This option only works with devices that support SNMP version v2c or higher. Make sure that you set the correct SNMP Version in the Credentials for SNMP Devices settings of the parent device or inherit it from objects that are higher in the object hierarchy^[138]. ▪ Use GETNEXT requests: Request one OID at a time. This can increase compatibility with older devices or with devices that have insufficient SNMP BULKWALK support.

Setting	Description
Port Name Template	<p>Select how PRTG displays the name of SNMP sensors. Enter a template that uses several variables. When you add new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID, several fields with interface descriptions are usually available. They are different for every device and OID. PRTG uses the information in these fields to name the sensors. If a field is empty or if it is not available, PRTG adds an empty string to the name. By default, the port name template is ([port]) [ifalias] [ifsensor], which creates a name like (001) Ethernet1 Traffic. You can use and combine any field names that are available at an OID of your device, for example:</p> <ul style="list-style-type: none"> ▪ [port]: The port number of the monitored interface. ▪ [ifalias]: The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling. ▪ [ifname]: The textual name of the monitored interface as assigned by the local device. ▪ [ifdescr]: A textual string containing information about the monitored device or interface, for example, manufacturer, product name, or version. ▪ [ifspeed]: An estimate of the monitored interface's current bandwidth (Kbit/s). ▪ [ifsensor]: The type of the sensor, this is Traffic or RMON. This helps to differentiate between SNMP Traffic^[3094] and SNMP RMON^[3021] sensors. <p>■ For more information about SNMP sensor names, see the Knowledge Base: How can I change the defaults for names automatically generated for new SNMP sensors?</p>
Port Name Update	<p>Select how PRTG reacts if you change the names of ports in your physical device (for example, a switch or router):</p> <ul style="list-style-type: none"> ▪ Keep port names (use this if you edit the names in PRTG): Do not automatically adjust sensor names. This is the best option if you want to manually change names in PRTG. ▪ Automatically update sensor names if port names change in the device: If PRTG detects port name changes in your physical device, it tries to automatically adjust the sensor names accordingly. <p>■ For more information about automatic name updates, see the Knowledge Base: Automatically update port name and number for SNMP Traffic sensors when the device changes them</p>
Port Identification	<p>Select the field that PRTG uses for SNMP interface identification:</p> <ul style="list-style-type: none"> ▪ Automatic identification (recommended): Try the ifAlias field first to identify an SNMP interface and then try ifDescr. <ul style="list-style-type: none"> ⓘ PRTG does not automatically try ifName. ▪ Use ifAlias: For most devices, ifAlias is the best field to use for unique interface names.

Setting	Description
	<ul style="list-style-type: none"> ▪ Use ifDescr: Use this option if the port order of your device changes after a restart, and if no ifAlias field is available. For example, this is the best option for Cisco ASA devices. <ul style="list-style-type: none"> ⓘ If you use this option, it is important that your device returns unique interface names in the ifDescr field. ▪ Use ifName: You can also use this option if no unique ifAlias is available. <ul style="list-style-type: none"> ⓘ If you use this option, it is important that your device returns unique interface names in the ifName field. ▪ Do not update ports: Use this option to disable the automatic port identification.
Start Interface Index	<ul style="list-style-type: none"> ⓘ This setting only applies to SNMP Traffic sensors^[3094] and to Cisco IP SLA sensors^[658]. <p>Enter the index at which PRTG starts to query the interface range during sensor creation. Enter 0 for the automatic mode.</p> <ul style="list-style-type: none"> ⓘ We recommend that you use the default value.
End Interface Index	<ul style="list-style-type: none"> ⓘ This setting only applies to SNMP Traffic sensors^[3094] and to Cisco IP SLA sensors^[658]. <p>Enter the index at which PRTG stops querying the interface range during sensor creation. Enter 0 for the automatic mode.</p> <ul style="list-style-type: none"> ⓘ We recommend that you use the default value.

Proxy Settings for HTTP Sensors

Click  to interrupt the [inheritance](#)^[142].

The proxy settings determine how a sensor connects to a URL. You can enter data for an HTTP proxy server that sensors use when they connect via HTTP or HTTPS.

- ⓘ This setting only applies to HTTP sensors and how they monitor. To change the proxy settings for the PRTG core server, see section [Core & Probes](#)^[4203].
- ⓘ The [SSL Certificate sensor](#)^[3302] and the [SSL Security Check sensor](#)^[3315] do not support HTTP proxies but you can configure connections via SOCKS proxies in the sensors' settings.

Setting	Description
IP Address/DNS Name	Enter the IP address or Domain Name System (DNS) name of the proxy server. If you leave this field empty, HTTP sensors do not use a proxy.

Setting	Description
Port	Enter the port number of the proxy. The default is 8080. Enter an integer value.
User	<p>If the proxy requires authentication, enter the user name for the proxy login.</p> <p> Only basic authentication is available. Enter a string or leave the field empty.</p>
Password	<p>If the proxy requires authentication, enter the password for the proxy login.</p> <p> Only basic authentication is available. Enter a string or leave the field empty.</p>

Scanning Interval

Click  to interrupt the [inheritance](#) .

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration  on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Setting	Description
Schedule	Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:

Setting	Description
	<ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. <p>i You do not trigger a status change by dependency if you manually pause a master object or if you pause it by schedule.</p>

Setting	Description
	<p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
User Group Access	<p>Select the user groups ⁴²¹⁹ that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the object. The object neither shows up in lists nor in the device tree. <ul style="list-style-type: none"> ⓘ There is one exception: If a user in this user group has access to a child object, the parent object is visible in the device tree but users in this user group cannot access it. ▪ Read access: Users in this group can see the object and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the object, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the object, view its monitoring results, edit its settings, and edit its access rights settings. <p>To automatically set all child objects to inherit this object's access rights, enable the Revert children's access rights to inherited option.</p> <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>ⓘ Custom channel types are only available on sensor level.</p>

Advanced Network Analysis

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
Unusual Detection	<p>Select if you want to use the unusual detection^[4188] for sensors:</p> <ul style="list-style-type: none"> ▪ Enabled: Activate the unusual detection for this object and, by default, for all objects underneath in the object hierarchy^[138]. Sensors that are affected by this setting show the Unusual status if PRTG detects unusual activity. ▪ Disabled: Do not activate the unusual detection. PRTG ignores unusual values for sensors that are affected by this setting. These sensors do not show the Unusual status. <p> You can configure the behavior of the unusual detection or completely disable it in the system settings^[4188].</p>
Similar Sensors Detection	<p>Select if you want to activate the similar sensors^[215] analysis:</p> <ul style="list-style-type: none"> ▪ Enabled: Activate the similar sensors detection for this object and, by default, for all objects underneath in the object hierarchy. PRTG considers all sensors that are affected by this setting during the similarity analysis. ▪ Disabled: Do not the activate the similar sensors detection. PRTG does not consider sensors that are affected by this setting during the similarity analysis. <p> You can configure the depth of the analysis of the similar sensors detection or completely disable it in the system settings^[4190].</p>
System Information	<p>Select if you want to retrieve and show system information^[231] for your devices:</p> <ul style="list-style-type: none"> ▪ Enabled: Activate the system information feature for this object and, by default, for all objects underneath in the hierarchy. ▪ Disabled: Do not activate the system information feature. <p> The System Information feature is enabled by default. To retrieve the data, PRTG automatically uses the credentials for Windows systems^[452] and the credentials for SNMP devices^[455] that you entered in the device settings or that the device inherits^[138] from a parent object like the root group. Consider this when you monitor devices that are outside of your local network, especially when you use SNMP v1 or SNMP v2c, which do not provide encryption.</p> <p> This setting is not available on the hosted probe of a PRTG Hosted Monitor instance.</p>

Number of Sensors Limitation

Setting	Description
Sensor Limit	<p>This setting allows you to set a limit for the maximum number of sensors in this group, including subgroups. If the amount of sensors exceeds the limitation, PRTG sets the surplus sensors to the Paused status. Choose between:</p> <ul style="list-style-type: none"> ▪ Allow unlimited number of sensors: Do not limit the number of sensors for this group. Any number of sensors are allowed in this group and its subgroups. ▪ Limit number of sensors: Set a limitation for the number of sensors in this group. Only a defined number of sensors are allowed in this group and its subgroups.
Maximum Number of Sensors	<p>This setting is only visible if you select Limit number of sensors in this group above. Define how many sensors are allowed in this group and its subgroups. Sensors that exceed this group sensor limit are set to the Paused status. Enter an integer value.</p> <ul style="list-style-type: none"> ⓘ Sensors that are in the Paused status count for this group limit as well (for example, manually paused sensors or sensors that are paused by dependency or schedule), but not for the number of available sensors in your license. ⓘ Manually paused sensors override the sensor message exceeds group sensor limit.

ⓘ Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

7.7 Device Settings

The following settings are available on the Settings tab of a device.

- ❗ We recommend that you define as many settings as possible in the [root group settings](#) so that you can inherit them to all other objects in the [object hierarchy](#).

For device settings, you can also use multi-edit. This enables you to change the settings of many devices at the same time.

■ For more information, see section [Multi-Edit](#).

- ❗ This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Basic Device Settings

Setting	Description
Device Name	<p>Enter a meaningful name to identify the device. By default, PRTG shows this name in the device tree ^[183], as well as in alarms ^[228], logs ^[237], notifications ^[403], reports ^[409], maps ^[406], libraries ^[407], and tickets ^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Status	<p>Select the monitoring status of the device:</p> <ul style="list-style-type: none"> ▪ Started: Monitor the device. ▪ Paused: Pause monitoring for the device. All sensors on the device are in the Paused status ^[258] until you change this setting.
IP Version	<p>Select the IP protocol that PRTG uses to connect to the device:</p> <ul style="list-style-type: none"> ▪ IPv4: Use IP version 4 for all requests to the device. ▪ IPv6: Use IP version 6 for all requests to the device. <p>i The setting is valid for all sensors that you create on the device.</p>
IPv4 Address/DNS Name	<p>This setting is only visible if you select IPv4 above. Enter the IP address or Domain Name System (DNS) name for the device. Most sensors that you create on this device inherit this setting and try to connect to this address for monitoring.</p> <p>i Some sensors have their own setting for the IP address/DNS name to which they connect.</p>
IPv6 Address/DNS Name	<p>This setting is only visible if you select IPv6 above. Enter the IP address or Domain Name System (DNS) name for the device. Most sensors that you create on this device inherit this setting and try to connect to this address for monitoring.</p> <p>i Some sensors have their own setting for the IP address/DNS name to which they connect.</p>
Parent Tags	<p>Shows tags ^[145] that this device inherits ^[145] from its parent group ^[139] and its parent probe ^[139].</p>

Setting	Description
	<p> This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p> We recommend that you use the default value. You can also add additional tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p> For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>
Priority	<p>Select a priority^[253] for the device. This setting determines the position of the group in lists. The highest priority is at the top of a list. You can choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

Additional Device Information

Setting	Description
Device Icon	Select a device icon. PRTG shows it in the device tree.
Service URL	Specify a URL to open directly when you select Device Tools Go To Service URL from the context menu ^[268] of the device. For example, you can configure this option to open the address http://www.example.com/service.html . Enter a valid URL or leave the field empty.

Device Identification and Auto-Discovery

Setting	Description
Auto-Discovery Level	<p>Select the level of detail for the auto-discovery^[296]:</p> <ul style="list-style-type: none"> ▪ No auto-discovery: Select this option if you only want to manually create devices and sensors.

Setting	Description
	<ul style="list-style-type: none"> ▪ Standard auto-discovery (recommended): Create a set of standard sensors for standard monitoring. This option works fine for most installations. ▪ Detailed auto-discovery: Create all standard sensors and additional sensors from detailed variants of device templates. As a result, you might get many sensors. This option is suitable for small network segments and whenever you want to monitor the maximum number of sensors available. ▪ Auto-discovery with specific device templates: Customize the auto-discovery and select or combine standard, detailed, and custom device templates. Select one or more templates from the Devices Templates list. <p>i Auto-discoveries can be resource intensive. They are primarily intended for devices on the same network as your probes.</p>
Schedule	<p>This setting is only visible if you select one of the standard, detailed, or custom auto-discovery options above. Define when the auto-discovery runs:</p> <ul style="list-style-type: none"> ▪ Once: Perform the auto-discovery only once. For existing devices, this initiates a one-time sensor update for the selected device. If you select this option, you have to start the auto-discovery manually ^[297]. ▪ Hourly: Perform the auto-discovery for new sensors every 60 minutes. ▪ Daily: Perform the auto-discovery for new sensors every 24 hours. The first auto-discovery runs immediately, all other discoveries start at the time defined in the Auto-Discovery settings section under Setup System Administration Monitoring. ▪ Weekly: Perform the auto-discovery for new sensors every 7 days. The first auto-discovery runs immediately, all other discoveries start at the time defined in the Auto-Discovery settings section under Setup System Administration Monitoring.
Device Templates	<p>This setting is only visible if you select Auto-discovery with specific device templates above. Select one or more device templates by adding a check mark in front of the template name.</p> <p>i You can also select all items or cancel the selection by using the check box in the table header.</p> <p>PRTG uses the device templates that you select for the auto-discovery on the device. Choose from:</p> <ul style="list-style-type: none"> ▪ ADSL ▪ Amazon CloudWatch ▪ Buffalo TeraStation NAS ▪ Cisco ASA VPN

Setting	Description
	<ul style="list-style-type: none">▪ Cisco Device (Generic)▪ Dell EqualLogic▪ Dell MDi Disk▪ DNS Server▪ Environment Jakarta▪ Environment Poseidon▪ FTP Server▪ Generic Device (Ping Only)▪ Generic Device (SNMP Enabled)▪ Generic Device (SNMP Enabled, Detailed)▪ HTTP Web Server▪ Hyper-V Host Server▪ IPMI-enabled Device▪ Juniper NS Device▪ Linux/UNIX Device (SNMP or SSH Enabled)▪ Mail Server (Generic)▪ Mail Server (MS Exchange)▪ Microsoft SharePoint 2010▪ NAS LenovoEMC▪ NAS QNAP▪ NAS Synology▪ NetApp▪ NTP Server▪ Printer (HP)▪ Printer (Generic)▪ RDP Server▪ RMON-compatible Device▪ Server (Cisco UCS)▪ Server (Compaq/HP Agents)▪ Server (Dell)▪ Server (Fujitsu)▪ Server (IBM)

Setting	Description
	<ul style="list-style-type: none"> ▪ SonicWall ▪ SSL Security Check ▪ Switch (Cisco Catalyst) ▪ Switch (Cisco IOS Based) ▪ Switch (HP Procurve) ▪ UNIX/Linux Device ▪ UPS Health (APC) ▪ UPS Health (Generic) ▪ UPS Health (Liebert) ▪ VMware ESXi / vCenter Server ▪ Web Server ▪ Windows (Detailed via WMI) ▪ Windows (via Remote PowerShell) ▪ Windows (via WMI) ▪ Windows IIS (via SNMP) ▪ XenServer Hosts ▪ XenServer Virtual Machines <p>Once the auto-discovery is finished, PRTG creates a new ticket^[240] and lists the device templates that it used to create new sensors.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Location

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
Location (for Geo Maps)	<p>If you want to use Geo Maps⁴⁰²⁶, enter a location in the first line. Geographical maps then display objects like devices or groups with a status icon using a color code similar to the sensor status icons¹⁹⁷ (green–yellow–orange–red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, as PRTG automatically parses latitude and longitude, for example, enter 49.452778 11.077778, or enter 49.452778 any 11.077778 text.</p> <p>A minus sign (-) in the first line hides an object from a geographical map. In this case, you can enter location information in line two and following.</p> <p>You can define a specific label for each location. Enter a string denoting the label in the first line and provide the coordinates in the second line. This geographical marker then shows the object with the label in the geographical map.</p> <p> The preview map always has a road map layout regardless of the map layout you set in User Interface⁴¹⁷⁵.</p>

Credentials for Windows Systems

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
Domain or Computer Name	<p>Enter the domain or computer name of the user account with which you want to access the Windows system. PRTG uses this account for Windows Management Instrumentation (WMI) sensors and other Windows sensors.</p> <p>If you want to use a Windows local user account on the target device, enter the computer name. If you want to use a Windows domain user account (recommended), enter the domain name. PRTG automatically adds a prefix to use the NT LAN Manager (NTLM) protocol if you do not explicitly define it. Do not leave this field empty.</p>
User Name	Enter the user name for access to the Windows system. Usually, you use credentials with administrator rights.
Password	Enter the password for access to the Windows system. Usually, you use credentials with administrator rights.

Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User Name	Enter the user name for access to the Linux/Solaris/macOS system via Secure Shell (SSH) and Web-based Enterprise Management (WBEM). Usually, you use credentials with administrator rights.
Authentication Method	<p>Select the authentication method for login:</p> <ul style="list-style-type: none"> ▪ Password: Provide the password for the login. ▪ Private key: Provide an RSA private key for authentication. <p>i PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p>i PRTG only supports RSA keys. It does not support DSA keys.</p> <p>■ For details, see section Monitoring via SSH⁴³⁰¹.</p>
Password	This setting is only visible if you select Password above. Enter a password for access to the Linux/Solaris/macOS system via SSH and WBEM. Usually, you use credentials with administrator rights.
Private Key	<p>This setting is only visible if you select Private key above. Paste the entire RSA private key, including the BEGIN and END lines. Make sure that a corresponding public key exists on the target device.</p> <p>i PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p>i PRTG only supports RSA keys. It does not support DSA keys.</p> <p>■ For details, see section Monitoring via SSH⁴³⁰¹.</p> <p>i If you do not insert a private key for the first time but if you want to change the private key, you need to restart the PRTG core server service⁴²²⁵ for the private key change to take effect.</p>
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unsecure connection for WBEM. ▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM. <p>i This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	<p>Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:</p> <ul style="list-style-type: none"> ▪ Default: Use one of the default ports. The default port for unsecure connections is 5988 and the default port for secure connections is 5989. ▪ Custom: Use a custom port. <p>i This setting is only relevant if you use WBEM sensors.</p>

Setting	Description
Custom WBEM Port	This setting is only visible if you select Custom above. Enter a custom WBEM port. Enter an integer value.
SSH Port	<p>Enter the port for SSH connections. Enter an integer value. The default port is 22.</p> <p>i By default, PRTG automatically uses this setting for all SSH sensors unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Select the rights that you want to use to run the command on the target system:</p> <ul style="list-style-type: none"> ▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection. ▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for sudo to run commands on the target system, for example, as a root user. ▪ Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for sudo to run commands on the target system, for example, as a root user. ▪ Run the command as a different user using 'su': Use the rights of a different user with su to run commands on the target system.
Target User Name	This setting is only visible if you select an option that includes sudo or su above. Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.
Password	This setting is only visible if you select an option that includes sudo or su with password above. Enter the password to run the sudo command or the su command.
SSH Connection Mode	<p>Select the connection mode that you want to use to access data with SSH sensors.</p> <ul style="list-style-type: none"> ▪ Default (recommended): This is the default monitoring method for SSH sensors. It provides the best performance and security. ▪ Compatibility mode (deprecated): Use this mode only if the default mode does not work on the target system. The compatibility mode is the SSH engine that PRTG used in previous versions and it is deprecated. <p>i We strongly recommend that you use the default SSH connection mode.</p>

Setting	Description
	<p> You can also individually select the SSH connection mode for each SSH sensor in the sensor settings.</p>

Credentials for VMware/XenServer

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User Name	Enter the user name for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.
Password	<p>Enter the password for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.</p> <p> Single sign-on (SSO) passwords for vSphere do not support special characters. For details, see the VMware sensors sections.</p>
VMware Protocol	<p>Select the protocol for the connection to VMware ESXi, vCenter Server, or Citrix XenServer:</p> <ul style="list-style-type: none"> ▪ HTTPS (recommended): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. ▪ HTTP: Use an unsecure connection.
Session Handling	<p>Select if you want to reuse a session for VMware sensors:</p> <ul style="list-style-type: none"> ▪ Reuse a session for multiple scans (recommended): Select this option if you want a VMware sensor to reuse a single session for multiple sensor scans to query data. With this option, the sensor does not need to log in and out for each sensor scan. We recommend that you use this option because it reduces network load and log entries on the target device. This can increase performance. ▪ Create a new session for each scan: If you select this option, PRTG does not reuse a session and a VMware sensor has to log in and out for each sensor scan. This can decrease performance.

Credentials for SNMP Devices

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> ▪ SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> ❗ SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP. ▪ SNMP v2c (recommended): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters. ▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption. <ul style="list-style-type: none"> ❗ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in Interval Delay or Open Requests with the Probe Health sensor²⁰⁸³, distribute the load over multiple probes⁴⁶⁰³. SNMP v1 and SNMP v2c do not have this limitation.
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c above. Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>❗ We recommend that you use the default value.</p>
Authentication Method	<p>This setting is only visible if you select SNMP v3 above. Select the authentication method:</p> <ul style="list-style-type: none"> ▪ MD5: Use message-digest algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>❗ If you do not want to use authentication but you need SNMP v3, for example, because your device requires context, you can leave the Password field empty. In this case, PRTG uses SNMP_SEC_LEVEL_NOAUTH and it entirely deactivates authentication.</p> <p>❗ The authentication method you select must match the authentication method of your device.</p>
User Name	<p>This setting is only visible if you select SNMP v3 above. Enter the user name for access to the target SNMP device.</p> <p>❗ The user name that you enter must match the user name of your device.</p>
Password	<p>This setting is only visible if you select SNMP v3 above. Enter the password for access to the target SNMP device.</p>

Setting	Description
	<p> The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above. Select an encryption type:</p> <ul style="list-style-type: none"> ▪ DES: Use Data Encryption Standard (DES) as the encryption algorithm. ▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm. <p> Net-SNMP does not support AES-192 and AES-256. They do not have RFC specifications.</p> <p> The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above. Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above. Enter a context name only if the configuration of the device requires it. Context is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer value. The default port is 161.</p> <p> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for Database Management Systems

Click  to interrupt the [inheritance](#) .

The settings you define in this section apply to the following sensors:

- [ADO SQL v2 sensor](#) 
- [Microsoft SQL v2 sensor](#) 
- [MySQL v2 sensor](#) 
- [Oracle SQL v2 sensor](#) 

▪ [PostgreSQL sensor](#) 

Setting	Description
Port	<p>Select the port that PRTG uses for connections to the monitored databases:</p> <ul style="list-style-type: none"> ▪ Default (recommended): PRTG automatically determines the type of the database and uses the corresponding default port to connect. PRTG uses the following default ports: <ul style="list-style-type: none"> ▫ Microsoft SQL: 1433 ▫ MySQL: 3306 ▫ Oracle SQL: 1521 ▫ PostgreSQL: 5432 ▪ Custom port for all database sensors: Select this option if your database management systems do not use the default ports. Enter a custom port for database connections below. <p> PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Custom Port	<p>Enter a custom port for database connections. Enter an integer value.</p> <p> PRTG uses this custom port for all database sensors and for connections to all your databases.</p>
Authentication Method	<p>Select the authentication method for the connection to the Structured Query Language (SQL) database:</p> <ul style="list-style-type: none"> ▪ Windows authentication with impersonation: PRTG uses the Windows credentials that you define in settings that are higher in the object hierarchy ^[138], for example, in the settings of the parent device; for the database connection. <p> The user whose credentials PRTG uses needs to have permission to log in to the probe system with a database sensor. This is necessary for the impersonation.</p> <ul style="list-style-type: none"> ▪ SQL server authentication: Use explicit credentials for database connections. Enter a user name and password below.
User Name	<p>This setting is only visible if you select SQL server authentication above. Enter the user name for the database connection.</p>
Password	<p>This setting is only visible if you select SQL server authentication above. Enter the password for the database connection.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p>

Credentials for AWS

Click  to interrupt the [inheritance](#)¹⁴².

For more information about the permissions that are necessary to query the AWS API, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)

Setting	Description
Access Key	Enter the Amazon Web Services (AWS) access key.
Secret Key	Enter the AWS secret key.

Credentials for Dell EMC

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User	Enter the user name for access to the Dell EMC system.
Password	Enter the password for access to the Dell EMC system.
Port	Enter the port for the connection to the Dell EMC system. The default port for secure connections is 443 .

Credentials for Microsoft 365

Click  to interrupt the [inheritance](#)¹⁴².

 The [Microsoft 365 Service Status sensor](#)¹⁵⁴⁶ and the [Microsoft 365 Service Status Advanced sensor](#)¹⁵⁵⁷ use the following credentials to authenticate with Azure Active Directory (Azure AD).

For more information about the credentials and the permissions that are necessary to use the Microsoft 365 sensors, see the Knowledge Base: [How do I obtain credentials and set permissions for the Microsoft 365 sensors?](#)

Setting	Description
Tenant ID	Enter the Azure AD tenant ID.  A tenant ID must be a 32-digit sequence in hexadecimal notation.

Setting	Description
Client ID	Enter the Azure AD client ID.
Client Secret	Enter the Azure AD client secret.

Credentials for Microsoft Azure

Click  to interrupt the [inheritance](#) ¹⁴².

 The [Microsoft Azure Subscription Cost sensor](#) ¹⁵⁶⁸ and the [Microsoft Azure Virtual Machine sensor](#) ¹⁵⁸² use the following credentials to authenticate with Azure AD.

 For more information about the credentials and permissions that are necessary use the Microsoft Azure sensors, see the Knowledge Base: [How do I obtain credentials and create custom roles for the Microsoft Azure sensors?](#)

Setting	Description
Tenant ID	Enter the Azure AD tenant ID.  A tenant ID must be a 32-digit sequence in hexadecimal notation.
Client ID	Enter the Azure AD client ID.
Client Secret	Enter the Azure AD client secret.
Subscription ID	Enter the Azure AD subscription ID.

Credentials for MQTT

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
Authentication Method	Select if you want to connect without credentials or define credentials for access to the MQTT broker. <ul style="list-style-type: none"> None (default): Connect without credentials. User name and password: Define credentials for the connection.
User	This setting is only visible if you select User name and password above. Enter the user name for access to the Message Queue Telemetry Transport (MQTT) broker.

Setting	Description
Password	This setting is only visible if you select User name and password above. Enter the password for access to the MQTT broker.
Port	Enter the port for the connection to the MQTT broker. The default port for secure connections is 8883 and the default port for unsecure connections is 1883 .
Transport-Level Security	Select if you want to use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection: <ul style="list-style-type: none"> Do not use transport-level security: Establish the connection without connection security. Use transport-level security: Establish the connection with the strongest SSL/TLS method that the target device provides.
Server Authentication	This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for server authentication. <ul style="list-style-type: none"> Disable (default): Do not use a certificate for server authentication. Enable: Use a certificate for server authentication.
CA Certificate	Paste the certificate authority (CA) certificate for the verification of the MQTT broker. <p> The certificate must be in Privacy-Enhanced Mail (PEM) format.</p>
Client Authentication	This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for client authentication. <ul style="list-style-type: none"> Disable (default): Do not use a certificate for client authentication. Enable: Use a certificate for client authentication.
Client Certificate	Paste the certificate that you created for authenticating the sensor against the MQTT broker. <p> The certificate must be in PEM format.</p>
Client Key	Enter the client key for access to the MQTT broker. <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	Enter the password for the client key.

Credentials for OPC UA

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
Port	Enter the port for the connection to the OPC Unified Architecture (OPC UA) server. The default port for secure connections is 4840 .
Server Path	Enter the path of the OPC UA server endpoint if you run more than one server under the same IP address or DNS name.
Security Mode	Select if you want to use encryption: <ul style="list-style-type: none"> ▪ None (default): Do not use encryption. ▪ Sign: Sign messages between the sensor and the OPC UA server. ▪ Sign & Encrypt: Sign and encrypt messages between the sensor and the OPC UA server.
Security Policy	This setting is only visible if you select Sign or Sign & Encrypt above. Select if you want to use a security policy and define which policy you want to use: <ul style="list-style-type: none"> ▪ None (default): Do not use a security policy. ▪ Basic256Sha256: Use the Basic256Sha256 security policy. ▪ Basic256: Use the Basic256 security policy.
Client Certificate	Paste the certificate that you created for authenticating the sensor against the OPC UA server. <p> The certificate must meet the following requirements:</p> <ul style="list-style-type: none"> ▪ The key size must be 2048-bit. ▪ The secure hash algorithm must be SHA256. ▪ DataEncipherment must be part of the KeyUsage certificate extension. ▪ A uniform resource indicator (URI) must be set in subjectAltName. ▪ The certificate must be in Privacy-Enhanced Mail (PEM) format.
Client Key	Enter the client key for access to the OPC UA server. <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	Enter the password for the client key.
Authentication Method	Select if you want to connect without credentials or define credentials for access to the OPC UA server: <ul style="list-style-type: none"> ▪ Anonymous (default): Connect without credentials. ▪ Username/Password: Define credentials for the connection.

Setting	Description
	<p> Most OPC UA servers do not support Username/Password authentication without a client certificate. To use Username/Password authentication, select Sign or Sign & Encrypt under Security Mode and Basic256Sha256 or Basic256 under Security Policy and enter the Client Certificate, Client Key, and Client Key Password that you want to use.</p>
User	This setting is only visible if you select Username/Password above. Enter the user name for access to the OPC UA server.
Password	This setting is only visible if you select Username/Password above. Enter the password for access to the OPC UA server.

Credentials for Soffico Orchestra

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
Authentication Method	<p>Select if you want to connect without credentials or define credentials for access to the Orchestra platform:</p> <ul style="list-style-type: none"> None (default): Connect without credentials. Username/Password: Define credentials for the connection.
User	This setting is only visible if you select Username/Password above. Enter the user name for access to the Orchestra platform.
Password	This setting is only visible if you select Username/Password above. Enter the password for access to the Orchestra platform.
Timeout (Sec.)	Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).
Port	Enter the port for the connection to the Orchestra platform. The default port for secure connections is 8443 and the default port for unsecure connections is 8019 .
Protocol	<p>Select the protocol that you want to use for the connection to the Orchestra platform:</p> <ul style="list-style-type: none"> HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. HTTP: Use an unsecure connection.

Credentials for Veeam

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
User	Enter the user name for access to the Veeam Backup Enterprise Manager.
Password	Enter the password for access to the Veeam Backup Enterprise Manager.
Port	Enter the port for the connection to the Veeam Backup Enterprise Manager. The default port for secure connections is 9398 .

Windows Compatibility Options

Click  to interrupt the [inheritance](#)¹⁴².

If you experience problems when you monitor via Windows sensors, use the following compatibility options for troubleshooting.

Setting	Description
Preferred Data Source	<p> This setting only applies to hybrid sensors that use both performance counters and Windows Management Instrumentation (WMI). The setting does not apply to other sensors.</p> <p>Define the method that Windows sensors use to query data:</p> <ul style="list-style-type: none"> ▪ Performance counters and WMI as fallback: Try to query data via performance counters. If this is not possible, establish a connection via WMI. ▪ Performance counters only: Query data via performance counters only. If this is not possible, the sensor returns no data. ▪ WMI only (recommended): Query data via WMI only. If this is not possible, the sensor returns no data. We recommend that you use this option.
Timeout Method	<p>Select the time that the sensor waits for the return of the WMI query before the sensor cancels the query and shows an error message:</p> <ul style="list-style-type: none"> ▪ Use 1.5x scanning interval (recommended): Multiply the scanning interval of the sensor by 1.5 and use the resulting value. ▪ Set manually: Manually enter a timeout value. <p> We recommend that you use the default value.</p> <p> If you experience ongoing timeout errors, try increasing the timeout value.</p>

Setting	Description
Timeout Value (Sec.)	This setting is only visible if you select Set manually above. Enter the time the sensor waits for the return of its WMI query before it cancels it and shows an error message. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).

SNMP Compatibility Options

Click  to interrupt the [inheritance](#) .

If you experience problems when you monitor via Simple Network Management Protocol (SNMP) sensors, use the following compatibility options for troubleshooting.

Setting	Description
SNMP Delay (ms)	<p>Enter the time in milliseconds (ms) that PRTG waits between two SNMP requests. This can increase device compatibility. Enter an integer value. You can define a delay between 0 and 100. PRTG does not support higher delays.</p> <p> We recommend that you use the default value.</p> <p> If you experience SNMP connection failures, try increasing the delay.</p>
Failed Requests	<p>Select if an SNMP sensor tries again after a request fails:</p> <ul style="list-style-type: none"> ▪ Retry (recommended): Try again if an SNMP request fails. This can prevent false error messages because of temporary timeout failures. ▪ Do not retry: Do not retry if an SNMP request fails. If you select this option, an SNMP sensor shows a Down status earlier.
Overflow Values	<p>Select how PRTG handles overflow values. Some devices do not correctly handle internal buffer overflows. This can cause false peaks.</p> <ul style="list-style-type: none"> ▪ Ignore overflow values: Ignore overflow values and do not include them in the monitoring data. We recommend that you use this option. ▪ Handle overflow values as valid results: Regard all overflow values as regular data and include them in the monitoring data. <p> If you experience problems because of strange peaks in your data graphs, change this option. Peaks might indicate that the monitored device resets counters without an overflow. PRTG interprets such behavior as overflow that results in data peaks. Select the option Ignore overflow values in this case. For more details, see the Knowledge Base: What is the Overflow Values setting in the SNMP Compatibility Options?</p>
Zero Values	<p>Select how PRTG handles zero values. Some devices send incorrect zero values. This can cause false peaks.</p>

Setting	Description
32-bit/64-bit Counters	<ul style="list-style-type: none"> ▪ Ignore zero values for delta sensors (recommended): Ignore zero values and do not include them in the monitoring data. We recommend that you use this option. <ul style="list-style-type: none"> ⓘ If you experience problems, try changing this option. ▪ Handle zero values as valid results for delta sensors: Regard all zero values as regular data and include them in the monitoring data. <p>Select the type of traffic counters that PRTG searches for on a device:</p> <ul style="list-style-type: none"> ▪ Use 64-bit counters if available (recommended): The interface scan uses 64-bit traffic counters, if available. This can avoid buffer overflows in the devices <ul style="list-style-type: none"> ⓘ We recommend that you use the default value. ⓘ If you experience problems, try changing this option. ▪ Use 32-bit counters only: The interface scan always uses 32-bit traffic counters, even if 64-bit counters are available. This can make monitoring more reliable for some devices.
Request Mode	<p>Select the request method that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> ▪ Use multi get (recommended): Bundle multiple SNMP requests into one request. We recommend that you use this option. <ul style="list-style-type: none"> ⓘ If you experience problems, try changing this option. ▪ Use single get: Use one request for each SNMP value. This can increase compatibility with older devices. <p>ⓘ PRTG uses paging for SNMP requests. This means that if a sensor has to query more than 20 object identifiers (OID), it automatically polls the OIDs in packages of 20 OIDs each.</p>
Walk Mode	<p>Select the kind of SNMP walk that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> ▪ Use GETBULK requests (recommended): Request the next <i>x</i> OIDs in one SNMP request. The default value is 10. It is dynamic based on the response size. <ul style="list-style-type: none"> ⓘ This option only works with devices that support SNMP version v2c or higher. Make sure that you set the correct SNMP Version in the Credentials for SNMP Devices settings of the parent device or inherit it from objects that are higher in the object hierarchy^[138]. ▪ Use GETNEXT requests: Request one OID at a time. This can increase compatibility with older devices or with devices that have insufficient SNMP BULKWALK support.

Setting	Description
Port Name Template	<p>Select how PRTG displays the name of SNMP sensors. Enter a template that uses several variables. When you add new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID, several fields with interface descriptions are usually available. They are different for every device and OID. PRTG uses the information in these fields to name the sensors. If a field is empty or if it is not available, PRTG adds an empty string to the name. By default, the port name template is ([port]) [ifalias] [ifsensor], which creates a name like (001) Ethernet1 Traffic. You can use and combine any field names that are available at an OID of your device, for example:</p> <ul style="list-style-type: none"> ▪ [port]: The port number of the monitored interface. ▪ [ifalias]: The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling. ▪ [ifname]: The textual name of the monitored interface as assigned by the local device. ▪ [ifdescr]: A textual string containing information about the monitored device or interface, for example, manufacturer, product name, or version. ▪ [ifspeed]: An estimate of the monitored interface's current bandwidth (Kbit/s). ▪ [ifsensor]: The type of the sensor, this is Traffic or RMON. This helps to differentiate between SNMP Traffic^[3094] and SNMP RMON^[3021] sensors. <p>■ For more information about SNMP sensor names, see the Knowledge Base: How can I change the defaults for names automatically generated for new SNMP sensors?</p>
Port Name Update	<p>Select how PRTG reacts if you change the names of ports in your physical device (for example, a switch or router):</p> <ul style="list-style-type: none"> ▪ Keep port names (use this if you edit the names in PRTG): Do not automatically adjust sensor names. This is the best option if you want to manually change names in PRTG. ▪ Automatically update sensor names if port names change in the device: If PRTG detects port name changes in your physical device, it tries to automatically adjust the sensor names accordingly. <p>■ For more information about automatic name updates, see the Knowledge Base: Automatically update port name and number for SNMP Traffic sensors when the device changes them</p>
Port Identification	<p>Select the field that PRTG uses for SNMP interface identification:</p> <ul style="list-style-type: none"> ▪ Automatic identification (recommended): Try the ifAlias field first to identify an SNMP interface and then try ifDescr. <ul style="list-style-type: none"> ⓘ PRTG does not automatically try ifName. ▪ Use ifAlias: For most devices, ifAlias is the best field to use for unique interface names.

Setting	Description
	<ul style="list-style-type: none"> ▪ Use ifDescr: Use this option if the port order of your device changes after a restart, and if no ifAlias field is available. For example, this is the best option for Cisco ASA devices. <ul style="list-style-type: none"> ⓘ If you use this option, it is important that your device returns unique interface names in the ifDescr field. ▪ Use ifName: You can also use this option if no unique ifAlias is available. <ul style="list-style-type: none"> ⓘ If you use this option, it is important that your device returns unique interface names in the ifName field. ▪ Do not update ports: Use this option to disable the automatic port identification.
Start Interface Index	<ul style="list-style-type: none"> ⓘ This setting only applies to SNMP Traffic sensors^[3094] and to Cisco IP SLA sensors^[658]. <p>Enter the index at which PRTG starts to query the interface range during sensor creation. Enter 0 for the automatic mode.</p> <ul style="list-style-type: none"> ⓘ We recommend that you use the default value.
End Interface Index	<ul style="list-style-type: none"> ⓘ This setting only applies to SNMP Traffic sensors^[3094] and to Cisco IP SLA sensors^[658]. <p>Enter the index at which PRTG stops querying the interface range during sensor creation. Enter 0 for the automatic mode.</p> <ul style="list-style-type: none"> ⓘ We recommend that you use the default value.

Proxy Settings for HTTP Sensors

Click  to interrupt the [inheritance](#)^[142].

The proxy settings determine how a sensor connects to a URL. You can enter data for an HTTP proxy server that sensors use when they connect via HTTP or HTTPS.

- ⓘ This setting only applies to HTTP sensors and how they monitor. To change the proxy settings for the PRTG core server, see section [Core & Probes](#)^[4203].
- ⓘ The [SSL Certificate sensor](#)^[3302] and the [SSL Security Check sensor](#)^[3315] do not support HTTP proxies but you can configure connections via SOCKS proxies in the sensors' settings.

Setting	Description
IP Address/DNS Name	Enter the IP address or Domain Name System (DNS) name of the proxy server. If you leave this field empty, HTTP sensors do not use a proxy.

Setting	Description
Port	Enter the port number of the proxy. The default is 8080. Enter an integer value.
User	<p>If the proxy requires authentication, enter the user name for the proxy login.</p> <p> Only basic authentication is available. Enter a string or leave the field empty.</p>
Password	<p>If the proxy requires authentication, enter the password for the proxy login.</p> <p> Only basic authentication is available. Enter a string or leave the field empty.</p>

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Setting	Description
Schedule	Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:

Setting	Description
	<ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To cancel an active maintenance window before the defined end date, change the time entry under Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. <p>i You do not trigger a status change by dependency if you manually pause a master object or if you pause it by schedule.</p>

Setting	Description
	<p> To test your dependencies , select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector  to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p>

Access Rights

Click  to interrupt the [inheritance](#) .

Setting	Description
User Group Access	<p>Select the user groups ⁴²¹⁹ that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the object. The object neither shows up in lists nor in the device tree. <ul style="list-style-type: none"> ⓘ There is one exception: If a user in this user group has access to a child object, the parent object is visible in the device tree but users in this user group cannot access it. ▪ Read access: Users in this group can see the object and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the object, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the object, view its monitoring results, edit its settings, and edit its access rights settings. <p>To automatically set all child objects to inherit this object's access rights, enable the Revert children's access rights to inherited option.</p> <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>ⓘ Custom channel types are only available on sensor level.</p>

Advanced Network Analysis

Click  to interrupt the [inheritance](#)^[142].

Setting	Description
Unusual Detection	<p>Select if you want to use the unusual detection^[4188] for sensors:</p> <ul style="list-style-type: none"> ▪ Enabled: Activate the unusual detection for this object and, by default, for all objects underneath in the object hierarchy^[138]. Sensors that are affected by this setting show the Unusual status if PRTG detects unusual activity. ▪ Disabled: Do not activate the unusual detection. PRTG ignores unusual values for sensors that are affected by this setting. These sensors do not show the Unusual status. <p> You can configure the behavior of the unusual detection or completely disable it in the system settings^[4188].</p>
Similar Sensors Detection	<p>Select if you want to activate the similar sensors^[215] analysis:</p> <ul style="list-style-type: none"> ▪ Enabled: Activate the similar sensors detection for this object and, by default, for all objects underneath in the object hierarchy. PRTG considers all sensors that are affected by this setting during the similarity analysis. ▪ Disabled: Do not the activate the similar sensors detection. PRTG does not consider sensors that are affected by this setting during the similarity analysis. <p> You can configure the depth of the analysis of the similar sensors detection or completely disable it in the system settings^[4190].</p>
System Information	<p>Select if you want to retrieve and show system information^[231] for your devices:</p> <ul style="list-style-type: none"> ▪ Enabled: Activate the system information feature for this object and, by default, for all objects underneath in the hierarchy. ▪ Disabled: Do not activate the system information feature. <p> The System Information feature is enabled by default. To retrieve the data, PRTG automatically uses the credentials for Windows systems^[452] and the credentials for SNMP devices^[455] that you entered in the device settings or that the device inherits^[138] from a parent object like the root group. Consider this when you monitor devices that are outside of your local network, especially when you use SNMP v1 or SNMP v2c, which do not provide encryption.</p> <p> This setting is not available on the hosted probe of a PRTG Hosted Monitor instance.</p>

-  Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

7.8.1 Active Directory Replication Errors Sensor

The Active Directory Replication Errors sensor checks a Windows domain controller (DC) for replication errors.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Active Directory Replication Errors

Sensor in Other Languages

- Dutch: Active Directory Replicatie Fouten
- French: Erreurs de réplication Active Directory
- German: Active Directory Replikationsfehler
- Japanese: AD レプリケーションエラー監視
- Portuguese: Erros de replicação do Active Directory
- Russian: Active Directory
- Simplified Chinese: 活动目录复制错误
- Spanish: Errores de replicación de Active Directory

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
 - The parent device must be a DC.
 - This sensor [requires](#)⁴⁷⁸ the probe system to be part of the domain whose Active Directory you want to monitor.
 - This sensor requires .NET 4.7.2 or later on the probe system. If the sensor shows the error PE087, you must additionally install .NET 3.5 on the probe system.
 - This sensor requires credentials for Windows systems in the settings of the parent device.
 - We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
 - This sensor supports the IPv6 protocol.
 - This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)⁴⁴⁸⁵.
- ☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Member of Windows domain	<p>This sensor only works if the probe system is part of the domain whose Active Directory you want to monitor. You must add the sensor to a device that represents the DC.</p>
Windows credentials	<p>This sensor requires credentials for Windows systems⁴⁵² in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p> If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, the sensor cannot correctly connect.</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Setting	Description
Replication Neighbor	<p>Select the replication neighbor whose replication connection you want to monitor.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>
Naming Context	<p>Select the Active Directory naming context that you want to monitor:</p> <ul style="list-style-type: none"> ▪ Configuration (default): Includes information about partitions, sites, services, or the Active Directory schema. ▪ Schema: Includes the information by which objects, classes, and attributes that are used in the Active Directory are defined. ▪ DomainDnsZones: Includes information about the domain controllers that are in the domain. ▪ Domain: Includes domain information that is replicated to this domain's domain controllers, for example information about computers or users. <p>i The probe system must be part of the domain whose naming context you want to monitor.</p> ▪ ForestDnsZones: Includes information about domain controllers in the forest.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Sensor Name ⓘ

Tags ⓘ X +

Priority ⓘ ★ ★ ★ ☆ ☆

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[406], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ptfsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Settings

Sensor Settings

Replication Neighbor **i**

Naming Context **i** *Configuration (default)*

Sensor Settings

Setting	Description
Replication Neighbor	Shows the replication neighbor whose replication connection this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Naming Context	Shows the Active Directory naming context that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Debug Options

Debug Options

Result Handling ⓘ Discard result
 Store result

Debug Options

Setting	Description
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

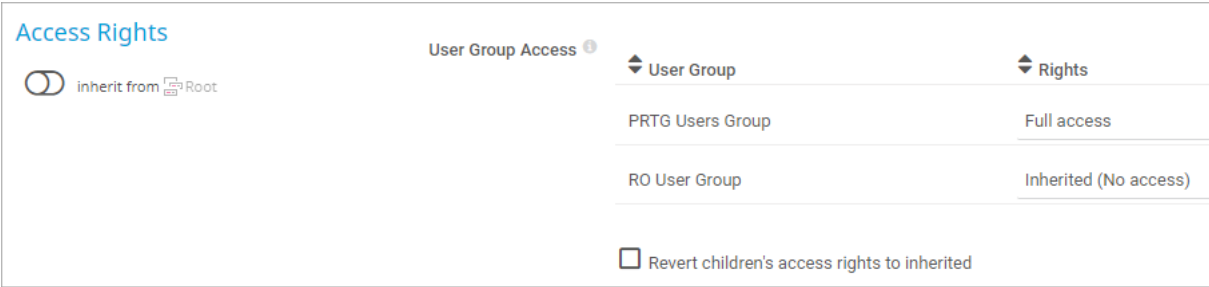

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

i Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types **i**

Channel Type	Unit
Bytes (Bandwidth)	KB ▼
	kbit ▼
	/ ▼
	sec... ▼
Bytes (Memory)	MB ▼
Bytes (Disk)	MB ▼
Bytes (File)	Byte ▼

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Consecutive Sync Failures	The number of consecutive synchronization failures
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Is Deleted Source	If the source is deleted <ul style="list-style-type: none"> Up status¹⁹⁷: No Down status: Yes
Last Sync Attempt	The time of the last synchronization attempt
Last Sync Result	The result of the last synchronization i This channel is the primary channel by default.
Last Sync Success	The time of the last synchronization success
Modified Consecutive Sync Failures	The number of modified, consecutive synchronization failures
Pending Replication Operations	The number of pending replication operations
Scheduled Sync Disabled	If the scheduled synchronization is disabled <ul style="list-style-type: none"> Up status: No Down status: Yes

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)⁴⁸⁸

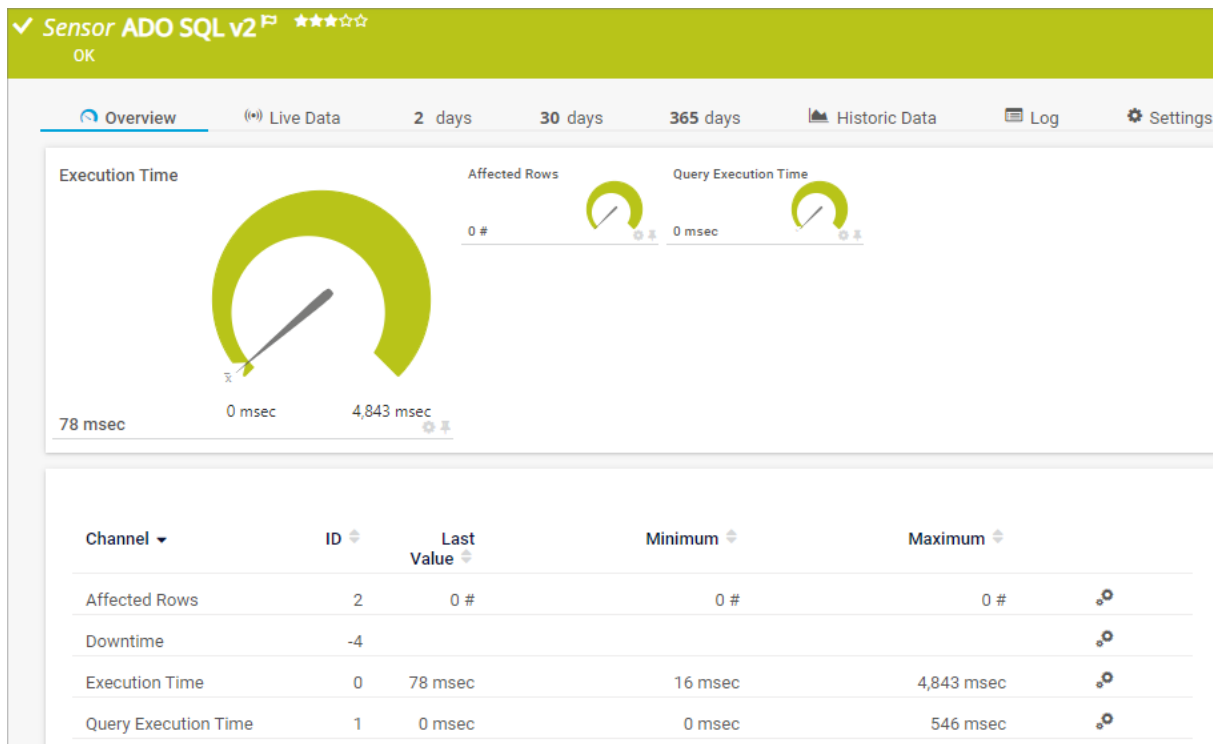

- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.2 ADO SQL v2 Sensor

The ADO SQL v2 sensor monitors a database via an ActiveX Data Objects (ADO) connection and it executes a Structured Query Language (SQL) query.

i The sensor can monitor any data source that is available via Object Linking and Embedding, Database (OLE DB) or Open Database Connectivity (ODBC).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

ADO SQL v2 Sensor

Sensor in Other Languages

- Dutch: ADO SQL v2
- French: ADO SQL v2
- German: ADO SQL v2
- Japanese: ADO SQL v2
- Portuguese: ADO SQL v2
- Russian: ADO SQL v2
- Simplified Chinese: ADO SQL v2
- Spanish: ADO SQL v2

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.

- This sensor requires .NET 4.7.2 or later on the probe system.
- You must store your Structured Query Language (SQL) query in a file on the probe system. In a cluster, copy the file to every cluster node.
- Define credentials, custom port (if required), and timeout in the [credentials for database management systems](#) settings of the parent device, or in the settings of a group or probe above.
- This sensor supports the IPv6 protocol.
- If you use an ODBC connection, you must define the ODBC connection in the Windows ODBC Connection Manager first. If it is a 64-bit Windows, you must define the ODBC connection as an ODBC 32-bit connection.
- See section [Monitoring Databases](#) for an [example](#) for channel value selection.
- See the Knowledge Base: [How to set up the SQL v2 sensors in PRTG? Is there a guide?](#)
- See the Knowledge Base: [How can I monitor strings from an SQL database and show a sensor status depending on it?](#)
- See the Knowledge Base: [How can I monitor error tables in SQL databases?](#)
- See the Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Database Specific

Setting	Description
Connection String	Enter the connection string that the sensor uses to connect to the database. A connection string can look like this, for example:

Setting	Description
	<p><code>Provider=SQLOLEDB.1;Data Source=10.0.0.200\SQLEXPRESS;User ID=user;Password=userpass;Initial Catalog=Northwind</code></p> <ul style="list-style-type: none"> ❗ For ODBC connections, you must enter <code>MSDASQL</code> as provider, for example <code>Provider=MSDASQL;DSN=_my_odbc_sqlserver</code>. ❗ You can use the placeholders <code>%dbloginuser</code> and <code>%dbloginpassword</code>. PRTG replaces them with the credentials for database management systems of the parent device.

Data

Setting	Description
SQL Query File	<p>Select the SQL query file that includes a valid SQL statement that the sensor executes on the server with every scanning interval. The list contains SQL scripts from the <code>\Custom Sensors\sql</code> subfolder of the PRTG program directory on the probe system. Store your script there. If you use the script on a cluster probe, you must store the script on all cluster nodes.</p> <p>A correct expression in the file could be: <code>SELECT AVG(UnitPrice) FROM Products</code>. If you want to use transactions, separate the individual steps with semicolons <code>;</code>.</p> <ul style="list-style-type: none"> ❗ Note that with each request, PRTG transfers the full result set, so use filters and limits in your query. ❗ The demo script <code>Demo Serveruptime.sql</code> is available by default. You can use the it to monitor the uptime of the target server. ■ See also the Knowledge Base: Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?
Data Processing	<p>Define whether the sensor processes data from the database:</p> <ul style="list-style-type: none"> ▪ Only execute query: Only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed by the query (for example, created, deleted, or edited). ▪ Count table rows: Execute a <code>SELECT</code> statement and monitor how many rows of the data table this statement returns. ▪ Process data table: Read and analyze the data table. If you select this option, the sensor counts rows with <code>SELECT</code> statements as well.

Setting	Description
Channel #2 – #10	<p>This setting is only visible if you select Process data table above. You can define up to 10 additional channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you automatically see all available settings for Channel #1. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> ▪ Disable: Do not create this channel. ▪ Enable: Create this channel. <p>i It is not possible to enable or disable channels after sensor creation.</p>
Channel #x Name	<p>This setting is only visible if you select Process data table above. Enter a unique name for the channel. Enter a string. PRTG dynamically generates channels with this name as the identifier.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Channel #x Mode	<p>This setting is only visible if you select Process data table above. Define how to display the determined value in the channel:</p> <ul style="list-style-type: none"> ▪ Absolute (recommended): Show the value as the sensor retrieves it from the data table. ▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table. <ul style="list-style-type: none"> i This mode is not compatible with the unit Lookup. i This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.
Channel #x Unit	<p>This setting is only visible if you select Process data table above. Define the unit of the channel value:</p> <ul style="list-style-type: none"> ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU

Setting	Description
	<ul style="list-style-type: none"> ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Lookup <p>■ For more information about the available units, see section Custom Sensors.</p> <p>ⓘ To use lookups with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor.</p> <p>ⓘ It is not possible to use the unit Lookup in combination with the Difference mode. You are not able to create the sensor in this case.</p>

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>ⓘ This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ sqlsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Database Specific

Database Specific	<p>Connection String ⓘ Provider=SQLOLEDB.1;Data Source=10.0.0.200\SQLEXPRESS;User ID=user;Password=userpass;Initial Catalog=Northwind</p>
--------------------------	---

Database Specific

Setting	Description
Connection String	Shows the string that the sensor uses to connect to the database. You can change the string if necessary.

Data

Data

SQL Query File ⓘ *Demo Serveruptime.sql*

Input Parameter Handling ⓘ Do not use input parameter (default)
 Use input parameter

Transaction Handling ⓘ Do not use transaction (default)
 Use transaction and always roll back
 Use transaction and commit on success

Data Processing ⓘ *Only execute query*

Result Handling ⓘ Discard result
 Store result

Data

Setting	Description
SQL Query File	Shows the SQL script file that the sensor executes on the server. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Input Parameter Handling	Define if you want to pass a parameter to the SQL query file: <ul style="list-style-type: none"> ▪ Do not use input parameter (default): Execute the SQL query file without using variables. ▪ Use input parameter: Execute an SQL query file that contains a variable. Provide the parameter that you want to use in the query below.
Input Parameter	This setting is only visible if you select Input Parameter Handling above. Enter the parameter that you want to pass to the SQL query file. This parameter replaces the variables @prtg, :prtg, or ? in the SQL query, considering the general rules for SQL variables. You can also use PRTG placeholders for custom sensors (command-line parameters) as input parameters, for example, %sensorid or %deviceid. For details, see section Custom Sensors [444]. ⓘ Provide strings as they are and do not surround them with quotation marks. PRTG automatically and correctly inserts string parameters into the query.
Transaction Handling	Define if you want to use transactions and if they affect the database content: <ul style="list-style-type: none"> ▪ Do not use transaction (default): Do not execute transactions.

Setting	Description
Data Processing	<ul style="list-style-type: none"> ▪ Use transaction and always roll back: The query does not change data in the database. In the SQL query file, separate the single steps of the transaction with semicolons. ▪ Use transaction and commit on success: The query changes data in the database. The changes only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons. <p>Shows how the sensor processes data from the database.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Handle DBNull in Channel Values as	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define the sensor behavior if the query returns DBNull:</p> <ul style="list-style-type: none"> ▪ Error: Show a Down status if the query returns DBNull. ▪ Number 0: Recognize the result DBNull as a valid value and interpret it as the number 0.
Select Channel Value by	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define how to select the desired cell in the database table:</p> <ul style="list-style-type: none"> ▪ Column number: Determine the channel value by using the value in row 0 of the column whose number you specify in Channel #x Column Number. ▪ Column name: Determine the channel value by using the value in row 0 of the column whose name you specify in Channel #x Column Name. ▪ Row number: Determine the channel value by using the value in column 0 of the row whose number you specify in Channel #x Row Number. ▪ Key value pair: Determine the channel value by searching in column 0 for the key you specify in Channel #x Key and by returning the value in column 1 of the same row where the key value was found. <p>i Defining how the desired cell in the database table is selected is necessary to configure the cells that are used in the channels.</p> <p>i The option you select here also defines the method of how to optionally determine a value for the sensor message. For details, see setting Use Data Table Value in Sensor Message.</p> <p>■ For an example for channel value selection, see section Monitoring Databases ⁴³²⁵.</p>
Channel #x	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. The setting shows if the channel is disabled.</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Lookup
Channel #x Custom Unit	This setting is only visible if you select the channel unit Custom above. Define a unit for the channel value. Enter a string.
Channel #x Lookup	This setting is only visible if you select the channel unit Lookup above. Select a lookup file that you want to use with this channel.
Use Data Table Value in Sensor Message	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define if the sensor message shows a value from the data table:</p> <ul style="list-style-type: none"> ▪ Disable: Do not use a custom sensor message. ▪ Enable: Define a custom sensor message with a defined value of the data table. Define the value selection below. <p>The method of how to determine a value for the sensor message is defined in the setting Select Channel Value by above.</p>
Sensor Message Column Number	This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column number for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the number of a column. The sensor message shows the value in row 0 of this column. Enter an integer value.
Sensor Message Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column name for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter a string.</p> <p> Columns start with index 0.</p>

Setting	Description
Sensor Message Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Row number for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter the number of a row. The sensor message shows the value in column 0 of this row. Enter an integer value.</p> <p>i Rows start with index 0.</p>
Sensor Message Key	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Key value pair for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter a key to search for in column 0 of the data table. The sensor message shows the value in column 1 of the row where the key was found. Enter a string.</p>
Sensor Message	<p>This setting is only visible if you enable Use Data Table Value in Sensor Message. Define the sensor message. Enter a string. Use the placeholder {0} at the position where you want to display the value.</p> <p>Example: The message is {0}</p> <p>i The number sign (#) is not supported in sensor messages. If a message contains a number sign, the message is clipped at this point.</p>
If Sensor Message Changes	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</p> <p>Define what the sensor does when the sensor message changes:</p> <ul style="list-style-type: none"> Ignore changes (default): Take no action on change. Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger⁴¹³⁶, you can use this mechanism to trigger a notification³³⁶⁷ whenever the sensor value changes.
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

<p>Scanning Interval</p> <p> inherit from  Root</p>	<p>Scanning Interval ⓘ 60 seconds</p> <hr/> <p>If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)</p>
--	---

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Affected Rows	The number of rows that were addressed by the query (including SELECT statements if you process data tables)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Execution Time	<p>The execution time of the entire request (including connection buildup, query execution, transaction handling, disconnection) in milliseconds (msec)</p> <p>i This channel is the primary channel by default.</p>
Query Execution Time	The execution time of the specified query in msec

SQL Variables

You can use the following variables in the SQL query file to be replaced by an input parameter. This is useful if you have various SQL sensors with queries that differ in only one parameter.

- Microsoft SQL, MySQL, PostgreSQL: **@prtg**
- Oracle SQL: **:prtg**
- ADO SQL: **?** (question mark)

i @prtg, :prtg, and ? are common SQL query parameters and they are used in a parameterized SQL query. This means that the query and the parameter are forwarded without any changes to the database. This leads to some restrictions on the database side. For example, you cannot use variables as placeholders for table names or as lists in IN operators.

Examples for variables usage:

```
SELECT * FROM Table WHERE name = @prtg  
SELECT @prtg FROM Table
```

Sensor Settings Overview

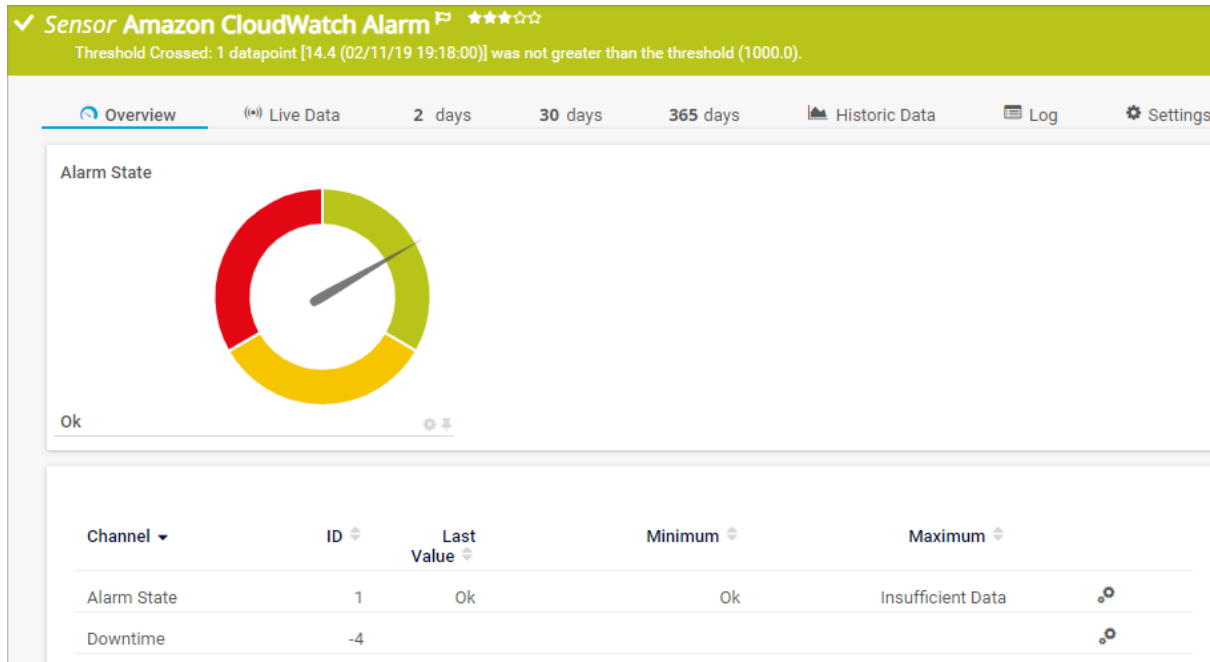

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.3 Amazon CloudWatch Alarm Sensor

The Amazon CloudWatch Alarm sensor monitors the status of an Amazon CloudWatch alarm. It reads the data via the Amazon Web Services (AWS) CloudWatch application programming interface (API).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Amazon CloudWatch Alarm Sensor

Sensor in Other Languages

- Dutch: Amazon CloudWatch Alarm
- French: Alarme Amazon CloudWatch
- German: Amazon CloudWatch Alarm
- Japanese: Amazon CloudWatch アラーム
- Portuguese: Amazon CloudWatch Alarmes
- Russian: Amazon CloudWatch
- Simplified Chinese: Amazon CloudWatch 报警
- Spanish: Alarma Amazon CloudWatch

Remarks

- This sensor requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)
- This sensor requires .NET 4.7.2 or later on the probe system.
- Define [credentials for AWS](#) in settings that are higher in the [object hierarchy](#), for example, in the settings of the parent device.
- This sensor supports the IPv6 protocol.

- This sensor has a medium performance impact.
- The names of configured alarms that you want to monitor must not contain double spaces.
- The data you see in the sensor message is not necessarily the most recent data. It merely shows the reason for the current [status](#)^[197] and why the sensor changed to it. This means for the Up status, for example, that this data is as old as the amount of time that has passed since the last alarm disappeared.
- Amazon charges you for each AWS API request that the sensor sends to the Amazon servers. For details, see the Knowledge Base: [How much does Amazon charge for using Amazon CloudWatch sensors in PRTG?](#)
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)^[448].

Detailed Requirements

Requirement	Description
Permissions for the AWS API key	<p>This sensor requires sufficient rights to query data from the AWS API.</p> <ul style="list-style-type: none"> ■ For more information, see the Knowledge Base: How do I set permissions for the Amazon Web Services (AWS) API key to use certain sensors in PRTG?
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <ul style="list-style-type: none"> ⓘ If the framework is missing, you cannot create this sensor. ■ For more information, see the Knowledge Base: Which .NET version does PRTG require?

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG looks for configured alarms on CloudWatch.

- ⓘ This can take up to several minutes.
- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Amazon CloudWatch Specific

Setting	Description
Services	<p>Select the services that you want to monitor. PRTG creates one sensor for each service that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> cloudwatchsensor alarm
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Region	Shows the region in which the AWS instance runs. It is one of the following regions: <ul style="list-style-type: none"> US East (Northern Virginia) US East (Ohio) US West (Northern California) US West (Oregon) Europe (Stockholm)

Setting	Description
	<ul style="list-style-type: none"> ▪ Europe (Ireland) ▪ Europe (London) ▪ Europe (Paris) ▪ Europe (Frankfurt) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Seoul) ▪ Asia Pacific (Mumbai) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Sydney) ▪ South America (São Paulo) ▪ Canada (Central) <p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p> <p> For more information, see section Supported Regions and Their Codes .</p>
Description	<p>Shows the description of the AWS service instance that this sensor monitors.</p> <p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
ID	<p>Shows the ID of the AWS instance that this sensor monitors.</p> <p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory  on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click ⓘ to interrupt the [inheritance](#).

Scanning Interval	
Scanning Interval ⓘ	60 seconds
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access

Sensor Settings Overview

For more information about sensor settings, see the following sections:

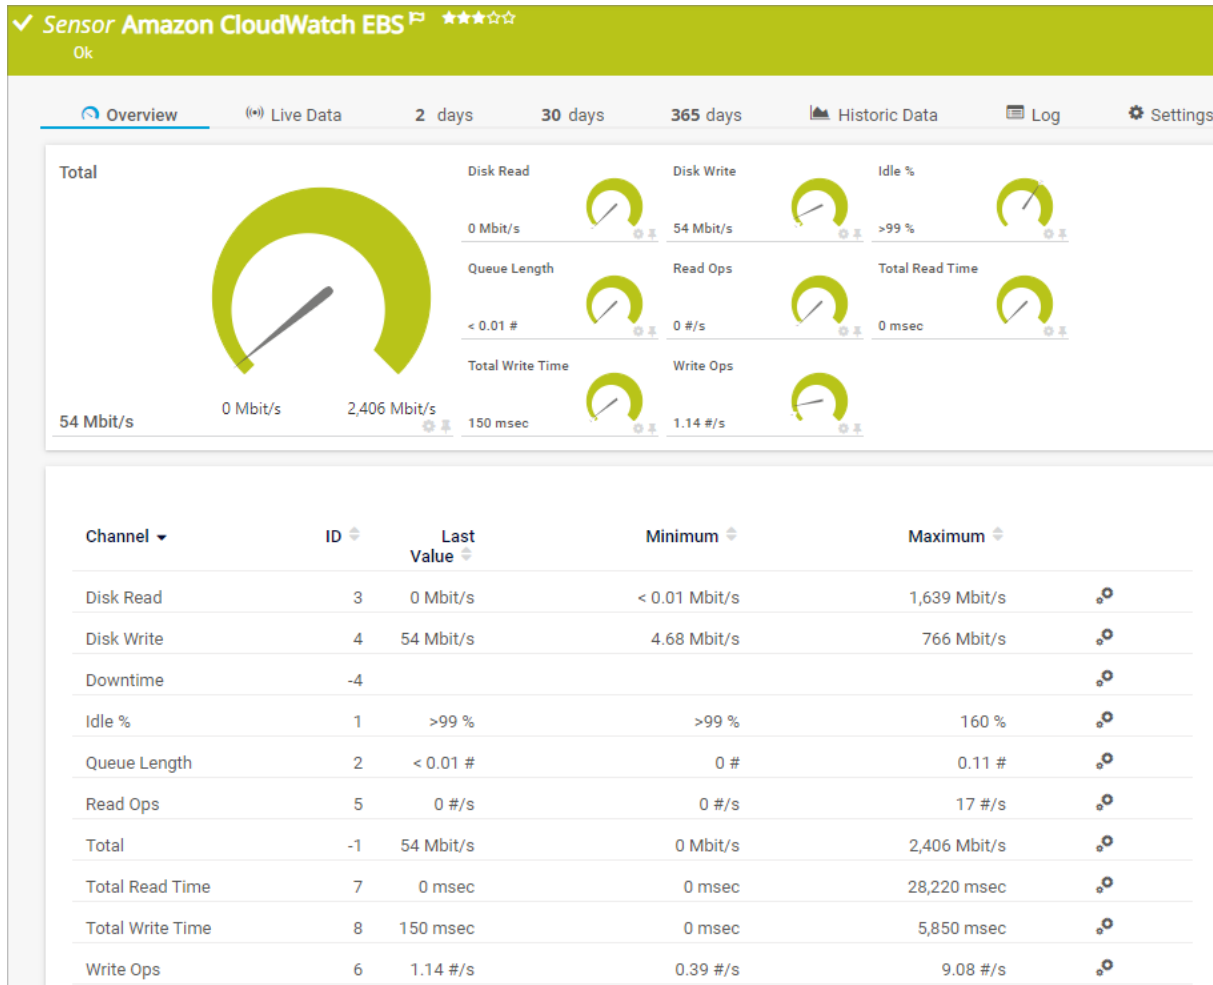

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.4 Amazon CloudWatch EBS Sensor

The Amazon CloudWatch EBS sensor monitors the performance of the Amazon Cloud service Elastic Block Store (EBS).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ⁵³⁸.

For a list of metrics that this sensor supports, see section [Supported Metrics](#) ⁵³⁴.

Amazon CloudWatch EBS Sensor

Sensor in Other Languages

- Dutch: Amazon CloudWatch EBS
- French: Amazon CloudWatch EBS
- German: Amazon CloudWatch EBS
- Japanese: Amazon CloudWatch EBS
- Portuguese: Amazon CloudWatch EBS
- Russian: Amazon CloudWatch EBS
- Simplified Chinese: Amazon CloudWatch EBS

- Spanish: Amazon CloudWatch EBS

Remarks

- This sensor requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)
- This sensor requires .NET 4.7.2 or later on the probe system.
- Define [credentials for AWS](#) ^[459] in settings that are higher in the [object hierarchy](#) ^[138], for example, in the settings of the parent device.
- The minimum scanning interval for this sensor is 15 minutes.
- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- This sensor only shows the channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the Amazon Web Services (AWS) website. To know which channels are possible for the various services of this sensor, see section Supported Metrics. If the sensor has not received data from Amazon for more than 6 hours, it shows a Down status.
- Configure [notification triggers](#) ^[387] with a latency of 0 seconds to receive all notifications for this sensor ([\[...\] for at least 0 seconds](#)).
- To know which dimensions you can monitor, see section Supported Dimensions.
- Amazon charges you for each AWS API request that the sensor sends to the Amazon servers. For details, see the Knowledge Base: [How much does Amazon charge for using Amazon CloudWatch sensors in PRTG?](#)

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click Q and use the object selector ²⁵¹ to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

User Group Access ⓘ

Asia Pacific (Tokyo)	ap-northeast-1
Asia Pacific (Seoul)	ap-northeast-2
Asia Pacific (Mumbai)	ap-south-1

Region	Code
Asia Pacific (Singapore)	ap-southeast-1
Asia Pacific (Sydney)	ap-southeast-2
South America (São Paulo)	sa-east-1
Canada (Central)	ca-central-1

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Disk Read	The disk read speed in bytes per second
Disk Write	The disk write speed in bytes per second
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Idle %	The idle time with no submitted operations in percent
Queue Length	The number of read and write operations waiting to be completed
Read Ops	The number of disk read operations per second
Total	The total volume of input/output (I/O) operations in bytes per second i This channel is the primary channel by default.
Total Read Time	The total disk read time in milliseconds (msec)
Total Write Time	The total disk write time in msec
Write Ops	The number of disk write operations per second

Sensor Settings Overview

For more information about sensor settings, see the following sections:

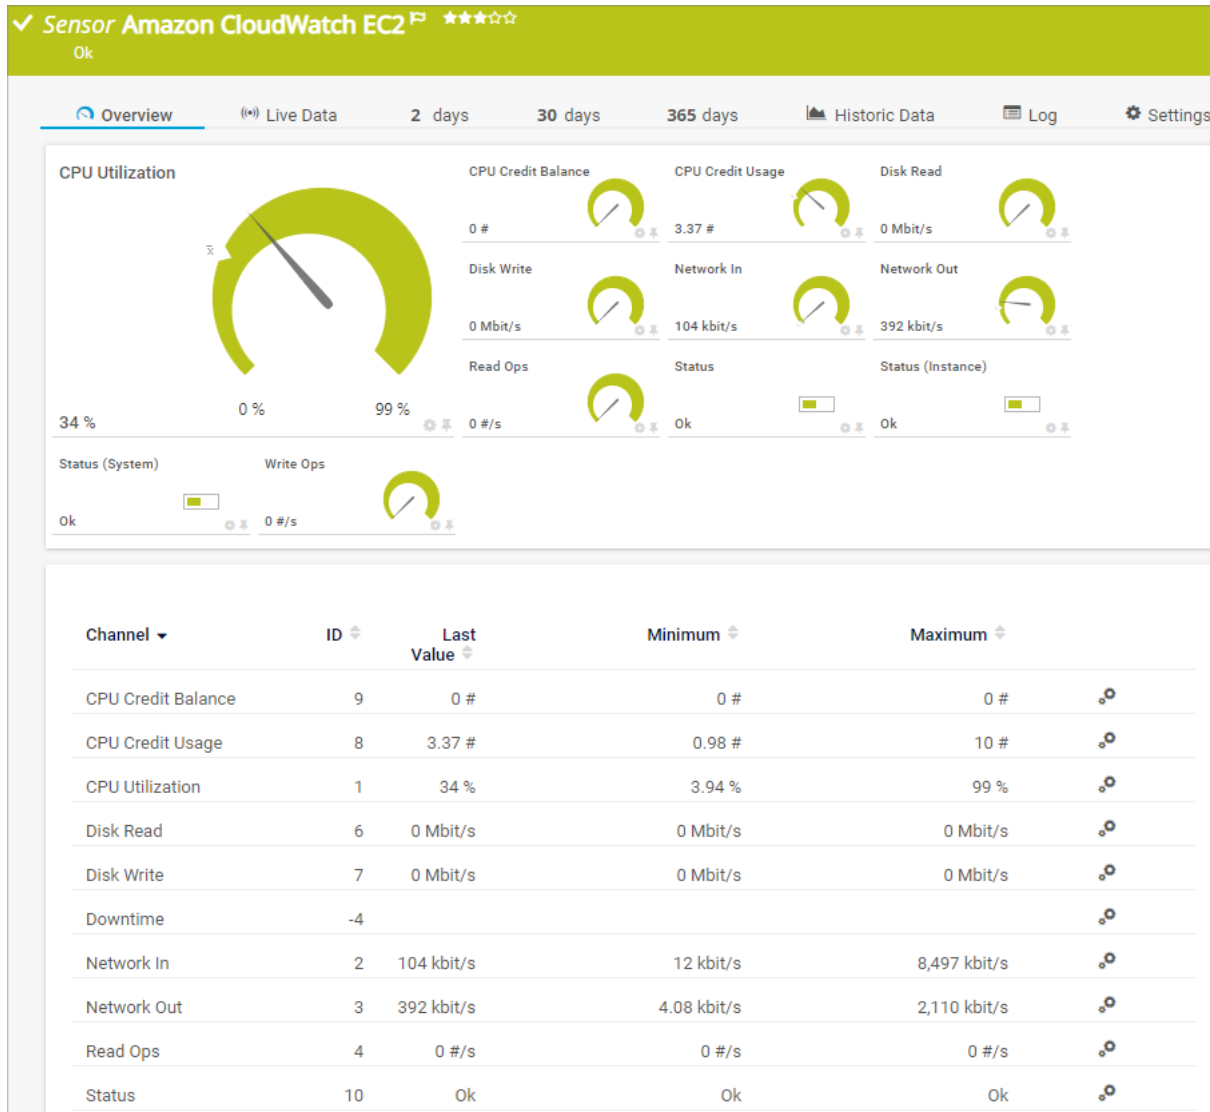

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.5 Amazon CloudWatch EC2 Sensor

The Amazon CloudWatch EC2 sensor monitors the performance of the Amazon Cloud service Elastic Compute Cloud (EC2).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)⁵⁵¹.

For a list of metrics that this sensor supports, see section [Supported Metrics](#)⁵⁵⁰.

Amazon CloudWatch EC2 Sensor

Sensor in Other Languages

- Dutch: Amazon CloudWatch EC2
- French: Amazon CloudWatch EC2
- German: Amazon CloudWatch EC2
- Japanese: Amazon CloudWatch EC2

- Portuguese: Amazon CloudWatch EC2
- Russian: Amazon CloudWatch EC2
- Simplified Chinese: Amazon CloudWatch EC2
- Spanish: Amazon CloudWatch EC2

Remarks

- This sensor requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)
- This sensor requires .NET 4.7.2 or later on the probe system.
- Define [credentials for AWS](#) ^[459] in settings that are higher in the [object hierarchy](#) ^[138], for example, in the settings of the parent device.
- The minimum scanning interval for this sensor is 15 minutes.
- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- This sensor only shows the channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the Amazon Web Services (AWS) website. To know which channels are possible for the various services of this sensor, see section Supported Metrics. If the sensor has not received data from Amazon for more than 6 hours, it shows a Down status.
- Configure [notification triggers](#) ^[397] with a latency of 0 seconds to receive all notifications for this sensor ([\[...\] for at least 0 seconds](#)).
- To know which dimensions you can monitor, see section Supported Dimensions.
- Amazon charges you for each AWS API request that the sensor sends to the Amazon servers. For details, see the Knowledge Base: [How much does Amazon charge for using Amazon CloudWatch sensors in PRTG?](#)

Detailed Requirements

Requirement	Description
Permissions for the AWS API key	<p>This sensor requires sufficient rights to query data from the AWS API.</p> <ul style="list-style-type: none"> ■ For more information, see the Knowledge Base: How do I set permissions for the Amazon Web Services (AWS) API key to use certain sensors in PRTG?
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <ul style="list-style-type: none"> ⓘ If the framework is missing, you cannot create this sensor. ■ For more information, see the Knowledge Base: Which .NET version does PRTG require?

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG looks for available instances or auto scaling groups.

- i** This can take up to several minutes.
- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Amazon CloudWatch Specific

Setting	Description
Services	<p>Select the services that you want to monitor. PRTG creates one sensor for each service that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority:** A row of five stars, with the first three filled, indicating a priority level of 3.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ cloudwatchsensor ▪ ec2
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Amazon CloudWatch Specific

Setting	Description
Region	<p>Shows the region in which the AWS instance runs. It is one of the following regions:</p> <ul style="list-style-type: none"> ▪ US East (Northern Virginia) ▪ US East (Ohio) ▪ US West (Northern California) ▪ US West (Oregon) ▪ Europe (Stockholm) ▪ Europe (Ireland) ▪ Europe (London) ▪ Europe (Paris) ▪ Europe (Frankfurt) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Seoul) ▪ Asia Pacific (Mumbai) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Sydney) ▪ South America (São Paulo) ▪ Canada (Central)

Setting	Description
	<p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p> <p>■ For more information, see section Supported Regions and Their Codes^[551].</p>
Description	<p>Shows the description of the AWS service instance that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
ID	<p>Shows the ID of the AWS instance that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory^[4526] on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>
Detailed Monitoring	<p>Select whether you would like to import more or less detailed monitoring data from the AWS API:</p> <ul style="list-style-type: none"> ▪ Enabled: You get 1 dataset per minute. ▪ Disabled (default): You get 1 dataset per 5 minutes. <p>i To use detailed monitoring, you must also activate it for your monitored instance in the AWS web console.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

i This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#)⁴¹⁸⁷ settings are not available for this sensor.

Scanning Interval

 inherit from  Root

Scanning Interval  60 seconds

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>i The minimum scanning interval of this sensor is 15 minutes.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails.

Setting	Description
	<p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies ⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>

Setting	Description
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

7.8.6 Amazon CloudWatch ElastiCache Sensor

The Amazon CloudWatch ElastiCache sensor monitors the performance of the Amazon Cloud service ElastiCache.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)⁵⁶⁷.

For a list of metrics that this sensor supports, see section [Supported Metrics](#)⁵⁶⁵.

Amazon CloudWatch ElastiCache Sensor

Sensor in Other Languages

- Dutch: Amazon CloudWatch ElastiCache
- French: Amazon CloudWatch ElastiCache
- German: Amazon CloudWatch ElastiCache
- Japanese: Amazon CloudWatch ElastiCache
- Portuguese: Amazon CloudWatch ElastiCache
- Russian: Amazon CloudWatch ElastiCache

- Simplified Chinese: Amazon CloudWatch ElastiCache
- Spanish: Amazon CloudWatch ElastiCache

Remarks

- This sensor requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)
- This sensor requires .NET 4.7.2 or later on the probe system.
- Define [credentials for AWS](#) [459] in settings that are higher in the [object hierarchy](#) [138], for example, in the settings of the parent device.
- The minimum scanning interval for this sensor is 15 minutes.
- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- This sensor only shows the channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the Amazon Web Services (AWS) website. To know which channels are possible for the various services of this sensor, see section Supported Metrics. If the sensor has not received data from Amazon for more than 6 hours, it shows a Down status.
- Configure [notification triggers](#) [387] with a latency of 0 seconds to receive all notifications for this sensor ([...] for at least 0 seconds).
- To know which dimensions you can monitor, see section Supported Dimensions.
- Amazon charges you for each AWS API request that the sensor sends to the Amazon servers. For details, see the Knowledge Base: [How much does Amazon charge for using Amazon CloudWatch sensors in PRTG?](#)

Detailed Requirements

Requirement	Description
Permissions for the AWS API key	<p>This sensor requires sufficient rights to query data from the AWS API.</p> <ul style="list-style-type: none"> ■ For more information, see the Knowledge Base: How do I set permissions for the Amazon Web Services (AWS) API key to use certain sensors in PRTG?
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <ul style="list-style-type: none"> ⓘ If the framework is missing, you cannot create this sensor. ■ For more information, see the Knowledge Base: Which .NET version does PRTG require?

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG looks for available cache clusters or cache cluster nodes.

i This can take up to several minutes.

Amazon CloudWatch Specific

Setting	Description
Services	<p>Select the services that you want to monitor. PRTG creates one sensor for each service that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A list of tags with a search box and a plus sign. One tag 'exampletag' is visible with an 'x' to remove it.
- Priority:** A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited. ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ cloudwatchsensor ▪ elasticache
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Amazon CloudWatch Specific

Amazon CloudWatch Specific

Setting	Description
Region	<p>Shows the region in which the AWS instance runs. It is one of the following regions:</p> <ul style="list-style-type: none"> ▪ US East (Northern Virginia) ▪ US East (Ohio) ▪ US West (Northern California) ▪ US West (Oregon) ▪ Europe (Stockholm) ▪ Europe (Ireland) ▪ Europe (London) ▪ Europe (Paris) ▪ Europe (Frankfurt) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Seoul) ▪ Asia Pacific (Mumbai) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Sydney) ▪ South America (São Paulo) ▪ Canada (Central) <p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p> <p> For more information, see section Supported Regions and Their Codes ⁵⁶⁶.</p>
Description	<p>Shows the description of the AWS service instance that this sensor monitors.</p> <p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
ID	<p>Shows the ID of the AWS instance that this sensor monitors.</p> <p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result.

Setting	Description
	<ul style="list-style-type: none"> Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

i This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#) settings are not available for this sensor.

Scanning Interval	
 inherit from  Root	Scanning Interval  60 seconds
	If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>i The minimum scanning interval of this sensor is 15 minutes.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click to interrupt the [inheritance](#) ¹⁴².

ⓘ Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Supported Metrics

The Amazon CloudWatch ElastiCache sensor supports the following metrics:

- CPUUtilization (Average)
- CurrConnections (Average)
- CurrItems (Average)
- NewItems (Sum)
- NewConnections (Sum)
- FreeableMemory (Average)
- UnusedMemory (Average)

- SwapUsage (Average)
- BytesUsedForCacheItems (Average)
- BytesReadIntoMemcached (Sum)
- BytesWrittenOutFromMemcached (Sum)
- NetworkBytesIn (Sum)
- NetworkBytesOut (Sum)
- Evictions (Sum)
- Reclaimed (Sum)
- CasBadval (Sum)
- CasHits (Sum)
- CasMisses (Sum)
- CmdFlush (Sum)
- Cmdget (Sum)
- Cmdset (Sum)
- DecrMisses (Sum)
- DecrHits (Sum)
- DeleteHits (Sum)
- DeleteMisses (Sum)
- GetHits (Sum)
- GetMisses (Sum)
- IncrHits (Sum)
- IncrMisses (Sum)

Supported Dimensions

The Amazon CloudWatch ElastiCache sensor supports the following dimensions:

- Cache Cluster
- Cache Cluster Node

Supported Regions and Their Codes

Region	Code
US East (Northern Virginia)	us-east-1
US East (Ohio)	us-east-2

Region	Code
US West (Northern California)	us-west-1
US West (Oregon)	us-west-2
Europe (Stockholm)	eu-north-1
Europe (Ireland)	eu-west-1
Europe (London)	eu-west-2
Europe (Paris)	eu-west-3
Europe (Frankfurt)	eu-central-1
Asia Pacific (Tokyo)	ap-northeast-1
Asia Pacific (Seoul)	ap-northeast-2
Asia Pacific (Mumbai)	ap-south-1
Asia Pacific (Singapore)	ap-southeast-1
Asia Pacific (Sydney)	ap-southeast-2
South America (São Paulo)	sa-east-1
Canada (Central)	ca-central-1

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
CPU Utilization	The CPU usage in percent i This channel is the primary channel by default.
Current Connections	The number of current connections

Channel	Description
Current Items	The number of current items
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Evictions	The number of evictions
Freeable Memory	The freeable memory in bytes
Network In	The incoming network load in bytes per second
Network Out	The outgoing network load in bytes per second
New Connections	The number of new connections
Reclaimed	The number of reclaimed items
Swap Usage	The swap usage in bytes

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

i This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#) settings are not available for this sensor.

Scanning Interval	
 inherit from  Root	Scanning Interval  60 seconds
	If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>i The minimum scanning interval of this sensor is 15 minutes.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Backend Connection Errors	The number of backend connection errors
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Healthy Hosts	The number of healthy hosts i This channel is the primary channel by default.
HTTPCode Backend 2XX	The number of HTTP 2XX response codes
HTTPCode Backend 4XX	The number of HTTP 4XX response codes
HTTPCode ELB 5XX	The number of HTTP 5XX server error codes
Latency	The latency in milliseconds (msec)
Requests	The number of requests
Surge Queue Length	The surge queue length
Unhealthy Hosts	The number of unhealthy hosts

Sensor Settings Overview

For more information about sensor settings, see the following sections:

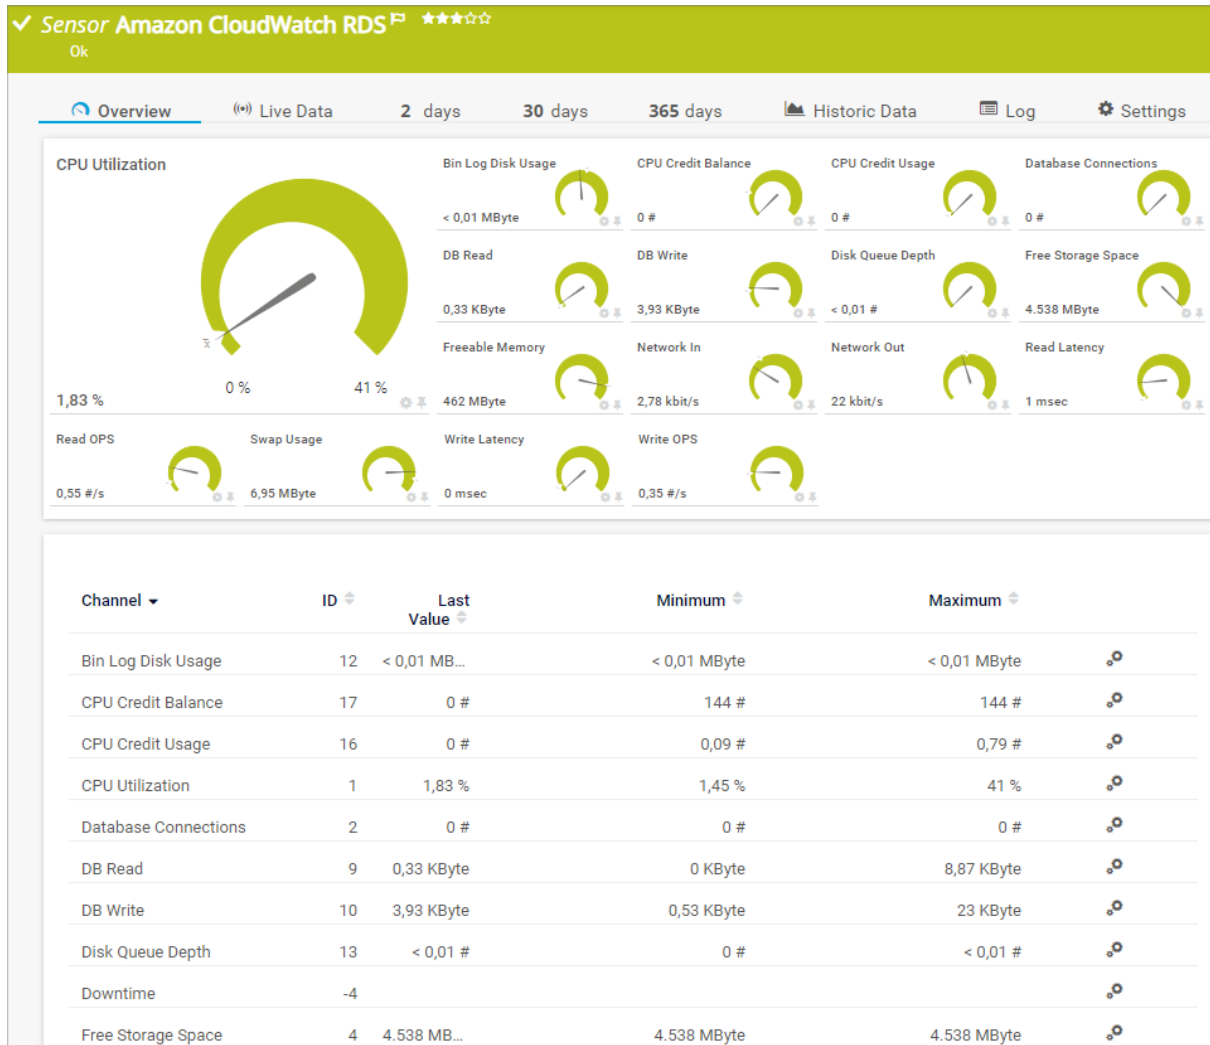

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.8 Amazon CloudWatch RDS Sensor

The Amazon CloudWatch RDS sensor monitors the performance of the Amazon Cloud service Relational Database Service (RDS).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ⁵⁹⁸.

For a list of metrics that this sensor supports, see section [Supported Metrics](#) ⁵⁹⁶.

Amazon CloudWatch RDS Sensor

Sensor in Other Languages

- Dutch: Amazon CloudWatch RDS
- French: Amazon CloudWatch RDS
- German: Amazon CloudWatch RDS
- Japanese: Amazon CloudWatch RDS
- Portuguese: Amazon CloudWatch RDS

- Russian: Amazon CloudWatch RDS
- Simplified Chinese: Amazon CloudWatch RDS
- Spanish: Amazon CloudWatch RDS

Remarks

- This sensor requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)
- This sensor requires .NET 4.7.2 or later on the probe system.
- Define [credentials for AWS](#) in settings that are higher in the [object hierarchy](#), for example, in the settings of the parent device.
- The minimum scanning interval for this sensor is 15 minutes.
- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- This sensor only shows the channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the Amazon Web Services (AWS) website. To know which channels are possible for the various services of this sensor, see section Supported Metrics. If the sensor has not received data from Amazon for more than 6 hours, it shows a Down status.
- Configure [notification triggers](#) with a latency of 0 seconds to receive all notifications for this sensor ([...] for at least 0 seconds).
- To know which dimensions you can monitor, see section Supported Dimensions.
- Amazon charges you for each AWS API request that the sensor sends to the Amazon servers. For details, see the Knowledge Base: [How much does Amazon charge for using Amazon CloudWatch sensors in PRTG?](#)

Detailed Requirements

Requirement	Description
Permissions for the AWS API key	<p>This sensor requires sufficient rights to query data from the AWS API.</p> <ul style="list-style-type: none"> ■ For more information, see the Knowledge Base: How do I set permissions for the Amazon Web Services (AWS) API key to use certain sensors in PRTG?
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <ul style="list-style-type: none"> ⓘ If the framework is missing, you cannot create this sensor. ■ For more information, see the Knowledge Base: Which .NET version does PRTG require?

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG looks for available engines or database instances.

i This can take up to several minutes.

Amazon CloudWatch Specific

Setting	Description
Services	<p>Select the services that you want to monitor. PRTG creates one sensor for each service that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a delete 'x' icon and an add '+' icon.
- Priority:** A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited. ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ cloudwatchsensor ▪ rds
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

It is one of the following regions:</p> <ul style="list-style-type: none"> ▪ US East (Northern Virginia) ▪ US East (Ohio) ▪ US West (Northern California) ▪ US West (Oregon) ▪ Europe (Stockholm) ▪ Europe (Ireland) ▪ Europe (London) ▪ Europe (Paris) ▪ Europe (Frankfurt) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Seoul) ▪ Asia Pacific (Mumbai) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Sydney) ▪ South America (São Paulo) ▪ Canada (Central) <p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p> <p> For more information, see section Supported Regions and Their Codes ⁵⁸⁷.</p>
Description	<p>Shows the description of the AWS service instance that this sensor monitors.</p> <p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
ID	<p>Shows the ID of the AWS instance that this sensor monitors.</p> <p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result.

Setting	Description
	<ul style="list-style-type: none"> Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel Downtime

Graph Type Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the [inheritance](#).

i This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#) settings are not available for this sensor.

Scanning Interval	
 inherit from  Root	Scanning Interval  60 seconds
	If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>i The minimum scanning interval of this sensor is 15 minutes.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

DB Read	The database instance read in bytes
DB Write	The database instance write in bytes
Disk Queue Depth	The disk queue depth

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Free Storage Space	The free storage space in bytes
Freeable Memory	The freeable memory in bytes
Network In	The incoming network load in bytes per second
Network Out	The outgoing network load in bytes per second
Read Latency	The read latency in milliseconds (msec)
Read OPS	The number of disk read operations per second
Swap Usage	The swap usage in bytes
Write Latency	The write latency in msec
Write OPS	The number of disk write operations per second

7.8.9 Amazon CloudWatch SNS Sensor

The Amazon CloudWatch SNS sensor monitors the performance of the Amazon Cloud service Simple Notification Service (SNS).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ⁶¹³.

For a list of metrics that this sensor supports, see section [Supported Metrics](#) ⁶¹².

Amazon CloudWatch SNS Sensor

Sensor in Other Languages

- Dutch: Amazon CloudWatch SNS
- French: Amazon CloudWatch SNS
- German: Amazon CloudWatch SNS
- Japanese: Amazon CloudWatch SNS
- Portuguese: Amazon CloudWatch SNS
- Russian: Amazon CloudWatch SNS
- Simplified Chinese: Amazon CloudWatch SNS
- Spanish: Amazon CloudWatch SNS

Remarks

- This sensor requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)
- This sensor requires .NET 4.7.2 or later on the probe system.

- Define [credentials for AWS](#) [459] in settings that are higher in the [object hierarchy](#) [138], for example, in the settings of the parent device.
- The minimum scanning interval for this sensor is 15 minutes.
- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- This sensor only shows the channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the Amazon Web Services (AWS) website. To know which channels are possible for the various services of this sensor, see section Supported Metrics. If the sensor has not received data from Amazon for more than 6 hours, it shows a Down status.
- Configure [notification triggers](#) [387] with a latency of 0 seconds to receive all notifications for this sensor ([...] for at least 0 seconds).
- To know which dimensions you can monitor, see section Supported Dimensions.
- Amazon charges you for each AWS API request that the sensor sends to the Amazon servers. For details, see the Knowledge Base: [How much does Amazon charge for using Amazon CloudWatch sensors in PRTG?](#)

Detailed Requirements

Requirement	Description
Permissions for the AWS API key	<p>This sensor requires sufficient rights to query data from the AWS API.</p> <ul style="list-style-type: none"> ■ For more information, see the Knowledge Base: How do I set permissions for the Amazon Web Services (AWS) API key to use certain sensors in PRTG?
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <ul style="list-style-type: none"> ⓘ If the framework is missing, you cannot create this sensor. ■ For more information, see the Knowledge Base: Which .NET version does PRTG require?

Add Sensor

The [Add Sensor](#) [361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG looks for available applications, platforms, or topics.

ⓘ This can take up to several minutes.

Amazon CloudWatch Specific

Setting	Description
Services	<p>Select the services that you want to monitor. PRTG creates one sensor for each service that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> cloudwatchsensor sns
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Setting	Description
Region	<p>Shows the region in which the AWS instance runs. It is one of the following regions:</p> <ul style="list-style-type: none"> US East (Northern Virginia) US East (Ohio) US West (Northern California) US West (Oregon) Europe (Stockholm)

Setting	Description
	<ul style="list-style-type: none"> ▪ Europe (Ireland) ▪ Europe (London) ▪ Europe (Paris) ▪ Europe (Frankfurt) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Seoul) ▪ Asia Pacific (Mumbai) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Sydney) ▪ South America (São Paulo) ▪ Canada (Central) <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p> <p>■ For more information, see section Supported Regions and Their Codes ⁶¹².</p>
Description	<p>Shows the description of the AWS service instance that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
ID	<p>Shows the ID of the AWS instance that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click ⓘ to interrupt the [inheritance](#).

ⓘ This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#) settings are not available for this sensor.

Scanning Interval Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p> <p> ⓘ The minimum scanning interval of this sensor is 15 minutes.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit

Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the [inheritance](#).

i This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#) settings are not available for this sensor.

Scanning Interval	
 inherit from  Root	Scanning Interval  60 seconds
	If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>i The minimum scanning interval of this sensor is 15 minutes.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent

 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Sensor Settings Overview

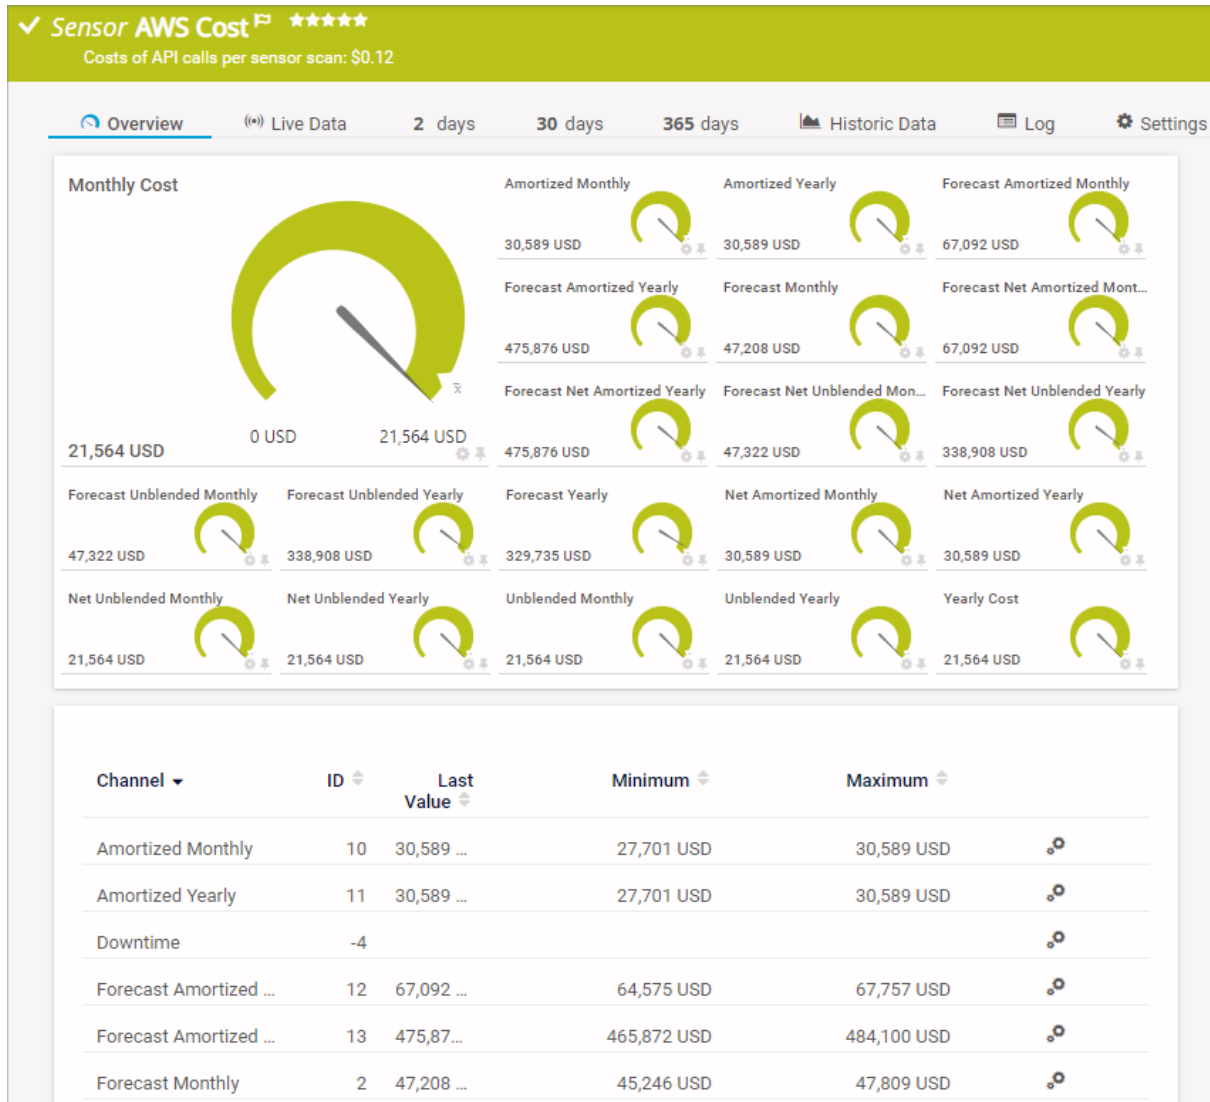

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.11 AWS Cost Sensor

The AWS Cost sensor monitors the cost of an Amazon Web Services (AWS) account by reading its data from the AWS Cost Explorer API.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

AWS Cost Sensor

Sensor in Other Languages

- Dutch: AWS Cost
- French: AWS Cost
- German: AWS Cost
- Japanese: AWS Cost
- Portuguese: AWS Cost
- Russian: AWS Cost

- Simplified Chinese: AWS Cost
- Spanish: AWS Cost

Remarks

- This sensor requires the AWS Cost Explorer to be activated in your AWS account.
- This sensor requires IAM User and Role Access to Billing Information enabled in your AWS account.
- This sensor requires [credentials for AWS](#) [459] in the settings of the parent device or group.
- This sensor requires [permissions](#) [631] for the API key.
- After sensor setup, the first data is available after 24 hours. Forecast data is available after a few days.
- The minimum scanning interval for this sensor is 6 hours.
- Amazon charges you for each API call that the sensor sends to the Amazon servers.
- You can only set up this sensor for one AWS account per PRTG installation.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- See the Knowledge Base: [What settings do I have to define in my AWS account to set up the AWS Cost sensor?](#)
- See the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)

Detailed Requirements

Requirement	Description
Permissions for the AWS API key	<p>This sensor requires sufficient rights to query data from the AWS API. The AWS API key requires the following permissions:</p> <ul style="list-style-type: none"> ▪ "ce:GetCostAndUsage", ▪ "ce:GetCostForecast", ▪ "ce:GetDimensionValues", ▪ "ce:GetCostAndUsageWithResources", ▪ "ce:GetUsageForecast" <p>■ For more information, see the Knowledge Base: How do I set permissions for the Amazon Web Services (AWS) API key to use certain sensors in PRTG?</p>

Add Sensor

The [Add Sensor](#) [361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ aws ▪ cost ▪ awscost

Setting	Description
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

What settings do I have to define in my AWS account to set up the AWS Cost sensor?

- <https://kb.paessler.com/en/topic/87401>

How do I set permissions for the Amazon Web Services (AWS) API key to use certain sensors in PRTG?

- <https://kb.paessler.com/en/topic/38083>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

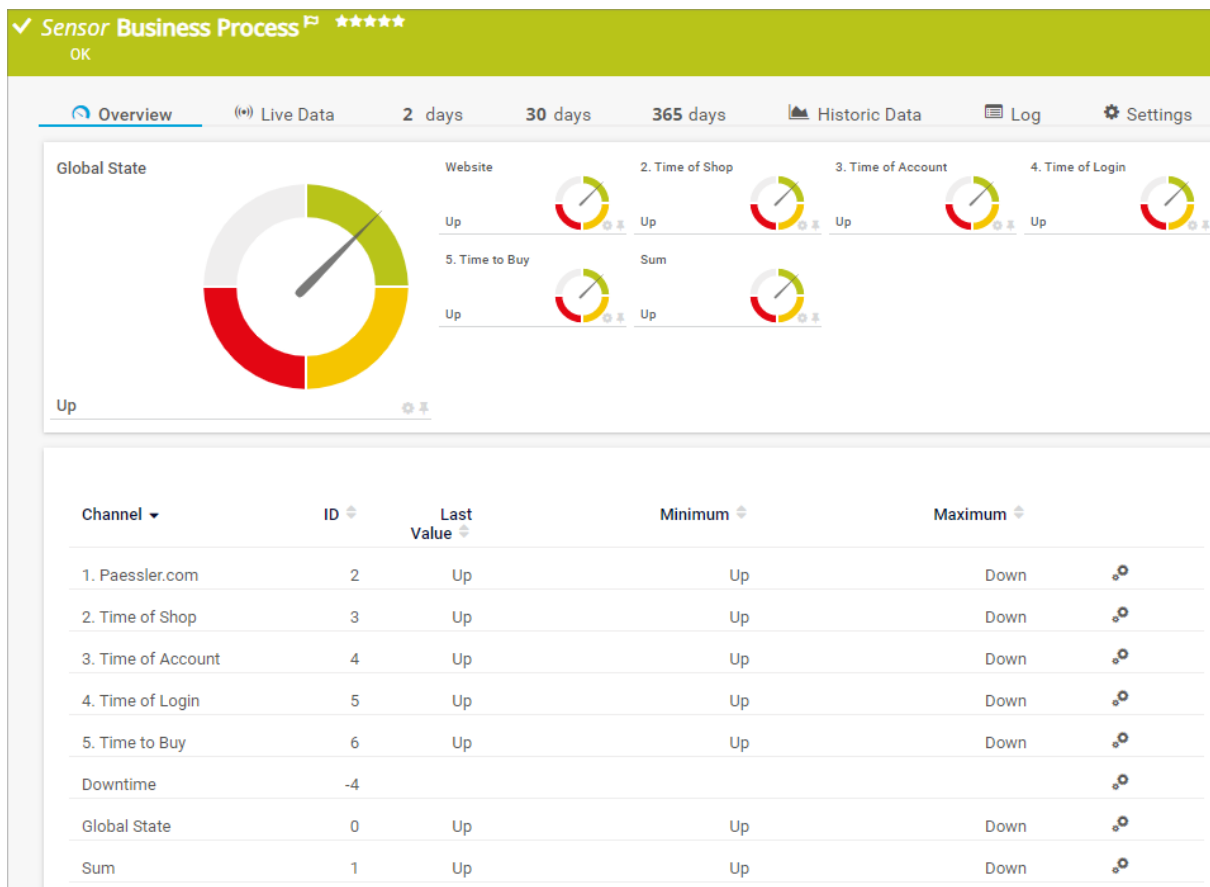

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.12 Business Process Sensor

The Business Process sensor gives you a summarized status of entire business processes while monitoring several process components. This means that you can create a customized sensor with channels based on data from other sensors ("source sensors") that are specific to your network.

i If you want to process values from other sensors and you want to perform calculations with these values, for example, use the [Sensor Factory sensor](#) ²¹⁷⁸ instead.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ⁶⁵⁸.

Business Process Sensor

Sensor in Other Languages

- Dutch: Bedrijfs Proces
- French: Processus métier
- German: Business Process
- Japanese: ビジネスプロセス
- Portuguese: Processo empresarial
- Russian: -
- Simplified Chinese: 业务进程

- Spanish: Proceso de negocio

Remarks

- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.
- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).
- See the Knowledge Base: [How does the Business Process sensor calculate summarized sensor states?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets . ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe .

Setting	Description
	<p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ factorysensor ▪ businessprocesssensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Business Process Specific Settings

Business Process Specific Settings

States and Conditions

Step 1. The sensor maps object states to object conditions. The following object states are mapped to the "up" condition:

Up, Warning, Unusual, Down (Partial), Unknown (Collecting)

The following object states are mapped to the "down" condition:

Down, Unknown (None), Paused, Down (Acknowledged)

See the [PRTG Manual](#) for the reasoning behind this behavior. A probe, group, or device that you add to a channel is in the "up" condition as long as none of its sensors are in the "down" condition.

Step 2. The Business Process sensor compares the percentage of the "up" conditions of the objects in a channel with the thresholds you define. If the percentage of objects in the "up" condition is smaller than indicated by your warning or error threshold, the channel will be in an overall "warning" or "down" status respectively.

Step 3. The Global State channel of the Business Process sensor always shows the "most severe" status that at least one of your channels has.

Channel Name	Error	Threshold %	Warning	Objects	
Channel 1		50	25	<input checked="" type="checkbox"/> Battery: SMP D... ✕	
Channel 2		50	75	<input checked="" type="checkbox"/> SSH Disk Free ✕	
Channel 3		50	75	<input checked="" type="checkbox"/> CPU Load ✕	
Enter Channel Name		50	75		

Business Process Specific Settings

Setting	Description
Channel Name	<p>Enter a meaningful name to identify the channel. To add a new channel to the sensor, click the Enter Channel Name field, enter a name for the channel, and confirm with the Enter or Tab key.</p> <p> It might take several sensor scans until new channel names or changes to channel names become visible.</p>
Error Threshold %	<p>Set a percentage limit to define when the channel displays the Down status. Enter an integer value. The default is 50%.</p> <p> This value depends on how many objects you feed into a Business Process channel.</p> <p>If the percentage of source objects in the "up" condition is less than the error threshold defines, the channel and the Global State channel of the Business Process sensor show the Down status.</p> <p>PRTG maps the following sensor states^[197] to the "up" condition ▲ for a Business Process channel:</p> <ul style="list-style-type: none"> ▪ Up ▪ Warning ▪ Unusual ▪ Down (Partial)

Setting	Description
Warning Threshold %	<p>PRTG maps all other sensor states to the "down" condition ▼ (see Up and Down Conditions^[649]).</p> <p>For example, if you define 4 source sensors for a channel, an error threshold of 50% means that 3 source sensors have to be in the "down" condition to set this channel to the Down status. So, 50% means that more than half of the source sensors must not be in the "up" condition to set the sensor to the Down status.</p> <p>■ For more information, an illustration of the business process mechanisms, and some use cases for the Business Process sensor, see the table below^[649] and the Knowledge Base: How can I use the Business Process sensor?</p> <p>Set a percentage limit to define when the channel displays the Warning status. Enter an integer value. The default is 75%.</p> <p>ⓘ This value depends on how many objects you feed into a Business Process channel.</p> <p>If the percentage of source objects in the "up" condition is less than the threshold defines, the channel and the Global State channel of the Business Process sensor show the Warning status.</p> <p>PRTG maps the following sensor states to the "up" condition ▲ for a Business Process channel:</p> <ul style="list-style-type: none"> ▪ Up ▪ Warning ▪ Unusual ▪ Down (Partial) <p>PRTG maps all other sensor states to the "down" condition ▼ (see Up and Down Conditions^[649]).</p> <p>For example, if you define 4 source sensors for a channel, a warning threshold of 75% means that all 4 source sensors have to be in the "down" condition to set this channel to the Warning status. So, 75% means that more than three out of four of the source sensors must not be in the "up" condition to set the sensor to the Warning status.</p> <p>■ For more information, an illustration of the business process mechanisms, and some use cases for the Business Process sensor, see the table below^[649] and the Knowledge Base: How can I use the Business Process sensor?</p>
Objects	<p>Enter the objects that you want to have in a channel by clicking ⊕. This way, you can select the desired objects from the device tree with the object selector^[251]. You can also start to type the object's ID, name, or a tag. PRTG then suggests the possible objects.</p>

Setting	Description
	<p>You can add sensors, devices, groups, and probes to a channel. Each object you add is weighted equally, no matter if it is a single sensor or a device with many sensors. To give more weight to a specific object, add it several times. For example, add the object twice to give double weight to it, add it three times to give it triple weight.</p> <p> A probe, group, or device is in the "up" condition  as long as it does not contain any sensors in the "down" condition .</p>

Up and Down Conditions

The Business Process "up"  and "down"  conditions are different from the normal Up and Down sensor states. This is necessary for the Business Process sensor to calculate summarized states and to show a calculated result for an entire business process. This table illustrates which sensor status leads to which Business Process condition.

The Relation Between Object States And Business Process Conditions

Channel Object Status	Business Process Condition	Reason: Why does a specific sensor status correspond to a specific Business Process condition?
 Up	Up 	The monitored object works, so everything is fine.
 Warning	Up 	The sensor might show a warning, but the monitored object still works.
 Down (Partial)	Up 	This status is available in a cluster and is displayed if at least one cluster node reports the sensor as in the Up status and at least one cluster node reports it as in the Down status. With at least one Up report, the monitored object is supposed to be working and meets the Business Process "up" condition.
 Unusual	Up 	The sensor might show unusual values, but the monitored object works.
 Collecting	Up 	The sensor is still waiting for more monitoring data to definitely decide on the sensor status, but so far the monitored object works. This PRTG internal status is visualized as the Unknown status in the PRTG web interface.
 Down	Down 	The monitored object does not work.

Channel Object Status	Business Process Condition	Reason: Why does a specific sensor status correspond to a specific Business Process condition?
Unknown	Down	The sensor does not know if the monitored object works, for example because it has not yet received any data or because it has not received any data for a certain amount of time.
None	Down	The sensor has not yet received any monitoring data from the monitored object. This PRTG internal status is visualized as the Unknown status in the PRTG web interface.
Paused	Down	The monitored object does not work and monitoring has been paused, for example actively by the user, by inheritance, or by schedules. It might be convenient to exclude regularly or frequently paused objects from your business process monitoring, so you do not give more weight than necessary to a Business Process "down" condition because of issues you already know about.
Down (Acknowledged)	Down	The monitored object does not work and someone already knows.

i If you encounter issues with your Business Process sensor and want to [contact the Paessler support team](#), send us your **exact configuration**. Click in the upper-right corner of the Business Process Specific Settings table to copy your configuration:

Business Process Specific Settings

States and Conditions *Step 1. The sensor maps object states to object conditions. The following object states are mapped to the "up" condition:*
Up, Warning, Unusual, Down (Partial), Unknown (Collecting)

The following object states are mapped to the "down" condition:
Down, Unknown (None), Paused, Down (Acknowledged)

See the PRTG Manual for the reasoning behind this behavior. A probe, group, or device that you add to a channel is in the "up" condition as long as none of its sensors are in the "down" condition.

Step 2. The Business Process sensor compares the percentage of the "up" conditions of the objects in a channel with the thresholds you define. If the percentage of objects in the "up" condition is smaller than indicated by your warning or error threshold, the channel will be in an overall "warning" or "down" status respectively.

Step 3. The Global State channel of the Business Process sensor always shows the "most severe" status that at least one of your channels has.

Channel Name	Error	Threshold %	Warning	Objects	
Sum		50	75	<input checked="" type="checkbox"/> Ping <input type="checkbox"/>	
Website		50	75	<input checked="" type="checkbox"/> Ping <input type="checkbox"/>	

The Business Process Sensor Configuration Clipboard

A window opens that contains your configuration. Copy the highlighted text and paste it into the [support form](#)^[4266] to send it to the Paessler support team.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[3977]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval	
 inherit from  Root	Scanning Interval ⓘ 60 seconds
	If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

-  Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
[Channel]	<p>The summarized status of the objects contained in each channel according to the individually defined error and warning thresholds</p> <ul style="list-style-type: none"> ▪ Up status ¹⁹⁷: Up ▪ Warning status: Warning ▪ Down status: Down ▪ Unknown status: Inactive
Downtime	<p>In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.</p> <p> The Business Process sensor never shows values in the Downtime channel because they cannot be calculated for this sensor.</p>
Global State	<p>The overall and summarized status of all channels in the Global State channel</p> <ul style="list-style-type: none"> ▪ Up status: Up

Channel	Description
	<ul style="list-style-type: none">▪ Warning status: Warning▪ Down status: Down▪ Unknown status: Inactive <p> This channel is the primary channel by default.</p>

Sensor Settings Overview

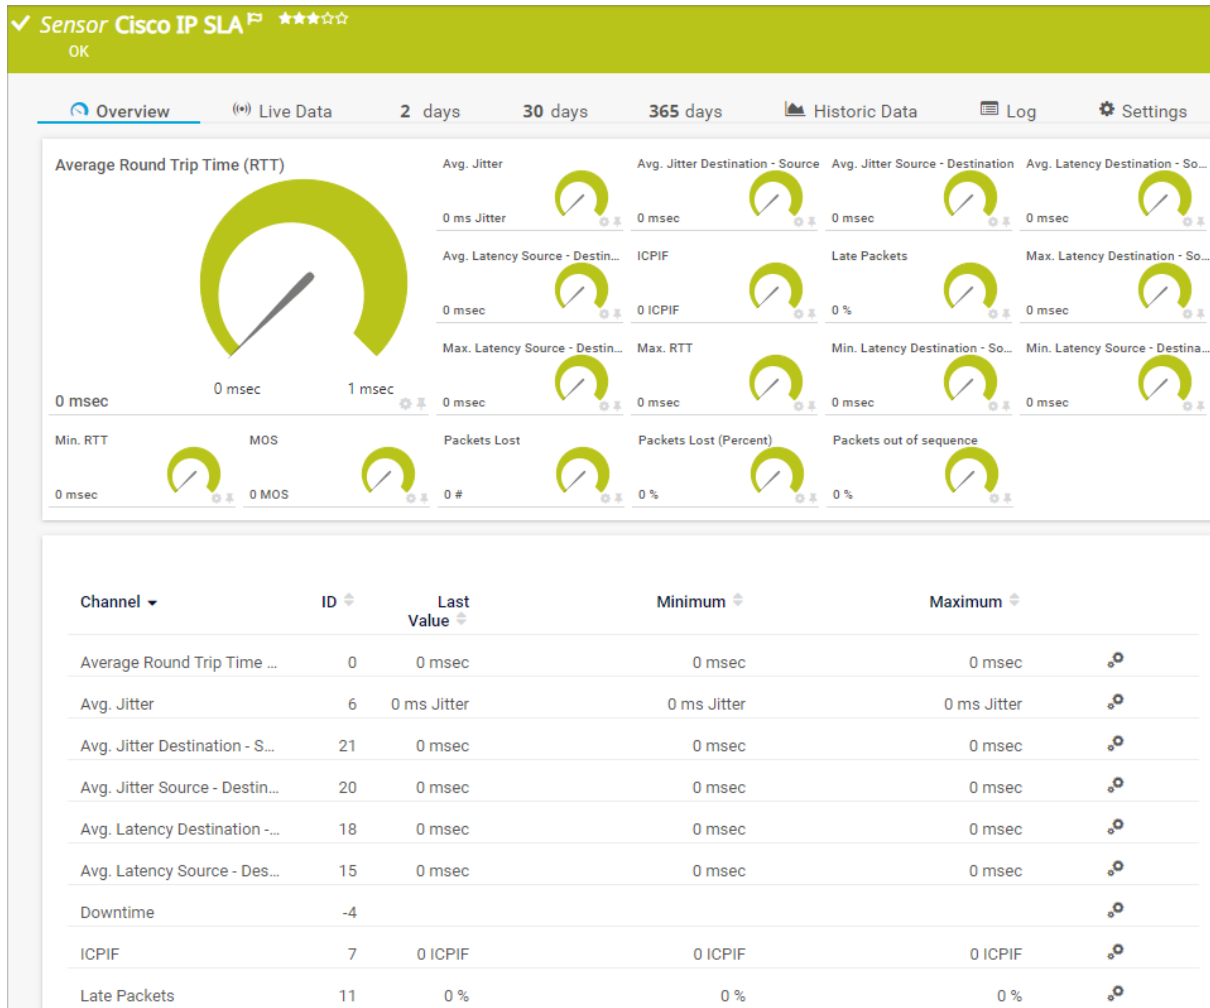

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.13 Cisco IP SLA Sensor

The Cisco IP SLA sensor monitors Voice over IP (VoIP) network parameters using IP service level agreements (SLA) from Cisco via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Cisco IP SLA Sensor

Sensor in Other Languages

- Dutch: Cisco IP SLA
- French: IP SLA Cisco
- German: Cisco IP SLA
- Japanese: Cisco IP SLA
- Portuguese: Cisco IP SLA
- Russian: Cisco IP SLA
- Simplified Chinese: Cisco IP SLA
- Spanish: Cisco IP SLA

Remarks

- In certain cases, the object identifiers (OID) that the sensor uses are not available on the target device. The sensor shows the following error message: **No such object (SNMP error # 222)**. If you encounter this issue, open the SNMP Compatibility Options [setting](#)^[463] of the parent device or group and set the Request Mode to Use single get.
- If there is a very large number of IP SLAs available during sensor creation, we recommend that you limit the result set by using the Start Interface Index and End Interface Index options in the SNMP Compatibility Options setting of the parent device or group.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)^[445].

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

IP SLA Specific

Setting	Description
IP SLAs	<p>Select the IP SLAs that you want to monitor. PRTG creates one sensor for each SLA that you select.</p> <p>The list options depend on the configuration of the target device that you query. If a type is missing, check the configuration of the target device. The sensor can support the following operations with the specified type IDs:</p> <ul style="list-style-type: none"> ▪ echo (1) ▪ pathEcho (2) ▪ fileIO (3) ▪ script (4) ▪ udpEcho (5) ▪ tcpConnect (6) ▪ http (7) ▪ dns (8) ▪ jitter (9) ▪ dlsW (10)

Setting	Description
	<ul style="list-style-type: none"> ▪ dhcp (11) ▪ ftp (12) ▪ icmp-jitter (16) ▪ path-jitter (23) <p>i The numbers are the IDs of the SLA types as reported by the target device. PRTG translates them into the corresponding strings. These IDs are independent of the IDs that you see in the first column of the list. If the target device returns other values, the sensor shows an error message that says that it cannot find the type.</p> <p>i Packet Loss values are summarized but have no explicit channel for Source-Destination or Destination-Source values.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Type	Shows the type of the SLA that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Name (Tag)	Shows the name of the SLA that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Owner	Shows the owner of the SLA that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Frequency	Shows the frequency of the SLA that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor. ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how different channels are shown for this sensor: <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel.

Setting	Description
	<ul style="list-style-type: none"> Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁸ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes 30 minutes

Setting	Description
	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵³.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Avg. Jitter	The average jitter in milliseconds (msec)
Avg. Jitter Destination - Source	The average jitter between destination and source in msec

Channel	Description
Avg. Jitter Source - Destination	The average jitter between source and destination in msec
Avg. Latency Destination - Source	The average latency between destination and source in msec
Avg. Latency Source - Destination	The average latency between source and destination in msec
Average Round Trip Time (RTT)	The average round-trip time (RTT) in msec i This channel is the primary channel by default.
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
ICPIF	The Impairment Calculated Planning Impairment Factor (ICPIF)
Late Packets	The number of late packets
Max. Latency Destination - Source	The maximum latency between destination and source in msec
Max. Latency Source - Destination	The maximum latency between source and destination in msec
Max. RTT	The maximum RTT in msec
Min. Latency Destination - Source	The minimum latency between destination and source in msec
Min. Latency Source - Destination	The minimum latency between source and destination in msec
Min. RTT	The minimum RTT in msec
MOS	The mean opinion score (MOS)
Packets Lost	The number of lost packets
Packets Lost (Percent)	The number of lost packets in percent
Packets Out Of Sequence	The number of out-of-sequence packets

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.14 Citrix XenServer Host Sensor

The Citrix XenServer Host sensor monitors a Xen host server via HTTP.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) [679].

Citrix XenServer Host Sensor

Sensor in Other Languages

- Dutch: Citrix XenServer Host
- French: Hôte Citrix XenServer
- German: Citrix XenServer Host
- Japanese: Citrix XenServer ホスト
- Portuguese: Citrix XenServer Host
- Russian: Citrix XenServer
- Simplified Chinese: Citrix XenServer 主机

- Spanish: Citrix XenServer Host

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- The parent device must be a Citrix XenServer version 5.0 or later.
- The parent device must represent one host server of your XenServer pool.
- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor requires [credentials for VMware/XenServer](#) in the settings of the parent device.
- This sensor does not fully support Transport Layer Security (TLS) 1.2 connections and cannot be added to XenServers with the security protocol setting "TLS 1.2 only".

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Monitoring a XenServer Pool

In a XenServer pool, there is one "pool master" that manages the pool. Incoming queries on any host are automatically forwarded to the pool master. If you want to monitor your VMs or host servers, create respective sensors on a device that represents **one** host server of your pool. Internal processes make sure that monitoring takes place and continues independently from the physical host.

-  In the device tree, the sensors for VMs always remain on the host you originally created them on, also if they are currently running on a different host.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

-  The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Host Settings

Setting	Description
Hosts	<p>Select the XenServer hosts that you want to monitor, including hosts that do not run. PRTG creates one sensor for each host that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ xenhostsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Host Settings

Host Settings

UUID **i**

Name **i**

Host Settings

Setting	Description
UUID	<p>Shows the universally unique identifier (UUID) of the host that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. We strongly recommend that you only change it if the Paessler support team explicitly asks you to do so. Wrong usage can result in incorrect monitoring data.</p>
Name	<p>Shows the name of the host that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Monitoring a XenServer Pool

In a XenServer pool, there is one "pool master" that manages the pool. Incoming queries on any host are automatically forwarded to the pool master. If you want to monitor your VMs or host servers, create respective sensors on a device that represents [one](#) host server of your pool. Internal processes make sure that monitoring takes place and continues independently from the physical host.

-  In the device tree, the sensors for VMs always remain on the host you originally created them on, also if they are currently running on a different host.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

-  PRTG requests a full list of all VMs that are configured on the Citrix XenServer. Therefore, it may take a few seconds before the dialog loads.
-  The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Virtual Machine Settings

Setting	Description
Virtual Machines	Select the VMs that you want to monitor, including VMs that do not run. PRTG creates one sensor for each VM that you select.

Setting	Description
	<p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a title 'Basic Sensor Settings' in blue. Below it are three settings: 'Sensor Name' with an information icon and the value 'Example Name'; 'Tags' with an information icon and a tag 'exampletag' that can be removed (X) or added (+); and 'Priority' with an information icon and a star rating of 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[4031], reports^[4069], maps^[4096], libraries^[4047], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ xenhostsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Virtual Machine Settings

Virtual Machine Settings

UUID **i**

Name **i**

Virtual Machine Settings

Setting	Description
UUID	<p>Shows the universally unique identifier (UUID) of the VM that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. We strongly recommend that you only change it if the Paessler support team explicitly asks you to do so. Wrong usage can result in incorrect monitoring data.</p>
Name	<p>Shows the name of the VM that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

Debug Options

Debug Options

Result Handling **i** Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory^[4526] on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[3977]).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

Sensor Settings Overview

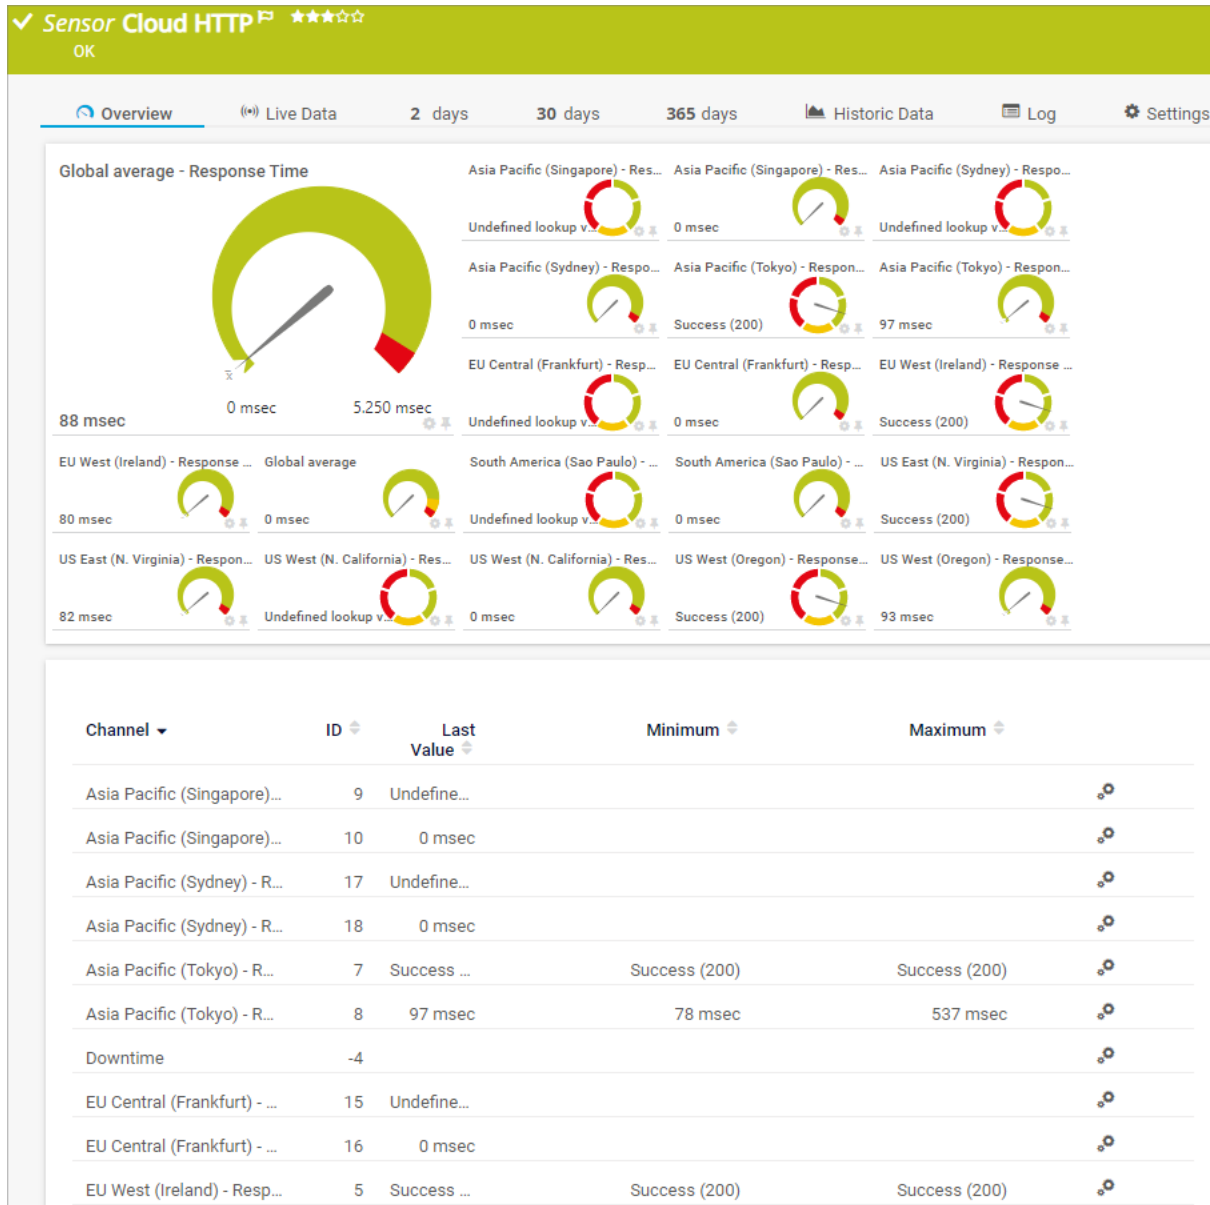

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.16 Cloud HTTP Sensor

The Cloud HTTP sensor monitors the loading time of a web server via HTTP from different locations worldwide via the PRTG Cloud. The locations are distributed among five continents around the globe.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Cloud HTTP Sensor

Sensor in Other Languages

- Dutch: Cloud HTTP
- French: Cloud HTTP
- German: Cloud HTTP
- Japanese: クラウド HTTP

- Portuguese: Cloud HTTP
- Russian: HTTP
- Simplified Chinese: 云 HTTP
- Spanish: HTTP de nube

Remarks

- The probe system must have access to the internet and must be able to reach <https://api.prtgcloud.com:443> to communicate with the PRTG Cloud.
- The address you define in the [settings of the parent device](#)^[447] must be reachable over the internet. You cannot use this sensor to monitor localhost (127.0.0.1) or other target devices that are only reachable within your private network.
- This sensor inherits [proxy settings for HTTP sensors](#)^[468] from the parent device.
- This sensor has predefined limits for several metrics. You can individually change these limits in the channel settings. For detailed information about channel limits, see section [Channel Settings](#)^[3977].
- This sensor supports smart URL replacement.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)^[4485].
- In rare cases, this sensor may result in false timeouts and show the error message [The returned JSON does not match the expected structure \(Invalid JSON.\). \(code: PE231\)](#). In this case, set the If a Sensor Query Fails option to up to five scanning intervals to not receive false alerts.
- See the Knowledge Base: [Are there any limits for using Cloud Ping and Cloud HTTP sensors?](#)
- See the Knowledge Base: [What is the PRTG Cloud Bot?](#)

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains the following fields and controls:

- Sensor Name**: A text input field containing "Example Name".
- Tags**: A text input field containing "exampletag" with a blue 'x' icon to the right and a plus icon to the left of the input area.
- Priority**: A field showing four stars (★★★★) out of five.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ httpsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

HTTP Settings

HTTP Settings

URL ⓘ

Request Method ⓘ

GET

HEAD

Timeout (Sec.) ⓘ

HTTP Settings

Setting	Description
URL	<p>Enter the URL that the sensor connects to. If you enter an absolute URL, the sensor uses this address independently of the IP Address/DNS Name setting of the parent device.</p> <p>ⓘ The URL must be valid and URL encoded.</p> <p>ⓘ You can enter a URL that leads to a web page, for example, to measure the page source code's loading time, or you can enter the URL of an image or other page asset to measure this element's availability and loading time.</p> <p>■ PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section Smart URL Replacement^[70].</p>
Request Method	<p>Select an HTTP request method to determine how the sensor requests the URL:</p> <ul style="list-style-type: none"> ▪ GET (default): Directly request the web page. We recommend that you use this setting for a simple check of a web page. ▪ POST: Send post form data to the URL. ▪ HEAD: Only request the HTTP header from the server without the actual web page. <ul style="list-style-type: none"> ⓘ This setting saves bandwidth because it transfers less data. However, we do not recommend this setting because the measured request time is not the request time that the users experience and you might not be notified of slow results or timeouts.
Postdata	<p>This option is only visible if you select POST as Request Method above. Enter the data part for the POST request.</p> <p>ⓘ No Extensible Markup Language (XML) is allowed here.</p>

Setting	Description
	<p>i The only content type that sensor supports is application/x-www-form-urlencoded.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the server request. If the reply takes longer than this value, PRTG cancels the request and shows an error message. The maximum timeout value is 5 seconds.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking + below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

i This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#) settings are not available for this sensor.

Scanning Interval	
 inherit from  Root	Scanning Interval  60 seconds
	If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>i The minimum scanning interval of this sensor is 10 minutes.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either <http://> or <https://>, or even a simple forward slash / as the equivalent for <http://>). PRTG automatically fills in the parent device's IP address or DNS name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name www.mycompany.com and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter <https://> in the URL field, PRTG automatically creates the URL <https://www.mycompany.com/>
- If you enter [/help](http://www.mycompany.com/help) in the URL field, PRTG automatically creates and monitor the URL <http://www.mycompany.com/help>

- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, <http://:8080/>

i Smart URL replacement does not work for sensors that run on the probe device.

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Asia Pacific (Singapore) - Response Code	<p>The response code of the target server at the location</p> <ul style="list-style-type: none"> ▪ Up status¹⁹⁷: Information, Success ▪ Warning status: Redirection ▪ Down status: Client Error, Server Error
Asia Pacific (Singapore) - Response Time	The response time of the target server at the location in milliseconds (msec)
Asia Pacific (Sydney) - Response Code	<p>The response code of the target server at the location</p> <ul style="list-style-type: none"> ▪ Up status: Information, Success ▪ Warning status: Redirection ▪ Down status: Client Error, Server Error

Sensor Settings Overview

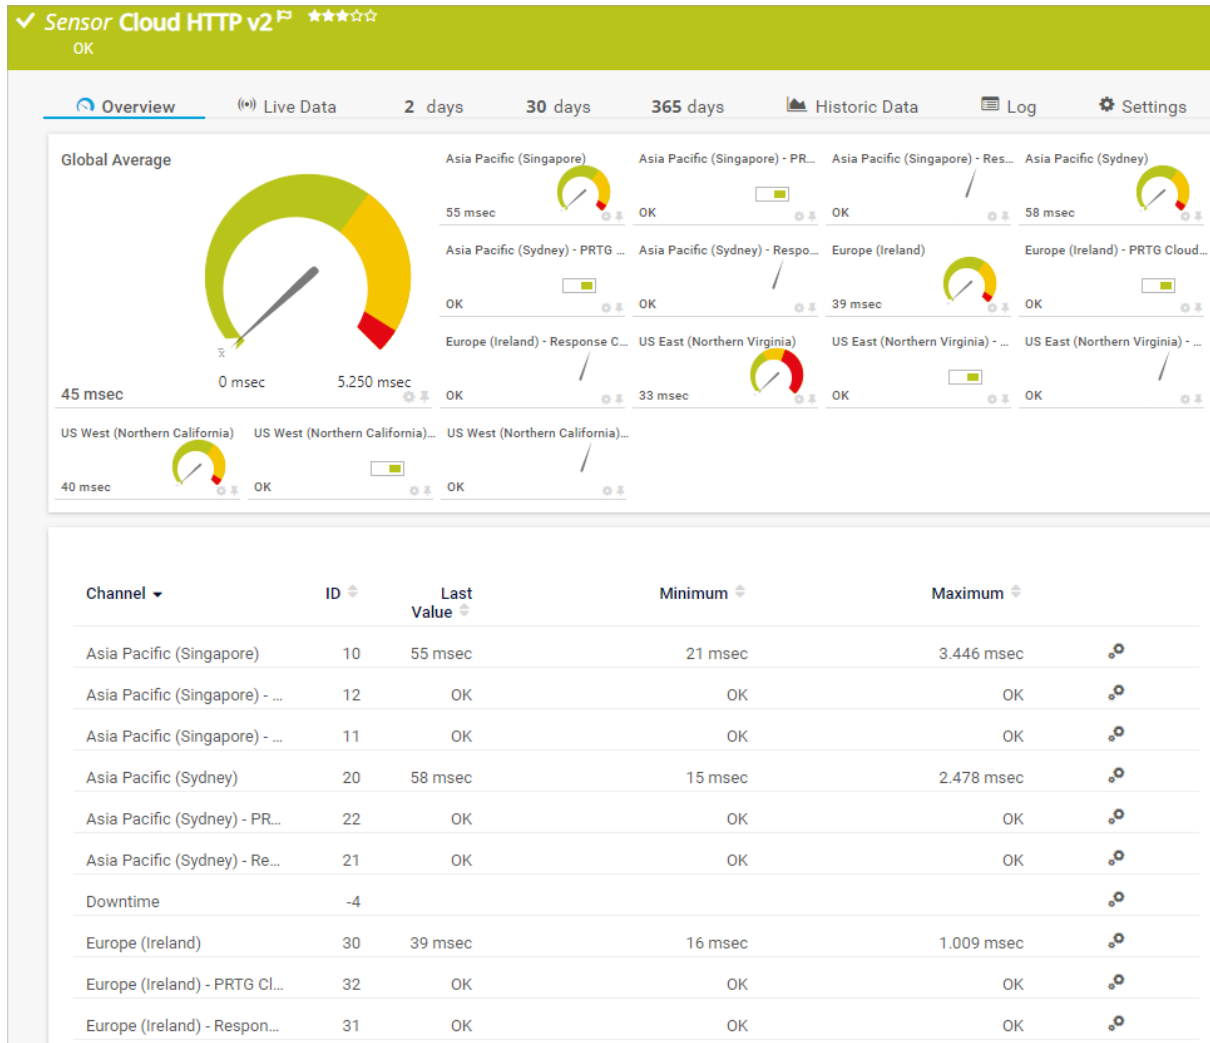

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.17 Cloud HTTP v2 Sensor

The Cloud HTTP v2 sensor monitors the loading time of a web server via HTTP from different locations worldwide via the PRTG Cloud. The locations are distributed among four continents around the globe.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Cloud HTTP v2 Sensor

Sensor in Other Languages

- Dutch: Cloud HTTP v2
- French: Cloud HTTP v2
- German: Cloud HTTP v2
- Japanese: Cloud HTTP v2
- Portuguese: Cloud HTTP v2
- Russian: Cloud HTTP v2
- Simplified Chinese: Cloud HTTP v2

- Spanish: Cloud HTTP v2

Remarks

- The probe system must have access to the internet and must be able to reach <https://api.prtgcloud.com:443> to communicate with the PRTG Cloud.
- The address you define in the [settings of the parent device](#) must be reachable over the internet. You cannot use this sensor to monitor localhost (127.0.0.1) or other target devices that are only reachable within your private network.
- This sensor inherits [proxy settings for HTTP sensors](#) from the parent device.
- This sensor supports smart URL replacement.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).
- This sensor has predefined limits for several metrics. You can individually change these limits in the channel settings. For detailed information about channel limits, see section [Channel Settings](#).
- See the Knowledge Base: [What is the PRTG Cloud Bot?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A list of tags with "exampletag" selected. There are "X" and "+" icons next to the tag.
- Priority:** A star rating system showing 5 stars, with the first three stars filled.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ cloud ▪ cloudhttpsensor ▪ http
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Cloud HTTP Settings

Setting	Description
URL	<p>Select if you want to inherit the URL from the parent device or if you want to enter a custom URL:</p> <ul style="list-style-type: none"> ▪ Inherit (default) ▪ Custom
Custom URL	<p>This option is only visible if you select Custom above. Enter a custom URL that the sensor connects to.</p> <p>ⓘ The URL must be valid and URL encoded.</p> <p>ⓘ You can enter a URL that leads to a web page, for example, to measure the page source code's loading time, or you can enter the URL of an image or other page asset to measure this element's availability and loading time.</p> <p>■ PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section Smart URL Replacement ^[716].</p>

Setting	Description
Request Method	<p>Select an HTTP request method to determine how the sensor requests the URL:</p> <ul style="list-style-type: none"> ▪ GET (default): Directly request the web page. We recommend that you use this setting for a simple check of a web page. ▪ POST: Send post form data to the URL. ▪ HEAD: Only request the HTTP header from the server without the actual web page. <ul style="list-style-type: none"> ⓘ This setting saves bandwidth because it transfers less data. However, we do not recommend this setting because the measured request time is not the request time that the users experience and you might not be notified of slow results or timeouts.
Postdata	<p>This option is only visible if you select POST as Request Method above. Enter the data part for the POST request.</p>
Region	<p>Select the regions from which you want to check the service:</p> <ul style="list-style-type: none"> ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Sydney) ▪ Europe (Ireland) ▪ US East (Northern Virginia) ▪ US West (Northern California) <p>ⓘ PRTG creates two channels for every region that you select.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the Ping. If the reply takes longer than this value, PRTG cancels the request and shows an error message. Enter an integer value. You can enter a value between 1 and 30 seconds.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Debug Options

Debug Options

Result Handling **i**

Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules 4170.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A text input field containing "exampletag" with a blue 'x' to remove it and a plus sign to add more.
- Priority:** A section with five stars, where the first three are filled, indicating a priority of 3.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ pingsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Ping Settings

Ping Settings	
Packet Size (Bytes) i	32
Ping Count i	1
Timeout (Sec.) i	5
Port i	80

Ping Settings

Setting	Description
Packet Size (Bytes)	<p>Enter the packet size in bytes for the Ping. You can enter any value between 1 and 10,000.</p> <p>i We recommend that you use the default value.</p>
Ping Count	<p>Enter the number of Pings that PRTG sends in a row to the parent device in one scanning interval. Enter an integer value. The default value is 1. The maximum value is 5.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the Ping. If the reply takes longer than this value, PRTG cancels the request and shows an error message. Enter an integer value. The maximum timeout value is 5 seconds.</p>
Port	<p>Enter the number of the port that the sensor uses for TCP ping. The default port is 80.</p> <p>i This sensor does not support port 25.</p>

Sensor Display

Sensor Display

Primary Channel ⁱ Downtime

Graph Type ⁱ
 Show channels independently (default)

 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ^[142].

Scanning Interval

Click  to interrupt the [inheritance](#) ^[142].

 This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#) ^[4167] settings are not available for this sensor.

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> i You can change the available intervals in the system administration on PRTG on premises installations. </p> <p> i The minimum scanning interval of this sensor is 10 minutes. </p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p> i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply. </p> <p> i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply. </p> <p> i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply. </p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵³.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Asia Pacific (Singapore) - Response Time	The response time of the target server at the location in milliseconds (msec)

Channel	Description
Asia Pacific (Sydney) - Response Time	The response time of the target server at the location in msec
Asia Pacific (Tokyo) - Response Time	The response time of the target server at the location in msec
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
EU Central (Frankfurt) - Response Time	The response time of the target server at the location in msec
EU West (Ireland) - Response Time	The response time of the target server at the location in msec
Global Average	The global average in msec
Global Average - Response Time	The global average response time in msec i This channel is the primary channel by default.
South America (São Paulo) - Response Time	The response time of the target server at the location in msec
US East (N. Virginia) - Response Time	The response time of the target server at the location in msec
US West (N. California) - Response Time	The response time of the target server at the location in msec
US West (Oregon) - Response Time	The response time of the target server at the location in msec

Sensor Settings Overview

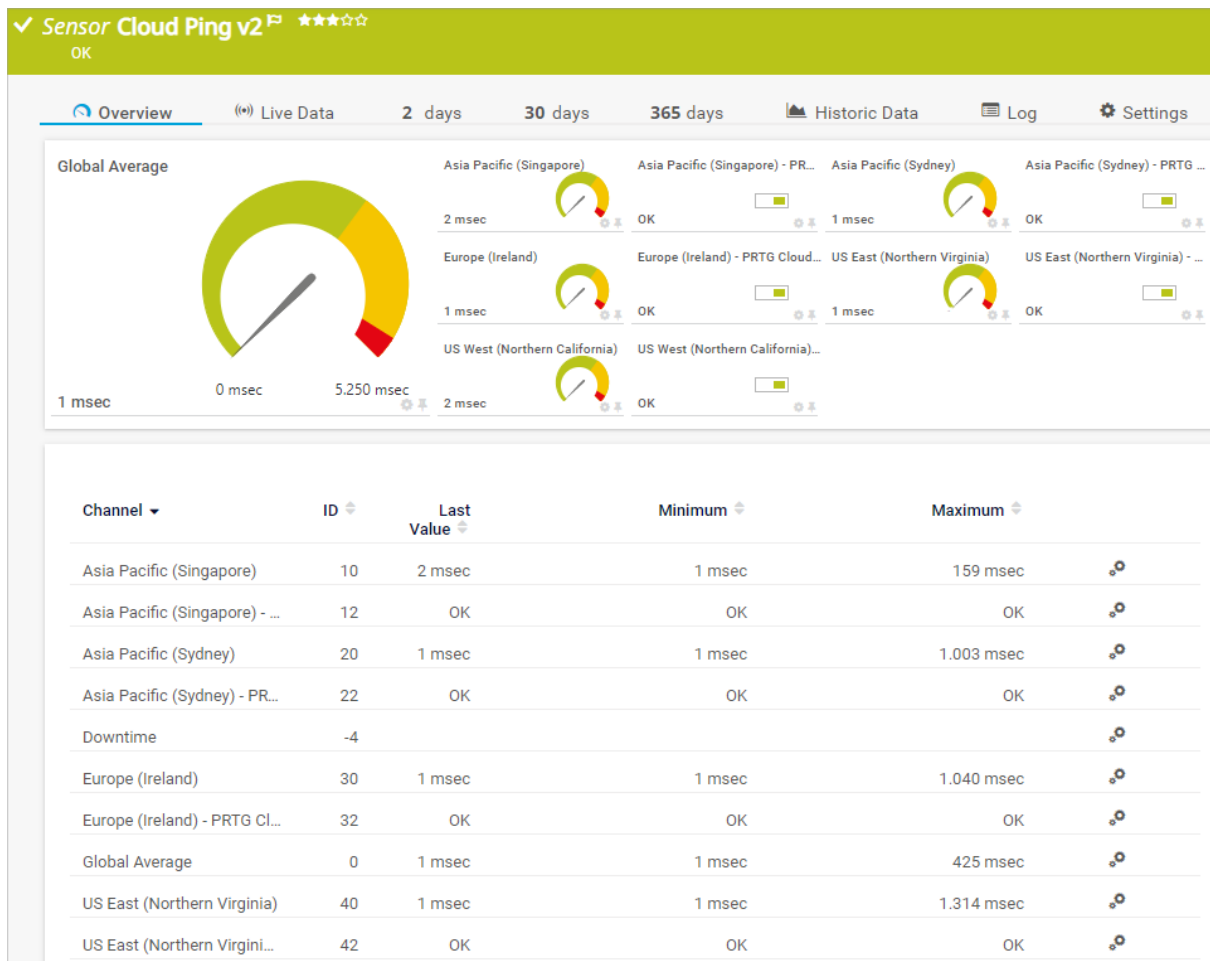

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.19 Cloud Ping v2 Sensor

The Cloud Ping v2 sensor monitors the Transmission Control Protocol (TCP) ping times to its parent device from different locations worldwide via the PRTG Cloud. These locations are distributed among four continents around the globe.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Cloud Ping v2 Sensor

Sensor in Other Languages

- Dutch: Cloud Ping v2
- French: Cloud Ping v2
- German: Cloud Ping v2
- Japanese: Cloud Ping v2
- Portuguese: Cloud Ping v2
- Russian: Cloud Ping v2
- Simplified Chinese: Cloud Ping v2
- Spanish: Cloud Ping v2

Remarks

- This sensor uses Transmission Control Protocol (TCP) ping.
- The probe system must have access to the internet and must be able to reach <https://api.prtgcloud.com:443> to communicate with the PRTG Cloud.
- The address you define in the [settings of the parent device](#) must be reachable over the internet. You cannot use this sensor to monitor localhost (127.0.0.1) or other target devices that are only reachable within your private network.
- This sensor inherits [proxy settings for HTTP sensors](#) from the parent device.
- This sensor has predefined limits for several metrics. You can individually change these limits in the channel settings. For detailed information about channel limits, see section [Channel Settings](#).
- This sensor has a low performance impact.
- See the Knowledge Base: [What is the PRTG Cloud Bot?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field with the placeholder text "Example Name".
- Tags:** A text input field containing "exampletag" with a blue 'x' icon to remove it and a plus icon to add more.
- Priority:** A section with five star icons, all of which are filled, indicating a priority of 5.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	<p>Shows tags [145] that the sensor inherits [145] from its parent device [140], parent group [139], and parent probe [139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited [145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ cloud ▪ cloudpingsensor ▪ ping
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

■ KNOWLEDGE BASE

What is the PRTG Cloud Bot?

- <https://kb.paessler.com/en/topic/65719>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

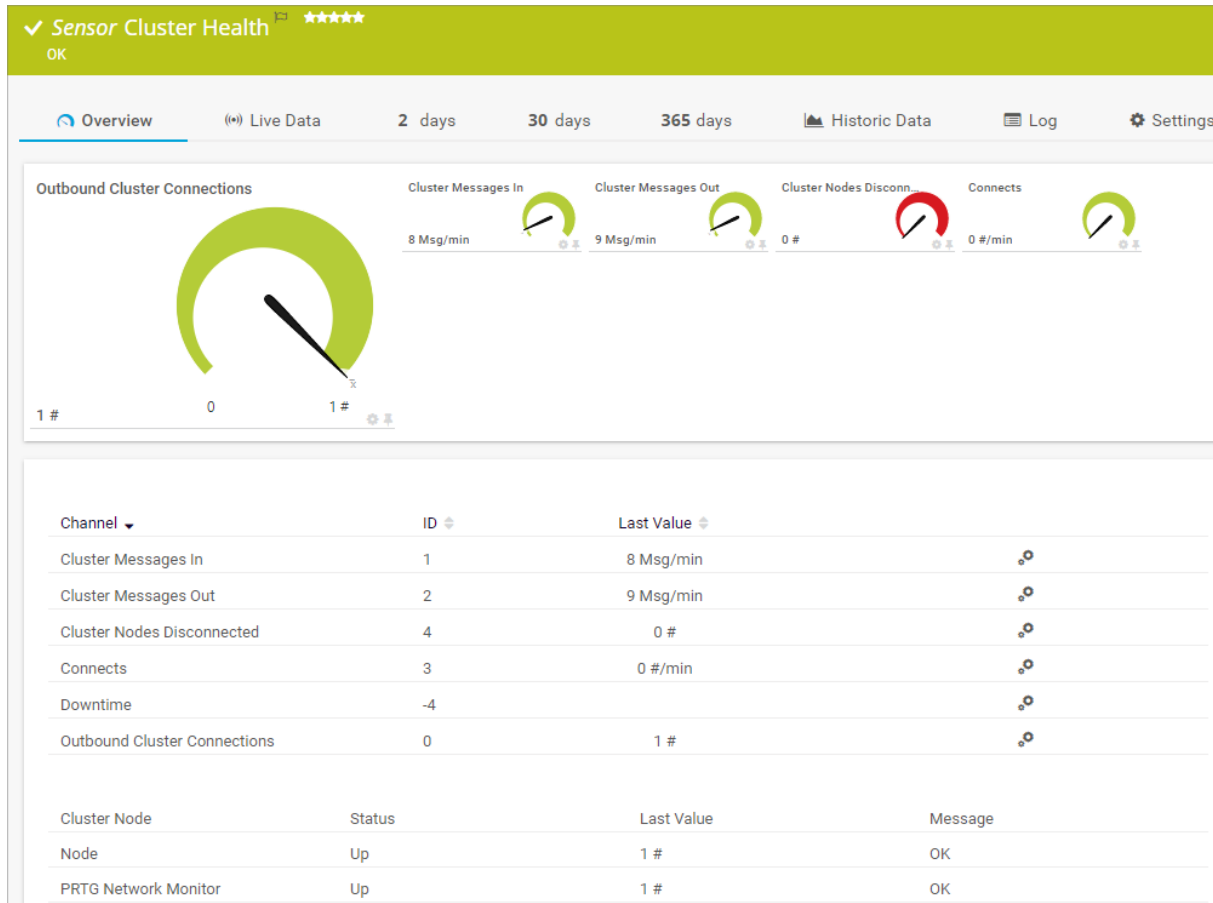

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.20 Cluster Health Sensor

The Cluster Health sensor monitors the health of a [cluster](#)^[135] and indicates the system health status of PRTG.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)^[749].

Cluster Health Sensor

Sensor in Other Languages

- Dutch: Cluster Status
- French: État du cluster
- German: Cluster-Zustand
- Japanese: クラスターの正常性
- Portuguese: Funcionamento do cluster
- Russian:
- Simplified Chinese: 群集健康状况
- Spanish: Salud de clúster

Remarks

- PRTG automatically creates this sensor with a cluster installation. You cannot manually delete it or add it.
- If at least one cluster node is disconnected, this sensor shows the Down [status](#)^[197] by default.
- You can review the states of each cluster node on the sensor's Overview tab.
- You can choose the cluster node for which you want to show data (or for all cluster nodes) on the [monitoring data review tabs](#)^[205].
- This sensor has a very low performance impact.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> clusterhealthsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Sensor Display

Primary Channel **ⓘ** Downtime

Graph Type **ⓘ** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Access Rights

Click  to interrupt the [inheritance](#).

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Cluster Messages In	The number of ingoing cluster messages per minute
Cluster Messages Out	The number of outgoing cluster messages per minute
Cluster Nodes Disconnected	The number of disconnected cluster nodes
Connects	The number of connects per minute

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Outbound Cluster Connections	The number of outbound cluster connections  This channel is the primary channel by default.

More

KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

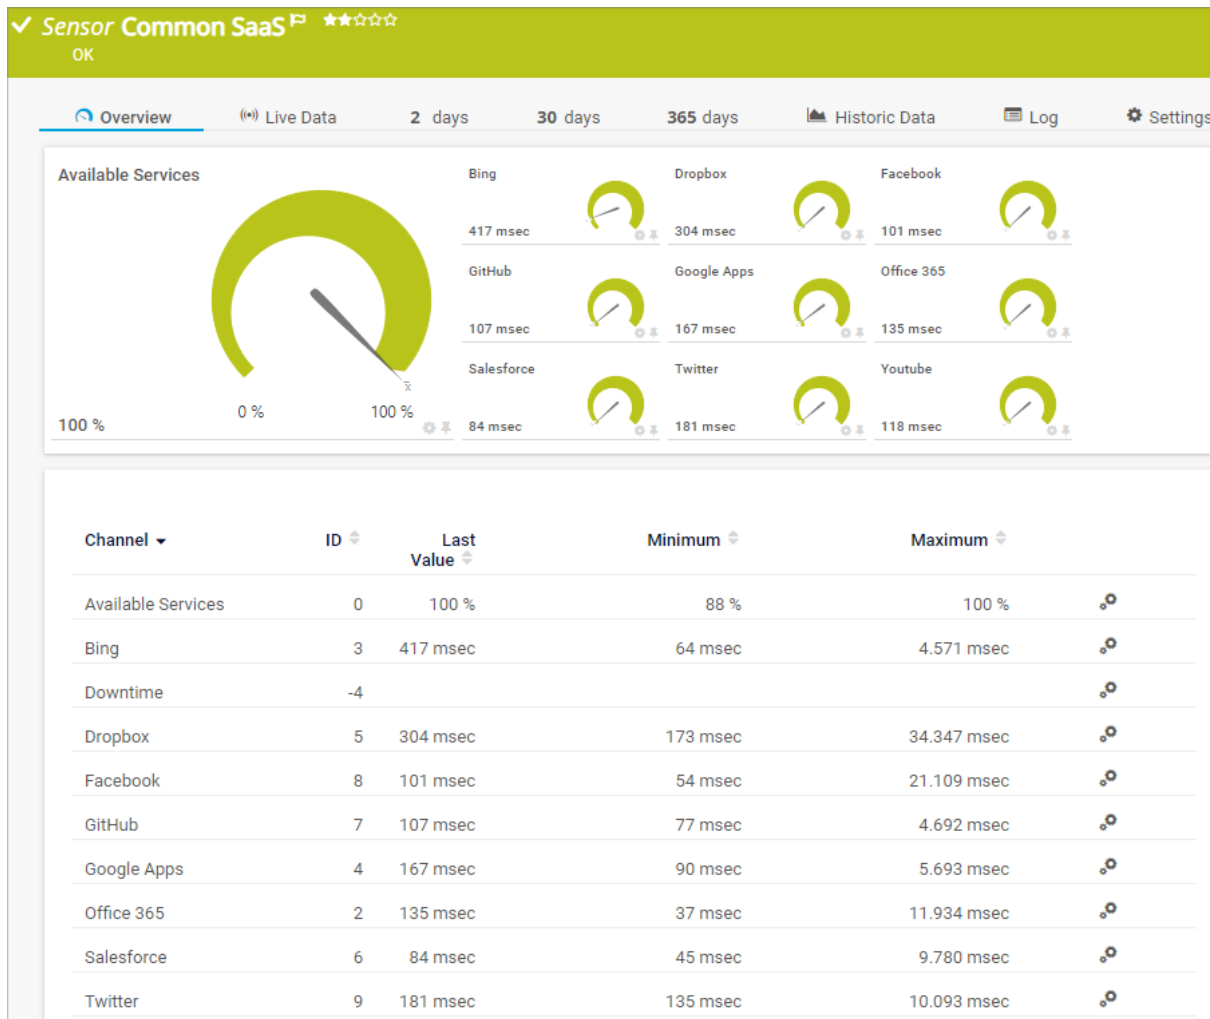

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.21 Common SaaS Sensor

The Common SaaS sensor monitors the availability of several software as a service (SaaS) providers.

i With this sensor, you can get alarms if your cloud services are not reachable.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Common SaaS Sensor

Sensor in Other Languages

- Dutch: Algemene SaaS
- French: SaaS courants
- German: Verbreitete SaaS-Dienste
- Japanese: Common SaaS
- Portuguese: Provedores SaaS Comuns
- Russian: SaaS
- Simplified Chinese: 常用 SaaS

- Spanish: SaaS común

Remarks

- The probe system must have access to the internet.
- This sensor has a fixed scanning interval of 15 minutes. You cannot change it.
- PRTG automatically creates this sensor on every probe device. If the probe system has no connection to the internet, manually [pause](#) or [delete](#) this sensor to avoid error messages.
- This sensor inherits [proxy settings for HTTP sensors](#) from the parent device.
- This sensor has predefined limits for several metrics. You can individually change these limits in the channel settings. For detailed information about channel limits, see section [Channel Settings](#).
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Common SaaS Specific

Setting	Description
SaaS Checklists	<p>Select the services that you want to monitor. The sensor creates one channel for each service that you select.</p> <p>i You can also select all items or cancel the selection by using the check box in the table header.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Sensor Name ⓘ Example Name

Tags ⓘ X +

This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from  Root

Schedule  None ▼

Maintenance Window  Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type  Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from: <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies ⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>

Setting	Description
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

 inherit from  Root

User Group Access 	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>For more details on access rights, see section Access Rights Management.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Available Services	<p>The available services in percent</p> <p>i This channel is the primary channel by default.</p>
Bing	The response time of the SaaS provider in milliseconds (msec)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Dropbox	The response time of the SaaS provider in msec
Facebook	The response time of the SaaS provider in msec
GitHub	The response time of the SaaS provider in msec
Google Apps	The response time of the SaaS provider in msec

Channel	Description
Office 365	The response time of the SaaS provider in msec
Salesforce	The response time of the SaaS provider in msec
Twitter	The response time of the SaaS provider in msec
Youtube	The response time of the SaaS provider in msec

More

KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

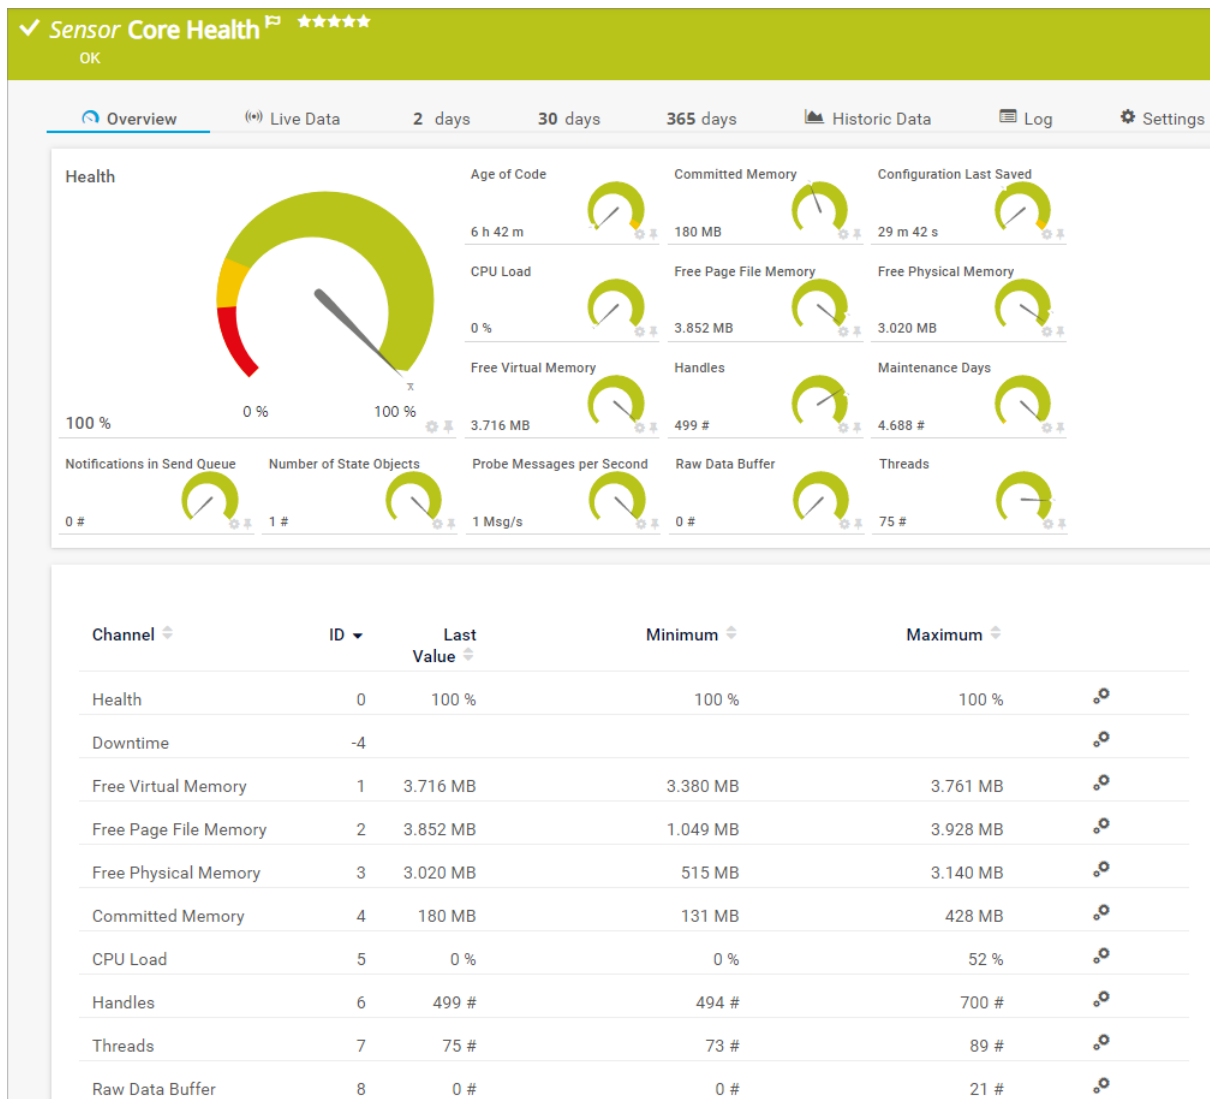

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.22 Core Health Sensor

The Core Health sensor is a probe-dependent sensor that monitors internal PRTG parameters. It shows the status of the PRTG core server and checks various parameters of the PRTG core server that have an impact on the stability of the system.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)⁷⁶⁰.

Core Health Sensor

Sensor in Other Languages

- Dutch: Core Status
- French: État du serveur central
- German: Serverzustand
- Japanese: コアの正常性
- Portuguese: Funcionamento do servidor central

- Russian:
- Simplified Chinese: 核心健康状况
- Spanish: Salud del servidor central

Remarks

- PRTG automatically creates this sensor. You cannot delete it.
- You can only set up this sensor on a local probe device.
- This sensor has a very low performance impact.
- You can also find information related to PRTG core server system memory under Setup | PRTG Status. For details, see the Knowledge Base: [What do the PRTG core memory parameters mean?](#)

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a title 'Basic Sensor Settings' in blue. Below the title, there are three main sections: 'Sensor Name' with an information icon and the text 'Example Name'; 'Tags' with an information icon and a text input field containing 'exampletag' and a plus sign; and 'Priority' with an information icon and a star rating of three stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[408], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Bytes (Memory)	MB
Bytes (Disk)	MB
Bytes (File)	Byte

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>ⓘ Custom channel types are only available on sensor level.</p>

Channel List

ⓘ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Age of Code	<p>The time that has passed since the last update of your PRTG core server. Update regularly to get the best security and stability for PRTG, as well as the latest features. We recommend that you use the auto-update⁴²⁵⁷ to automatically get new versions.</p>

Channel	Description
Committed Memory	The amount of memory committed to the PRTG core server as reported by the memory manager
Configuration Last Saved	The time passed since the configuration file was last saved successfully. PRTG saves the configuration every 24 hours. If the configuration cannot be saved, PRTG creates a ticket as soon as the saving process has failed, and warns you via this channel after 26 hours. None of your changes to PRTG can be saved if this happens. In this case, restart your PRTG core server to save the file.
CPU Load	The CPU load in percent. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value should usually stay below 50%.
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Free Page File Memory	The amount of free page file memory that is available on the system. Page file memory is aggregated RAM and the size of page file. It is the maximum amount of memory that is available on the system to be used for all running processes. If it gets too low, the system can break down, and at least some applications throw Out of memory errors.
Free Physical Memory	The amount of free physical memory that is available on the system. This is the RAM that is physically built into the computer. If it gets too low, the system becomes very slow and PRTG no longer works in a useful way. Some sensors might not be displayed correctly and show the Unknown status.
Free Virtual Memory	The address space on the system that PRTG can access. PRTG cannot use more memory than reported here, which is independent from free page file and physical memory. On a 32-bit operating system, the maximum is 2 GB (3 GB with special settings under Windows). On a 64-bit operating system, it is 4 GB if PRTG runs as a 32-bit version, and unlimited if it runs as a 64-bit version (PRTG core server only). If the free virtual memory gets too low, PRTG throws Out of memory errors or the message not enough storage to process this command . This message is visible in the Core log.
Handles	The counter for the data structures of the operating system. It is responsible for internal resource management. Investigate obviously increasing values that occur repeatedly.
Health	The sum of the core state as a value between 100% (healthy) and 0% (failing). Investigate frequent or repeated health values below 100%.  This channel is the primary channel by default.

Channel	Description
Maintenance Days	The remaining maintenance days of your PRTG on premises license. Renew your maintenance in time to make sure that you get updates for your PRTG on premises installation. PRTG Hosted Monitor instances show a fixed value here for technical reasons.
Notifications in Send Queue	The number of notifications that are in the send queue
Number of State Objects	The number of user-specific state objects that are found in the PRTG core server system's memory
Probe Messages per Second	The number of messages sent per second from all probes to the PRTG core server
Raw Data Buffer	The amount of raw data that is temporarily stored on the physical memory during input/output (I/O) operations on the disk. Usually, this value should be 0 (or very low). Investigate increasing values.
Threads	The number of program parts that are running simultaneously. This number can increase with heavy load. Usually, this number should not exceed 100.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

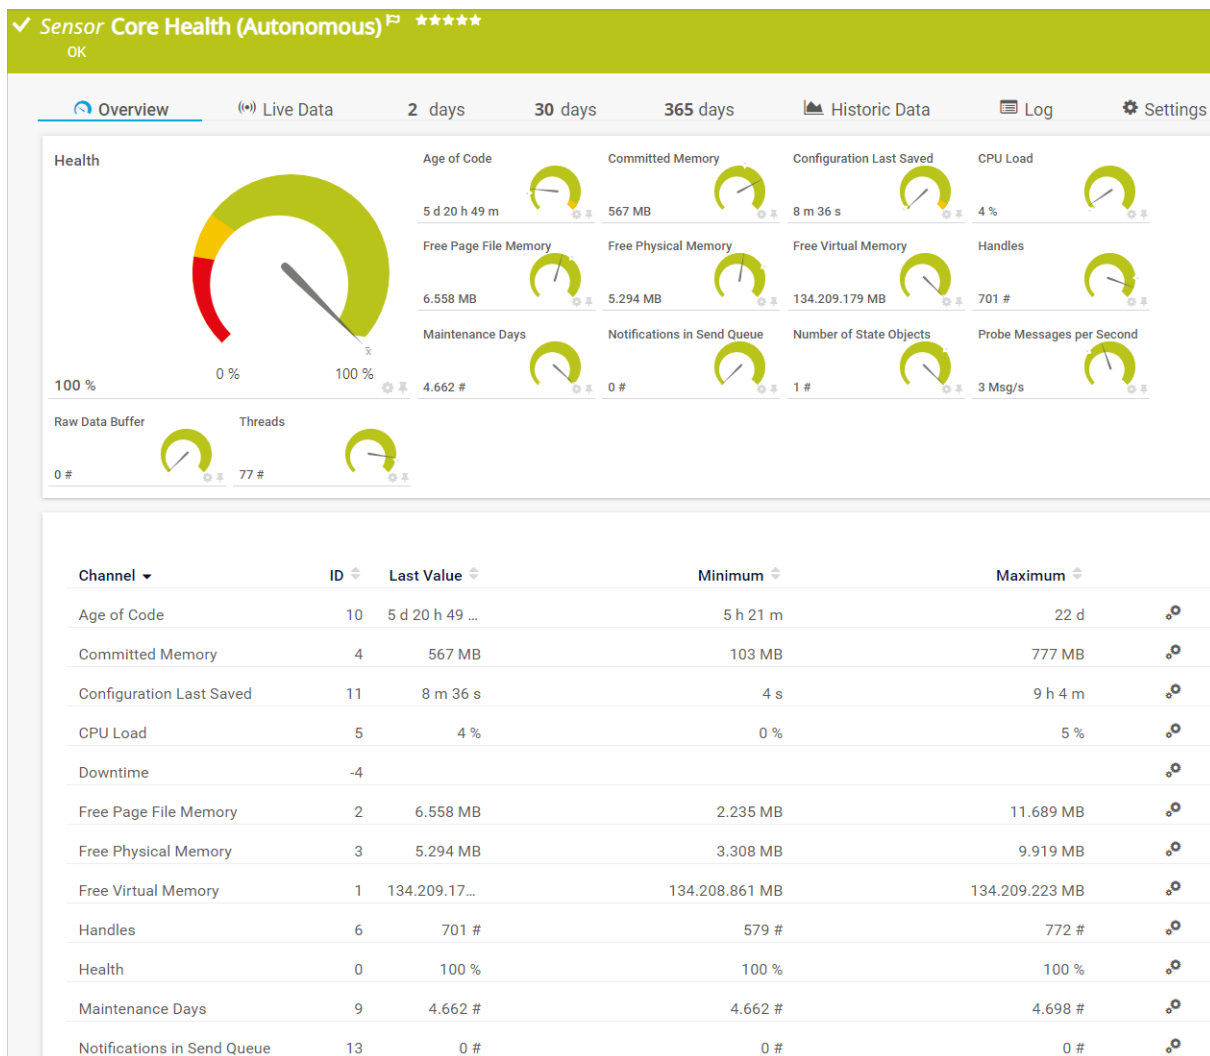

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3997

7.8.23 Core Health (Autonomous) Sensor

The Core Health (Autonomous) sensor is a probe-independent sensor that monitors internal PRTG parameters. It shows the status of the PRTG core server and checks various parameters of the PRTG core server that have an impact on the stability of the system.

i The Core Health (Autonomous) sensor has the same functionality as the [Core Health sensor](#)^[760]. The only difference is that the Core Health (Autonomous) sensor runs independently of the probe. This means that if the probe disconnects, the sensor still monitors the status of the PRTG core server.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)^[773].

Core Health (Autonomous) Sensor

Sensor in Other Languages

- Dutch: Core Health (Autonomous)
- French: Core Health (Autonomous)
- German: Serverzustand (Autonom)
- Japanese: Core Health (Autonomous)

- Portuguese: Core Health (Autonomous)
- Russian: Core Health (Autonomous)
- Simplified Chinese: Core Health (Autonomous)
- Spanish: Core Health (Autonomous)

Remarks

- PRTG automatically creates this sensor. You cannot delete it.
- You cannot add this sensor to a probe.
- This sensor has a very low performance impact.
- You can also find information related to PRTG core server system memory under Setup | PRTG Status. For details, see the Knowledge Base: [What do the PRTG core memory parameters mean?](#)

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' configuration window. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag', and a 'Priority' field set to 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[183] , as well as in alarms ^[228] , logs ^[237] , notifications ^[403] , reports ^[406] , maps ^[405] , libraries ^[407] , and tickets ^[240] . ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?
Parent Tags	Shows tags ^[145] that the sensor inherits ^[145] from its parent device ^[140] , parent group ^[139] , and parent probe ^[139] . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145] .

Setting	Description
	<p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> corehealthsensor autonomous
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

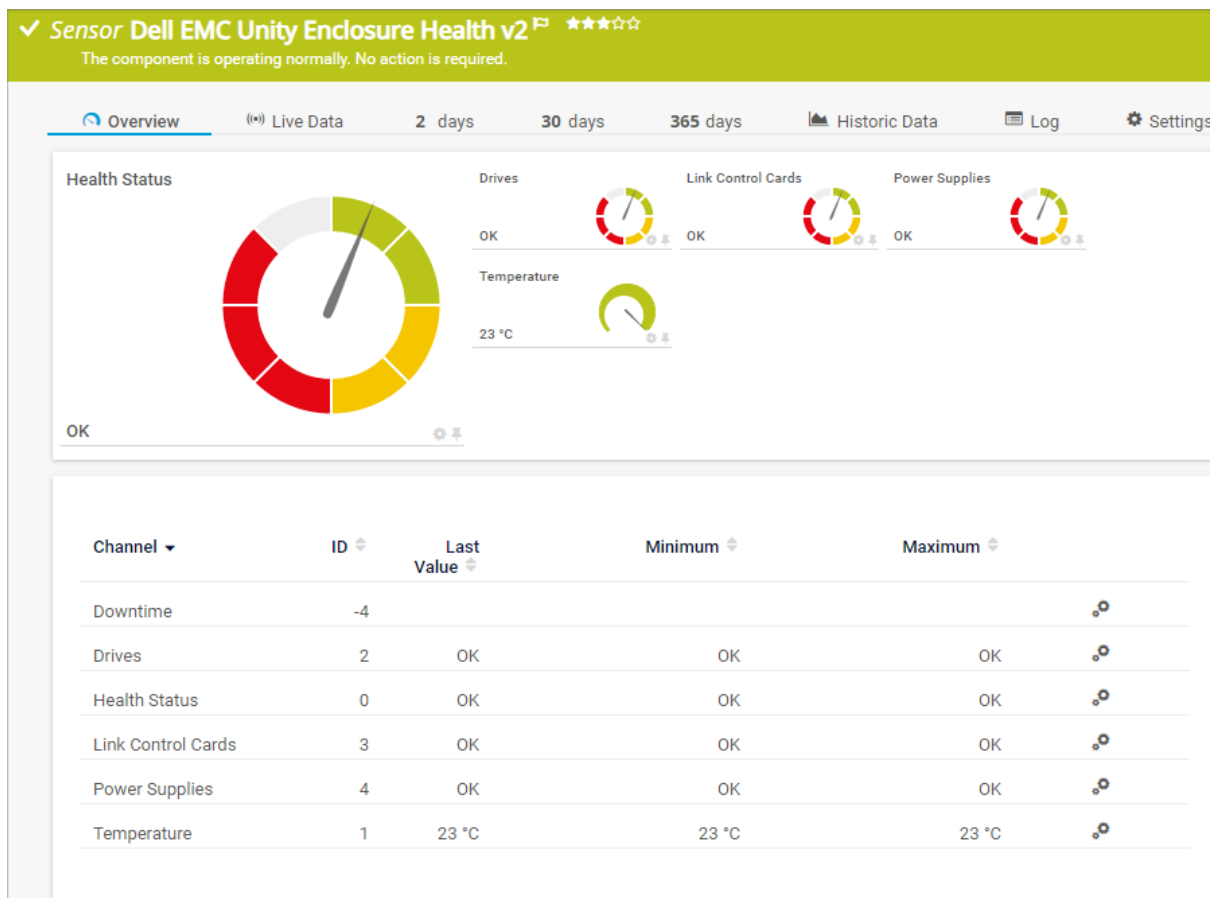

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3997

7.8.24 Dell EMC Unity Enclosure Health v2 Sensor

The Dell EMC Unity Enclosure Health v2 sensor monitors the health of a disk-array enclosure (DAE) or a physical or virtual disk processor enclosure (DPE) on a Dell EMC storage system via the Representational State Transfer (REST) application programming interface (API).

i Dell EMC systems that provide a REST API are [EMC Unity Family](#), [EMC Unity All Flash](#), [EMC Unity Hybrid](#), and [EMC UnityVSA](#).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ⁷⁸⁸.

Dell EMC Unity Enclosure Health v2 Sensor

Sensor in Other Languages

- Dutch: Dell EMC Unity Enclosure Health v2
- French: Dell EMC Unity Enclosure Health v2
- German: Dell EMC Unity Enclosure Health v2
- Japanese: Dell EMC Unity Enclosure Health v2
- Portuguese: Dell EMC Unity Enclosure Health v2
- Russian: Dell EMC Unity Enclosure Health v2
- Simplified Chinese: Dell EMC Unity Enclosure Health v2

- Spanish: Dell EMC Unity Enclosure Health v2

Remarks

- This sensor requires [credentials for Dell EMC](#) in settings that are higher in the [object hierarchy](#), for example, in the settings of the parent device.
- This sensor only supports systems from the Dell EMC Unity family with Unity OE 5.x.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Dell EMC Specific

Setting	Description
Enclosure Name	<p>Select the enclosure that you want to monitor.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

7.8.25 Dell EMC Unity File System v2 Sensor

The Dell EMC Unity File System v2 sensor monitors a file system on a Dell EMC storage system via the Representational State Transfer (REST) application programming interface (API).

❶ Dell EMC systems that provide a REST API are [EMC Unity Family](#), [EMC Unity All Flash](#), [EMC Unity Hybrid](#), and [EMC UnityVSA](#).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Dell EMC Unity File System v2 Sensor

Sensor in Other Languages

- Dutch: Dell EMC Unity File System v2
- French: Dell EMC Unity File System v2
- German: Dell EMC Unity File System v2
- Japanese: Dell EMC Unity File System v2
- Portuguese: Dell EMC Unity File System v2
- Russian: Dell EMC Unity File System v2
- Simplified Chinese: Dell EMC Unity File System v2
- Spanish: Dell EMC Unity File System v2

Remarks

- This sensor requires [credentials for Dell EMC](#) in settings that are higher in the [object hierarchy](#), for example, in the settings of the parent device.
- This sensor only supports systems from the Dell EMC Unity family with Unity OE 5.x.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name**: A text input field containing "Example Name".
- Tags**: A list of tags with "exampletag" selected, and a plus sign icon to add more.
- Priority**: A star rating system showing three stars filled and two empty.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p>

Setting	Description
	<p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ dellemc ▪ dellemcfilesystem ▪ dellemcstorage ▪ emcfilesystemsensor ▪ emcsensor ▪ restsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor. ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how different channels are shown for this sensor: <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Debug Options

Debug Options

Result Handling ⓘ

Discard result

Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory^[4526] on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

 inherit from  Root

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails.

Setting	Description
	<p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent

 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

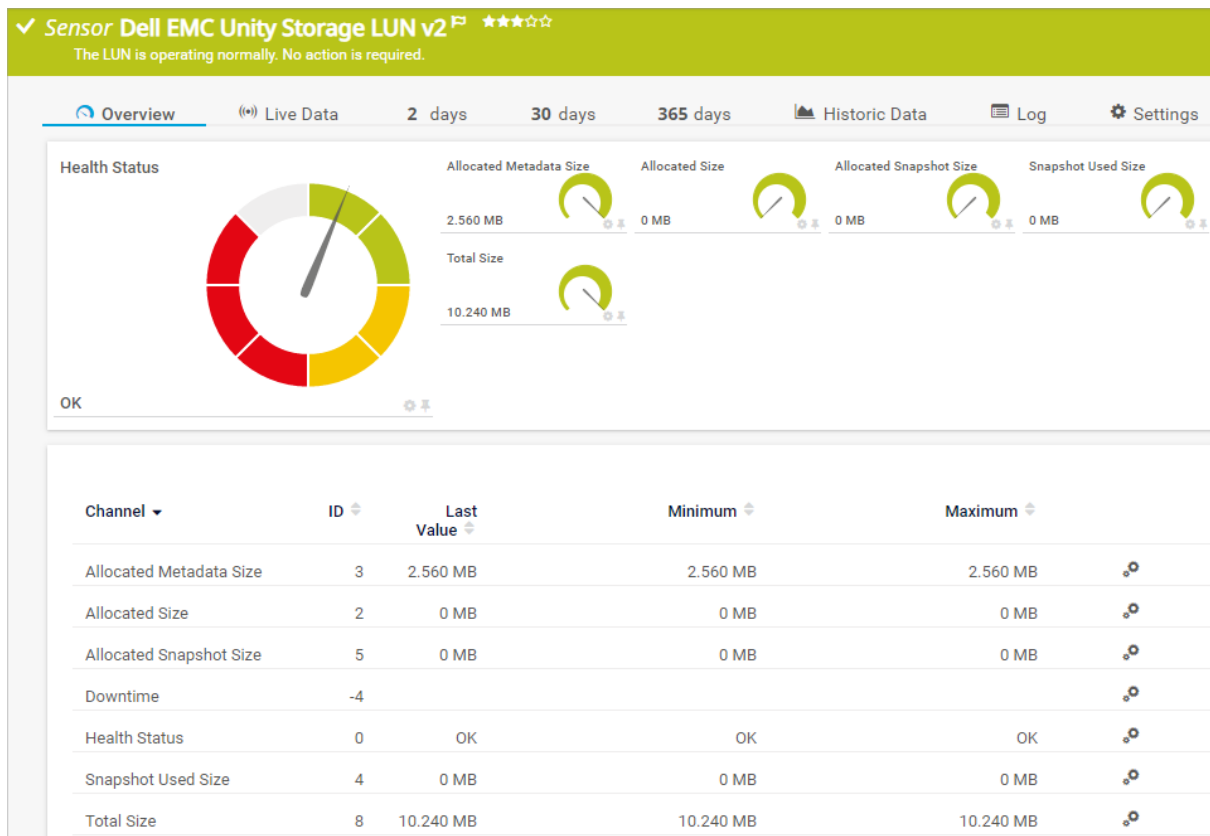

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.27 Dell EMC Unity Storage LUN v2 Sensor

The Dell EMC Unity Storage LUN v2 sensor monitors a logical unit number (LUN) on a Dell EMC storage system via the Representational State Transfer (REST) application programming interface (API).

❶ Dell EMC systems that provide a REST API are [EMC Unity Family](#), [EMC Unity All Flash](#), [EMC Unity Hybrid](#), and [EMC UnityVSA](#).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Dell EMC Unity Storage LUN v2 Sensor

Sensor in Other Languages

- Dutch: Dell EMC Unity Storage LUN v2
- French: Dell EMC Unity Storage LUN v2
- German: Dell EMC Unity Storage LUN v2
- Japanese: Dell EMC Unity Storage LUN v2
- Portuguese: Dell EMC Unity Storage LUN v2
- Russian: Dell EMC Unity Storage LUN v2
- Simplified Chinese: Dell EMC Unity Storage LUN v2
- Spanish: Dell EMC Unity Storage LUN v2

Remarks

- This sensor requires [credentials for Dell EMC](#) [459] in settings that are higher in the [object hierarchy](#) [136], for example, in the settings of the parent device.
- This sensor only supports systems from the Dell EMC Unity family with Unity OE 5.x.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#) [448].

Add Sensor

The [Add Sensor](#) [367] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG performs a meta-scan before you can add this sensor and requires basic information in advance. Provide the required information in the dialog box that appears. PRTG then recognizes all items that are available for monitoring based on your input.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.29 Dell EMC Unity VMware Datastore v2 Sensor

The Dell EMC Unity VMware Datastore v2 sensor monitors a VMware datastore on a Dell EMC storage system via the Representational State Transfer (REST) application programming interface (API).

❶ Dell EMC systems that provide a REST API are [EMC Unity Family](#), [EMC Unity All Flash](#), [EMC Unity Hybrid](#), and [EMC UnityVSA](#).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ⁸⁴⁸.

Dell EMC Unity VMw are Datastore v2 Sensor

Sensor in Other Languages

- Dutch: Dell EMC Unity VMware Datastore v2
- French: Dell EMC Unity VMware Datastore v2
- German: Dell EMC Unity VMware Datastore v2
- Japanese: Dell EMC Unity VMware Datastore v2
- Portuguese: Dell EMC Unity VMware Datastore v2
- Russian: Dell EMC Unity VMware Datastore v2
- Simplified Chinese: Dell EMC Unity VMware Datastore v2
- Spanish: Dell EMC Unity VMware Datastore v2

Remarks

- This sensor requires [credentials for Dell EMC](#) in settings that are higher in the [object hierarchy](#), for example, in the settings of the parent device.
- This sensor only supports systems from the Dell EMC Unity family with Unity OE 5.x.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Dell EMC Specific

Setting	Description
VMware Datastore Name	<p>Select the VMware datastores that you want to monitor. PRTG creates one sensor for each VMware datastore that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

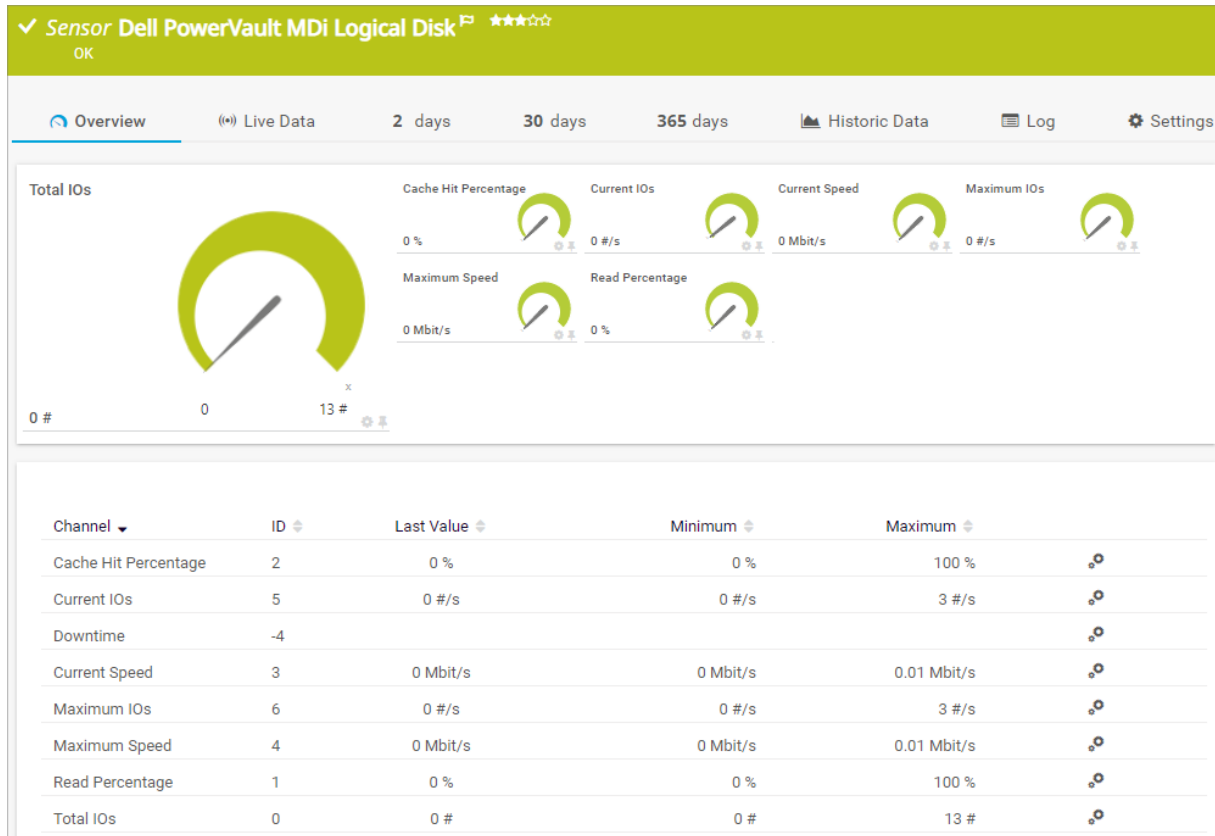

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.30 Dell PowerVault MDi Logical Disk Sensor

The Dell PowerVault MDi Logical Disk sensor monitors a virtual disk on a Dell PowerVault system.

i The sensor supports Dell PowerVault [MD3000i](#), [MD3420](#), [MD3620i](#), [MD3000f](#), [MD3620f](#), or [MD3820i](#). It might work with other models, too.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Dell PowerVault MDi Logical Disk Sensor

Sensor in Other Languages

- Dutch: Dell PowerVault MDi Logische Schijf
- French: Disque logique Dell PowerVault MDi
- German: Dell PowerVault MDi Logischer Datenträger
- Japanese: Dell PowerVault MDi 論理ディスク
- Portuguese: Disco lógico Dell PowerVault MDi
- Russian: Dell PowerVault MDi
- Simplified Chinese: Dell PowerVault MDi 逻辑磁盘
- Spanish: Disco lógico de Dell PowerVault MDi

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires Dell Modular Disk Storage Manager on the probe system. See the Knowledge Base: [Where do I find the Dell PowerVault Modular Disk Storage Manager for use with my MDi SAN?](#)
- This sensor requires the IP address of the storage area network (SAN) defined in the settings of the parent device.
- This sensor works with Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i, and might support other models.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Dell Modular Disk Storage Manager	<p>This sensor requires the installation of the Dell Modular Disk Storage Manager program. You have to install it on the probe system (on every cluster node, if on a cluster probe). For details about setup, see section More below.</p> <p>i Create this sensor on a device that has the IP address of the SAN configured in the IP Address/DNS Name field of the sensor settings.</p>

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Settings

Setting	Description
Virtual Disks	<p>Select the virtual disks that you want to monitor. PRTG creates one sensor for each virtual disk that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a title 'Basic Sensor Settings' in blue. Below the title are three settings: 'Sensor Name' with a value of 'Example Name', 'Tags' with a value of 'exampletag' and a plus sign to add more, and 'Priority' set to 5 stars (represented by five star icons).

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[409], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ powervault
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Settings

Sensor Settings

Important: The Dell Modular Disk Storage Manager needs to be installed on the probe system.

Virtual Disk **ⓘ**

Result Handling **ⓘ** Discard result
 Store result

Sensor Settings

Setting	Description
Virtual Disk	Shows the name of the virtual disk that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. i In a cluster, PRTG stores the result in the PRTG data directory of the master node.

Sensor Display

Sensor Display

Primary Channel **ⓘ**

Graph Type **ⓘ** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

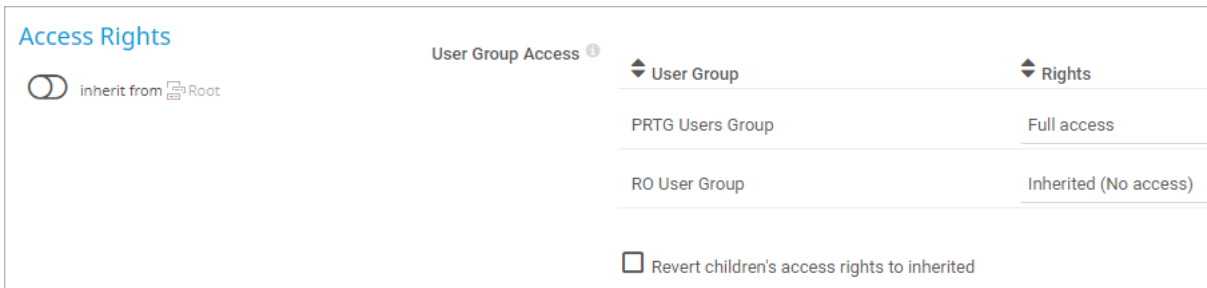

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

i Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

inherit from  Root

Channel Unit Types **i**

Channel Type	Unit
Bytes (Bandwidth)	KB ▼
	kbit ▼
	/ ▼
	sec... ▼
Bytes (Memory)	MB ▼
Bytes (Disk)	MB ▼
Bytes (File)	Byte ▼

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Cache Hit Percentage	The cache hits in percent
Current IOs	The number of current input/output (I/O) operations per second
Current Speed	The current disk speed per second
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Maximum IOs	The number of maximum I/O operations per second
Maximum Speed	The maximum disk speed per second
Read Percentage	The read operations in percent
Total IOs	The total number of I/O operations  This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

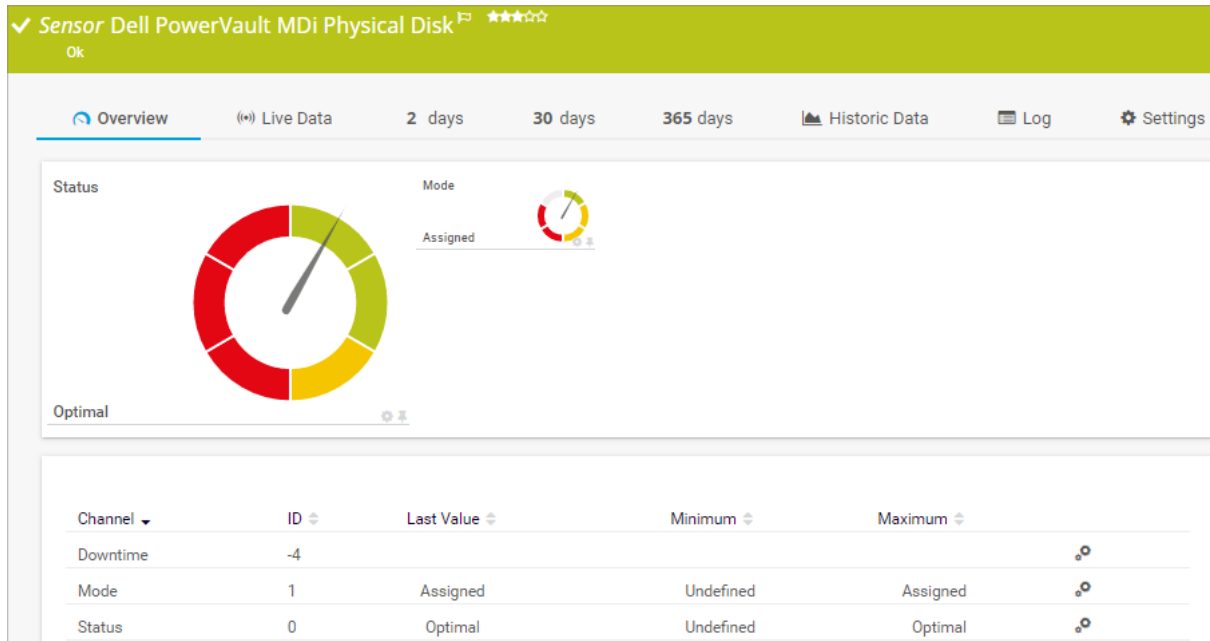

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.31 Dell PowerVault MDi Physical Disk Sensor

The Dell PowerVault MDi Physical Disk sensor monitors a physical disk on a Dell PowerVault system.

i The sensor supports Dell PowerVault [MD3000i](#), [MD3420](#), [MD3620i](#), [MD3000f](#), [MD3620f](#), or [MD3820i](#). It might work with other models, too.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)⁸⁷⁰.

Dell PowerVault MDi Physical Disk Sensor

Sensor in Other Languages

- Dutch: Dell PowerVault MDi Fysieke Schijf
- French: Disque physique Dell PowerVault MDi
- German: Dell PowerVault MDi Physikalischer Datenträger
- Japanese: Dell PowerVault MDi 物理ディスク
- Portuguese: Disco físico Dell PowerVault MDi
- Russian: Dell PowerVault MDi
- Simplified Chinese: Dell PowerVault MDi 物理磁盘
- Spanish: Disco físico de Dell PowerVault MDi

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires Dell Modular Disk Storage Manager on the probe system. See the Knowledge Base: [Where do I find the Dell PowerVault Modular Disk Storage Manager for use with my MDi SAN?](#)

- This sensor requires the IP address of the storage area network (SAN) defined in the settings of the parent device.
- This sensor only supports devices with one drawer of hard-drives. Multiple drawers are not supported and prevent sensor creation.
- This sensor supports the IPv6 protocol.
- This sensor works with Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i, and might support other models.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)^[448].

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Dell Modular Disk Storage Manager	<p>This sensor requires the installation of the Dell Modular Disk Storage Manager program. You have to install it on the probe system (on every cluster node, if on a cluster probe). For details about setup, see section More below.</p> <p>i Create this sensor on a device that has the IP address of the SAN configured in the IP Address/DNS Name field of the sensor settings.</p>

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Settings

Setting	Description
Disk	<p>Select the physical disks that you want to monitor. PRTG creates one sensor for each physical disk that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

i Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

inherit from  Root

Channel Unit Types **i**

Channel Type	Unit
Bytes (Bandwidth)	KB ▼
	kbit ▼
	/ ▼
	sec... ▼
Bytes (Memory)	MB ▼
Bytes (Disk)	MB ▼
Bytes (File)	Byte ▼

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

The sensor shows the status and mode of the physical disk in the channels as reported in the [Modular Disk Storage Manager](#). Status and mode combined indicate the particular status of a redundant array of independent disks (RAID) controller physical disk. The table below provides you with the status description according to the Dell documentation:

Status Channel	Mode Channel	Description
Up status ^[197] : Optimal	Unassigned	The physical disk in the indicated slot is unused and available to be configured
	Assigned	The physical disk in the indicated slot is configured as part of a disk group
	Hot Spare Standby	The physical disk in the indicated slot is configured as a hot spare
	Hot Spare In Use	The physical disk in the indicated slot is in use as a hot spare within a disk group
Down status: Failed	<ul style="list-style-type: none"> ▪ Assigned ▪ Unassigned ▪ Hot Spare In Use ▪ Hot Spare Standby 	The physical disk in the indicated slot has failed because of an unrecoverable error, an incorrect drive type or drive size, or by its operational state being set to failed
	Assigned	The physical disk in the indicated slot has been replaced and is ready to be, or is actively being, configured into a disk group
	<ul style="list-style-type: none"> ▪ Assigned ▪ Unassigned ▪ Hot Spare In Use ▪ Hot Spare Standby 	A Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) error has been detected on the physical disk in the indicated slot
	Warning status: None	None
Down status: Undefined

Sensor Settings Overview

For more information about sensor settings, see the following sections:

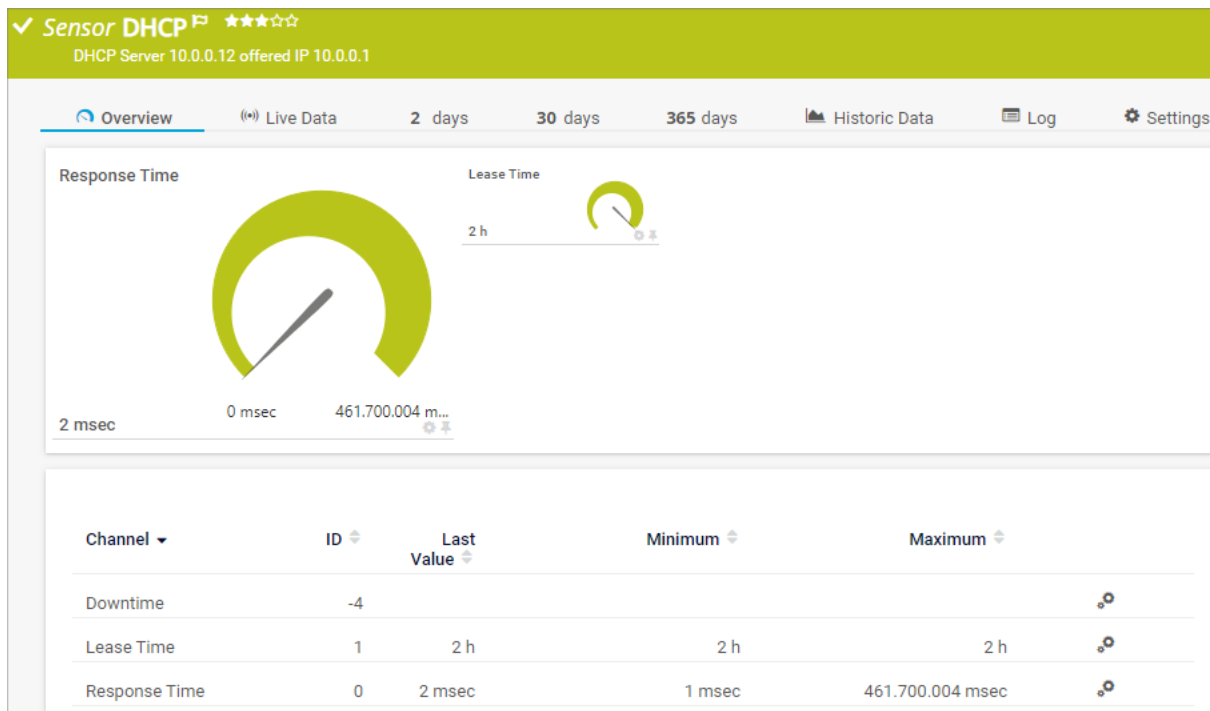

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.32 DHCP Sensor

The DHCP sensor monitors a Dynamic Host Configuration Protocol (DHCP) server. It sends a broadcast message to the network and waits for a DHCP server to respond.

i The sensor shows the address of the server and the offered IP address in the sensor message. You can check the server's response via a [regular expressions](#) ⁴⁴⁹⁷.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ⁸⁸³.

DHCP Sensor

Sensor in Other Languages

- Dutch: DHCP
- French: DHCP
- German: DHCP
- Japanese: DHCP
- Portuguese: DHCP
- Russian: DHCP
- Simplified Chinese: DHCP
- Spanish: DHCP

Remarks

- You can only create this sensor on a probe device, either a local probe device or a remote probe device.

- The probe device where you create a DHCP sensor must have a static IP address. It cannot get its IP address from DHCP because this can cause a DHCP failure that results in a severe issue for the probe device so that you risk losing monitoring data.
- Your DHCP sensors show a timeout error if no DHCP is available, or if you use more than 2 DHCP sensors per device.
- Adding a DHCP sensor on a link-local address is valid and is not prohibited. However, as this is a local IP address, the sensor does not receive any data and shows a timeout error.
- This sensor does not work if Probe Connection IPs is set to Local Probe only. For more information, see section [Core & Probes](#).
- This sensor has a low performance impact.
- See the Knowledge Base: [How can I monitor a DHCP server in a specific network if there are several DHCP networks?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

DHCP Specific

Setting	Description
Network Interfaces	<p>Select the network interfaces that you want to monitor. PRTG creates one sensor for each network interface that you select.</p> <p>i Choose the network card on the probe system that is used to send the broadcast message.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Sensor Name ⓘ Example Name

DHCP Specific

Setting	Description
MAC Address	Shows the MAC address of the network adapter that sends the broadcast message to the network. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Client IP Address	Specify if you want to check the returned client IP address with a regular expression (regex): <ul style="list-style-type: none"> ▪ Do not check the IP address using a regular expression: The IP address only appears in the sensor message without further processing. ▪ Check the IP address using a regular expression: Enter the regex that you want to use below.
Client IP Address Must Include (Down Status if Not Included)	This setting is only visible if you enable Check the IP address using a regular expression above. In the response of the DHCP server, search by using a regex. If the response for the client IP address does not contain this string, the sensor shows the Down status ¹⁹⁷ . ⓘ For example, enter <code>10\.\0\.\5\..*</code> to make sure that any answering DHCP server returns any client IP address starting with <code>10.0.5.</code> . If it does not, the sensor shows the Down status. Leave this field empty if you do not want to use it. ⓘ PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section Regular Expressions ⁴⁴⁹⁷ .

Setting	Description
Client IP Address Must Not Include (Down Status if Included)	<p>This setting is only visible if you enable Check the IP address using a regular expression above. In the response of the DHCP server, search by using a regex. If the response for the client IP address contains this string, the sensor shows the Down status. See the example above. Leave this field empty if you do not want to use it.</p> <p>i PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section Regular Expressions⁴⁴⁹⁷.</p>
Server IP Address	<p>Specify if you want to check the returned server IP address with a regex:</p> <ul style="list-style-type: none"> Do not check the IP address using a regular expression: The IP address only appears in the sensor message without further processing. Check the IP address using a regular expression: Enter the regex that you want to use below.
Server IP Address Must Include (Down Status if Not Included)	<p>This setting is only visible if you enable Check the IP address using a regular expression above. In the response of the DHCP server, search by using a regex. If the response for the server IP address does not contain this string, the sensor shows the Down status. See the example above. Leave this field empty if you do not want to use it.</p> <p>i PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section Regular Expressions⁴⁴⁹⁷.</p>
Server IP Address Must Not Include (Down Status if Included)	<p>This setting is only visible if you enable Check the IP address using a regular expression above. In the response of the DHCP server, search by using a regex. If the response for the server IP address contains this string, the sensor shows the Down status. See the example above. Leave this field empty if you do not want to use it.</p> <p>i PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section Regular Expressions⁴⁴⁹⁷.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
DHCP Server Change	<p>If there is more than one DHCP server in the network that can respond to the broadcast message, the sensor can receive a response from a different DHCP server compared to the last scan of the sensor. In this case, PRTG can write an entry to the system logs²³⁷. Specify how PRTG handles DHCP server changes:</p> <ul style="list-style-type: none"> Ignore: Do not write a log entry if the DHCP server changes.

Setting	Description
	<ul style="list-style-type: none"> Write log entry: Write an entry to the system logs whenever the DHCP server changes between two sensor scans. <p>i Regardless of this setting, entries are always added to the sensor log.</p>
Offered IP Address Change	<p>If the IP address offered by the DHCP server changes between two sensor scans, PRTG can write an entry to the system logs^[237]. Specify how PRTG handles IP address changes:</p> <ul style="list-style-type: none"> Ignore: Do not write a log entry if the offered IP address changes. Write log entry: Write an entry to the system logs whenever the DHCP server offers a different IP address compared to the last sensor scan. <p>i Regardless of this setting, entries are always added to the sensor log.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking + below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Lease Time	The lease time reported by the server
Response Time	The response time in milliseconds (msec)

This channel is the primary channel by default.

KNOWLEDGE BASE

How can I monitor a DHCP server in a specific network if there are several DHCP networks?

- <https://kb.paessler.com/en/topic/64601>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

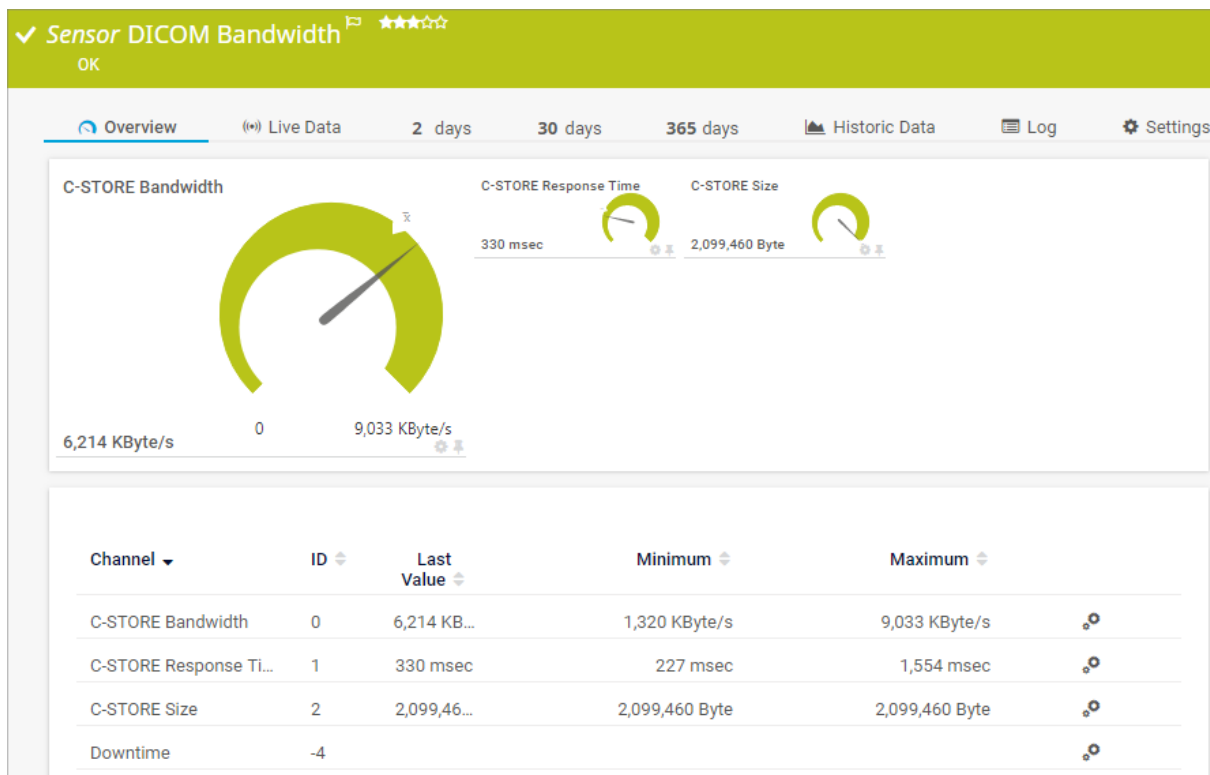

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.33 DICOM Bandwidth Sensor

The DICOM Bandwidth sensor monitors the bandwidth usage of a C-STORE request to a Digital Imaging and Communications in Medicine (DICOM) capable device. It sends one or more DICOM images and files that you have stored in a folder on a local disk or share and checks if the DICOM device can handle the C-STORE request.

i You can use the sensor to test your picture archiving and communication system (PACS), for example.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

DICOM Bandwidth Sensor

Sensor in Other Languages

- Dutch: DICOM Bandbreedte
- French: Bande passante DICOM
- German: DICOM-Bandbreite
- Japanese: DICOM 帯域幅
- Portuguese: Largura de banda do DICOM
- Russian: DICOM
- Simplified Chinese: DICOM 带宽
- Spanish: Anchura de banda de DICOM

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor supports the IPv6 protocol.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A list of tags with 'exampletag' selected and a plus sign to add more.
- Priority**: A star rating system showing 3 stars selected out of 5.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[183] , as well as in alarms ^[228] , logs ^[237] , notifications ^[403] , reports ^[406] , maps ^[405] , libraries ^[407] , and tickets ^[240] .

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ dicom ▪ bandwidth
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

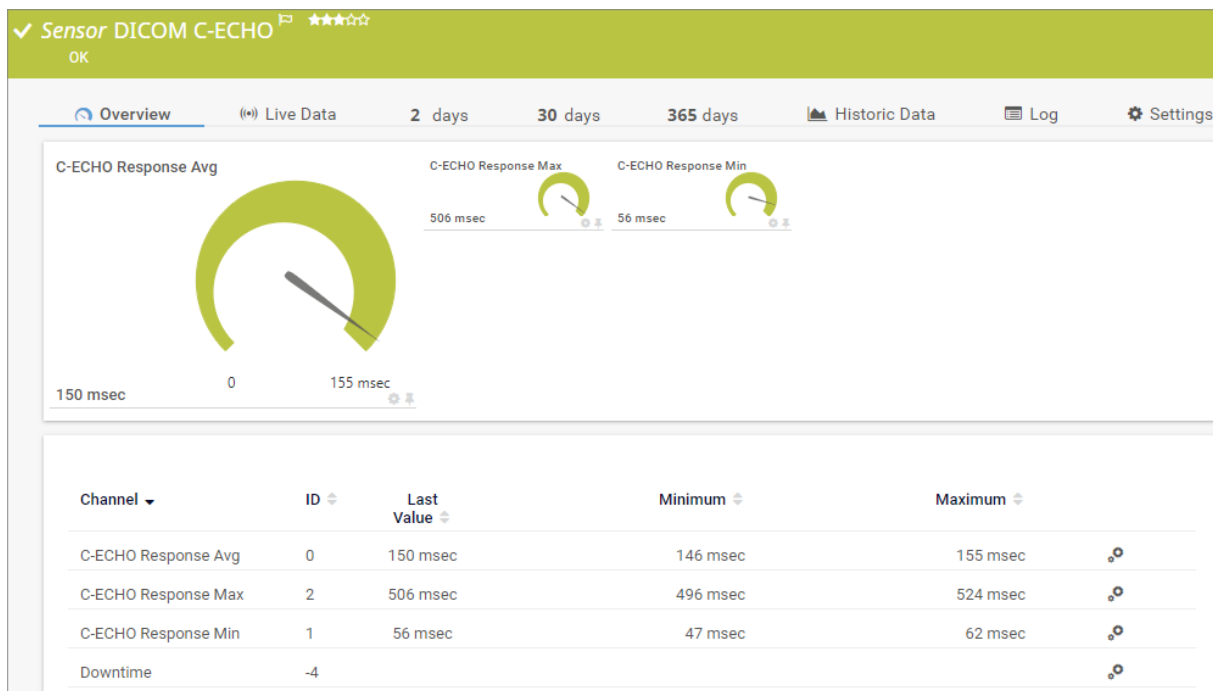

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.34 DICOM C-ECHO Sensor

The DICOM C-ECHO sensor monitors the availability of Digital Imaging and Communications in Medicine (DICOM) capable systems and devices by sending C-ECHO requests to the target system. C-ECHO is also known as DICOM-Ping.

i You can use the sensor to verify that the DICOM handshake is executed and that your target system is capable of answering DICOM messages.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

DICOM C-ECHO Sensor

Sensor in Other Languages

- Dutch: DICOM C-ECHO
- French: C-ECHO DICOM
- German: DICOM-C-ECHO
- Japanese: DICOM C-ECHO
- Portuguese: C-ECHO do DICOM
- Russian: DICOM C-ECHO
- Simplified Chinese: DICOM C-ECHO
- Spanish: C-ECHO DICOM

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.

- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor supports the IPv6 protocol.

Detailed Requirements

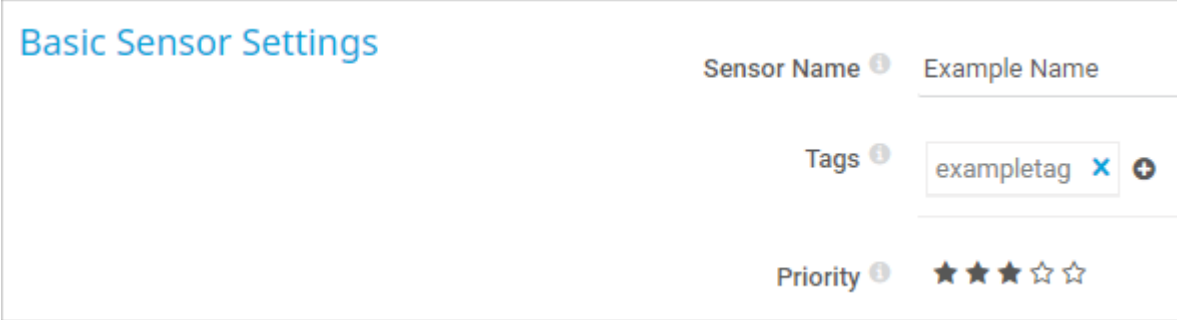

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus icon, and a 'Priority' field with five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[4031], reports^[4069], maps^[4096], libraries^[4047], and tickets^[240].</p> <p> If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited . ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ dicom ▪ cecho ▪ ping
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes 30 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None ▼

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵³.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Avg Query Entry Time	The average query entry time in milliseconds (msec)

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Max Query Entry Time	The maximum query entry time in msec
Min Query Entry Time	The minimum query entry time in msec
Total	The total number of items found i This channel is the primary channel by default.
Total Time	The total time of the C-FIND request or MWL query in msec

i The sensor also adds channels for the number of items in each field it finds.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

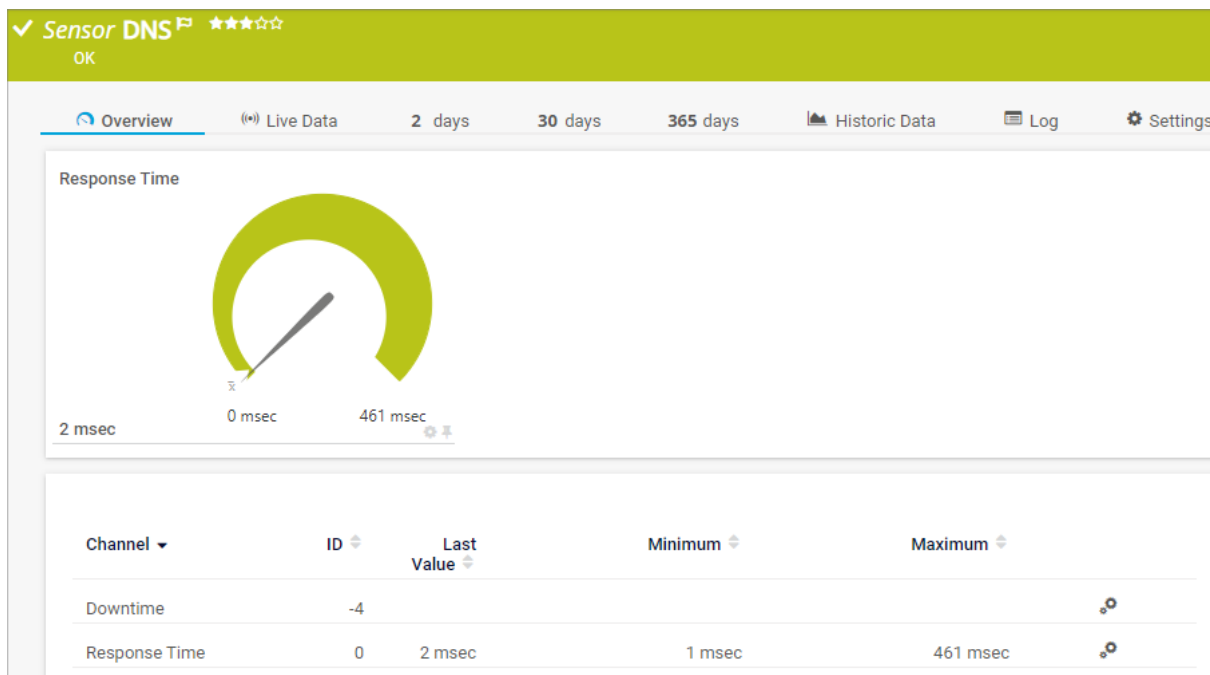

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.36 DNS Sensor

The DNS sensor monitors a Domain Name System (DNS) server. It resolves a domain name and compares it to a specific IP address. The sensor checks the answer section as well as the additional section, if one was sent.

i The sensor shows the Down [status](#)¹⁹⁷ if the DNS server does not correctly resolve a specified domain name.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)⁹²⁸.

DNS Sensor

Sensor in Other Languages

- Dutch: DNS
- French: DNS
- German: DNS
- Japanese: DNS
- Portuguese: DNS
- Russian: DNS
- Simplified Chinese: DNS
- Spanish: DNS

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.

- If the address of the parent device is a fully qualified domain name (FQDN) or NetBIOS name, PRTG also includes the time it takes to resolve this address in the response time measurement.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ dnssensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Response Time	<p>The response time in milliseconds (msec)</p> <p> This channel is the primary channel by default.</p>
Downtime	<p>In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.</p>

KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

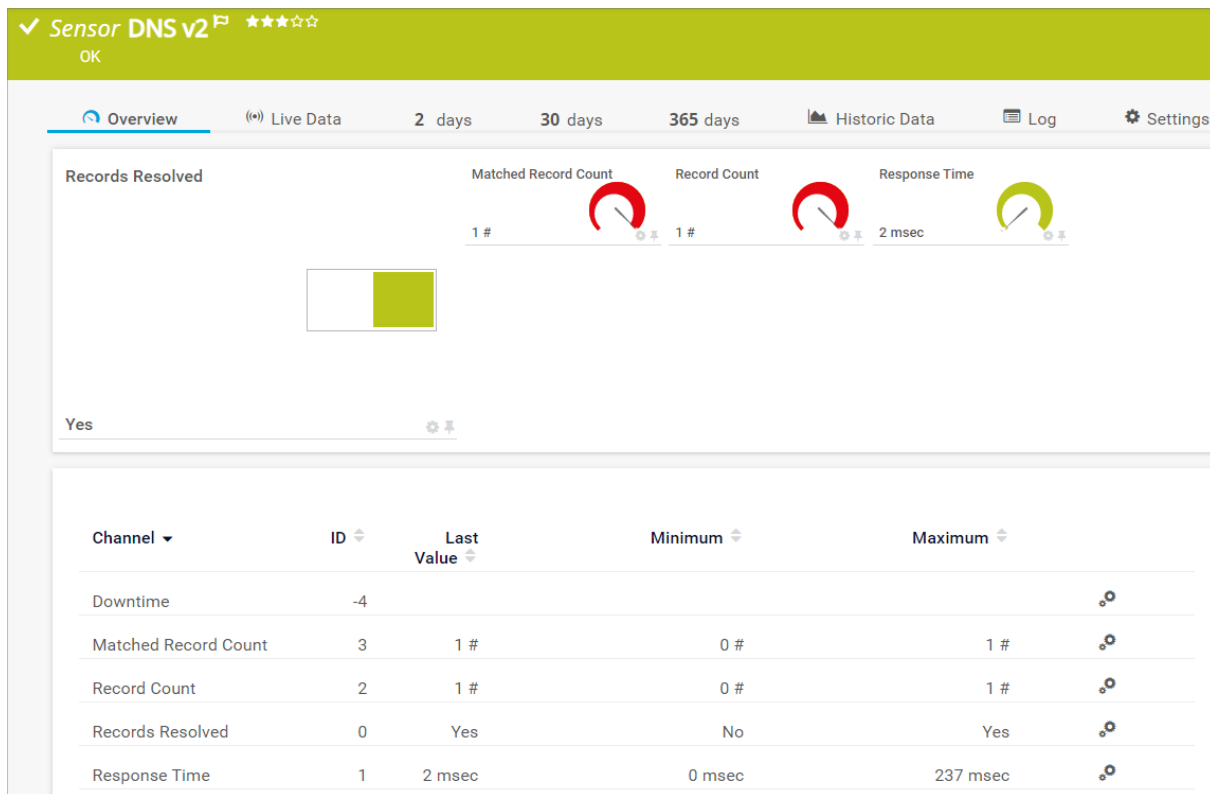

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.37 DNS v2 Sensor

The DNS v2 sensor monitors a Domain Name System (DNS) server, resolves domain name records, and compares them to a filter.

i The sensor can show the Down status if the DNS server does not correctly resolve a specified domain name

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

DNS v2 Sensor

Sensor in Other Languages

- Dutch: DNS v2
- French: DNS v2
- German: DNS v2
- Japanese: DNS v2
- Portuguese: DNS v2
- Russian: DNS v2
- Simplified Chinese: DNS v2
- Spanish: DNS v2

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A list of tags with "exampletag" selected. There are "X" and "+" icons next to the tag.
- Priority:** A star rating system showing 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p>

Setting	Description
	<p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ dns ▪ dnssensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

DNS Sensor Specific

DNS Sensor Specific

Domain Name ⓘ company.com

Query Type ⓘ

- Host address IPv4 (A) (default)
- Host address IPv6 (AAAA)
- Canonical name for an alias (CNAME)
- Mail exchange (MX)
- Naming authority pointer (NAPTR)
- Authoritative name server (NS)
- PTR resource record (PTR)
- Start of a zone of authority marker (SOA)
- Text resource record (TXT)
- Any (depends on the DNS server configuration)

Timeout (Sec.) ⓘ 30

Filter Usage ⓘ

- Do not use a filter (default)
- Use a filter

Filter Value ⓘ 127.0.0.1

Port ⓘ 53

DNS Sensor Specific

Setting	Description
Domain Name	<p>Enter the DNS name to resolve.</p> <p>i If you use the query type PTR resource record (PTR), enter a proper reverse DNS representation of the IP address. For example, 1.0.0.127.in-addr.arpa.</p>
Query Type	<p>Select the query type that the sensor sends to the DNS server:</p> <ul style="list-style-type: none"> ▪ Host address IPv4 (A) (default) ▪ Host address IPv6 (AAAA) ▪ Canonical name for an alias (CNAME) ▪ Mail exchange (MX) ▪ Naming authority pointer (NAPTR) ▪ Authoritative name server (NS) ▪ PTR resource record (PTR) ▪ Start of a zone of authority marker (SOA) ▪ Text resource record (TXT) ▪ Any (depends on the DNS server configuration)
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p> <p>i The timeout value must be shorter than the scanning interval of the sensor.</p>
Filter Usage	<p>Define if the sensor checks for a specific filter value in the response.</p> <ul style="list-style-type: none"> ▪ Do not use a filter (default): Do not check the response. ▪ Use a filter: Use a filter to check the response. Define the filter value below.
Filter Value	<p>This setting is only visible if you select Filter Usage above. Enter the filter value. For an A record, the filter value can be an IP address like 127.0.0.1, for example. The filter value can also contain a wildcard (*) to match any content, for example 127.*.1.</p>
Port	<p>Enter the number of the port to which the sensor tries to connect. This must be the port on which the parent device answers queries. The default port is 53.</p>

Setting	Description
	<p>i We recommend that you use the default value.</p> <p>i The sensor connects to the IP address or the DNS name of the parent device^[446].</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking + below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Debug Options

Debug Options

Result Handling ⓘ

Discard result

Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory^[4526] on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

 inherit from  Root

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails.

Setting	Description
	<p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies ⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>

Setting	Description
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

More

■ KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

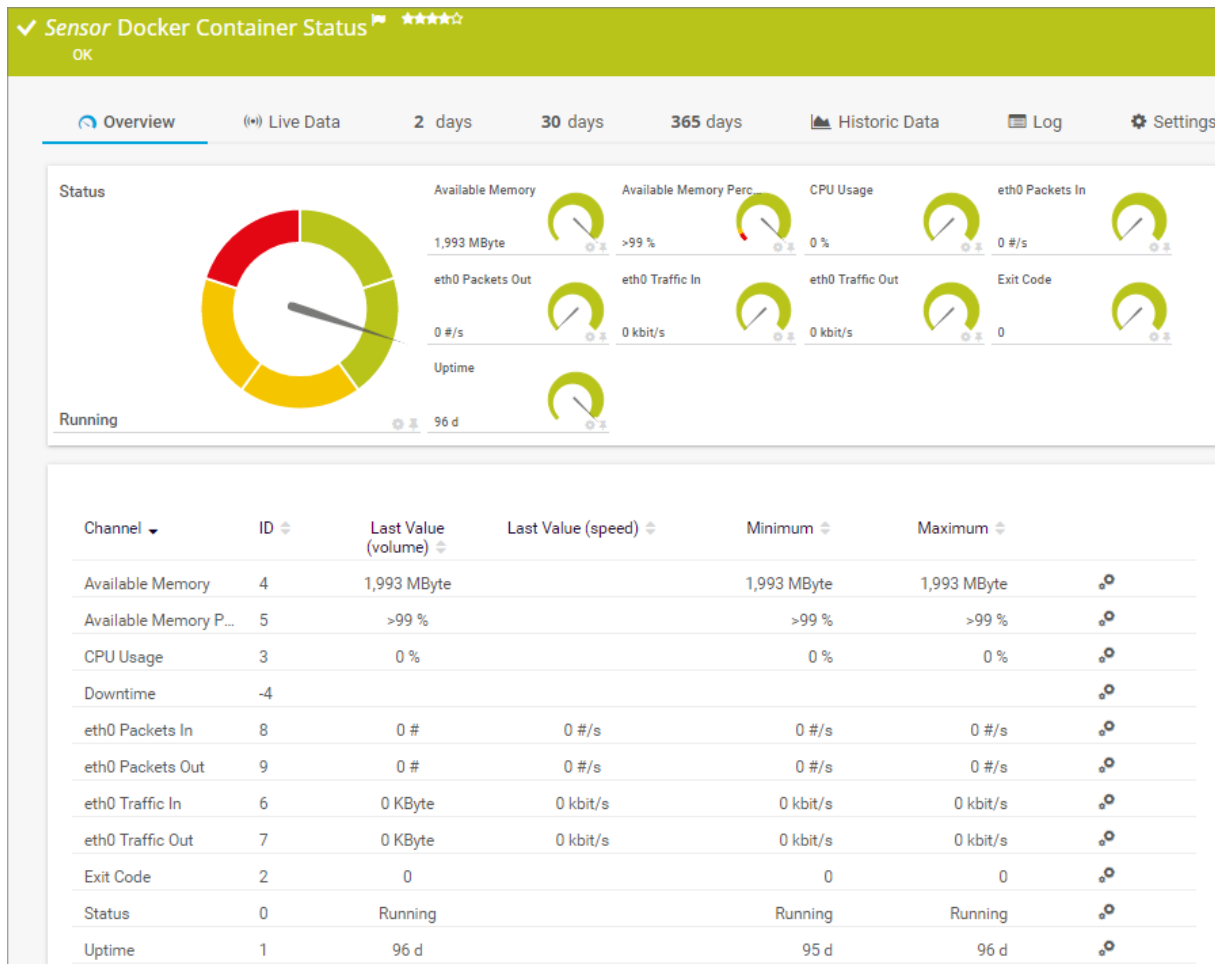

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.38 Docker Container Status Sensor

The Docker Container Status sensor monitors the status of a Docker container.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)⁹⁵⁴.

Docker Container Status Sensor

Sensor in Other Languages

- Dutch: Docker Container Status
- French: État de conteneur Docker
- German: Docker-Container-Zustand
- Japanese: Docker コンテナの状態
- Portuguese: Status do Container Docker
- Russian: Docker
- Simplified Chinese: Docker 容器状态
- Spanish: Estado de contenedor de Docker.

Remarks

- The parent device of this sensor must be the Docker machine on which the container that you want to monitor runs.
- You need to provide certificates and private keys to monitor Docker with this sensor. For details, see the Knowledge Base: [How can I create private key and certificate for the Docker sensor?](#)
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG requires an authentication with a certificate and a private key before you can add this sensor. Provide Port (usually 2376), Private Key, and Certificate in the dialog box that appears and click OK. PRTG can now scan Docker for containers.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Docker Specific

Setting	Description
Container	<p>Select the Docker containers that you want to monitor. PRTG creates one sensor for each container that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

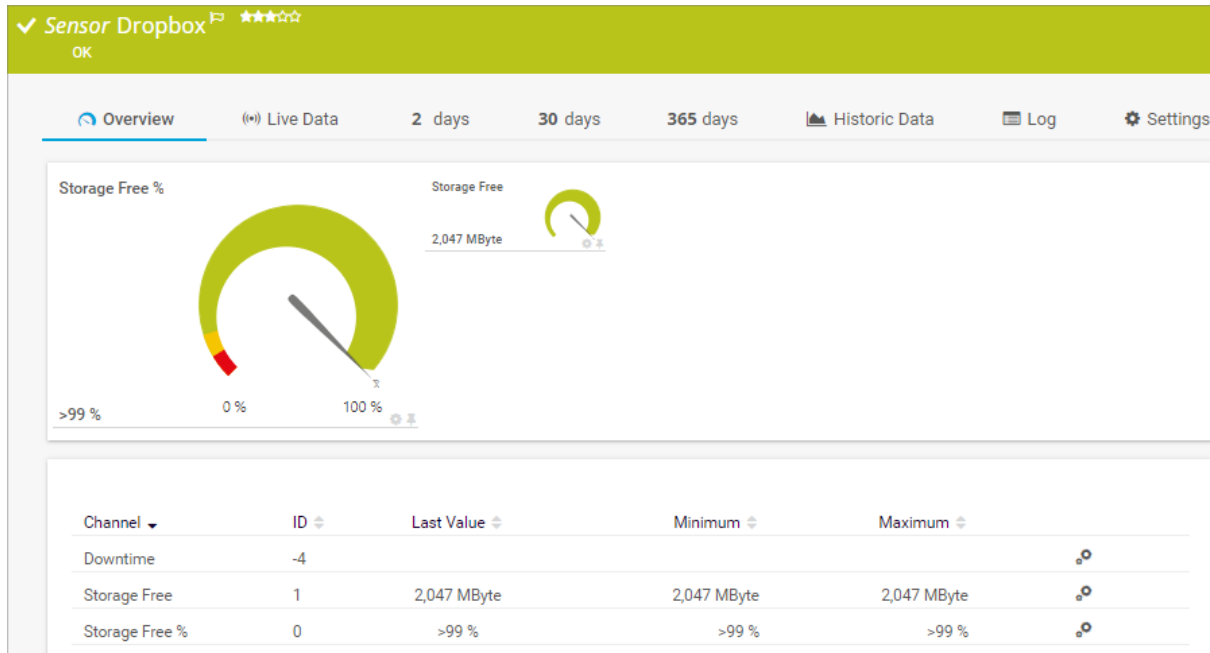

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁸⁷

7.8.39 Dropbox Sensor

The Dropbox sensor monitors a Dropbox account via the Dropbox application programming interface (API) and Open Authorization 2 (OAuth2).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)⁹⁶⁷.

Dropbox Sensor

Sensor in Other Languages

- Dutch: Dropbox
- French: Dropbox
- German: Dropbox
- Japanese: Dropbox
- Portuguese: Dropbox
- Russian: Dropbox
- Simplified Chinese: Dropbox
- Spanish: Dropbox

Remarks

- The minimum scanning interval for this sensor is 30 minutes.
- For details about OAuth2 authentication, see section [Authentication via OAuth2](#)⁹⁶⁶.
- This sensor has a low performance impact.

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG requires OAuth2 authorization before you can add this sensor. Provide the required credentials in the dialog box that appears.

Dropbox Credentials

This sensor uses OAuth2 authentication to get access to your Dropbox account.

■ For details about this authentication approach, see section [Authentication via OAuth2](#) ⁹⁶⁶.

Dropbox Credentials

Setting	Description
OAuth URL	Click Get Access Code to connect this sensor to your Dropbox account via OAuth2. This is necessary to allow the sensor to query data from Dropbox. A new browser window appears. Follow the steps in the window and confirm the permission for PRTG to connect to your Dropbox account. Copy the OAuth code you get and paste it into the OAuth Code field below.
OAuth Code	Paste the access code that you receive after completing the authorization process for PRTG in your Dropbox account.

Setting	Description
	<p>i It is mandatory to connect this sensor to your Dropbox account to create this sensor. Complete the OAuth approach first to get the OAuth code.</p> <p>Click OK to define the sensor settings.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a title 'Basic Sensor Settings' in blue. Below the title are three settings: 'Sensor Name' with a value of 'Example Name', 'Tags' with a value of 'exampletag' and a plus sign to add more, and 'Priority' with a value of 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[3977]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

i This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#)^[4187] settings are not available for this sensor.

Scanning Interval

 inherit from  Root

Scanning Interval **i** 60 seconds

If a Sensor Query Fails **i** Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>i The minimum scanning interval for this sensor is 30 minutes.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails.

Setting	Description
	<p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00)

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Authentication via OAuth2

 This sensor uses the OAuth2 security protocol to access the account from which you want to retrieve and monitor data. OAuth2 enables you to grant access to the target account without sharing your password with PRTG. The authorization approach of PRTG using OAuth2 works as follows.

1. Authorization Request

First, you have to request authorization for this sensor to access service resources from your account. For this purpose, you are asked to get an access code for this sensor in the Add Sensor dialog. Click Get Access Code to start the authorization process using OAuth2. A new browser window opens on the authorization server of the target service.

2. Verifying Identity

This new window contains a login form for your account that you want to monitor. Log in to your account using your credentials for this service to authenticate your identity. This is a common login to your account on the target server so PRTG does not see your password. The service forwards you to the authorization page and asks you to permit PRTG to access the data in your account.

 If you are already logged in to the service with a user account, you do not have to enter credentials in this step and get directly to the access permission page.

3. Authorizing PRTG

Permit PRTG to access information on your account. Note that this permission holds only for this specific sensor, not for other sensors of this type or PRTG as a whole. For each sensor of this type you add, you have to confirm the access permission anew. You can change the account permissions at any time in your account at the target service.

4. Getting Authorization Code

Permitting PRTG to access your account data forwards you to a page where the service provides an authorization code. Copy this code and switch back to the Add Sensor dialog in PRTG.

 The code is only valid for a short period of time and expires after a few minutes. You can use a particular code only once.

5. Providing Authorization Code

Paste the authorization code into the OAuth Code field and complete the Add Sensor dialog. You do not have to go through further configuration steps manually. The sensor automatically accomplishes the following steps.

6. Requesting Access Token

After receiving the authorization code, PRTG requests an access token from the API of the target service. For this purpose, PRTG transmits the authorization code together with several authentication details. The API checks if the authorization is valid and returns the access token to PRTG. Access tokens are specific for one account and one application (here: PRTG). The authorization process to read data from your account is now complete.

7. Retrieving Data

The sensor transmits the access token with each sensor scan in the defined scanning interval to authenticate with your account. It is not necessary to use the original account credentials anew. The used tokens refresh automatically from time to time.

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Storage Free	The free storage in bytes
Storage Free %	The free storage in percent i This channel is the primary channel by default.

More

■ KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.40 Enterprise Virtual Array Sensor

The Enterprise Virtual Array sensor monitors an HPE Storage Enterprise Virtual Array (EVA) via the `sssu.exe` from [HPE P6000 Command View Software](#) (previously known as HP Command View EVA Software).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)⁹⁷⁸.

Sensor in Other Languages

- Dutch: Enterprise Virtual Array
- French: Enterprise Virtual Array
- German: Enterprise Virtual Array
- Japanese: Enterprise Virtual Array
- Portuguese: Enterprise Virtual Array
- Russian: Enterprise Virtual Array
- Simplified Chinese: Enterprise Virtual Array
- Spanish: Enterprise Virtual Array

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- You must explicitly specify the credentials for the EVA in the sensor settings.
- This sensor [requires](#)⁹⁶⁸ the HPE P6000 Command View Software (previously known as HP Command View EVA Software) on the probe system, or the alternative described in the Knowledge Base: [Do I really have to install the whole Command View on the probe to use the EVA sensor?](#)
- This sensor supports the IPv6 protocol.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)⁴⁴⁸⁵.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
HPE 6000 Command View Software	This sensor needs the HPE P6000 Command View Software (previously known as HP Command View EVA Software) installed on the probe system.

Requirement	Description
	<p> If you do not want to install the whole command view tool, you can use a different option. For details, see the Knowledge Base: Do I really have to install the whole Command View on the probe to use the EVA sensor?</p>

Add Sensor

The [Add Sensor](#)³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG performs a meta-scan before you can add this sensor and requires basic information in advance. Provide the required information in the dialog box that appears. PRTG then recognizes all items that are available for monitoring based on your input.

 The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

EVA Credentials

Setting	Description
Scanning Mode	<p>Specify the depth of the meta-scan:</p> <ul style="list-style-type: none"> ▪ Basic mode: We recommend that you use this scanning mode. Various modules of your EVA are available for monitoring. ▪ Detailed mode: PRTG scans for each disk of your EVA. It lists every disk in the module selection.

EVA Settings

Setting	Description
Modules	<p>Select the modules that you want to monitor. PRTG creates one sensor for each module that you select.</p> <p> Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ eva
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

EVA Credentials

Setting	Description
User Name	Enter the user name for the EVA.
Password	Enter the password for the EVA.

EVA Settings

Setting	Description
Module	Shows the module that this sensor monitors. You can edit this setting if, for example, you rename the module or move it to a different folder. This way, PRTG can find the module again and you do not lose the monitoring history.
System	Shows the system of the module that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Module Type	Shows the type of the module that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Description	Shows the description of the module that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. i In a cluster, PRTG stores the result in the PRTG data directory of the master node.

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none">▪ Bandwidth▪ Memory▪ Disk▪ File▪ Custom <p> Custom channel types are only available on sensor level.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

The sensor can show the status of several HPE EVA modules:

- System controllers
- Enclosures
- Disks
- Disk groups
- Folders
- Hosts
- Snapshots
- Data replication
- Cabinets
- If the devices have measuring tools for fans and temperature, the sensor displays corresponding data as well.

For these EVA components, this sensor can show the following:

- Operational status
- Predicted failures
- Accessible media
- Allocation in percent
- Availability for VRaids in bytes
- Exaggerated bytes

- Group host access
- Number of grouped and ungrouped disks
- Age of snapshots
- License status

More

KNOWLEDGE BASE

Do I really have to install the whole Command View on the probe to use the EVA sensor?

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

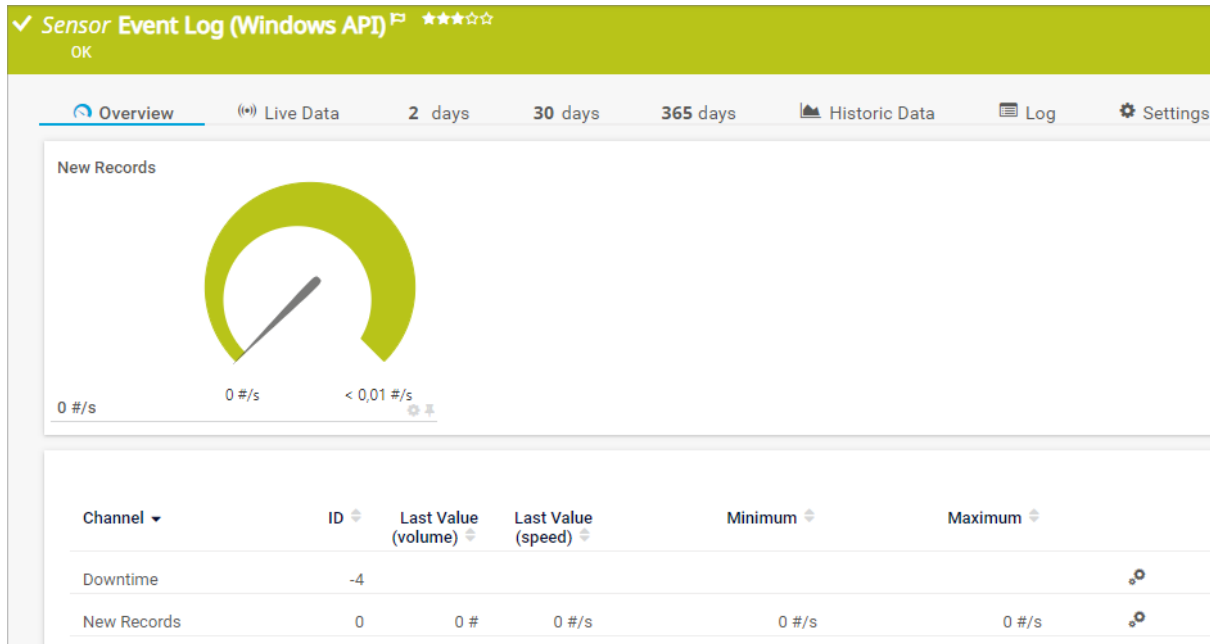

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.41 Event Log (Windows API) Sensor

The Event Log (Windows API) sensor monitors Event Log entries via the Windows application programming interface (API).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Event Log (Windows API) Sensor

Sensor in Other Languages

- Dutch: Event Log (Windows API)
- French: Log des événements (Windows API)
- German: Ereignisprotokoll (Windows API)
- Japanese: イベントログ (Windows API)
- Portuguese: Log de Eventos do Windows (API)
- Russian: (API Windows)
- Simplified Chinese: 事件日志 (Windows API)
- Spanish: Registro de eventos (Windows API)

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [My Event Log sensor ignores changes in the event log. What can I do?](#)
- See the Knowledge Base: [How can I configure sensors using speed limits to keep the status for more than one interval?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ wmiapieventlogsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵³.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.

Channel	Description
New Records	The number of new records per second  This channel is the primary channel by default.

Sensor Settings Overview

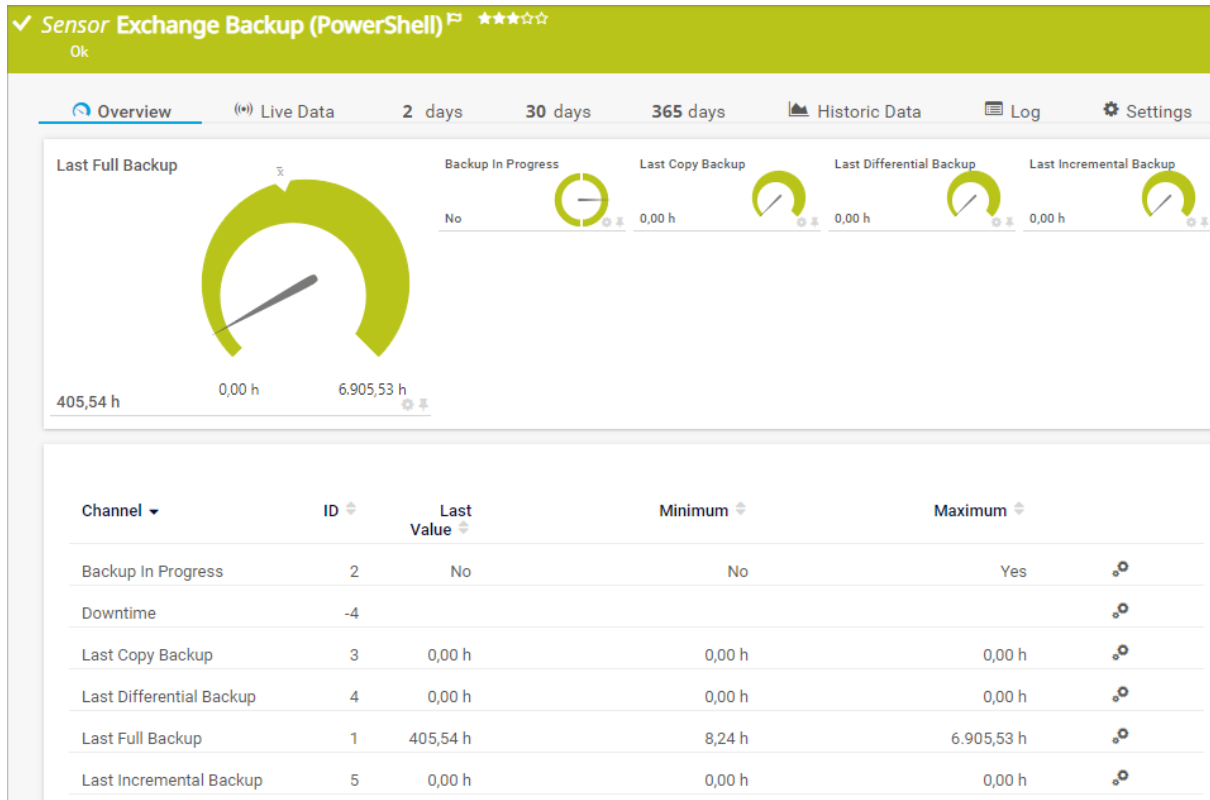

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.42 Exchange Backup (PowerShell) Sensor

The Exchange Backup (PowerShell) sensor monitors backups of an Exchange server via Remote PowerShell.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Exchange Backup (PowerShell) Sensor

Sensor in Other Languages

- Dutch: Exchange Backup (PowerShell)
- French: Sauvegarde Exchange (PowerShell)
- German: Exchange-Sicherung (PowerShell)
- Japanese: Exchange バックアップ (PowerShell)
- Portuguese: Backup do Exchange (PowerShell)
- Russian: Exchange (PowerShell)
- Simplified Chinese: Exchange 备份 (PowerShell)
- Spanish: Copia de seguridad de Exchange (PowerShell)

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database that you want to monitor.
 - This sensor requires Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
 - This sensor requires the fully qualified domain name (FQDN) of the Exchange server in the [settings of the parent device](#)^[447].
 - This sensor requires .NET 4.7.2 or later on the probe system.
 - This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
 - This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)^[448].
 - See the Knowledge Base: [Where can I find more information about PowerShell sensors?](#)
- ☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Remote PowerShell and Remote Exchange Management Shell	<p>This sensor uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable Remote PowerShell and Remote Exchange Management Shell on the target servers that you want to monitor. Also ensure you have installed PowerShell 2.0 or later on the probe system.</p> <p>i In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message The WSMAN provider host process did not return a proper response. In this case, increase the memory limit for Remote PowerShell.</p> <p>■ For more information, see the Knowledge Base: How do I enable and use remote commands in Windows PowerShell? and How can I increase memory for Remote PowerShell?</p>
FQDN	<p>To connect to Exchange servers, this sensor needs the FQDN. In the device settings^[447] of the Exchange server, provide the FQDN instead of the IP address.</p> <p>■ For more information, see the Knowledge Base: I have problems with the PowerShell Exchange sensors, what can I do?</p>
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i If the framework is missing, you cannot create this sensor.</p> <p>■ For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Settings

Setting	Description
Databases	<p>Select the databases that you want to monitor. PRTG creates one sensor for each database that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has a title bar 'Basic Sensor Settings'. Below the title bar, there are three rows of settings:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A text input field containing 'exampletag', with a blue 'x' icon to the right and a plus sign icon to the left of the input field.
- Priority**: A row of five star icons, with the first three stars filled and the last two empty.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited . ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ exchange ▪ powershell ▪ backup
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Result Handling ⓘ Discard result
 Store result

Sensor Settings

Setting	Description
Database	Shows the name of the database that this sensor monitors.

Setting	Description
	<p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p> i You can change the available intervals in the system administration on PRTG on premises installations. </p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p> i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply. </p> <p> i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply. </p> <p> i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply. </p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

- ⓘ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Backup In Progress	<p>If a backup is running</p> <ul style="list-style-type: none"> ▪ Up status ¹⁹⁷: No, Yes
Downtime	<p>In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.</p>
Last Copy Backup	<p>The time since the last copy backup</p>

Channel	Description
Last Differential Backup	The time since the last differential backup
Last Full Backup	The time since the last full backup  This channel is the primary channel by default.
Last Incremental Backup	The time since the last incremental backup

Sensor Settings Overview

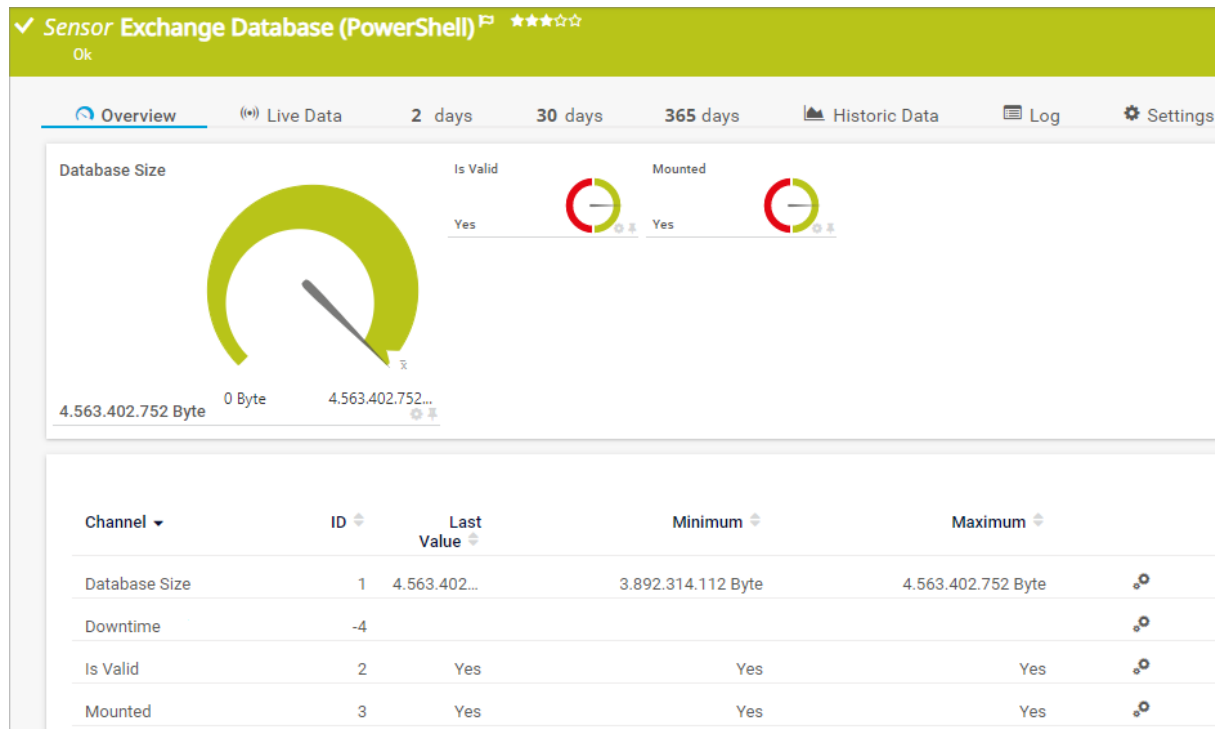

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.43 Exchange Database (PowerShell) Sensor

The Exchange Database (PowerShell) sensor monitors database information of an Exchange server via Remote PowerShell.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Exchange Database (PowerShell) Sensor

Sensor in Other Languages

- Dutch: Exchange Database (PowerShell)
- French: Base de données Exchange (PowerShell)
- German: Exchange-Datenbank (PowerShell)
- Japanese: Exchange データベース (PowerShell)
- Portuguese: Banco de dados do Exchange (PowerShell)
- Russian: Exchange (PowerShell)
- Simplified Chinese: Exchange 数据库 (PowerShell)
- Spanish: Base de datos de Exchange (PowerShell)

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database that you want to monitor.

- This sensor requires Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- This sensor requires the fully qualified domain name (FQDN) of the Exchange server in the [settings of the parent device](#)^[447].
- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- See the Knowledge Base: [Where can I find more information about PowerShell sensors?](#)
- See the Knowledge Base: [How can I monitor additional values of Exchange databases?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Remote PowerShell and Remote Exchange Management Shell	<p>This sensor uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable Remote PowerShell and Remote Exchange Management Shell on the target servers that you want to monitor. Also ensure you have installed PowerShell 2.0 or later on the probe system.</p> <p>i In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message The WSMAN provider host process did not return a proper response. In this case, increase the memory limit for Remote PowerShell.</p> <p>■ For more information, see the Knowledge Base: How do I enable and use remote commands in Windows PowerShell? and How can I increase memory for Remote PowerShell?</p>
FQDN	<p>To connect to Exchange servers, this sensor needs the FQDN. In the device settings^[447] of the Exchange server, provide the FQDN instead of the IP address.</p> <p>■ For more information, see the Knowledge Base: I have problems with the PowerShell Exchange sensors, what can I do?</p>
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i If the framework is missing, you cannot create this sensor.</p> <p>■ For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Settings

Setting	Description
Databases	<p>Select the databases that you want to monitor. PRTG creates one sensor for each database that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has a title bar 'Basic Sensor Settings'. Below the title bar, there are three rows of settings:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A text input field containing 'exampletag' with a blue 'x' icon to the right and a plus sign icon to the left of the input field.
- Priority**: A row of five star icons, with the first three stars filled and the last two empty.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited. ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ exchange ▪ powershell ▪ database
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes 30 minutes

Setting	Description
	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None ▼

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

Sensor Settings Overview

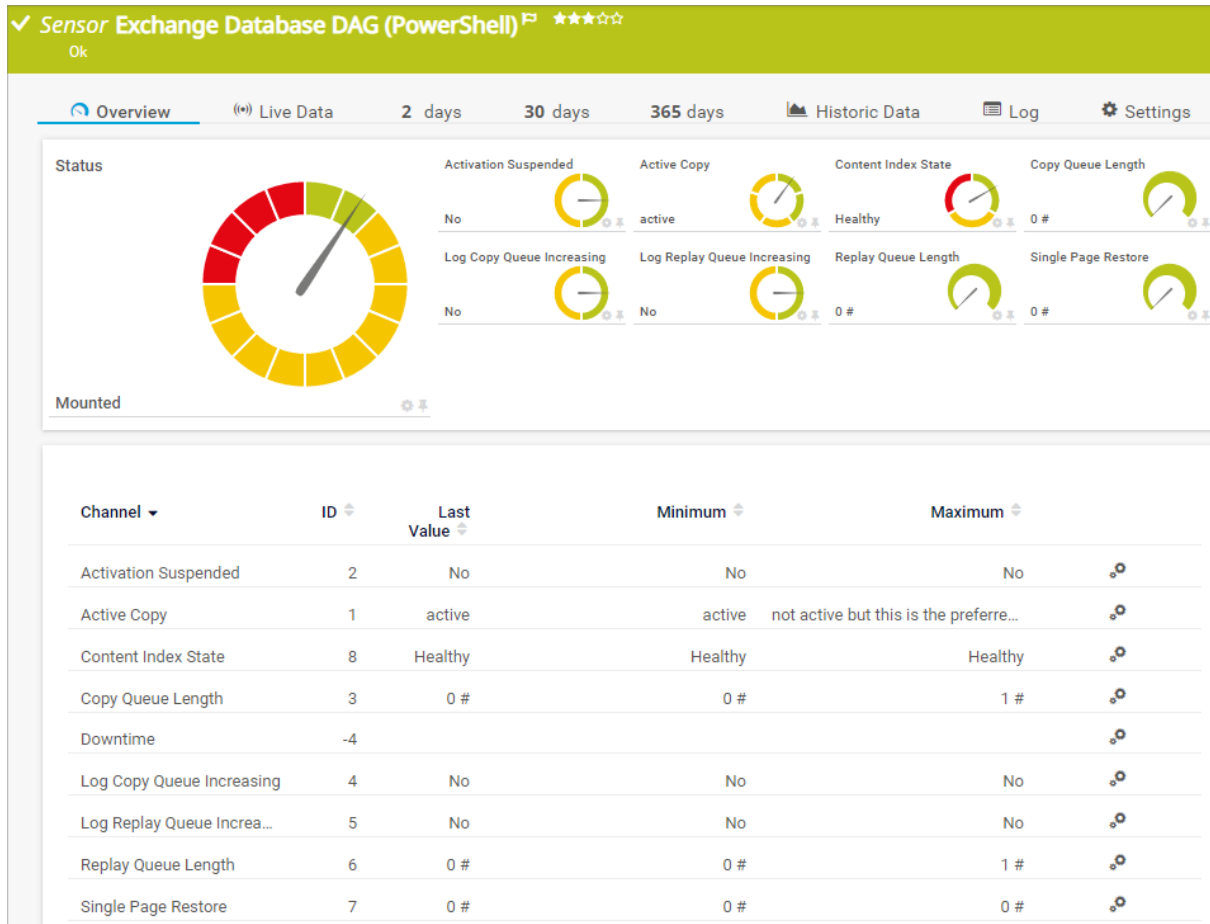

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.44 Exchange Database DAG (PowerShell) Sensor

The Exchange Database DAG (PowerShell) sensor monitors the Database Availability Group (DAG) status of a database on an Exchange server via Remote PowerShell.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Exchange Database DAG (PowerShell) Sensor

Sensor in Other Languages

- Dutch: Exchange Database DAG (PowerShell)
- French: DAG de base de données Exchange (PowerShell)
- German: Exchange-Datenbank DAG (PowerShell)
- Japanese: Exchange データベース DAG(PowerShell)
- Portuguese: DAG do banco de dados do Exchange (PowerShell)
- Russian: DAG Exchange (PowerShell)
- Simplified Chinese: Exchange 数据库 DAG (PowerShell)
- Spanish: Base de datos DAG de Exchange (PowerShell)

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database that you want to monitor.
- The Exchange server must be part of a valid DAG. See also the Knowledge Base: [Why doesn't PRTG show available databases when adding the Exchange Database DAG \(PowerShell\) sensor?](#)
- This sensor requires Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- This sensor requires the fully qualified domain name (FQDN) of the Exchange server in the [settings of the parent device](#)^[447].
- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- Make sure that the Exchange database is mounted on the target device. Otherwise, you might not be able to properly add the sensor.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)^[448].
- See the Knowledge Base: [Where can I find more information about PowerShell sensors?](#)
- See the Knowledge Base: [How can I monitor additional values of Exchange databases?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Remote PowerShell and Remote Exchange Management Shell	<p>This sensor uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable Remote PowerShell and Remote Exchange Management Shell on the target servers that you want to monitor. Also ensure you have installed PowerShell 2.0 or later on the probe system.</p> <p>i In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message The WSMAN provider host process did not return a proper response. In this case, increase the memory limit for Remote PowerShell.</p> <p>■ For more information, see the Knowledge Base: How do I enable and use remote commands in Windows PowerShell? and How can I increase memory for Remote PowerShell?</p>

Requirement	Description
FQDN	<p>To connect to Exchange servers, this sensor needs the FQDN. In the device settings⁴⁴⁷ of the Exchange server, provide the FQDN instead of the IP address.</p> <ul style="list-style-type: none"> For more information, see the Knowledge Base: I have problems with the PowerShell Exchange sensors, what can I do?
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <ul style="list-style-type: none"> i If the framework is missing, you cannot create this sensor. For more information, see the Knowledge Base: Which .NET version does PRTG require?

Add Sensor

The [Add Sensor](#)³⁶⁷ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Settings

Setting	Description
Databases	<p>Select the databases that you want to monitor. PRTG creates one sensor for each database that you select.</p> <ul style="list-style-type: none"> i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Priority ⓘ ★ ★ ★ ☆ ☆

Example Name

exampletag X +

★ ★ ★ ☆ ☆

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p> ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p> ⓘ This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p> ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p> ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ exchange ▪ powershell ▪ database ▪ dag
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Settings

Sensor Settings

Database ⓘ Database 1

Result Handling ⓘ Discard result
 Store result

Sensor Settings

Setting	Description
Database	Shows the name of the database that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. i In a cluster, PRTG stores the result in the PRTG data directory of the master node.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database that you want to monitor.
- This sensor requires Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- This sensor requires the fully qualified domain name (FQDN) of the Exchange server in the [settings of the parent device](#)^[447].
- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- See the Knowledge Base: [Where can I find more information about PowerShell sensors?](#)
- See the Knowledge Base: [What types of Exchange transport queues are there?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Remote PowerShell and Remote Exchange Management Shell	<p>This sensor uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable Remote PowerShell and Remote Exchange Management Shell on the target servers that you want to monitor. Also ensure you have installed PowerShell 2.0 or later on the probe system.</p> <p>i In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message The WSMAN provider host process did not return a proper response. In this case, increase the memory limit for Remote PowerShell.</p> <p>■ For more information, see the Knowledge Base: How do I enable and use remote commands in Windows PowerShell? and How can I increase memory for Remote PowerShell?</p>
FQDN	<p>To connect to Exchange servers, this sensor needs the FQDN. In the device settings^[447] of the Exchange server, provide the FQDN instead of the IP address.</p> <p>■ For more information, see the Knowledge Base: I have problems with the PowerShell Exchange sensors, what can I do?</p>
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i If the framework is missing, you cannot create this sensor.</p> <p>■ For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Settings

Setting	Description
Hub Transport Server or Edge-Server	<p>Select the roles that you want to monitor. PRTG creates one sensor for each role that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited . ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ exchange ▪ powershell ▪ mailqueue
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Settings

Sensor Settings

Result Handling ⓘ

Discard result
 Store result

Sensor Settings

Setting	Description
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result.

Setting	Description
	<ul style="list-style-type: none"> Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel Downtime

Graph Type
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Poisonous Mails	The number of poisonous mails
Queued Mails	The number of queued mails

This channel is the primary channel by default.

Channel	Description
Retrying Mails	The number of retrying mails
Unreachable Mails	The number of unreachable mails

Sensor Settings Overview

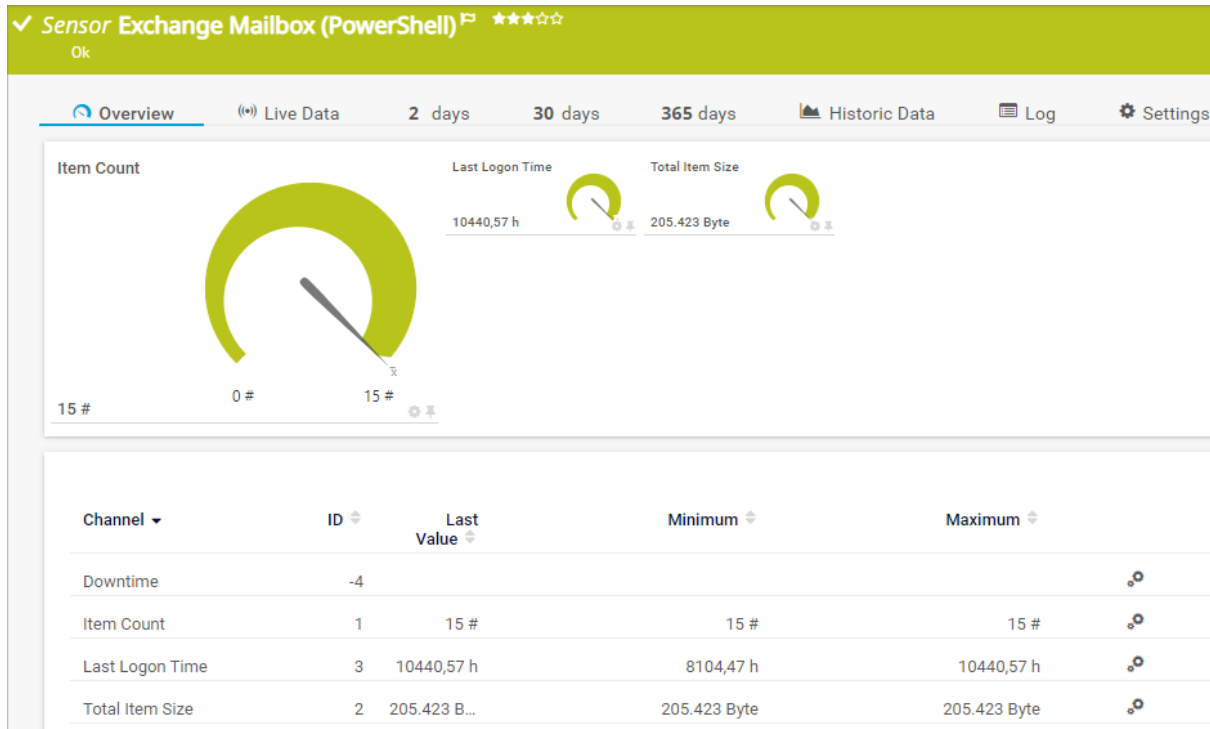

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.46 Exchange Mailbox (PowerShell) Sensor

The Exchange Mailbox (PowerShell) sensor monitors mailboxes of an Exchange server via Remote PowerShell.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Exchange Mailbox (PowerShell) Sensor

Sensor in Other Languages

- Dutch: Exchange Postbus (PowerShell)
- French: Boîte aux lettres Exchange (PowerShell)
- German: Exchange-Postfach (PowerShell)
- Japanese: Exchange Mailbox(PowerShell)
- Portuguese: Caixa de correio do Exchange (PowerShell)
- Russian: Exchange (PowerShell)
- Simplified Chinese: Exchange 邮箱 (PowerShell)
- Spanish: Buzón de Exchange (PowerShell)

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database that you want to monitor.

- This sensor requires Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- This sensor requires the fully qualified domain name (FQDN) of the Exchange server in the [settings of the parent device](#)^[447].
- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor requires elevated rights for the user of this sensor on the Exchange system. It is not sufficient to have administrative rights. For details, see the Knowledge Base: [I have problems with the PowerShell Exchange sensors, what can I do?](#) (solution (2) in the reply)
- See the Knowledge Base: [Where can I find more information about PowerShell sensors?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Remote PowerShell and Remote Exchange Management Shell	<p>This sensor uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable Remote PowerShell and Remote Exchange Management Shell on the target servers that you want to monitor. Also ensure you have installed PowerShell 2.0 or later on the probe system.</p> <p>i In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message The WSMAN provider host process did not return a proper response. In this case, increase the memory limit for Remote PowerShell.</p> <p>■ For more information, see the Knowledge Base: How do I enable and use remote commands in Windows PowerShell? and How can I increase memory for Remote PowerShell?</p>
FQDN	<p>To connect to Exchange servers, this sensor needs the FQDN. In the device settings^[447] of the Exchange server, provide the FQDN instead of the IP address.</p> <p>■ For more information, see the Knowledge Base: I have problems with the PowerShell Exchange sensors, what can I do?</p>
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i If the framework is missing, you cannot create this sensor.</p> <p>■ For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Settings

Setting	Description
Mailboxes	<p>Select the Exchange server mailboxes that you want to monitor. PRTG creates one sensor for each mailbox that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It includes a 'Sensor Name' field with an information icon, a 'Tags' field with an information icon and a list containing 'exampletag', and a 'Priority' field with an information icon and a star rating.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited . ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ exchange ▪ powershell ▪ mailbox
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Item Count	<p>The number of items</p> <p> This channel is the primary channel by default.</p>

Channel	Description
Last Logon Time	The time since the last mailbox login
Total Item Size	The total size of items in bytes

Sensor Settings Overview

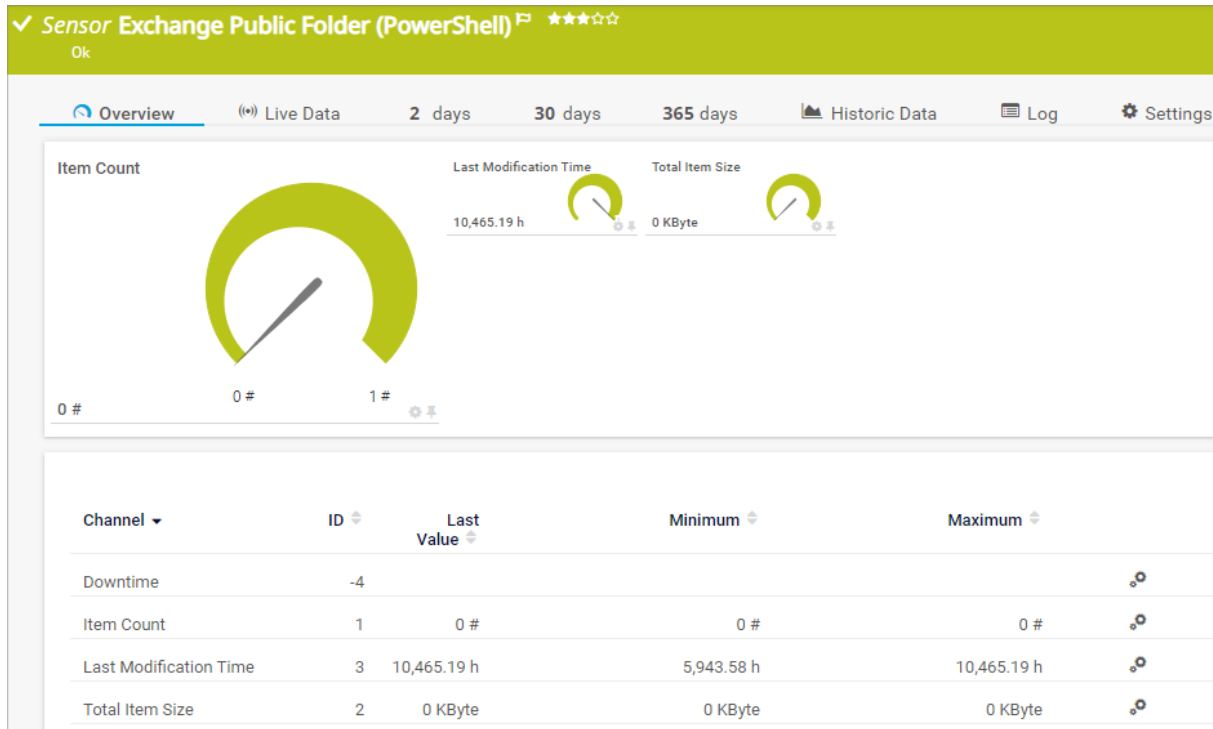

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.47 Exchange Public Folder (PowerShell) Sensor

The Exchange Public Folder (PowerShell) sensor monitors the public folders and subfolders of an Exchange server via Remote PowerShell.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Exchange Public Folder (PowerShell) Sensor

Sensor in Other Languages

- Dutch: Exchange Openbare Map (PowerShell)
- French: Dossier public Exchange (PowerShell)
- German: Exchange Öffentlicher Ordner (PowerShell)
- Japanese: Exchange パブリックフォルダー (PowerShell)
- Portuguese: Pasta pública do Exchange (PowerShell)
- Russian: Exchange (PowerShell)
- Simplified Chinese: Exchange 公共文件夹 (PowerShell)
- Spanish: Carpeta pública de Exchange (PowerShell)

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database that you want to monitor.

- This sensor requires Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- This sensor requires the fully qualified domain name (FQDN) of the Exchange server in the [settings of the parent device](#)^[447].
- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- See the Knowledge Base: [Where can I find more information about PowerShell sensors?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Remote PowerShell and Remote Exchange Management Shell	<p>This sensor uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable Remote PowerShell and Remote Exchange Management Shell on the target servers that you want to monitor. Also ensure you have installed PowerShell 2.0 or later on the probe system.</p> <p>i In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message The WSMAN provider host process did not return a proper response. In this case, increase the memory limit for Remote PowerShell.</p> <p>■ For more information, see the Knowledge Base: How do I enable and use remote commands in Windows PowerShell? and How can I increase memory for Remote PowerShell?</p>
FQDN	<p>To connect to Exchange servers, this sensor needs the FQDN. In the device settings^[447] of the Exchange server, provide the FQDN instead of the IP address.</p> <p>■ For more information, see the Knowledge Base: I have problems with the PowerShell Exchange sensors, what can I do?</p>
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i If the framework is missing, you cannot create this sensor.</p> <p>■ For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Settings

Setting	Description
Public Folders	<p>Select the public folders that you want to monitor. PRTG creates one sensor for each mailbox that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog box. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' to remove it and a plus sign to add more.
- Priority:** A section with five stars, where the first three are filled, indicating a priority of 3.

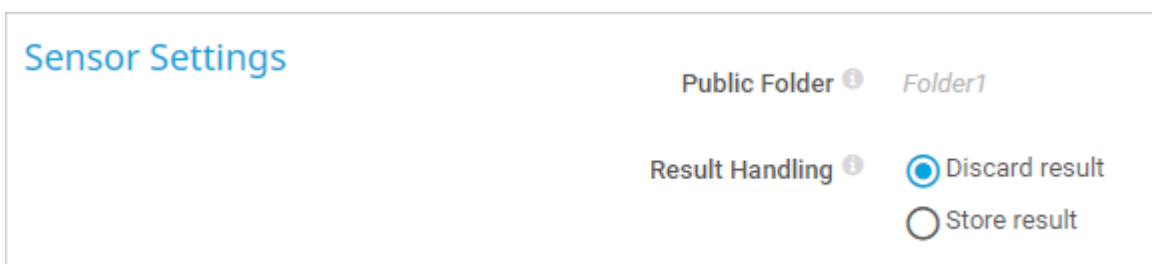

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <ul style="list-style-type: none"> ❗ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ❗ For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ exchange ▪ powershell ▪ publicfolder
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

❗ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Settings

Sensor Settings

Setting	Description
Public Folder	<p>Shows the name of the public folder that this sensor monitors.</p> <ul style="list-style-type: none"> ❗ PRTG applies this filter in real time. If the configuration underneath the linked object changes, the library node accordingly shows matching sensors.

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **ⓘ** Downtime

Graph Type **ⓘ** Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking + below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration^[4187] on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule None

Maintenance Window
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Sensor Settings Overview

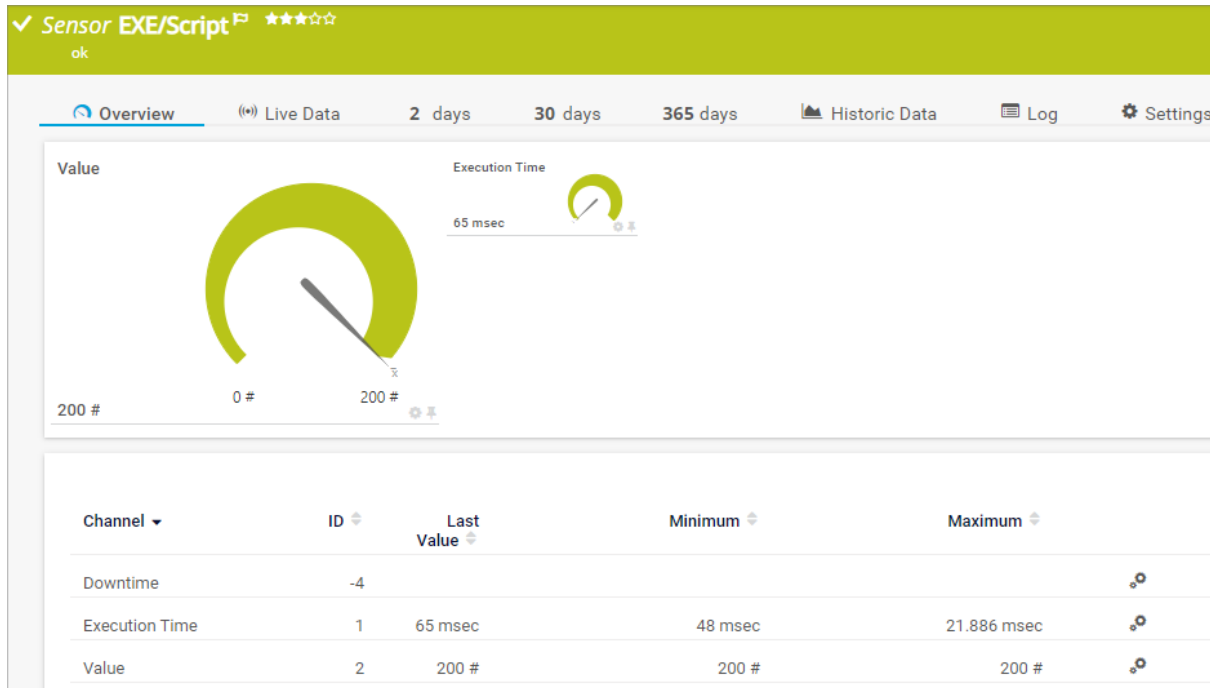

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3967

7.8.48 EXE/Script Sensor

The EXE/Script sensor runs an executable file (.exe, .dll) or a script (batch file, VBScript, PowerShell) on the probe system. This option is available as part of the PRTG API.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

EXE/Script Sensor

Sensor in Other Languages

- Dutch: EXE/Script
- French: Script/EXE
- German: Programm/Skript
- Japanese: EXE/スクリプト
- Portuguese: EXE/Script
- Russian: EXE/
- Simplified Chinese: EXE/脚本
- Spanish: EXE/Script

Remarks

- You must store the executable or script file on the probe system. In a cluster, copy the file to every cluster node.
- This sensor [requires](#) that Remote PowerShell is enabled on the target system and PowerShell 3.0 on both the probe system and the target system.
- This sensor requires .NET 4.7.2 or later on the probe system.

- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- If you want to execute a custom Windows Management Instrumentation Query Language (WQL) script, use the [WMI Custom sensor](#)³⁵⁹⁶.
- This sensor has a low performance impact.
- See the Knowledge Base: [What is the Mutex Name in the PRTG EXE/Script sensor settings?](#)
- See the Knowledge Base: [How can I test if parameters are correctly transmitted to my script when using an EXE/Script sensor?](#)
- See the Knowledge Base: [How can I show special characters with EXE/Script sensors?](#)
- See the Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Remote PowerShell	<p>This sensor uses PowerShell commands. To monitor devices with this sensor, Remote PowerShell access must be enabled on the target computer. Also make sure that you have installed PowerShell 3.0 or later on both the probe system and the target system.</p> <p> If you receive an error message regarding issues with the WinRM connection, make sure that remote commands have been enabled in PowerShell. For more details, see the Knowledge Base: How do I enable and use remote commands in Windows PowerShell?</p>

Add Sensor

The [Add Sensor](#)³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Sensor Settings

Setting	Description
EXE/Script	<p>Select an executable file from the list. The sensor executes it with every scanning interval.</p> <p>The list contains all files in the corresponding \Custom Sensors\EXE subfolder of the PRTG program directory⁴⁵²⁶ on the probe system. For a file to appear in this list, store the file ending in .bat, .cmd, .dll, .exe, .ps1, or .vbs into this subfolder.</p> <ul style="list-style-type: none">  To show the expected sensor values and states, your files must use the correct format for the returned values (in this case, value:message to standard output). The exit code of the file determines the sensor status¹⁹⁷.  For detailed information on how to create custom sensors and for the return format, see section Custom Sensors⁴⁴³⁸.  If you use custom sensors on the cluster probe⁴⁵⁶⁰, copy your files to every cluster node.
Value Type	<p>Define the type of the values that your executable or script file returns:</p> <ul style="list-style-type: none"> ▪ Integer: An integer is expected as return value. If the script returns a float, PRTG displays the value 0. ▪ Float: A float is expected as return value, with a dot (.) between the predecimal position and the decimal places. <ul style="list-style-type: none">  The sensor also displays integer values unless they produce a buffer overflow. ▪ Counter: Your script returns an integer that increases. PRTG shows the difference between the values of two sensor scans. <ul style="list-style-type: none">  A counter must return an integer. It does not support float values. <p> The sensor does not support string values.</p>
Channel Name	<p>Enter a name for the channel in which the sensor shows returned values. Enter a string. This is for display purposes only. You can change the name later in the channel settings³⁹⁷⁷.</p>
Unit String	<p>Enter the unit for the values that this sensor returns. Enter a string. PRTG uses the unit string for display purposes and shows it in graphs, data tables, and gauges.</p> <p> If you want to change the unit after sensor creation, you can change it in the sensor's channel settings³⁹⁷⁷.</p>

Sensor Settings

Setting	Description
EXE/Script	Shows the executable or script file that the sensor executes with each sensor scan. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Parameters	If your executable or script file catches command-line parameters, you can define them here. You can use placeholders as well. Enter a string or leave the field empty. ■ For a full list of all placeholders, see section Custom Sensors ⁴⁴⁴⁹ . i You need to escape special characters and whitespaces in your parameters and surround them with double quotes. See section Escape Special Characters and Whitespaces in Parameters ¹⁰⁷⁴ for details.
Environment	Select whether PRTG command-line parameters are also available as environment parameters: <ul style="list-style-type: none"> ▪ Default environment: Do not provide values of PRTG placeholders in the environment. Select this secure option if you are not sure.

Setting	Description
	<ul style="list-style-type: none"> Set placeholders as environment values: From within your executable or script, the values of the PRTG command-line parameters are available via environment variables. For example, you can then read and use the current host value of the parent device from within your script. This option can pose a security risk because credentials are provided in several variables as well. For a full list of all available variables, see section Custom Sensors⁴⁴⁵⁰.
Security Context	<p>Define the Windows user account that the sensor uses to run the executable or script file:</p> <ul style="list-style-type: none"> Use security context of probe service: Run the file under the same Windows user account that the probe runs under. By default, this is the Windows system user account. Use Windows credentials of parent device: Use the Windows user account in the parent device settings⁴⁴⁶¹.
Mutex Name	<p>Define a mutual exclusion (mutex) name for the process. Enter a string or leave the field empty.</p> <p>i PRTG executes all EXE/Script sensors that have the same mutex serially, not simultaneously. This is useful if you use a lot of sensors and you want to avoid high resource usage caused by simultaneously running processes.</p> <p>See the Knowledge Base: What is the Mutex Name in the PRTG EXE/Script settings?</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
Value Type	<p>Shows the value type.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
If Value Changes	<p>Define what the sensor does when the sensor value changes:</p> <ul style="list-style-type: none"> Ignore changes (default): Take no action on change. Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger⁴¹³⁸, you can use this mechanism to trigger a notification³⁹⁸⁷ whenever the sensor value changes.

Setting	Description
Result Handling	<p>Define what the sensor does with the result that the executable file gives back:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status. <p>i Enable this option if you do not want failures to be overwritten by a following success of the script.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **ⓘ** Downtime

Graph Type **ⓘ** Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules 4170.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Escape Special Characters and Whitespaces in Parameters

You need to escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure that the characters are correctly interpreted. PowerShell scripts in particular require adequate escaping so that the parameters are passed in a valid PowerShell syntax. PRTG automatically does most of the escaping for you.

Follow these rules to escape special characters and whitespaces in the parameters fields:

- Use quotes for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotes for parameters that contain single quotes.

```
-name "Mr 'John Q' Public"
```

- Use single quotes for parameters that contain double quotes.

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quote.

```
-name pub\"lic
```

- Use double quotes for parameters that contain double and single quotes and escape double quotes.

```
-name "pu'b\"lic"
```

- ⓘ In SSH scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.
- ⓘ We recommend that you do not pass passwords in parameters. Use placeholders instead. See section [Custom Sensors](#)⁴⁴⁵⁰ for details.

Channel List

- ⓘ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Execution Time	The execution time in milliseconds (msec) ⓘ This channel is the primary channel by default.
[Value]	The value that the executable file or script file returns in one channel ■ For details about the return value format, see section Custom Sensors ⁴⁴³⁹ .

Sensor Settings Overview

For more information about sensor settings, see the following sections:

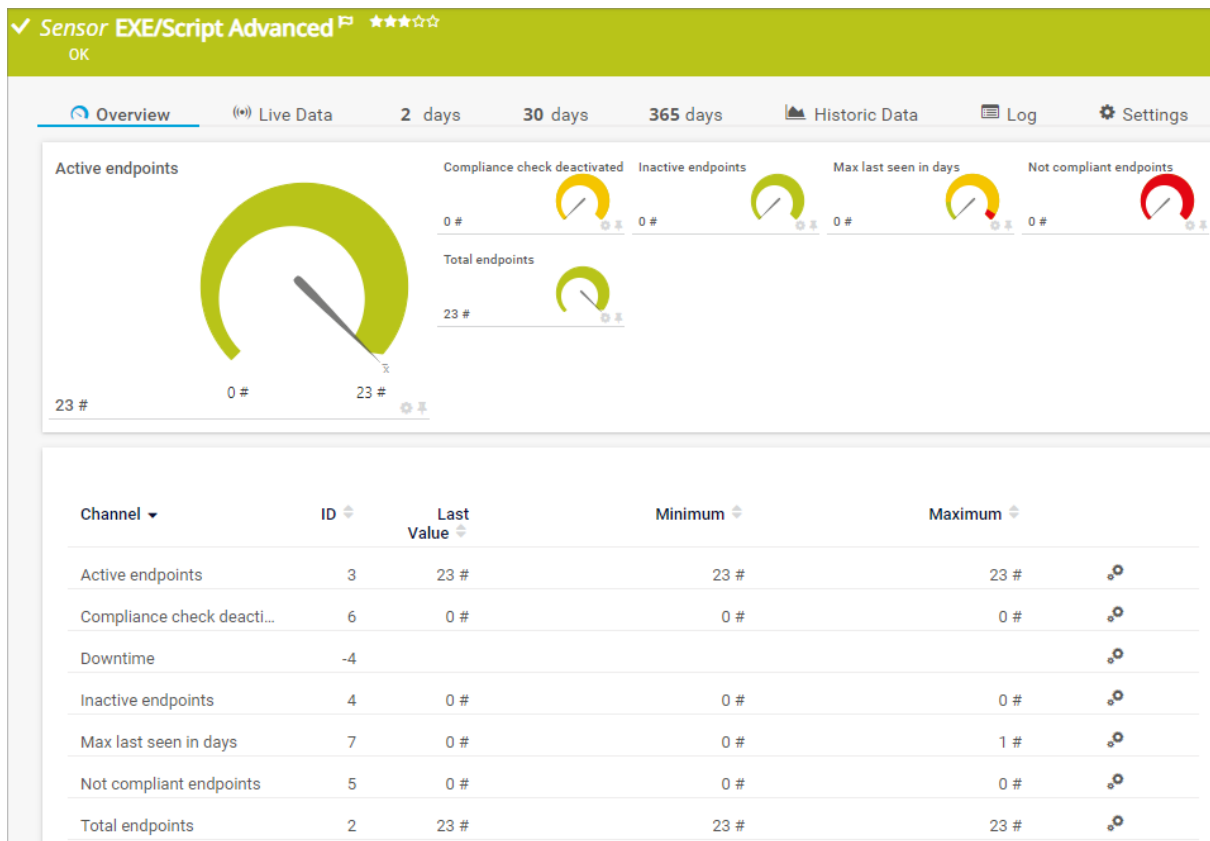

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.49 EXE/Script Advanced Sensor

The EXE/Script Advanced sensor runs an executable file (.exe, .dll) or a script (batch file, VBScript, PowerShell) on the probe system. This option is available as part of the PRTG API.

i The return value of this sensor must be valid Extensible Markup Language (XML) or JavaScript Object Notation (JSON).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

EXE/Script Advanced Sensor

Sensor in Other Languages

- Dutch: EXE/Script Geavanceerd
- French: Script/EXE version améliorée
- German: Programm/Skript (Erweitert)
- Japanese: EXE/スクリプト(アドバンスト)
- Portuguese: EXE/Script avançado
- Russian: EXE/Script
- Simplified Chinese: 高级 EXE/脚本
- Spanish: EXE/Script Avanzado

Remarks

- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.
 - You must store the executable or script file on the probe system. In a cluster, copy the file to every cluster node.
 - This sensor [requires](#)¹⁰⁷⁸ that Remote PowerShell is enabled on the target system and PowerShell 3.0 on both the probe system and the target system.
 - This sensor requires .NET 4.7.2 or later on the probe system.
 - We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
 - If you want to execute a custom Windows Management Instrumentation Query Language (WQL) script, use the [WMI Custom sensor](#)³⁵⁹⁶.
 - This sensor has a medium performance impact.
 - See the Knowledge Base: [What is the Mutex Name in the PRTG EXE/Script sensor settings?](#)
 - See the Knowledge Base: [How can I test if parameters are correctly transmitted to my script when using an EXE/Script sensor?](#)
 - See the Knowledge Base: [How can I show special characters with EXE/Script sensors?](#)
 - See the Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)
 - See the Knowledge Base: [How can I use meta-scans for custom EXE/Script sensors?](#)
- ☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Remote PowerShell	<p>This sensor uses PowerShell commands. To monitor devices with this sensor, Remote PowerShell access must be enabled on the target computer. Also make sure that you have installed PowerShell 3.0 or later on both the probe system and the target system.</p>

Requirement	Description
	<p>i If you receive an error message regarding issues with the WinRM connection, make sure that remote commands have been enabled in PowerShell. For more details, see the Knowledge Base: How do I enable and use remote commands in Windows PowerShell?</p>

Add Sensor

The [Add Sensor](#)³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Sensor Settings

Setting	Description
EXE/Script	<p>Select an executable file from the list. The sensor executes it with every scanning interval.</p> <p>The list contains all files in the corresponding \Custom Sensors\EXE subfolder of the PRTG program directory⁴⁵²⁶ on the probe system. For a file to appear in this list, store the file ending in .bat, .cmd, .dll, .exe, .ps1, or .vbs into this subfolder.</p> <p>i To show the expected values and sensor states, your files must return the expected XML or JSON format to standard output. Values and message must be embedded in the XML or JSON.</p> <p>■ For detailed information on how to create custom sensors and for the return format, see section Custom Sensors⁴⁴⁴⁰.</p> <p>i If you use custom sensors on the cluster probe⁴⁵⁶⁰, copy your files to every cluster node.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Sensor Name **i** Example Name

Tags **i** exampletag ✕ +

Priority **i** ★★☆☆☆

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ xmlxesensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Settings

Sensor Settings

The EXE file has to run on the computer where the parent probe is installed, not on the parent device. The working directory for EXE files is the probe directory. .vbs files, .ps1 files, or other script files may use different working directories.

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Escape Special Characters and Whitespaces in Parameters

You need to escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure that the characters are correctly interpreted. PowerShell scripts in particular require adequate escaping so that the parameters are passed in a valid PowerShell syntax. PRTG automatically does most of the escaping for you.

Follow these rules to escape special characters and whitespaces in the parameters fields:

- Use quotes for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotes for parameters that contain single quotes.

```
-name "Mr 'John Q' Public"
```

- Use single quotes for parameters that contain double quotes.

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quote.

```
-name pub\"lic
```

- Use double quotes for parameters that contain double and single quotes and escape double quotes.

```
-name "pu'b\"lic"
```

 In SSH scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.

 We recommend that you do not pass passwords in parameters. Use placeholders instead. See section [Custom Sensors](#) ⁴⁴⁵⁰ for details.

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
[Value]	<p>The values that the executable file or script file returns in several channels</p> <p>■ For details about the return value format, see section Custom Sensors ⁴⁴⁴⁰.</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

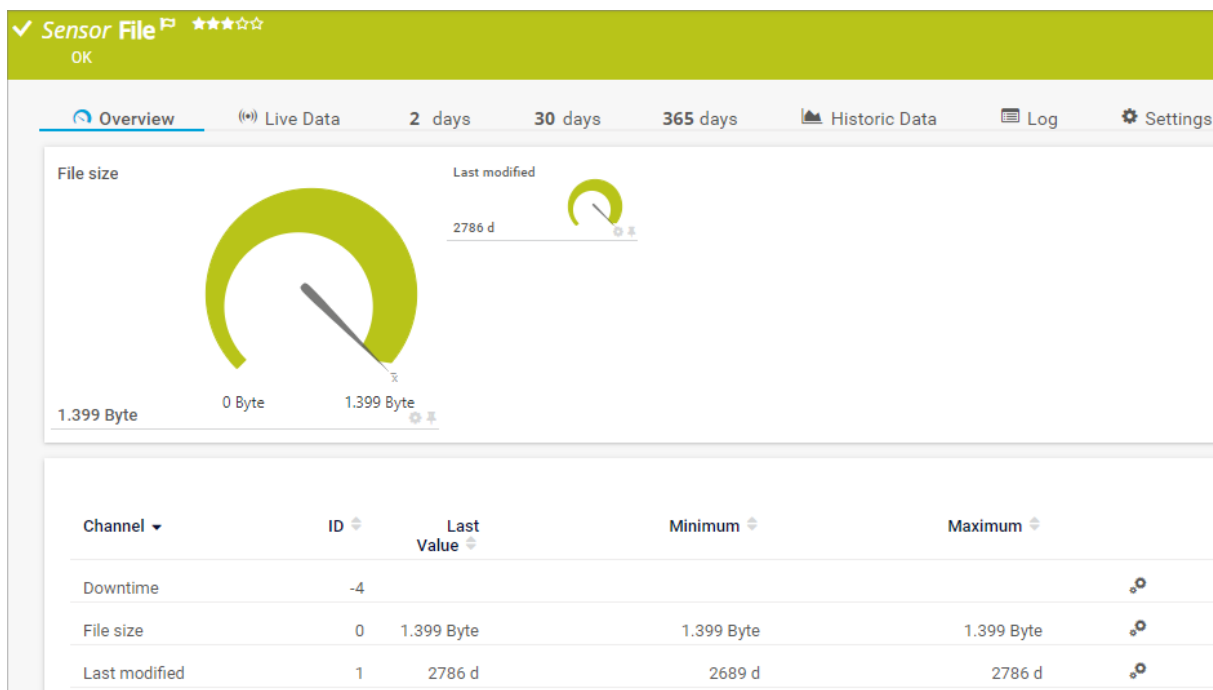

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.50 File Sensor

The File sensor monitors a file located on the local disk on the probe system, parent device, or a file that is accessible via server message block (SMB). You can monitor changes to the file content and file time stamp.

i In contrast to the [Folder sensor](#)^[1116], you can also monitor changes to the actual content of a file.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)^[1102].

File Sensor

Sensor in Other Languages

- Dutch: Bestand
- French: Fichier
- German: Datei
- Japanese: ファイル
- Portuguese: Arquivo
- Russian:
- Simplified Chinese: 文件
- Spanish: Archivo

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires that the LanmanServer service runs on the target computer.

- Try using the fully qualified domain name (FQDN) of the target device if the sensor does not get a connection with the IP address.
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032](#)
- See the Knowledge Base: [Can I use placeholders in file names to monitor logfiles?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
LanmanServer service	<p>To monitor shares on Windows machines, make sure that the LanmanServer service runs on the target computer.</p> <p>i The display name of the service is Server.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Sensor Name ⓘ Example Name

Tags ⓘ X +

Priority ⓘ ★★☆☆☆

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ filesensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Specific

Sensor Specific

File Name ⓘ C:\Windows\file.txt

Sensor Behavior ⓘ Show down status if file does not exist
 Show down status if file exists

Monitor File Content ⓘ Ignore changes
 Trigger 'change' notification

Monitor File Time Stamp ⓘ Ignore changes
 Trigger 'change' notification

Sensor Specific

Setting	Description
File Name	<p>Enter the full path to the file that this sensor monitors. For example, enter C:\Windows\file.txt. to monitor a file on the probe system.</p> <p>If you use a local path, the sensor only looks for the target file on the probe system, not on the parent device. To monitor a file on the parent device, use the dollar sign (\$) like C\$\User\johnqpublic\file.txt.</p> <p>If the file is located on a network device, use the Universal Naming Convention (UNC) path without the server part (only enter share\folder\file.txt). The sensor inherits the server part (\\server\ from the parent device settings^[446]. Enter a valid path and file name.</p> <p>i To monitor Windows shares, the LanmanServer service must run on the target computer.</p>
Sensor Behavior	<p>Specify when the sensor shows the Down status^[197]:</p> <ul style="list-style-type: none"> Show down status if file does not exist: Show the Down status if the file does not exist. Show down status if file exists: Show the Down status if the file does exist.
Monitor File Content	<p>Specify if the sensor sends a notification when the content of the file changes (based on a checksum):</p> <ul style="list-style-type: none"> Ignore changes: Take no action on change. Trigger 'change' notification: Send an internal message that indicates that its value has changed. In combination with a change trigger^[4138], you can use this mechanism to trigger a notification^[3987] whenever the sensor value changes.

Setting	Description
Monitor File Time Stamp	<p>Specify if the sensor sends a notification when the content of the file's time stamp changes:</p> <ul style="list-style-type: none"> Ignore changes: Take no action on change. Trigger 'change' notification: Send an internal message that indicates that its value has changed. In combination with a change trigger, you can use this mechanism to trigger a notification whenever the sensor value changes.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. Sensor Settings Overview

For more information about sensor settings, see the following sections:

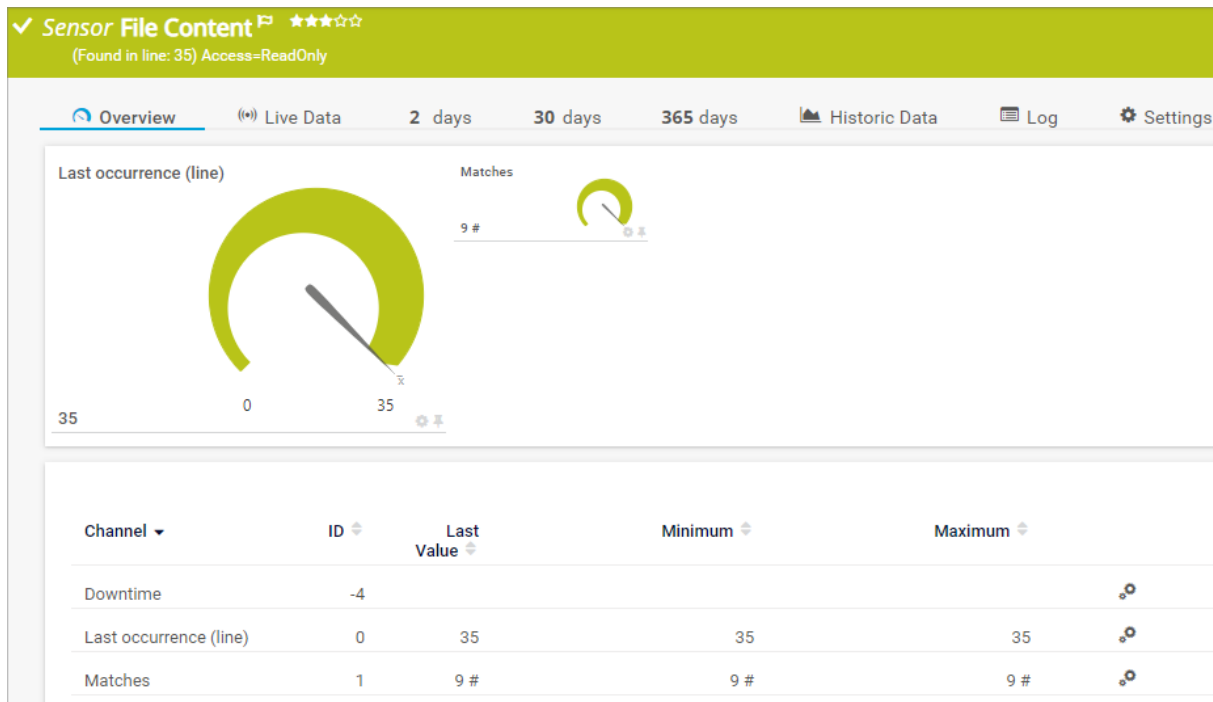

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.51 File Content Sensor

The File Content sensor checks a text file (for example, a logfile) for certain strings.

i Additionally, the sensor quotes matching lines in the sensor message.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

File Content Sensor

Sensor in Other Languages

- Dutch: Bestands inhoud
- French: Contenu du fichier
- German: Datei-Inhalt
- Japanese: ファイルの内容
- Portuguese: Conteúdo de arquivo
- Russian:
- Simplified Chinese: 文件内容
- Spanish: Contenido de archivo

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires that the LanmanServer service runs on the target computer.

- This sensor does not support UTF-16 encoded files. In this case, try to use a custom sensor like the [EXE/Script sensor](#)^[1063] or the [EXE/Script Advanced sensor](#)^[1077].
- This sensor does not officially support binary files. If you would still like to monitor binary files contrary to our recommendation, choose the option Always transmit the entire file in the sensor settings, section Network Usage.
- This sensor supports Unix line feeds.
- This sensor supports the IPv6 protocol.
- To monitor files on a Linux system, the folder must be accessible via server message block (SMB).
- Try using the fully qualified domain name (FQDN) of the target device if the sensor does not get a connection with the IP address.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
LanmanServer service	<p>To monitor shares on Windows machines, make sure that the LanmanServer service runs on the target computer.</p> <p>❗ The display name of the service is Server.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog box. It contains the following elements:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A text input field containing 'exampletag', with a blue 'x' icon to remove the tag and a plus icon to add more tags.
- Priority**: A star rating system showing 4 stars filled and 1 star empty.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[406], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons.  Trigger 'change' notification

Sensor Specific

Setting	Description
File Name	<p>Enter the full path to the file that this sensor monitors. For example, enter C:\Windows\file.txt. to monitor a file on the probe system.</p> <p>If you use a local path, the sensor only looks for the target file on the probe system, not on the parent device. To monitor a file on the parent device, use the dollar sign (\$) like C\$\User\johnqpublic\file.txt.</p> <p>If the file is located on a network device, use the Universal Naming Convention (UNC) path without the server part (only enter share\folder\file.txt). The sensor inherits the server part (\\server\ from the parent device settings⁴⁴⁶. Enter a valid path and file name.</p> <ul style="list-style-type: none"> ⓘ To monitor Windows shares, the LanmanServer service must run on the target computer. ⓘ To monitor Linux files, the folder with these files must be accessible via SMB. ⓘ Note that it might produce a high amount of network traffic if you define that PRTG queries an entire file on your network with every scanning interval.
Search String	<p>Define the string that you want to search the file for. You can enter a simple string in plain text or a regular expression (regex)⁴⁴⁹.</p> <ul style="list-style-type: none"> ⓘ The search string must be case sensitive.

Setting	Description
Search Method	<p>Define the method with which you want to provide the search string:</p> <ul style="list-style-type: none"> ▪ Simple string search: Search for a simple string in plain text. <p>i The characters <code>*</code> and <code>?</code> work as placeholders. <code>*</code> stands for no number or any number of characters and <code>?</code> stands for exactly one character. You cannot change this behavior. The literal search for these characters is only possible with a regex.</p> <ul style="list-style-type: none"> ▪ Regular expression: Search with a regex. <p>i The pattern must be in one line and only the last matching line is returned.</p> <p>i PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section Regular Expressions⁴⁴⁹⁷.</p>
File Transmission Handling	<p>Define in which way the sensor transmits the target file to PRTG:</p> <ul style="list-style-type: none"> ▪ Only transmit new lines at the end of the file (default): Send the entire file to PRTG only with the first scanning interval. With the following scanning intervals, the sensor only transmits new lines at the end of the file. It does not send old lines but it still counts them. This option improves the performance of the sensor. BETA This option is in beta status. Do not expect that it works as expected in every usage scenario. ▪ Always transmit the entire file: Send the entire file to PRTG with every sensor scanning interval. If this results in too much traffic on the target system, we recommend that you choose Only transmit new lines at the end of the file instead. <p>The sensor can only transmit new lines in the following cases:</p> <ul style="list-style-type: none"> ▪ the file is bigger than in the previous scanning interval, and ▪ the last line in the file is still in the same place in the file. <p>i The sensor supports Windows and Linux line endings (CRLF or LF).</p>
File Encoding	<p>Specify the encoding of the file that this sensor monitors:</p> <ul style="list-style-type: none"> ▪ Windows-1252 (default) ▪ UTF-8 ▪ UTF-16
Sensor Behavior	<p>Define the condition for which the sensor shows the Warning status¹⁹⁷:</p> <ul style="list-style-type: none"> ▪ Shows the warning status when the string is not found: Show the Warning status if there is no match. Otherwise it remains in the Up status.

Setting	Description
If Value Changes	<p>Define what the sensor does if the value of the Last occurrence (line) channel changes</p> <ul style="list-style-type: none"> Shows the warning status when the string is found: Show the Warning status if there is a match. Otherwise it remains in the Up status. Ignore changes (default): Take no action on change. Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger, you can use this mechanism to trigger a notification whenever the sensor value changes. <p>i The sensor does not trigger the notification when the number of Matches changes.</p>

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i**

Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

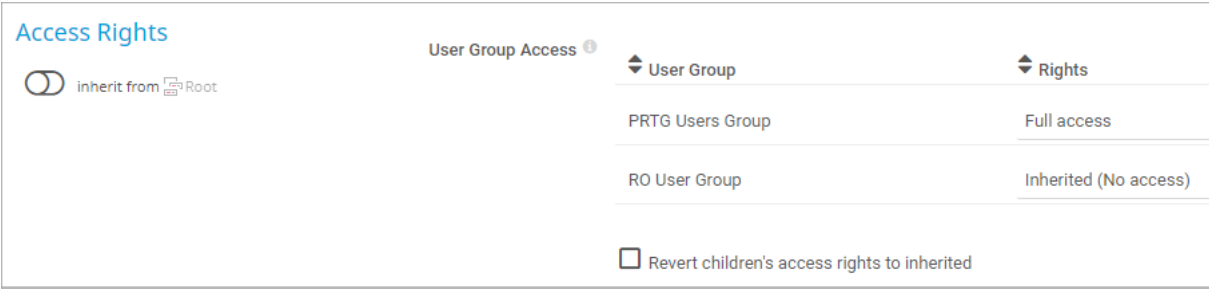

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

User Group Access	User Group	Rights
<input checked="" type="checkbox"/> inherit from  Root	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Last Occurrence (Line)	The line number of the last match i This channel is the primary channel by default.
Matches	The number of matches

More

■ KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

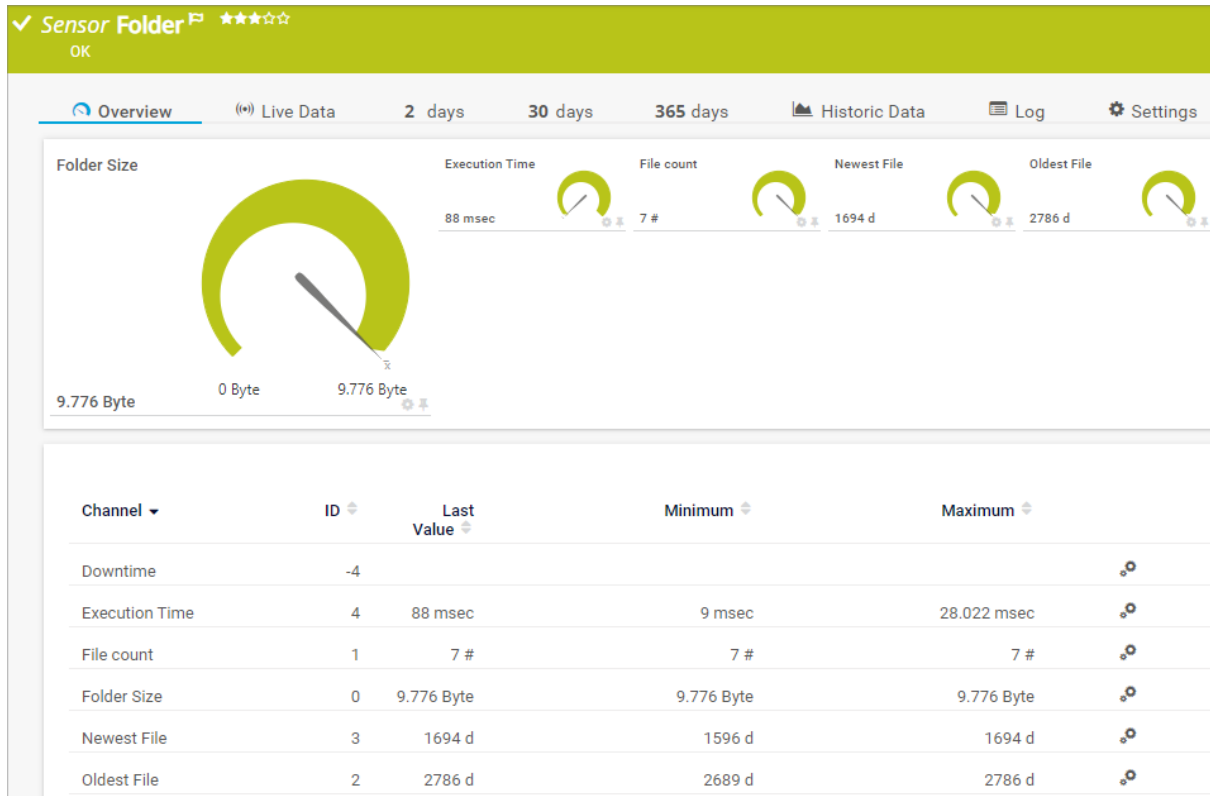

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.52 Folder Sensor

The Folder sensor monitors a folder via server message block (SMB). You can monitor file changes and file ages.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Folder Sensor

Sensor in Other Languages

- Dutch: Map
- French: Dossier
- German: Ordner
- Japanese: フォルダ
- Portuguese: Pasta
- Russian:
- Simplified Chinese: 文件夹
- Spanish: Carpeta

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires that the LanmanServer service runs on the target computer.

- This sensor counts all files in a folder, including hidden files.
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
LanmanServer service	<p>To monitor shares on Windows machines, make sure that the LanmanServer service runs on the target computer.</p> <p>i The display name of the service is Server.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Add Sensor

The [Add Sensor](#)³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Folder Monitor

Setting	Description
File Age Check	<p>Specify if the sensor monitors the folder for certain file ages and shows a corresponding status¹⁹⁷:</p> <ul style="list-style-type: none"> ▪ Do not check: Do not check the age of the files in the folder: ▪ Show warning status if older: Set the sensor to the Warning status if one of the files in the folder is older than a specific limit unit. ▪ Show down status if older: Set the sensor to the Down status if one of the files in the folder is older than a specific limit unit. ▪ Show warning status if younger: Set the sensor to the Warning status if one of the files in the folder is younger than a specific limit unit. ▪ Show down status if younger: Set the sensor to the Down status if one of the files in the folder is younger than a specific limit unit. <p>i You can change the file age check later via the Limits section in the channel settings^{397a} of Newest File and Oldest File.</p>

Setting	Description
File Age Limit	This setting is only visible if you select a file age check above. Enter the age of a file in the folder that triggers the sensor status change if the age falls below a specific value or if it is exceeded. Enter an integer value. Define the limit unit below.
File Age Limit Unit	This setting is only visible if you select a file age check above. Specify the unit for the file age value: <ul style="list-style-type: none"> Days: Select this option if the File Age Limit is a number of days. Hours: Select this option if the File Age Limit is a number of hours. Minutes: Select this option if the File Age Limit is a number of minutes.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[183] , as well as in alarms ^[228] , logs ^[237] , notifications ^[403] , reports ^[406] , maps ^[406] , libraries ^[407] , and tickets ^[240] . <i>i</i> If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?
Parent Tags	Shows tags ^[145] that the sensor inherits ^[145] from its parent device ^[140] , parent group ^[139] , and parent probe ^[139] . <i>i</i> This setting is for your information only. You cannot change it.

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <ul style="list-style-type: none"> i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). i For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ foldersensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

Folder Monitor

Folder Monitor

Folder Name ⁱ C:\Windows

Recurse Subfolders ⁱ Do not recurse subfolders
 Monitor the folder and its subfolders (recursive)

If Folder Contents Change ⁱ Ignore changes
 Trigger 'change' notification

Timeout (Sec.) ⁱ 300

Note: You can set up file age checks in the settings of the channels Oldest File and Newest File. Enter your desired thresholds (in seconds) in the channel settings section Limits.

Folder Monitor

Setting	Description
Folder Name	<p>Enter the full path to the folder this sensor monitors. For example, enter C:\Windows.</p> <p>If the file is located on a network device, use the Universal Naming Convention (UNC) path without the server part (only enter share\folder). The server part (\\server\) is taken from the parent device settings ^[446] of this sensor. Enter a valid path name.</p> <ul style="list-style-type: none"> i To monitor Windows shares, the LanmanServer service must run on the target computer.
Recurse Subfolders	<p>Specify if the sensor includes subfolders in the folder monitoring:</p>

Setting	Description
	<ul style="list-style-type: none"> Do not recurse subfolders: Only monitor the folder. Do not monitor its subfolders. Monitor the folder and its subfolders (recursive): Monitor the folder and all of its subfolders. <ul style="list-style-type: none"> i If you recurse subfolders in large directories that have a high number of branches, this may cause timeout errors or performance issues.
If Folder Contents Change	<p>Specify if the sensor sends a notification when the content of the folder changes:</p> <ul style="list-style-type: none"> Ignore changes: Changes to the folder do not trigger a notification. Trigger 'change' notification: The sensor triggers a notification if a file changes its time stamp or file name, or if there are new or deleted files. Create a change trigger on the Notification Triggers tab of this sensor to receive a notification whenever there is a change.
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <ul style="list-style-type: none"> i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.

 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Execution Time	The execution time in milliseconds (msec)
File Count	<p>The number of files in the folder</p> <p>i The sensor counts all files in a folder, including hidden files.</p>
Folder Size	<p>The folder size in bytes</p> <p>i This channel is the primary channel by default.</p>
Newest File	<p>The time since the newest modification of a file in the folder (newest file)</p> <p>i The sensor shows a negative value if the date of a modified file is in the future.</p>
Oldest File	The time since the oldest modification of a file in the folder (oldest file)

7.8.53 FTP Sensor

The FTP sensor monitors file servers via the File Transfer Protocol (FTP) and FTP over SSL (FTPS).

i The sensor also shows the response message of the server in the sensor message.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

FTP Sensor

Sensor in Other Languages

- Dutch: FTP
- French: FTP
- German: FTP
- Japanese: FTP
- Portuguese: FTP
- Russian: FTP
- Simplified Chinese: FTP
- Spanish: FTP

Remarks

- This sensor has a medium performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has a title bar 'Basic Sensor Settings' on the left. Below it, there are three rows of settings:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A tag input field containing 'exampletag' with a close button (X) and a plus button (+).
- Priority**: A star rating selector showing 3 stars out of 5.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p>

Setting	Description
	<ul style="list-style-type: none"> ftpsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Specific

Sensor Specific

Timeout (Sec.) **i** 60

Port **i** 21

FTP Mode **i**
 Active mode
 Passive mode

Sensor Specific

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
Port	<p>Enter the number of the FTP port that the sensor tries to connect to. Enter an integer value.</p> <p>i We recommend that you use the default value.</p> <p>i If the connection is unsuccessful, try a different port number.</p>
FTP Mode	<p>Define the FTP connection mode that the sensor uses for the connection to the FTP server:</p> <ul style="list-style-type: none"> Active mode: If you cannot establish a connection, use the passive mode.

Setting	Description
	<p>i We recommend that you use the default value.</p> <ul style="list-style-type: none"> Passive mode

Connection Security

Connection Security

Transport-Level Security **i**

Use transport-level security if available

Enforce transport-level security

Do not use transport-level security

Connection Security

Setting	Description
Transport-Level Security	<p>Specify if the sensor uses connection security:</p> <ul style="list-style-type: none"> Use transport-level security if available: The sensor tries to connect via Secure Sockets Layer (SSL)/Transport Layer Security (TLS). It automatically determines whether to connect via the explicit mode or the implicit mode. If the server does not support SSL/TLS, the sensor tries to connect without connection security and shows the Up status if this works. Enforce transport-level security: The connection must be established via SSL/TLS (in the explicit mode or the implicit mode). Otherwise, the sensor shows the Down status. Do not use transport-level security: The sensor connects to the FTP server without connection security. <p>i See the sensor logs to see which method the sensor previously used to connect to the FTP server.</p>

Authentication

Authentication

User Name **i**

Password **i**

Result Handling **i**

Discard result

Store result

Authentication

Setting	Description
User Name	<p>Enter a user name for the FTP login. Enter a string or leave the field empty.</p> <p>i The default user name is "anonymous". If the sensor cannot log on to the FTP server with this user name (or a different user name that you define), the sensor message shows that the credentials are incorrect but the sensor remains in the Up status.</p>
Password	<p>Enter a password for the FTP login. Enter a string or leave the field empty.</p> <p>i If the sensor cannot log on to the FTP server with this password, the sensor message shows that the credentials are incorrect but the sensor remains in the Up status.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel Downtime

Graph Type Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>

Setting	Description
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes

Setting	Description
	<ul style="list-style-type: none"> ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ¹⁴².

Access Rights

inherit from  Root

User Group Access ¹	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵³.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.

Channel	Description
Response Time	The response time in milliseconds (msec)  This channel is the primary channel by default.

Sensor Settings Overview

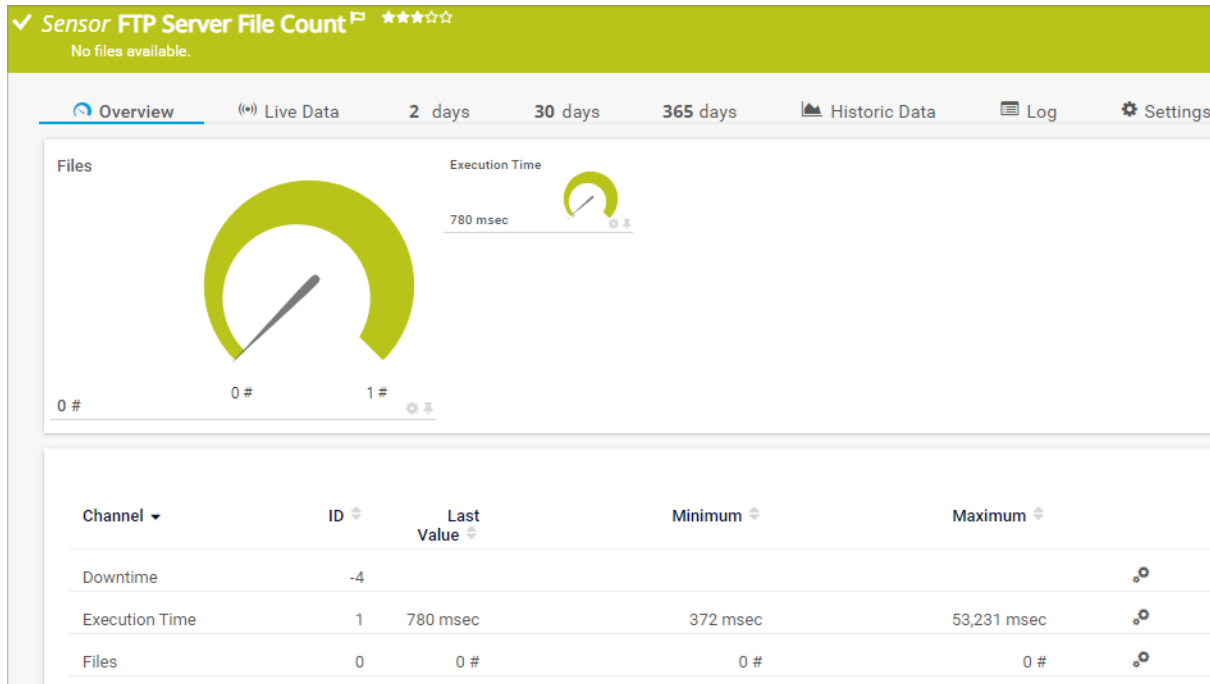

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.54 FTP Server File Count Sensor

The FTP Server File Count sensor logs in to a File Transfer Protocol (FTP) server and can monitor changes to files.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

FTP Server File Count Sensor

Sensor in Other Languages

- Dutch: FTP Server File Aantal
- French: Nombre de fichiers du serveur FTP
- German: FTP-Server Dateienanzahl
- Japanese: FTP サーバーファイルカウント
- Portuguese: Contagem de arquivos no FTP
- Russian: FTP-
- Simplified Chinese: FTP 服务器文件计数
- Spanish: Número de archivos en el servidor FTP

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires .NET 4.7.2 or later on the probe system. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.
- This sensor supports the IPv6 protocol.

- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name' with an information icon.
- Tags:** A list box containing 'exampletag' with a close button (X) and an add button (+).
- Priority:** A section with an information icon and five star icons, three of which are filled.

Basic Sensor Settings

Setting	Description

Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

7.8.55 Google Analytics Sensor

The Google Analytics sensor queries and monitors several metrics from a Google Analytics account via the Google application programming interface (API) and Open Authorization 2 (OAuth2).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Google Analytics Sensor

Sensor in Other Languages

- Dutch: Google Analytics
- French: Google Analytics
- German: Google Analytics
- Japanese: Google Analytics
- Portuguese: Google Analytics
- Russian: Google Analytics
- Simplified Chinese: Google Analytics
- Spanish: Google Analytics

Remarks

- The minimum scanning interval for this sensor is 30 minutes.
- For details about OAuth2 authentication, see section [Authentication via OAuth2](#).
- This sensor has a low performance impact.
- Some dimensions and metrics cannot be queried together. See the Knowledge Base: [Where do I find available Google Analytics metrics?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG requires OAuth2 authorization before you can add this sensor. Provide the required credentials in the dialog box that appears.

Google Credentials

This sensor uses OAuth2 authentication to get access to your Google account.

For details about this authentication approach, see section [Authentication via OAuth2](#).

Google Credentials

Setting	Description
OAuth URL	<p>Click Get Access Code to connect this sensor to your Google Analytics account via OAuth2. This is necessary to allow the sensor to query data from Google Analytics. A new browser window appears.</p> <p>Follow the steps in the browser window and confirm the permission for PRTG to connect to your Google Analytics account. Copy the OAuth code you get and paste it into the OAuth Code field below.</p>
OAuth Code	<p>Paste the access code that you receive after completing the authorization process for PRTG in your Google Analytics account.</p> <p>i It is mandatory to connect this sensor to your Google Analytics account to create this sensor. Complete the OAuth approach first to get the OAuth code.</p>

Setting	Description
	Click OK to define the sensor settings .

Google Analytics Specific

Setting	Description
Profile	Select the Google Analytics profile that you want to monitor.
Channel #2 – #10	<p>You can create up to 10 different channels for this sensor. You have to define at least one data channel, so you already see all available settings for Channel #1. Additionally, you can define Channel #2 up to Channel #10. To do so, choose between:</p> <ul style="list-style-type: none"> ▪ Disable: Do not create this channel. ▪ Enable: Create this channel. Define further settings below. <p>i It is not possible to enable or disable channels after sensor creation.</p>
Channel #x Mode	<p>Define how to display the retrieved value in the channel:</p> <ul style="list-style-type: none"> ▪ Absolute (recommended): Show the value as the sensor retrieves it from Google Analytics. ▪ Difference: Calculate and show the difference between the last value and the most recent value retrieved from Google Analytics. <p>i This mode is not compatible with the unit Lookup.</p>

Channel #2 – #10	Shows if you enabled or disabled a channel. <p>i You can define up to 10 different channels per sensor.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i**
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking + below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

 This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#)^[4167] settings are not available for this sensor.

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours

Setting	Description
	<ul style="list-style-type: none"> ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p> <p> ⓘ The minimum scanning interval for this sensor is 30 minutes.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p> ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p> ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p> ⓘ If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Authentication via OAuth2

This sensor uses the OAuth2 security protocol to access the account from which you want to retrieve and monitor data. OAuth2 enables you to grant access to the target account without sharing your password with PRTG. The authorization approach of PRTG using OAuth2 works as follows.

1. Authorization Request

First, you have to request authorization for this sensor to access service resources from your account. For this purpose, you are asked to get an access code for this sensor in the Add Sensor dialog. Click Get Access Code to start the authorization process using OAuth2. A new browser window opens on the authorization server of the target service.

2. Verifying Identity

This new window contains a login form for your account that you want to monitor. Log in to your account using your credentials for this service to authenticate your identity. This is a common login to your account on the target server so PRTG does not see your password. The service forwards you to the authorization page and asks you to permit PRTG to access the data in your account.

i If you are already logged in to the service with a user account, you do not have to enter credentials in this step and get directly to the access permission page.

3. Authorizing PRTG

Permit PRTG to access information on your account. Note that this permission holds only for this specific sensor, not for other sensors of this type or PRTG as a whole. For each sensor of this type you add, you have to confirm the access permission anew. You can change the account permissions at any time in your account at the target service.

4. Getting Authorization Code

Permitting PRTG to access your account data forwards you to a page where the service provides an authorization code. Copy this code and switch back to the Add Sensor dialog in PRTG.

i The code is only valid for a short period of time and expires after a few minutes. You can use a particular code only once.

5. Providing Authorization Code

Paste the authorization code into the OAuth Code field and complete the Add Sensor dialog. You do not have to go through further configuration steps manually. The sensor automatically accomplishes the following steps.

6. Requesting Access Token

After receiving the authorization code, PRTG requests an access token from the API of the target service. For this purpose, PRTG transmits the authorization code together with several authentication details. The API checks if the authorization is valid and returns the access token to PRTG. Access tokens are specific for one account and one application (here: PRTG). The authorization process to read data from your account is now complete.

7. Retrieving Data

The sensor transmits the access token with each sensor scan in the defined scanning interval to authenticate with your account. It is not necessary to use the original account credentials anew. The used tokens refresh automatically from time to time.

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
[Metric]	The values for all available Google Analytics metrics in several channels

Sensor Settings Overview

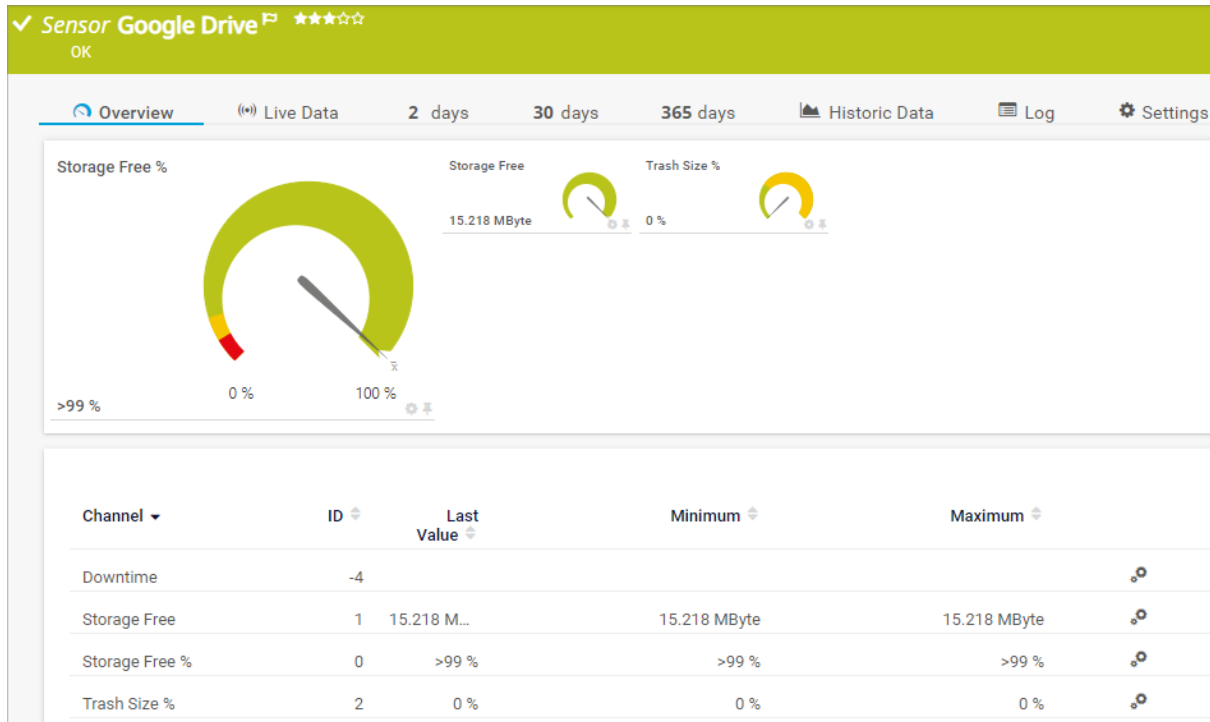

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.56 Google Drive Sensor

The Google Drive sensor monitors a Google Drive account via the Google application programming interface (API) and Open Authorization 2 (OAuth2).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Google Drive Sensor

Sensor in Other Languages

- Dutch: Google Drive
- French: Google Drive
- German: Google Drive
- Japanese: Google ドライブ
- Portuguese: Google Drive
- Russian: Google
- Simplified Chinese: Google Drive
- Spanish: Google Drive

Remarks

- The minimum scanning interval for this sensor is 30 minutes.
- For details about OAuth2 authentication, see section [Authentication via OAuth2](#).
- This sensor has a low performance impact.

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG requires OAuth2 authorization before you can add this sensor. Provide the required credentials in the dialog box that appears.

Google Credentials

This sensor uses OAuth2 authentication to get access to your Google account.

■ For details about this authentication approach, see section [Authentication via OAuth2](#) ¹¹⁷⁸.

Google Credentials

Setting	Description
OAuth URL	<p>Click Get Access Code to connect this sensor to your Google Drive account via OAuth2. This is necessary to allow the sensor to query data from Google Drive. A new browser window appears.</p> <p>Follow the steps in the browser window and confirm the permission for PRTG to connect to your Google Drive account. Copy the OAuth code you get and paste it into the OAuth Code field below.</p>
OAuth Code	<p>Paste the access code that you receive after completing the authorization process for PRTG in your Google Drive account.</p> <p>i It is mandatory to connect this sensor to your Google Drive account to create this sensor. Complete the OAuth approach first to get the OAuth code.</p>

Setting	Description
	Click OK to define the sensor settings .

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' configuration window. It includes a title bar, a 'Sensor Name' field with an information icon and the value 'Example Name', a 'Tags' field with an information icon, a list containing 'exampletag' with a delete 'x' icon and an add '+' icon, and a 'Priority' field with an information icon and five star icons, three of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p>

Setting	Description
	<p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[3977]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

 This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#)^[4167] settings are not available for this sensor.

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p> <p> ⓘ The minimum scanning interval for this sensor is 30 minutes.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails.

Setting	Description
	<p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies ⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>

Setting	Description
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

inherit from  Root

User Group Access 	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none">▪ Bandwidth▪ Memory▪ Disk▪ File▪ Custom <p> Custom channel types are only available on sensor level.</p>

Authentication via OAuth2

 This sensor uses the OAuth2 security protocol to access the account from which you want to retrieve and monitor data. OAuth2 enables you to grant access to the target account without sharing your password with PRTG. The authorization approach of PRTG using OAuth2 works as follows.

1. Authorization Request

First, you have to request authorization for this sensor to access service resources from your account. For this purpose, you are asked to get an access code for this sensor in the Add Sensor dialog. Click Get Access Code to start the authorization process using OAuth2. A new browser window opens on the authorization server of the target service.

2. Verifying Identity

This new window contains a login form for your account that you want to monitor. Log in to your account using your credentials for this service to authenticate your identity. This is a common login to your account on the target server so PRTG does not see your password. The service forwards you to the authorization page and asks you to permit PRTG to access the data in your account.

 If you are already logged in to the service with a user account, you do not have to enter credentials in this step and get directly to the access permission page.

3. Authorizing PRTG

Permit PRTG to access information on your account. Note that this permission holds only for this specific sensor, not for other sensors of this type or PRTG as a whole. For each sensor of this type you add, you have to confirm the access permission anew. You can change the account permissions at any time in your account at the target service.

4. Getting Authorization Code

Permitting PRTG to access your account data forwards you to a page where the service provides an authorization code. Copy this code and switch back to the Add Sensor dialog in PRTG.

 The code is only valid for a short period of time and expires after a few minutes. You can use a particular code only once.

5. Providing Authorization Code

Paste the authorization code into the OAuth Code field and complete the Add Sensor dialog. You do not have to go through further configuration steps manually. The sensor automatically accomplishes the following steps.

6. Requesting Access Token

After receiving the authorization code, PRTG requests an access token from the API of the target service. For this purpose, PRTG transmits the authorization code together with several authentication details. The API checks if the authorization is valid and returns the access token to PRTG. Access tokens are specific for one account and one application (here: PRTG). The authorization process to read data from your account is now complete.

7. Retrieving Data

The sensor transmits the access token with each sensor scan in the defined scanning interval to authenticate with your account. It is not necessary to use the original account credentials anew. The used tokens refresh automatically from time to time.

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Storage Free	The free storage in bytes
Storage Free %	The free storage in percent i This channel is the primary channel by default.
Trash Size	The trash size in percent

More

■ KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

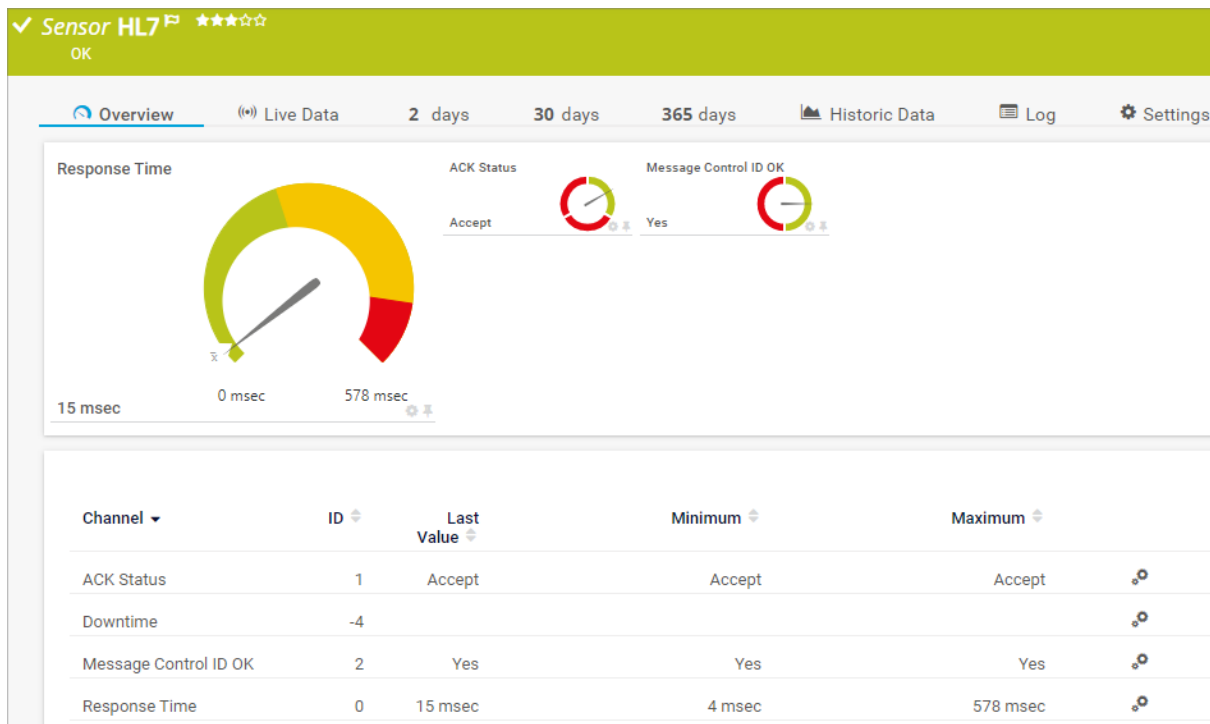

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.57 HL7 Sensor

The HL7 sensor monitors the availability of Health Level 7 (HL7) interfaces. It sends an HL7 message to the target device and checks for a valid response.

i You can define your own messages in HL7 format as .hl7 files in the [PRTG program directory](#).
The sensor sends them to the HL7-capable system with each scanning interval.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

HL7 Sensor

Sensor in Other Languages

- Dutch: HL7
- French: HL7
- German: HL7
- Japanese: HL7
- Portuguese: HL7
- Russian: HL7
- Simplified Chinese: HL7
- Spanish: HL7

Remarks

- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor supports the IPv6 protocol.

- This sensor has a medium performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

HL7 Message Specific

Setting	Description
HL7 Messages	<p>Select an HL7 file from the list. The sensor sends it to the target device with every scanning interval.</p> <p>The list shows all files that are available in the \Custom Sensors\hl7 subfolder of the PRTG program directory on the probe system. For files to appear in this list, store them in this subfolder with the extension .hl7.</p> <p> To be accepted by the HL7 interface, your files must have the expected HL7 message format. PRTG comes with two sample HL7 message files that you can use to test your HL7 monitoring and to have a look at the expected format. These files are in the \Custom Sensors\hl7 subfolder.</p> <p> You can override certain headers using the Message Header (MSH) sensor setting.</p>

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
ACK Status	<p>Acknowledgment (ACK) status</p> <ul style="list-style-type: none"> ▪ Up status ¹⁹⁷: Accept ▪ Down status: Error, Reject
Downtime	<p>In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.</p>
Message Control ID OK	<p>The message control ID status</p> <ul style="list-style-type: none"> ▪ Up status: Yes ▪ Down status: No
Response Time	<p>The response time in milliseconds (msec)</p> <p> This channel is the primary channel by default.</p>

7.8.58 HTTP Sensor

The HTTP sensor monitors a web server using HTTP.

i You can use this sensor to monitor if a website or a specific website element is reachable.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

HTTP Sensor

Sensor in Other Languages

- Dutch: HTTP
- French: HTTP
- German: HTTP
- Japanese: HTTP
- Portuguese: HTTP
- Russian: HTTP
- Simplified Chinese: HTTP
- Spanish: HTTP

Remarks

- This sensor does not support Secure Remote Password (SRP) ciphers.
- This sensor supports smart URL replacement.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

- See the Knowledge Base: [My HTTP sensors fail to monitor websites which use SNI. What can I do?](#)
- See the Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ httpsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

HTTP Specific

HTTP Specific

Timeout (Sec.) **i**

URL **i**

Request Method **i** GET
 POST
 HEAD

Server Name Indication **i**

SNI Inheritance **i** Inherit SNI from parent device
 Do not inherit SNI from parent device

HTTP Specific

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
URL	<p>Enter the URL that the sensor connects to. If you enter an absolute URL, the sensor uses this address independently of the IP Address/DNS Name setting of the parent device. You can enter the URL of a web page (to measure the loading time of the page's source code), or enter the URL of an image or of a page asset to measure this element's availability and loading time.</p>

Setting	Description
	<p> The URL must be URL encoded.</p> <p> If you monitor an image or a page asset, this can create a high amount of memory load. We recommend that the size of the elements that you want to monitor does not exceed 200 MB.</p> <p> PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section Smart URL Replacement ¹²⁰².</p>
Request Method	<p>Select an HTTP request method to determine how the sensor requests the URL:</p> <ul style="list-style-type: none"> ▪ GET: Directly request the website. <ul style="list-style-type: none">  We recommend that you use this setting for a simple check of the web page. ▪ POST: Send post form data to the URL. <ul style="list-style-type: none">  If you select this setting, you must enter the data in the Postdata field below. ▪ HEAD: Only request the HTTP header from the server without the actual web page. <ul style="list-style-type: none">  Although this saves bandwidth because it transfers less data, we do not recommend that you use this. This is because the measured request time is not the one that your users experience and you might not be notified of slow results or timeouts.
Postdata	<p>This setting is only visible if you select POST above. Enter the data part for the POST request.</p> <p> No Extensible Markup Language (XML) is allowed here.</p>
Content Type	<p>This setting is only visible if you select POST above. Define the content type of the POST request:</p> <ul style="list-style-type: none"> ▪ Default (application/x-www-form-urlencoded): Use the default content type to encode the form data set for submission to the server. ▪ Custom: Use a custom content type. Enter the content type below.
Custom Content Type	<p>This setting is only visible if you select Custom above. Define the custom content type, for example, XML, JavaScript Object Notation (JSON), or HTTP.</p>
Server Name Indication	<p>Shows the Server Name Identification (SNI) that the sensor automatically determines from the host address of the parent device ⁴⁴⁷ or from the target URL of the sensor.</p> <p> The SNI must be a fully qualified domain name (FQDN). Make sure that it matches the configuration of the target server.</p>

Setting	Description
	<p>■ For details, see the Knowledge Base: My HTTP sensors fail to monitor websites which use SNI. What can I do?</p> <p>ⓘ This sensor implicitly supports SNI, an extension to the Transport Layer Security (TLS) protocol.</p>
SNI Inheritance	<p>Define if you want to inherit the SNI from the parent device:</p> <ul style="list-style-type: none"> ▪ Inherit SNI from parent device: Determine the SNI from the host address of the parent device. ▪ Do not inherit SNI from parent device: Determine the SNI from the target URL as defined in the settings of this sensor.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Proxy Settings for HTTP Sensors

Click  to interrupt the [inheritance](#)^[142].

The proxy settings determine how a sensor connects to a URL. You can enter data for an HTTP proxy server that sensors use when they connect via HTTP or HTTPS.

 This setting only applies to HTTP sensors and how they monitor. To change the proxy settings for the PRTG core server, see section [Core & Probes](#)^[4203].

Proxy Settings for HTTP Sensors

IP Address/DNS Name 	192.0.2.0
Port 	8080
User Name 	johnqpublic
Password 

Proxy Settings for HTTP Sensors

Setting	Description
IP Address/DNS Name	Enter the IP address or Domain Name System (DNS) name of the proxy server. If you leave this field empty, HTTP sensors do not use a proxy.
Port	Enter the port number of the proxy. The default is 8080. Enter an integer value.
User Name	<p>If the proxy requires authentication, enter the user name for the proxy login.</p> <p> Only basic authentication is available. Enter a string or leave the field empty.</p>
Password	<p>If the proxy requires authentication, enter the password for the proxy login.</p> <p> Only basic authentication is available. Enter a string or leave the field empty.</p>

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

 User Group	 Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management.</p>

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either [http://](#) or [https://](#), or even a simple forward slash / as the equivalent for [http://](#)). PRTG automatically fills in the parent device's IP address or DNS name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.mycompany.com](#) and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter [https://](#) in the URL field, PRTG automatically creates the URL [https://www.mycompany.com/](#)
- If you enter [/help](#) in the URL field, PRTG automatically creates and monitor the URL [http://www.mycompany.com/help](#)
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, [http://:8080/](#)

i Smart URL replacement does not work for sensors that run on the probe device.

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Loading Time	The loading time of the web page or element in milliseconds (msec)  This channel is the primary channel by default.

We recommend that the size of the elements that you want to monitor does not exceed 200 MB.</p> <p>■ PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section Smart URL Replacement ¹²²¹.</p>
Request Method	<p>Select an HTTP request method to determine how the sensor requests the URL:</p> <ul style="list-style-type: none"> ▪ GET: Directly request the website. <ul style="list-style-type: none"> i We recommend that you use this setting for a simple check of the web page. ▪ POST: Send post form data to the URL. <ul style="list-style-type: none"> i If you select this setting, you must enter the data in the Postdata field below. ▪ HEAD: Only request the HTTP header from the server without the actual web page. <ul style="list-style-type: none"> i Although this saves bandwidth because it transfers less data, we do not recommend that you use this. This is because the measured request time is not the one that your users experience and you might not be notified of slow results or timeouts.
Postdata	<p>This setting is only visible if you select POST above. Enter the data part for the POST request.</p> <p>i No Extensible Markup Language (XML) is allowed here.</p>
Content Type	<p>This setting is only visible if you select POST above. Define the content type of the POST request:</p> <ul style="list-style-type: none"> ▪ Default (application/x-www-form-urlencoded): Use the default content type to encode the form data set for submission to the server. ▪ Custom: Use a custom content type. Enter the content type below.

Setting	Description
Custom Content Type	This setting is only visible if you select Custom above. Define the custom content type, for example, XML, JavaScript Object Notation (JSON), or HTTP.
Server Name Indication	Shows the Server Name Identification (SNI) that the sensor automatically determines from the host address of the parent device ^[447] or from the target URL of the sensor. <p>i The SNI must be a fully qualified domain name (FQDN). Make sure that it matches the configuration of the target server.</p> <p>■ For details, see the Knowledge Base: My HTTP sensors fail to monitor websites which use SNI. What can I do?</p> <p>i This sensor implicitly supports SNI, an extension to the Transport Layer Security (TLS) protocol.</p>
SNI Inheritance	Define if you want to inherit the SNI from the parent device: <ul style="list-style-type: none"> ▪ Inherit SNI from parent device: Determine the SNI from the host address of the parent device. ▪ Do not inherit SNI from parent device: Determine the SNI from the target URL as defined in the settings of this sensor.

HTTP Engine

HTTP Engine

Monitoring Engine **i**

Default engine (recommended)
 Compatibility engine

HTTP Engine

Setting	Description
Monitoring Engine	Choose the monitoring engine that the sensor uses: <ul style="list-style-type: none"> ▪ Default engine (recommended): Use the default monitoring engine. ▪ Compatibility engine: Execute an external executable program. Use this method as an alternative for websites that do not work with the default monitoring engine. <ul style="list-style-type: none"> i This method needs more resources but it can be helpful in some cases. i If you select the compatibility mode, the options for the SSL method are different. You can also check for trusted certificates. See below. i Smart URL Replacement does not work with the compatibility mode, so this sensor does not automatically use the IP Address/DNS value of the parent device.

Setting	Description
SSL/TLS Method	<p>This option is only visible if you select Alternate/Compatibility Mode above. Choose from:</p> <ul style="list-style-type: none"> ▪ SSLv3 ▪ TLS 1.0, TLS 1.1, TLS 1.2 ▪ SSLv3, TLS 1.0, TLS 1.1, TLS 1.2 (default)
Check SSL Certificates	<p>This option is only visible if you select Alternate/Compatibility Mode above. Specify if the sensor checks the certificate of the URL:</p> <ul style="list-style-type: none"> ▪ Do not check certificates: Do not check the certificates of the web pages. This the default setting. ▪ Check if certificates are trusted: Check the certificates of the web pages. If the certificate of the server is not trusted, the sensor shows a Down status and displays a corresponding message.

Advanced Sensor Data

Setting	Description
HTTP Version	<p>Define the HTTP version that the sensor uses when it connects to the target URL:</p> <ul style="list-style-type: none"> ▪ HTTP 1.0: Use HTTP version 1.0. ▪ HTTP 1.1: Use HTTP version 1.1.
User Agent	<p>Choose which user agent string the sensor sends when it connects to the target URL:</p> <ul style="list-style-type: none"> ▪ Use the default string: Do not enter a specific user agent and use the default string. Usually, this is Mozilla/5.0 (compatible; PRTG Network Monitor (www.paessler.com); Windows). ▪ Use a custom string: Use a custom user agent. Define the custom user agent below.
Custom User Agent	<p>This setting is only visible if you enable Use a custom string above. Enter the string that the sensor uses as the user agent when it connects to the target URL.</p>
HTTP Headers	<p>Define if you want to send custom HTTP headers to the target URL:</p> <ul style="list-style-type: none"> ▪ Do not use custom HTTP headers: Do not use custom HTTP headers. ▪ Use custom HTTP headers: Use custom headers. Define below.
Custom HTTP Headers	<p>This setting is only visible if you enable Use custom HTTP headers above. Enter a list of custom HTTP headers and values that you want to transmit to the URL, each pair in one line. The syntax of a header-value pair is header1:value1</p> <ul style="list-style-type: none"> ⓘ The sensor does not support the header field names user-agent, content-length, and host. ⓘ Ensure that the HTTP header statement is valid. Otherwise, the sensor request cannot be successful.
If Content Changes	<p>Define what the sensor does if the content of the web page (element) changes:</p> <ul style="list-style-type: none"> • Ignore changes: Take no action on change. • Trigger 'change' notification: Send an internal message that indicates that the web page content has changed. In combination with a change trigger⁴¹³⁸, you can use this mechanism to trigger a notification³⁹⁸⁷ whenever the web page content changes.
Require Keyword	<p>Define if the sensor checks the result at the URL for keywords:</p> <ul style="list-style-type: none"> ▪ Do not check for keyword (default): Do not search for keywords in the result.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning if keyword is missing: Check if a keyword exists in the result. If it exists, set the sensor to the Warning status. ▪ Set sensor to error if keyword is missing: Check if a keyword exists in the result. If it exists, set the sensor to the Down status. <p>i The content check is only intended for HTML websites and might not work with other target URLs. For example, binary files are not supported.</p> <p>i This sensor loads the source code at the URL. If you set up a content check, only this source code is checked for the keywords. The code is not necessarily identical to the code used to display the page when opening the same URL in a web browser. This is because a reload might be configured or certain information might be inserted after loading, for example, via JavaScript.</p> <p>i PRTG does not follow links to embedded objects nor does it execute scripts. Only the first page at the URL is loaded and checked against the expressions configured.</p>
Response Must Include	<p>This setting is only visible if you select keyword checking above. Define the search string that must be part of the source code at the URL. You can enter a simple string in plain text or a regular expression (regex)⁴⁴⁹⁷.</p> <p>i If the source code does not include the search pattern, the sensor shows the status defined above.</p> <p>i The search string must be case sensitive.</p>
Search Method	<p>Define the method with which you want to provide the search string:</p> <ul style="list-style-type: none"> ▪ Simple string search: Search for a simple string in plain text. <p>i The characters * and ? work as placeholders. * stands for no number or any number of characters and ? stands for exactly one character. You cannot change this behavior. The literal search for these characters is only possible with a regex.</p> <p>i You can also search for HTML tags.</p> <ul style="list-style-type: none"> ▪ Regular expression: Search with a regex. <p>i PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section Regular Expressions⁴⁴⁹⁷.</p>
Exclude Keyword	<p>Define if the sensor checks the result at the URL for keywords:</p> <ul style="list-style-type: none"> ▪ Do not check for keyword (default): Do not search for keywords in the result. ▪ Set sensor to warning if keyword is found: Check if a keyword exists in the result. If it exists, set the sensor to the Warning status.

Setting	Description
Response Must Not include	<ul style="list-style-type: none"> ▪ Set sensor to error if keyword is found: Check if a keyword exists in the result. If it exists, set the sensor to the Down status. <p>i The content check is only intended for HTML websites and might not work with other target URLs. For example, binary files are not supported.</p> <p>This setting is only visible if you select keyword checking (exclude) above. Define the search string that must not be part of the source code at the specified URL. You can enter a simple string in plain text or a regular expression.</p> <ul style="list-style-type: none"> i The search string must be case sensitive. i If the data does include this string, the sensor shows the status defined above.
Search Method	<p>Define the method with which you want to provide the search string:</p> <ul style="list-style-type: none"> ▪ Simple string search: Search for a simple string in plain text. <p>i The characters * and ? work as placeholders. * stands for no number or any number of characters and ? stands for exactly one character. You cannot change this behavior. The literal search for these characters is only possible with a regex.</p> <p>i You can also search for HTML tags.</p> <ul style="list-style-type: none"> ▪ Regular expression: Search with a regex. <p>i PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section Regular Expressions⁴⁴⁹⁷.</p>
Download Limit (KB)	<p>Enter the maximum amount of data (in kilobytes) that is transferred per request.</p> <p>i If you set content checks, be aware that they might be incomplete because only the content downloaded up to this limit is checked for search expressions.</p>
Result Handling	<p>Define what the sensor does with the data loaded at the URL:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last result of the requested data in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁸ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID]-A.txt, and Result of Sensor [ID].Data.txt. This setting is for debugging purposes, especially in combination with content checks. PRTG overwrites these files with each scanning interval.

Setting	Description
	<p> For debugging, select Store result to write the source code file to disk and to look up what exactly PRTG gets when it calls the URL. If the URL does not point to a web page but to a binary file, for example, to an image, you usually do not check for content.</p> <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Authentication

Authentication Authentication 

Web page does not need authentication
 Web page needs authentication

Authentication

Setting	Description
Authentication	<p>Define if authentication is necessary on the web page:</p> <ul style="list-style-type: none"> ▪ Web page does not need authentication ▪ Web page needs authentication
User Name	<p>This setting is only visible if you select Web page needs authentication above. Enter a user name. Enter a string.</p>
Password	<p>This setting is only visible if you select Web page needs authentication above. Enter a password. Enter a string.</p>
Authentication Method	<p>This setting is only visible if you select Web page needs authentication above. Select the authentication method that the URL uses:</p> <ul style="list-style-type: none"> ▪ HTTP authentication: Use simple HTTP authentication. <ul style="list-style-type: none">  This authentication method transmits credentials as plain text. ▪ NT LAN Manager authentication: Use the Microsoft NT LAN Manager (NTLM) protocol for authentication. ▪ Digest access authentication: Use digest access authentication. This applies a hash function to the password, which is safer than HTTP authentication.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ⓘ).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ⓘ if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ⓘ.

Proxy Settings for HTTP Sensors

Click ⓘ to interrupt the [inheritance](#) ⓘ.

The proxy settings determine how a sensor connects to a URL. You can enter data for an HTTP proxy server that sensors use when they connect via HTTP or HTTPS.

i This setting only applies to HTTP sensors and how they monitor. To change the proxy settings for the PRTG core server, see section [Core & Probes](#)⁴²⁰³.

Proxy Settings for HTTP Sensors

IP Address/DNS Name i	192.0.2.0
Port i	8080
User Name i	johnqpublic
Password i

Proxy Settings for HTTP Sensors

Setting	Description
IP Address/DNS Name	Enter the IP address or Domain Name System (DNS) name of the proxy server. If you leave this field empty, HTTP sensors do not use a proxy.
Port	Enter the port number of the proxy. The default is 8080. Enter an integer value.
User Name	<p>If the proxy requires authentication, enter the user name for the proxy login.</p> <p>i Only basic authentication is available. Enter a string or leave the field empty.</p>
Password	<p>If the proxy requires authentication, enter the password for the proxy login.</p> <p>i Only basic authentication is available. Enter a string or leave the field empty.</p>

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

 inherit from  Root	Scanning Interval i	60 seconds
	If a Sensor Query Fails i	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails.

Setting	Description
	<p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies ⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>

Setting	Description
Dependency	This setting is only visible if you enable Select a sensor above . Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

 inherit from  Root

User Group Access 	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either <http://> or <https://>, or even a simple forward slash / as the equivalent for <http://>). PRTG automatically fills in the parent device's IP address or DNS name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name www.mycompany.com and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter <https://> in the URL field, PRTG automatically creates the URL <https://www.mycompany.com/>
- If you enter [/help](http://www.mycompany.com/help) in the URL field, PRTG automatically creates and monitor the URL <http://www.mycompany.com/help>
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, <http://:8080/>

i Smart URL replacement does not work for sensors that run on the probe device.

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Bytes Received	The received bytes

Channel	Description
Download Bandwidth	The download speed in bytes per second
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Loading Time	The loading time in milliseconds (msec)  This channel is the primary channel by default.
Time To First Byte	The time to the first byte in msec
