Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None ▼

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

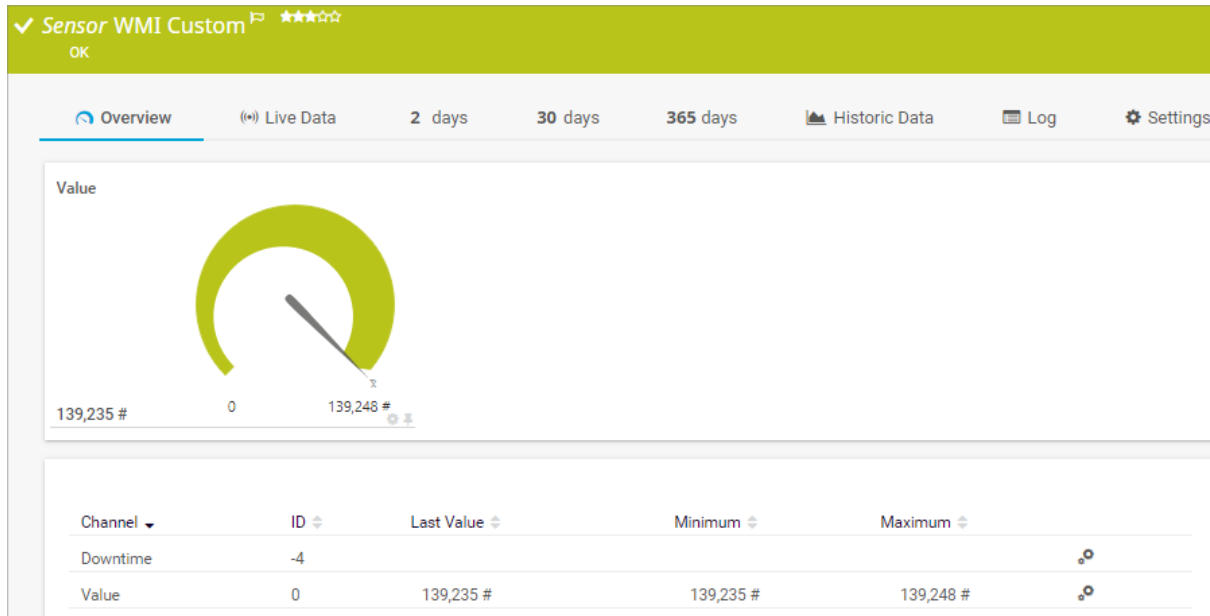

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.250 WMI Custom Sensor

The WMI Custom sensor performs a custom query via Windows Management Instrumentation (WMI) and monitors numeric values (integers and floats).

i If the WQL query returns strings, use the [WMI Custom String sensor](#)³⁶⁰⁸.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)³⁶⁰⁶.

WMI Custom Sensor

Sensor in Other Languages

- Dutch: WMI (Klant Specifiek)
- French: WMI (personnalisé)
- German: WMI (Benutzerdef.)
- Japanese: WMI カスタム
- Portuguese: WMI customizado
- Russian: WMI
- Simplified Chinese: WMI 自定义
- Spanish: WMI personalizado

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#)¹³⁰¹. Above this number, consider using multiple [remote probes](#)⁴⁵⁰³ for load balancing.
- This sensor requires [credentials for Windows systems](#)⁴⁵²¹ in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.

- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)
- See the Knowledge Base: [How do I create a WMI Custom sensor?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#)³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Custom Query Specific

Setting	Description
Channel Name	<p>Enter a name for the channel in which PRTG shows the received data. PRTG shows this name in graphs and tables. Enter a string.</p> <p>i You can change the name later in the sensor's channel settings³⁹⁷⁷.</p>
WQL File	<p>Select a WQL file. The sensor executes it with every scanning interval.</p> <p>The list contains WQL scripts that are available in the \Custom Sensors\WMI WQL scripts subfolder of the PRTG program directory⁴⁵²⁶ on the probe system. Store your script there. If used on a cluster probe, you must store the file on all cluster nodes.</p> <p>i Your query must return an integer or float value. Strings are not supported. Use the WMI Custom String sensor³⁶⁰⁸ in this case.</p>

Scanning Interval	
	Scanning Interval ⓘ 60 seconds
	If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management.</p>

Channel List

❗ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
[Value]	<p>The retrieved numeric value</p> <p>❗ This channel is the primary channel by default.</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

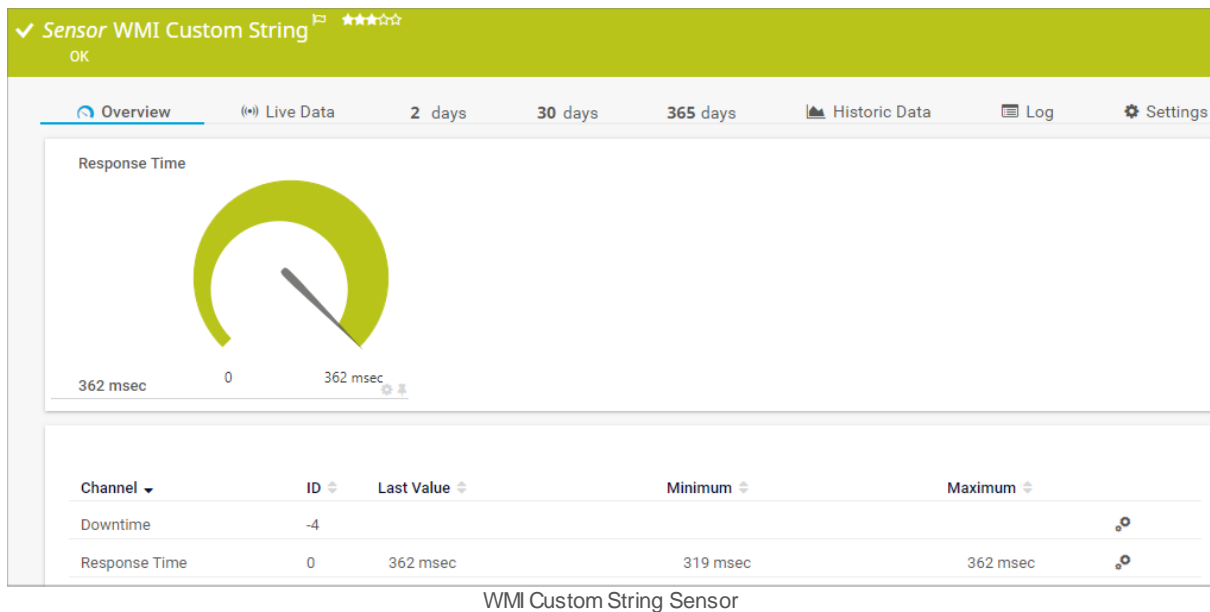

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.251 WMI Custom String Sensor

The WMI Custom String sensor performs a custom string query via Windows Management Instrumentation (WMI).

- ❶ The sensor can also show the retrieved string value in the sensor message.
- ❷ If the WQL query returns numeric values, use the [WMI Custom sensor](#).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Sensor in Other Languages

- Dutch: WMI Aangepaste Tekenreeks
- French: Chaîne personnalisée WMI
- German: WMI Text (benutzerdef.)
- Japanese: WMI カスタム文字列
- Portuguese: Sequência de caracteres personalizada WMI
- Russian: WMI
- Simplified Chinese: WMI 自定义字符串
- Spanish: WMI cadena personalizada

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.

- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)
- See the Knowledge Base: [How do I create a WMI Custom sensor?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Custom Query Specific

Setting	Description
WQL File	<p>Select a WQL file. The sensor executes it with every scanning interval.</p> <p>The list contains WQL scripts that are available in the \Custom Sensors\WMI WQL scripts subfolder of the PRTG program directory on the probe system. Store your script there. If used on a cluster probe, you must store the file on all cluster nodes.</p> <p>i If the WQL query returns integers or floats, use the WMI Custom sensor to not only show the returned value in the sensor message, but to also monitor the value in a channel.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Custom Query Specific

Setting	Description
Namespace	Enter the WMI namespace for the query. .
WQL File	Shows the WQL file that this sensor executes with every scanning interval. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Setting	Description
	<p> If the WQL query returns integers or floats, use the WMI Custom sensor ³⁵⁹⁶ to not only show the returned value in the sensor message, but to also monitor the value in a channel.</p>
Placeholder <#PH1>	In your WQL script, you can use up to three placeholders to which you can assign a value in this field. Enter a string for variable <#PH1> or leave the field empty.
Placeholder <#PH2>	In your WQL script, you can use up to three placeholders to which you can assign a value in this field. Enter a string for variable <#PH2> or leave the field empty.
Placeholder <#PH3>	In your WQL script, you can use up to three placeholders to which you can assign a value in this field. Enter a string for variable <#PH3> or leave the field empty.
Unit String	Enter a unit for the data that the sensor receives from your script. This is for display purposes only. The unit is displayed in graphs and tables. Enter a string.
If Value Changes	<p>Define what the sensor does when the sensor value changes:</p> <ul style="list-style-type: none"> ▪ Ignore changes (default): Take no action on change. ▪ Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger ⁴¹³⁸, you can use this mechanism to trigger a notification ³⁹⁸⁷ whenever the sensor value changes.
Response Must Include (Down Status if Not Included)	<p>Define the search string that must be part of the data that is received from the WMI object. You can enter a simple string in plain text or a regular expression ⁴⁴⁹⁷.</p> <p> The search string must be case sensitive.</p> <p> If the data does not include the search pattern, the sensor shows the Down status.</p>
Response Must Not Include (Down Status if Included)	<p>Define the search string that must not be part of the data that is received from the WMI object. You can enter a simple string in plain text or a regular expression.</p> <p> The search string must be case sensitive.</p> <p> If the data does include the search pattern, the sensor shows the Down status.</p>
Search Method	<p>Define the method with which you want to provide the search string:</p> <ul style="list-style-type: none"> ▪ Simple string search: Search for a simple string in plain text.

Setting	Description
	<p>i The characters <code>*</code> and <code>?</code> work as placeholders. <code>*</code> stands for no number or any number of characters and <code>?</code> stands for exactly one character. You cannot change this behavior. The literal search for these characters is only possible with a regex.</p> <ul style="list-style-type: none"> Regular expression: Search with a regular expression (regex). <p>i PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section Regular Expressions⁴⁴⁹⁷.</p>
Maximum Length of String	Define the maximum allowed length of the string that is received from the WMI object. If it is longer than this value, the sensor shows the Down status. Enter an integer value or leave the field empty.
Extract Number Using Regular Expression	<p>Define if you want to filter out a numeric value from the string received from the WMI object. You can convert this into a float value to use it with channel limits³⁹⁷⁸.</p> <ul style="list-style-type: none"> No extraction: Do not extract a float value. Use the result as a string value. Extract a numeric value using a regular expression: Use a regex to identify a numeric value in the string and convert it to a float value. Define below. <ul style="list-style-type: none"> See also the example³⁶¹⁹.
Regular Expression	<p>This setting is only visible if you select Extract a numeric value using a regular expression above. Enter a regex to identify the numeric value you want to extract from the string returned by the WMI object. You can use capturing groups here.</p> <p>i Make sure that the expression returns numbers only (including decimal and thousands separators). The result is further refined by the settings below.</p> <p>i PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section Regular Expressions⁴⁴⁹⁷.</p>
Index of Capturing Group	This setting is only visible if you select Extract a numeric value using a regular expression above. If your regex uses capturing groups, specify which group is used to capture the number. Enter an integer value or leave the field empty.
Decimal Separator	This setting is only visible if you select Extract a numeric value using a regular expression above. Define which character to use as decimal separator for the number extracted above. Enter a string or leave the field empty.

Setting	Description
Thousands Separator	This setting is only visible if you select Extract a numeric value using a regular expression above. Define which character to use as thousands separator for the number extracted above. Enter a string or leave the field empty.
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **ⓘ** Downtime

Graph Type **ⓘ** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Example: Number Extraction with Regular Expression

If you want to extract a number in the response string via a regex, note that the index for captures in this sensor is based on 1 (not on 0). Furthermore, capturing groups are not automatically created. The example below illustrates this issue.

Consider the following string as returned by a request for CPU usage:

```
5 Sec (3.49%), 1 Min (3.555%), 5 Min (3.90%)
```

Assuming you would like to filter for the number 3.555, this is the percentage in the second parentheses. Enter the following regex in the Regular Expression field:

```
(\d+\.\d+).*?(\d+\.\d+).*?(\d+\.\d+)
```

As Index of Capturing Group, enter 3. This extracts the desired number 3.555.

The index must be 3 in this case because the capturing groups here are the following:

- Group 1 contains 3.49%, 1 Min (3.555), 5 Min (3.90)

- Group 2 contains [3.49](#)
- Group 3 contains [3.555](#)
- Group 4 contains [3.90](#)

Keep this note about index and capturing groups in mind when using number extraction.

- i** It is not possible to match an empty string with the PRTG regex sensor search.
- i** PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section [Regular Expressions](#) ⁴⁴⁹⁷.

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Response Time	The response time in milliseconds (msec) i This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

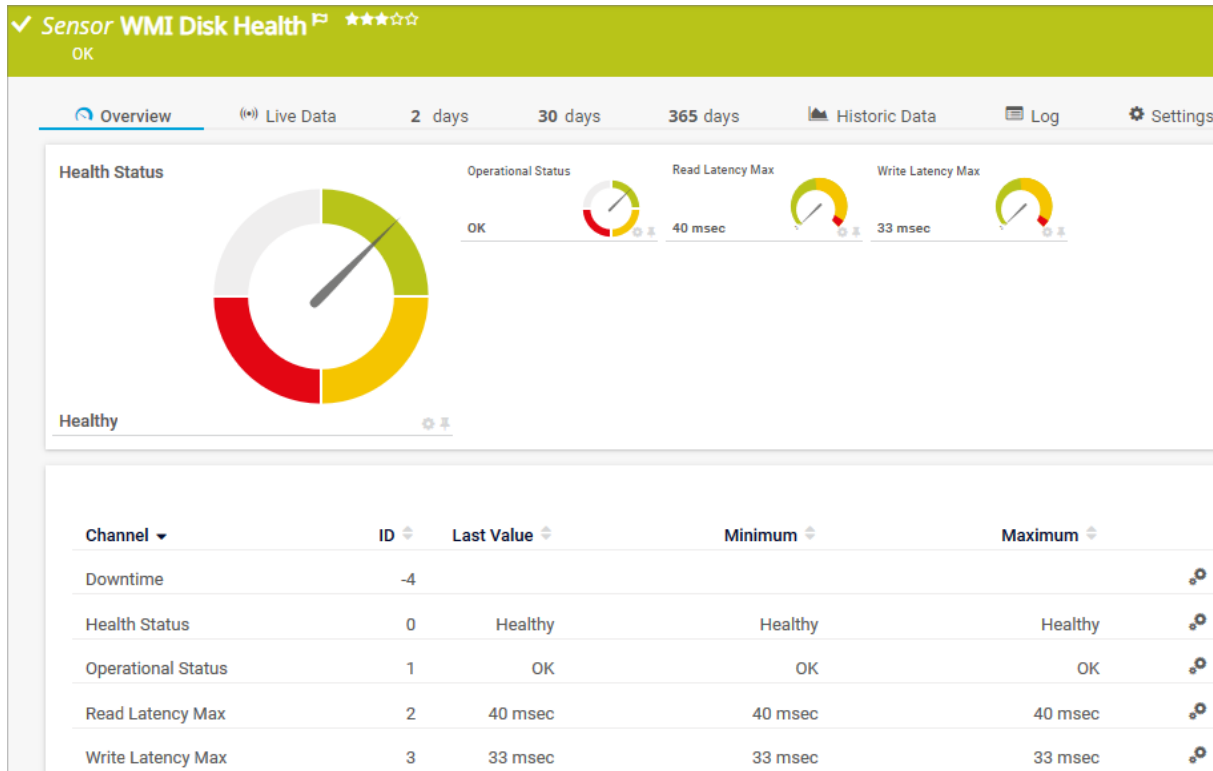

- [List of Available Sensor Types](#) ⁴³⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#) ³⁹⁷²

- [Channel Settings](#) 
- [Notification Triggers Settings](#) 

7.8.252 WMI Disk Health Sensor

The WMI Disk Health sensor monitors the health of a physical disk on a Windows system via Windows Management Instrumentation (WMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Disk Health Sensor

Sensor in Other Languages

- Dutch: WMI schijfstatus
- French: État de disque WMI
- German: WMI Laufwerkszustand
- Japanese: WMI ディスクの正常性
- Portuguese: Funcionamento do disco WMI
- Russian: WMI
- Simplified Chinese: WMI 磁盘运行状况
- Spanish: Estado de disco WMI

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.

- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports Windows 8 or Windows Server 2012 or later on the target system.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

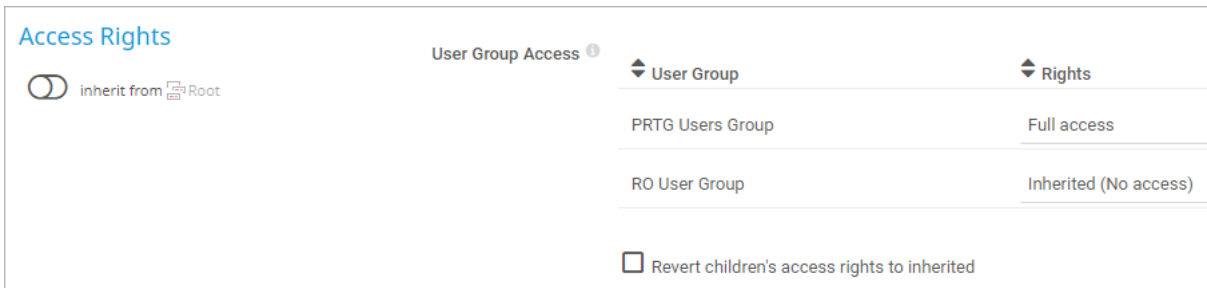

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [421] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

i Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷

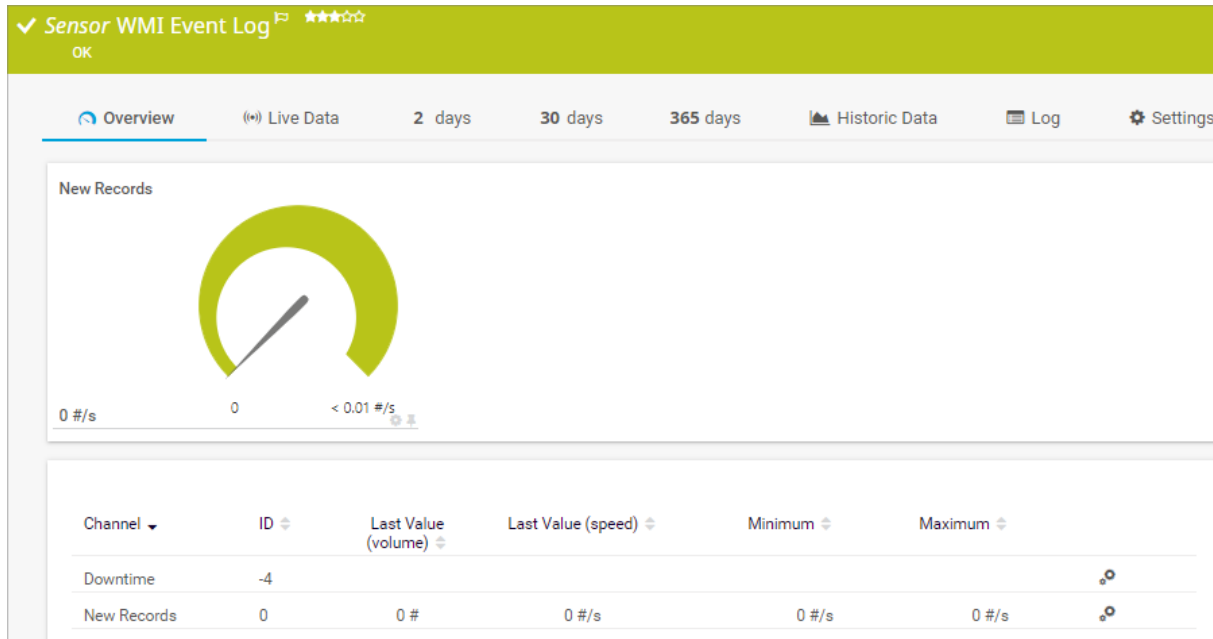

- [Notification Triggers Settings](#) 

7.8.253 WMI Event Log Sensor

The WMI Event Log sensor monitors a Windows logfile via Windows Management Instrumentation (WMI).

i You can individually set the sensor to a specific status according to a new event log entry.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Event Log Sensor

Sensor in Other Languages

- Dutch: WMI Logboek
- French: Log des événements WMI
- German: WMI Ereignisprotokoll
- Japanese: WMI イベントログ
- Portuguese: Log de eventos WMI
- Russian: WMI
- Simplified Chinese: WMI 事件日志
- Spanish: Registro de eventos WMI

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.

- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [My Event Log sensor ignores changes in the event log. What can I do?](#)
- See the Knowledge Base: [How can I configure sensors using speed limits to keep the status for more than one interval?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

WMI Event Log Monitor

Setting	Description
Log Files	<p>Select the log files that you want to monitor. PRTG creates one sensor for each log file that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
New Records	The number of new records per second This channel is the primary channel by default.

Sensor Settings Overview

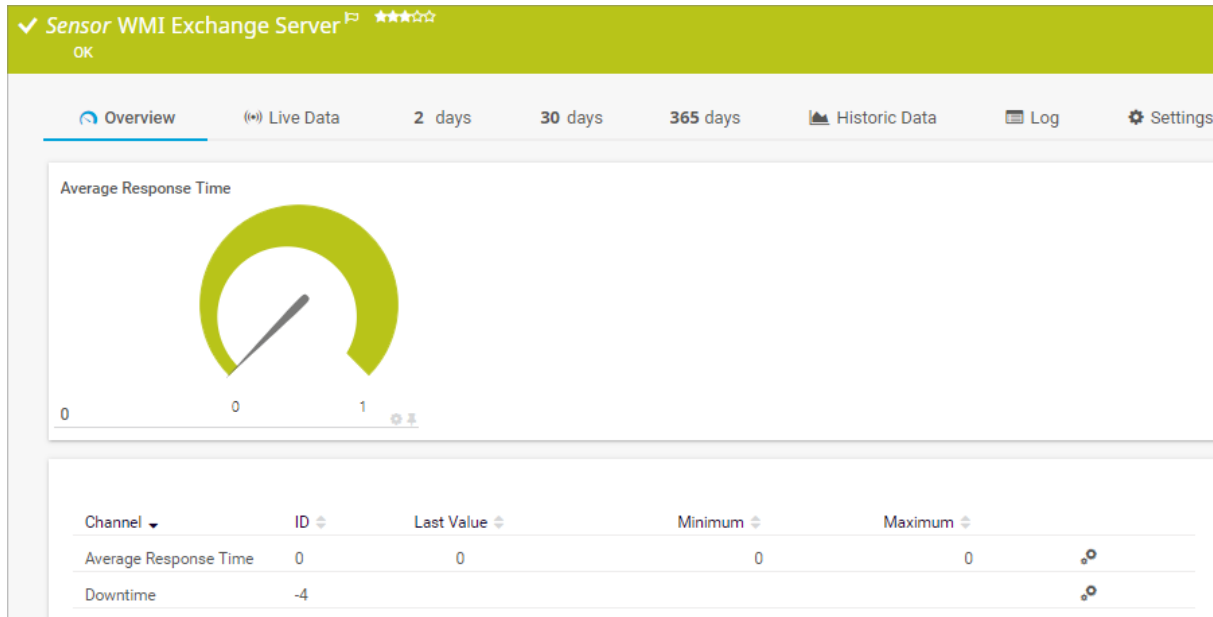

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.254 WMI Exchange Server Sensor

The WMI Exchange Server sensor monitors a Microsoft Exchange Server 2003 or later via Windows Management Instrumentation (WMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Exchange Server Sensor

Sensor in Other Languages

- Dutch: WMI Exchange Server
- French: Exchange Server WMI
- German: WMI Exchange-Server
- Japanese: WMI Exchange サーバー
- Portuguese: Exchange Server WMI
- Russian: WMI Exchange Server
- Simplified Chinese: WMI Exchange 服务器
- Spanish: WMI servidor Exchange

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports the IPv6 protocol.

i Former WMI Exchange Server **2003/2007** sensors from previous PRTG versions continue to monitor your Exchange server in PRTG 9, but newly added Exchange server sensors are WMI Exchange Server sensors that can monitor Exchange servers regardless of their version.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Exchange Server Data Readings Accessible Using WMI

Setting	Description
Performance Counters	<p>Select the performance counters of the Exchange server that you want to monitor. PRTG creates one sensor for each performance counter that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p> <p>The available options depend on your Exchange server configuration. PRTG shows all possible performance counters with the name and instance description (if available).</p> <p>You might be able to select aspects regarding:</p> <ul style="list-style-type: none"> ▪ SMTP Server: Queue Lengths ▪ MSEXchangeIS Mailbox: Queue Sizes, Delivery Times, Operations, Messages ▪ MSEXchangeIS Public: Queue Sizes, Delivery Times, Operations, Messages ▪ MSEXchangeIS: Packets, Operations, Clients, Latency, Requests, Users ▪ MSEXchange RPC Client Access: Active User Count, User Count, Connection Count ▪ MSEXchange OWA: Current Unique Users, Average Response Time <p>i Depending on your Exchange server version, not all counters might be available.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> wmiexchangeserversensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.

Setting	Description
	<p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval  60 seconds

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds

Setting	Description
	<ul style="list-style-type: none"> ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p>

Setting	Description
	<p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p>

Setting	Description
Maintenance Begins	<ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

- <https://kb.paessler.com/en/topic/61108>

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

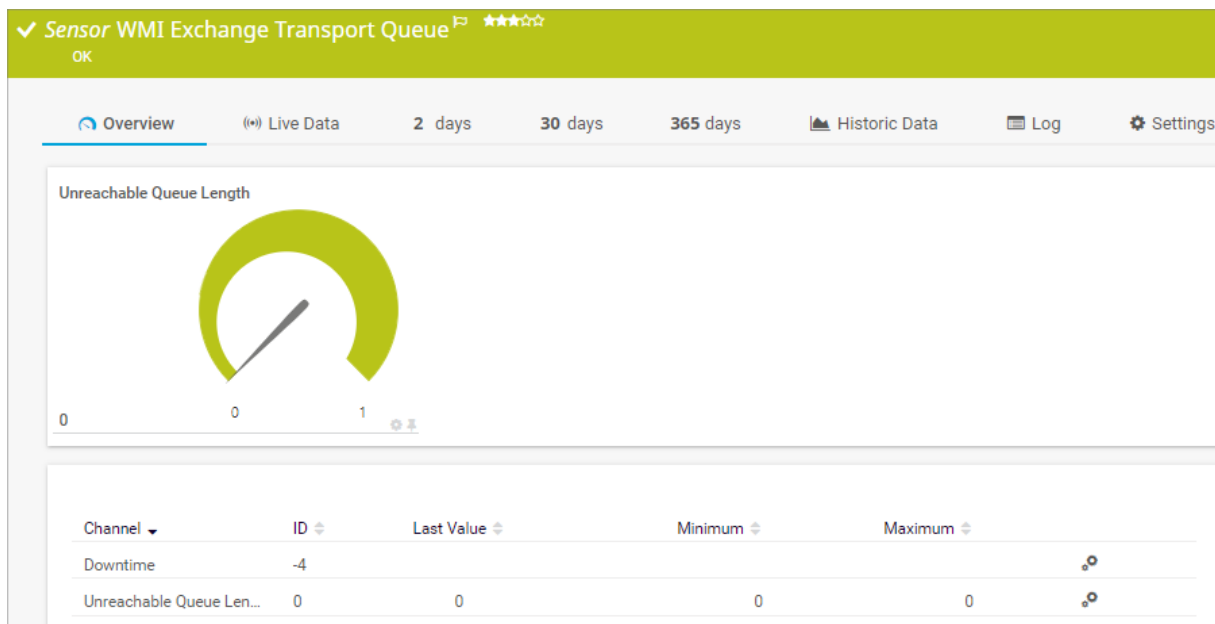

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3997

7.8.255 WMI Exchange Transport Queue Sensor

The WMI Exchange Transport Queue sensor monitors the length of transport queues of a Microsoft Exchange Server 2003 or later via Windows Management Instrumentation (WMI). It shows the same information as in Windows System Monitor [perfmon](#).

For an explanation of transport queue types, see the Knowledge Base: [What types of Exchange transport queues are there?](#)

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Exchange Transport Queue Sensor

Sensor in Other Languages

- Dutch: WMI Exchange Transport Wachtrij
- French: File d'attente de transport WMI Exchange
- German: WMI Exchange Transportwarteschlange
- Japanese: WMI Exchange 転送キュー
- Portuguese: Exchange Fila de transporte WMI
- Russian: WMI Exchange
- Simplified Chinese: WMI Exchange 传输队列
- Spanish: Cola de transporte WMI Exchange

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.

- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [What types of Exchange transport queues are there?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None ▼

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Channel List

ⓘ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Active Mailbox Delivery Queue Length	The number of items in the active mailbox delivery queue
Active Non-SMTP Delivery Queue Length	The number of items in the non-SMTP delivery queue

Channel	Description
Active Remote Delivery Queue Length	The number of items in the active remote delivery queue
Aggregate Delivery Queue Length (All Queues)	The number of items in the aggregate delivery queue (all queues)
Aggregate Shadow Queue Length	The number of items in the aggregate shadow queue
Categorizer Job Availability	The categorizer job availability
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Items Completed Delivery Per Second	The number of items with completed delivery per second
Items Completed Delivery Total	The number of items with completed delivery in total
Items Deleted By Admin Total	The number of items deleted by the admin in total
Items Queued For Delivery Expired Total	The number of items expired queued for delivery in total
Items Queued for Delivery Per Second	The number of items queued for delivery per second
Items Queued For Delivery Total	The number of items queued for delivery in total
Items Resubmitted Total	The number of items resubmitted in total
Largest Delivery Queue Length	The largest number of items in the delivery queue
Messages Completed Delivery Per Second	The number of messages with completed delivery per second
Messages Completed Delivery Total	The number of messages with completed delivery in total

Channel	Description
Messages Completing Categorization	The number of messages completing categorization
Messages Deferred Due To Local Loop	The number of messages deferred due to local loop
Messages Deferred During Categorization	The number of messages deferred during categorization
Messages Queued For Delivery	The number of messages queued for delivery
Messages Queued for Delivery Per Second	The number of messages queued for delivery per second
Messages Queued For Delivery Total	The number of messages queued for delivery in total
Messages Submitted Per Second	The number of messages submitted per second
Messages Submitted Total	The number of messages submitted in total
Poison Queue Length	The number of items in the poison queue
Retry Mailbox Delivery Queue Length	The number of items in the retry mailbox delivery queue
Retry Non-SMTP Delivery Queue Length	The number of items in the retry non-SMTP delivery queue
Retry Remote Delivery Queue Length	The number of items in the retry remote delivery queue
Shadow Queue Auto Discards Total	The number of auto discards in the shadow queue in total
Submission Queue Items Expired Total	The number of items expired in the submission queue in total
Submission Queue Length	The number of items in the submission queue

Channel	Description
Unreachable Queue Length	The number of items in the unreachable queue

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Sensor Settings Overview

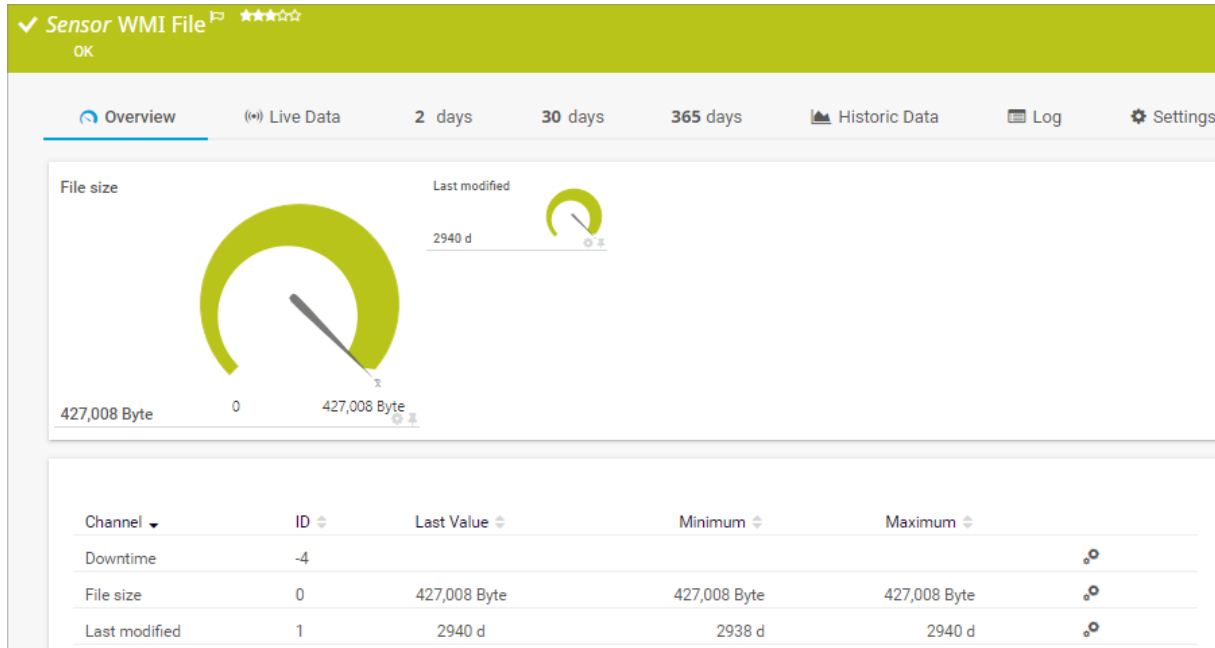

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3867

7.8.256 WMI File Sensor

The WMI File sensor monitors a file via Windows Management Instrumentation (WMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI File Sensor

Sensor in Other Languages

- Dutch: WMI Bestand
- French: Fichier WMI
- German: WMI Datei
- Japanese: WMI ファイル
- Portuguese: Arquivo WMI
- Russian: WMI
- Simplified Chinese: WMI 文件
- Spanish: WMI archivo

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections: 'Sensor Name' with the value 'Example Name', 'Tags' with a list containing 'exampletag', and 'Priority' set to 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ wmifilesensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

WMI File Monitor

WMI File Monitor

File Name ⁱ C:\Windows\regedit.exe

If Time Stamp Changes ⁱ Ignore changes
 Trigger 'change' notification

WMI File Monitor

Setting	Description
File Name	<p>Enter the name of the file that you want to monitor. Enter the full local path. The file must exist on the probe system.</p> <p>i The sensor does not support Universal Naming Convention (UNC) paths.</p>
If Time Stamp Changes	<p>Define what the sensor does when the time stamp of the file changes:</p> <ul style="list-style-type: none"> ▪ Ignore changes (default): Do not take action on change. ▪ Trigger 'change' notification: Send an internal message that indicates that the time stamp has changed. In combination with a change trigger ⁴¹³⁸, you can use this mechanism to trigger a notification ³⁹⁸⁷ whenever the time stamp changes.

Debug Options

Debug Options

Result Handling ⓘ

Discard result

Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p> ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ diskspacesensor ▪ wmidiskspacesensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

WMI Disk Free Configuration

WMI Disk Free Configuration

Drives **i** All

WMI Disk Free Configuration

Setting	Description
Drives	Shows the drives that this sensor monitors. This is either All or a specific drive letter. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Set Limits Checked for ALL Disks

In this section, you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor shows the Warning or the Down [status](#)¹⁹⁷, depending on the data provided by all drives that this sensor monitors. If you want to individually define limits for separate channels, use the limit settings in the [channel settings](#)³⁹⁷⁷.

i All limits that you define here are valid in addition to the limits defined in the particular Channel settings. The limits are valid simultaneously, so the first limit that is breached applies.

Set Limits Checked For ALL Disks Use the channel settings to set separate error limits or warning limits for each disk.

Percentage Limit Check i Only use the limits in the settings of the percentage channels
 Use the limits of both the sensor and the channel settings

Upper Error Limit i

Upper Warning Limit i

Lower Warning Limit i

Lower Error Limit i

Size Limit Check i Only use the limits in the settings of the byte size channels
 Use the limits of both the sensor and the channel settings

Alarm on Missing/Removed Disk i Deactivate alarm (default)
 Activate alarm

Set Limits Checked For ALL Disks

Setting	Description
Percentage Limit Check	Enable or disable a limit check for the free space in percentage channels of all drives. By default, the sensor enables percentage limits with a lower warning limit and a lower error limit. Choose between: <ul style="list-style-type: none"> Only use the limits in the settings of the percentage channels: Do not define sensor limits that are valid for all percentage channels. The sensor only uses the limits that you define in the settings of the particular "free space in percent" channels to determine the status.

Setting	Description
Upper Error Limit	<ul style="list-style-type: none"> ▪ Use the limits of both the sensor and the channel settings: Define sensor limits that are valid for all percentage channels. Additional fields appear below. The sensor shows the Warning or the Down status when free space limits are above or below the limits. <p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify an upper limit in percent for the Down status. If the free disk space of one of your drives exceeds this value, the sensor changes to the Down status. Enter an integer value or leave the field empty.</p>
Upper Warning Limit	<p>i The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p> <p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify an upper limit in percent for the Warning status. If the free disk space of one of your drives exceeds this value, the sensor changes to the Warning status. Enter an integer value or leave the field empty.</p>
Lower Warning Limit	<p>i The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p> <p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify a lower limit in percent for the Warning status. If the free disk space of one of your drives falls below this value, the sensor changes to the Warning status. Enter an integer value or leave the field empty.</p>
Lower Error Limit	<p>i The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p> <p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify a lower limit in percent for the Down status. If the free disk space of one of your drives falls below this value, the sensor changes to the Down status. Enter an integer value or leave the field empty.</p>
Size Limit Check	<p>Enable or disable a limit check for the free bytes channels of all drives:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ Only use the limits in the settings of the byte size channels: Do not define sensor limits that are valid for all byte size channels. The sensor only uses limits that you define in the settings of the particular free space in bytes channels to determine the status. ▪ Use the limits of both the sensor and the channel settings: Define limits for the sensor that are valid for all byte size channels. Additional fields appear below. The sensor shows the Warning or Down status when free space limits are above or below the value. <p>i By default, byte size limits are not enabled for drives.</p>
Upper Error Limit	<p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MB). If the free disk space of one of your drives exceeds this value, the sensor changes to the Down status. Enter an integer value or leave the field empty.</p> <p>i The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Upper Warning Limit	<p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MB). Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Sensor Settings Overview

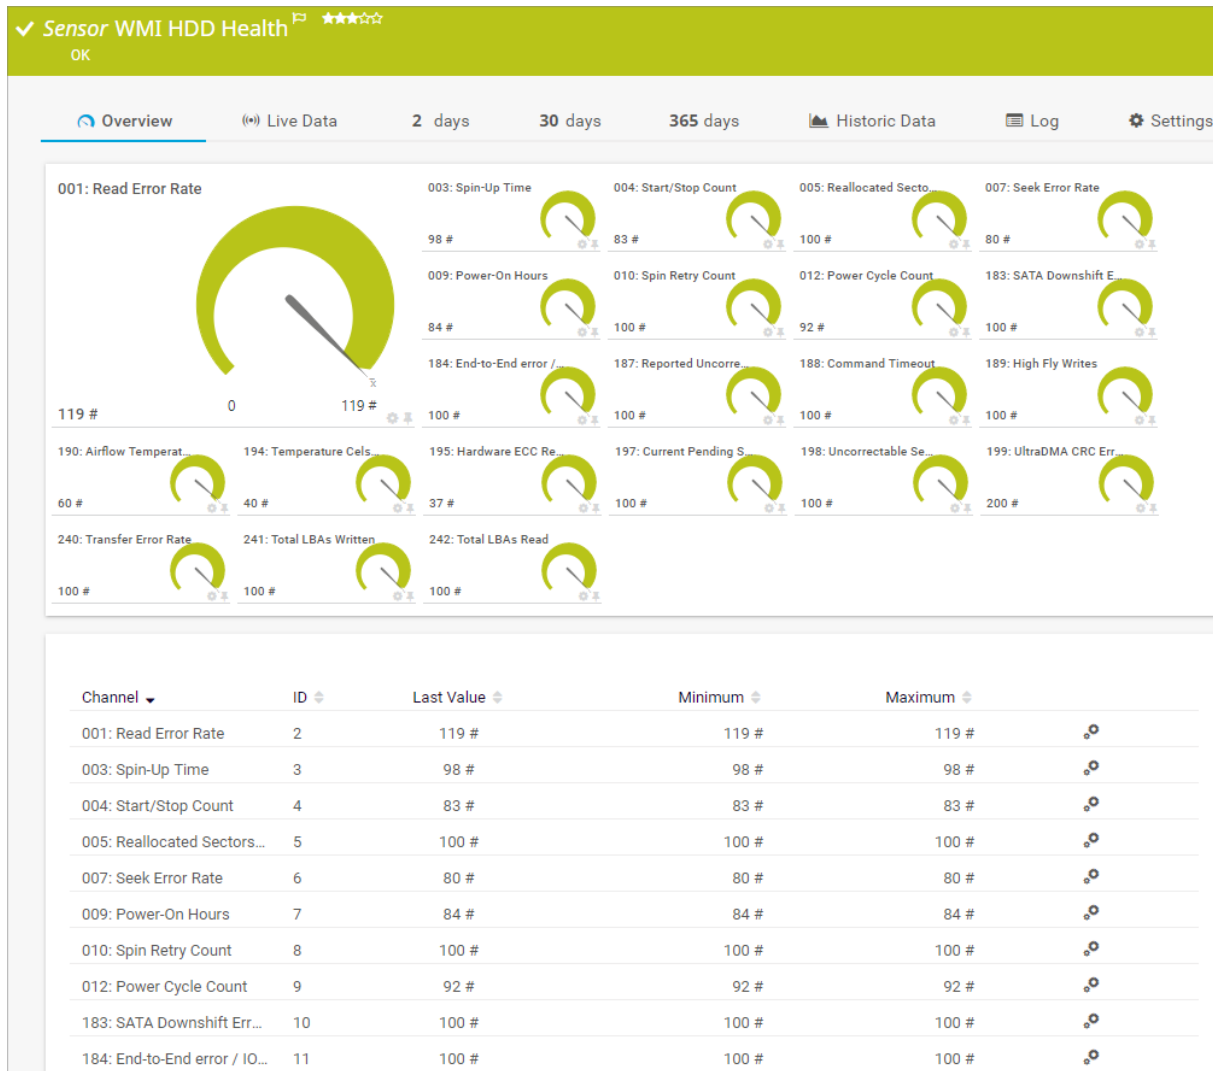

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.258 WMI HDD Health Sensor

The WMI HDD Health sensor connects to the parent device via Windows Management Instrumentation (WMI) and monitors the health of integrated development environment (IDE) disk drives on the target system using Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI HDD Health Sensor

Sensor in Other Languages

- Dutch: WMI HDD Status
- French: État WMI HDD
- German: WMI Laufwerkszustand
- Japanese: WMI HDD 正常性
- Portuguese: Funcionamento do HD WMI
- Russian: WMI

- Simplified Chinese: WMI 硬盘健康状况
- Spanish: Salud de disco duro WMI

Remarks

- This sensor requires Windows 7 or later on the target machine that holds the hard disk drives you want to monitor. The sensor might not work reliably if the target machine runs on Windows 2003, Windows XP, or Windows Vista. Because of a known bug in those systems, the sensor might not detect available hard disk drives.
- This sensor requires [credentials for Windows systems](#) [452] in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- The values that this sensor shows can vary depending on how a vendor handles S.M.A.R.T. values. See the respective vendor's documentation for more information.
- For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#) [4298].
- This sensor has a medium performance impact.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) [361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights							
User Group Access							
<input type="radio"/> inherit from Root	<table border="1"> <thead> <tr> <th>User Group</th> <th>Rights</th> </tr> </thead> <tbody> <tr> <td>PRTG Users Group</td> <td>Full access</td> </tr> <tr> <td>RO User Group</td> <td>Inherited (No access)</td> </tr> </tbody> </table>	User Group	Rights	PRTG Users Group	Full access	RO User Group	Inherited (No access)
User Group	Rights						
PRTG Users Group	Full access						
RO User Group	Inherited (No access)						
<input type="checkbox"/> Revert children's access rights to inherited							

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

- Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

The channel names indicate the ID of the S.M.A.R.T. attribute, followed by a colon, and the typical meaning of the channel. The sensor can also show other attributes that the target device returns, but some channels have the name Unknown Channel. This happens if PRTG cannot match the ID of a found attribute with an internally defined channel name.

- Some vendors do not agree on attribute definitions and define meanings other than the common ones.

Every attribute of a disk assumes a value. PRTG shows these attributes as channels with their last, minimum, and maximum value. These channel values change over time and indicate the disk health. Higher values correspond to a better health. The disk's attributes come with a threshold, defined by the manufacturer of the drive. If a channel value is lower than this threshold, the sensor automatically shows the Warning [status](#) ¹⁹⁷. This indicates that the S.M.A.R.T. status of the HDD might break soon.

i For some attributes, there are no thresholds defined and because of this, they cannot be categorized for a status other than the Up status. You can define [lookups](#) and use them with affected channels to get the desired status for a return value.

Channel	Description
Average Erase Count And Maximum Erase Count	The average erase count and the maximum erase count
Command Timeout	The command timeout count
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Erase Fail Count	The erase fail count
G-Sense Error Rate	The G-sense error rate count
Hardware ECC Recovered	The hardware ECC recovered count
Power Cycle Count	The power cycle count
Power Loss Protection Failure	The power loss protection failure count
Power-On Hours	The power-on hours count
Program Fail Count Total	The program fail count total
Read Error Rate	The read error rate count i This channel is the primary channel by default.
Read Error Retry Rate	The read error retry rate count
Reallocated Sectors Count	The reallocated sectors count
Reported Uncorrectable Errors	The reported uncorrectable errors count
SATA Downshift Error Count	The SATA downshift error count

Channel	Description
Soft ECC Correction	The soft ECC correction count
Soft Read Error Rate	The soft read error rate count
SSD Erase Fail Count	The SSD erase fail count
SSD Life Left	The SSD life left count
SSD Program Fail Count	The SSD program fail count
Unexpected Power Loss Count	The unexpected power loss count
Unknown Channel	PRTG cannot match the ID of a found attribute with an internally defined channel name
Unused Reserved Block Count Total	The unused reserved block count total
Used Reserved Block Count Total	The used reserved block count total
Temperature Celsius	The temperature
Total LBAs Read	The total LBAs read
Total LBAs Written	The total LBAs written
Wear Range Delta	The wear range delta

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#) 

Part 7: Device and Sensor Setup | 8 Sensor Settings
258 WMI HDD Health Sensor

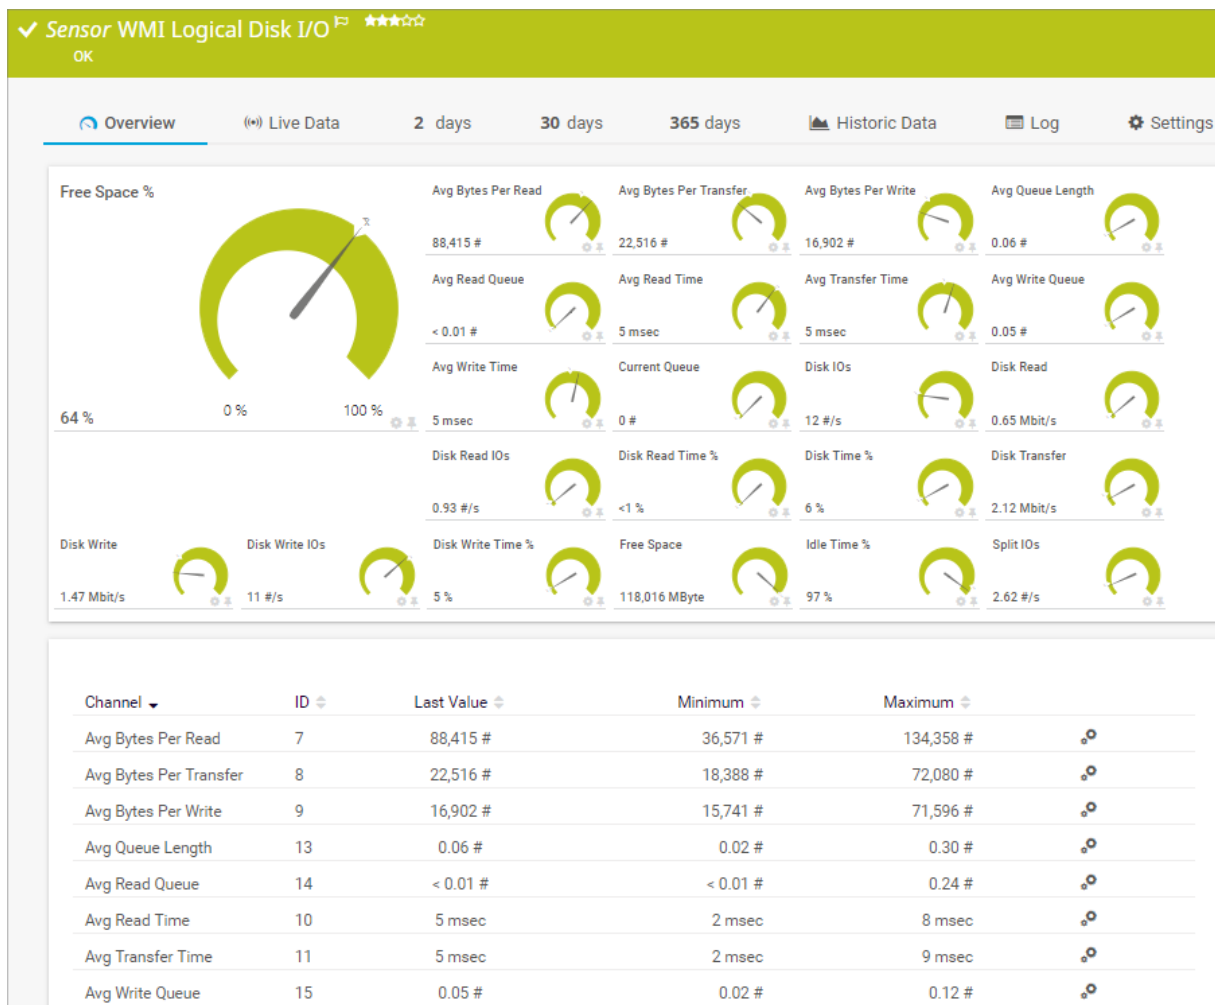

- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.259 WMI Logical Disk I/O Sensor

The WMI Logical Disk I/O sensor monitors the disk usage of a logical disk or mount point on a Windows system via Windows Management Instrumentation (WMI).

i The sensor shows performance data of counters that monitor logical partitions of a hard drive. The system monitor identifies logical disk instances by their identifier, such as C:, and the sensor reads the logical disk object in the system monitor and returns the values.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Logical Disk I/O Sensor

Sensor in Other Languages

- Dutch: WMI Logische Schijf I/O
- French: E/S du disque logique WMI
- German: WMI Logischer Datenträger E/A
- Japanese: WMI 論理ディスク I/O
- Portuguese: E/S do disco lógico de WMI

- Russian: - WMI
- Simplified Chinese: WMI 逻辑磁盘 I/O
- Spanish: E/S WMI de disco lógico

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[4503] for load balancing.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports Windows Server 2008 R2 or later. It does not work on previous Windows versions (Windows Server 2008 or earlier).
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#)^[36] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

WMI Logical Disk I/O Specific

Setting	Description
Disk	<p>Select the logical disks that you want to monitor. PRTG creates one sensor for each logical disk that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Sensor Name ⓘ Example Name

Primary Channel ⓘ Downtime

Graph Type ⓘ

Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Bytes (File)	Byte ▼

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Avg Bytes Per Read	The average number of bytes per read
Avg Bytes Per Transfer	The average number of bytes per transfer
Avg Bytes Per Write	The average number of bytes per write
Avg Queue Length	The average number of items in the queue
Avg Read Queue	The average number of items in the read queue
Avg Read Time	The average read time in milliseconds (msec)
Avg Transfer Time	The average transfer time in msec
Avg Write Queue	The average number of items in the write queue
Avg Write Time	The average write time in msec
Current Queue	The current number of items in the queue
Disk IOs	The number of disk input/output (I/O) operations per second
Disk Read	The disk read speed in bytes per second
Disk Read IOs	The number of disk read I/O operations per second
Disk Read Time %	The disk read time in percent
Disk Time %	The disk time in percent
Disk Transfer	The disk transfer speed in bytes per second
Disk Write	The disk write speed in bytes per second
Disk Write IOs	The number of disk write I/O operations per second
Disk Write Time %	The disk write time in percent
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Free Space	The free space in bytes

Channel	Description
Free Space %	The free space in percent  This channel is the primary channel by default.
Idle Time %	The idle time in percent
Split IOs	The number of split I/O operations per second

Sensor Settings Overview

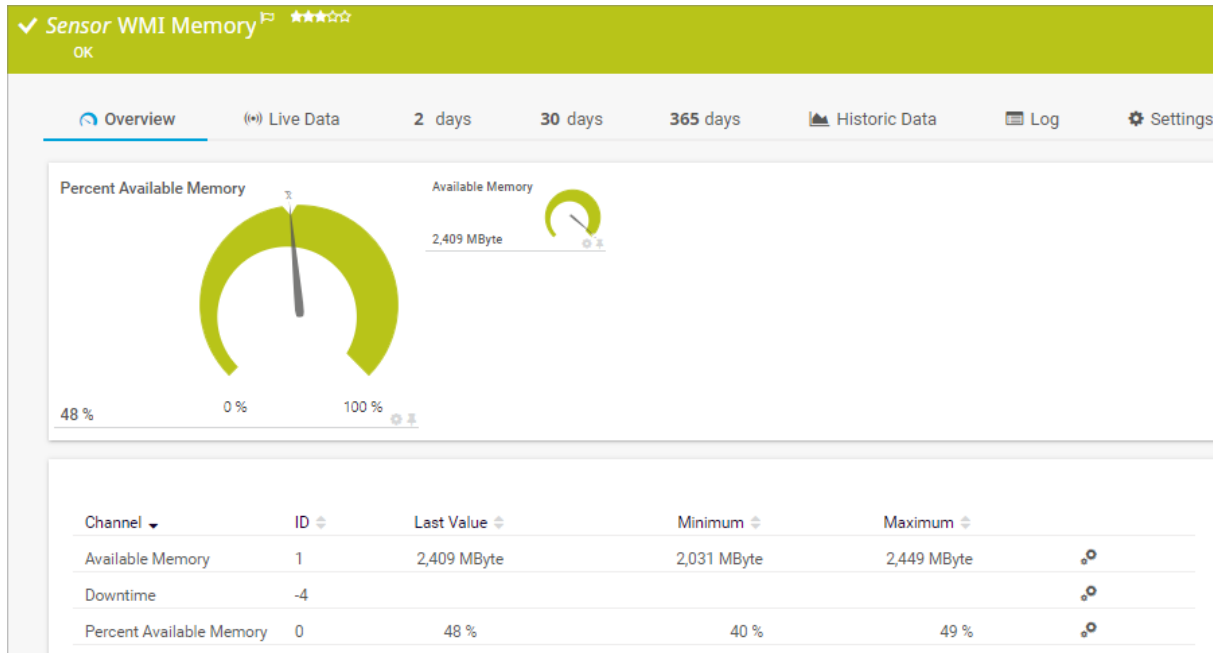

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.260 WMI Memory Sensor

The WMI Memory sensor monitors available (free) system memory on Windows systems via Windows Management Instrumentation (WMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Memory Sensor

Sensor in Other Languages

- Dutch: WMI Geheugen
- French: Mémoire WMI
- German: WMI Arbeitsspeicher
- Japanese: WMI メモリ
- Portuguese: Memória de WMI
- Russian: WMI
- Simplified Chinese: WMI 内存
- Spanish: WMI memoria

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections: 'Sensor Name' with the value 'Example Name', 'Tags' with a list containing 'exampletag', and 'Priority' set to 5 stars. Each field has an information icon (i).

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ memorysensor ▪ wmicmemorysensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Debug Options

Debug Options

Result Handling ⁱ
 Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory^[452] on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Alternative WMI Query

Alternative WMI Query

WMI sensors use the most efficient and accurate WMI queries possible. However, different Windows versions and even different patch levels on the target systems can lead to changes in some WMI classes. These changes often result in errors like class not valid or invalid data. If these errors persist, try using the option Query Method.

Query Method ⁱ

Use the default WMI query method
 Use the alternative WMI query method

Alternative WMI Query

Setting	Description
Query Method	<p>Select the method that the sensor uses to query via WMI:</p> <ul style="list-style-type: none"> Use the default WMI query method: Use the standard method to query WMI. We recommend that you use this option. Use the alternative WMI query method: Use an alternative method to query WMI for better compatibility if WMI sensors return errors such as class not valid or invalid data.

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type 
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration^[4187] on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3957

7.8.261 WMI Microsoft SQL Server 2005 Sensor (Deprecated)

Important Notice

This sensor is deprecated.

Monitoring of Microsoft SQL Server 2005 using PRTG is discontinued. Microsoft SQL Server 2005 cannot be monitored with PRTG anymore with the latest updates of SQL Server 2005. The reason for this is a software update delivered by Microsoft in August 2012. The following updates cause this issue:

- Security Update for SQL Server 2005 Service Pack 4 (KB2716429)
- Security Update for SQL Server 2005 Service Pack 4 (KB2716427)

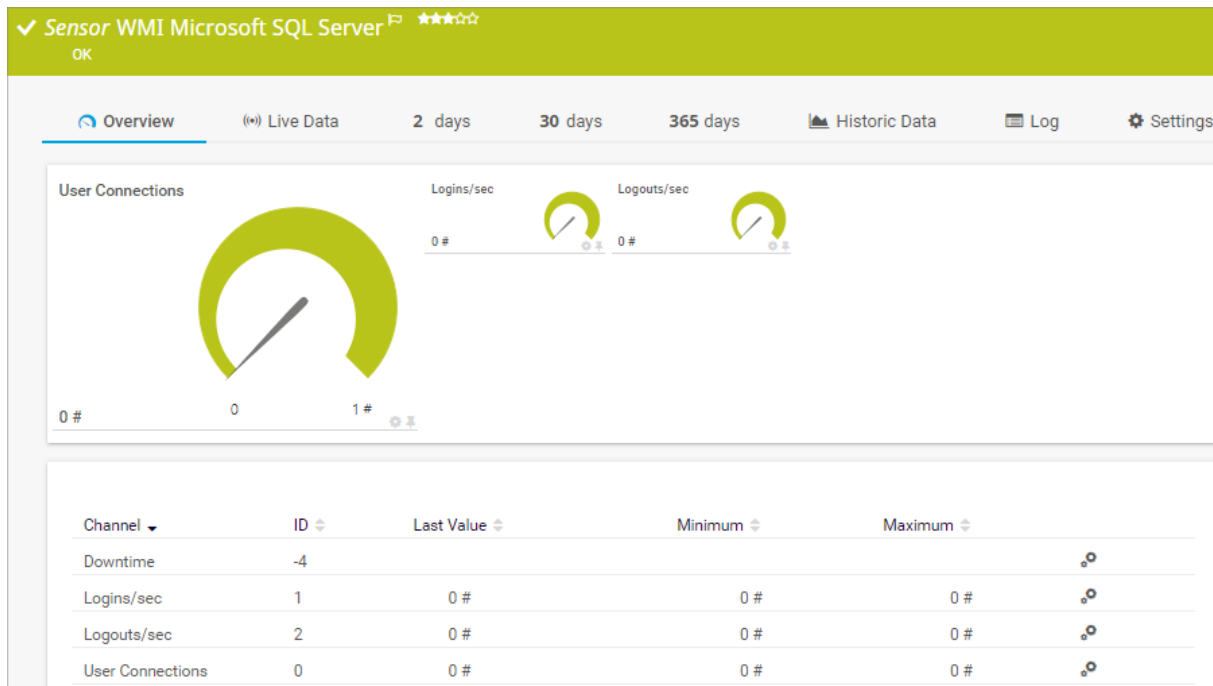

We have made reasonable effort to fix this from our side but we were unable to do so. We do not have instructions to circumvent this issue at this time. Please ask the vendor to fix this.

More

Knowledge Base: [Why does my WMI Microsoft SQL Server 2005 sensor not work anymore?](#)

The WMI Microsoft SQL Server 2005 sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Microsoft SQL Server 2005 Sensor

Sensor in Other Languages

- Dutch: WMI Microsoft SQL Server 2005
- French: Serveur WMI Microsoft SQL 2005
- German: WMI Microsoft SQL Server 2005
- Japanese: WMI Microsoft SQL Server 2005
- Portuguese: Microsoft SQL Server 2005 WMI
- Russian: WMI Microsoft SQL Server 2005
- Simplified Chinese: WMI Microsoft SQL Server 2005
- Spanish: WMI Microsoft SQL Server 2005

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[450] for load balancing.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- You can only add this sensor to a device (computer) running a Microsoft SQL database.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#)^[36] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

SQL Server Settings

Setting	Description
Server Instances	<p>Select the instances that you want to monitor. PRTG creates one sensor for each instance that you select.</p> <ul style="list-style-type: none"> ❗ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. ❗ Display name and service name are provided as returned by the SQL Server.

SQL Counter Specific

Setting	Description
SQL Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instances that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here. Choose from:</p> <ul style="list-style-type: none"> ▪ General Statistics: Read general performance counters. This shows the number of user connections and the number of logins and logouts per second. ▪ Access Methods: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second). ▪ Buffer Manager: Read buffer manager counters. This shows the buffer cache hit ratio in percent and the number of database pages and stolen pages. ▪ Memory Manager: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb). ▪ Locks: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time. ▪ SQL Statistics: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second). <p>Depending on your selection, PRTG creates a sensor with the specified channels.</p> <p>i To monitor more than one of the listed groups of performance counters, add the sensor several times for the respective instances.</p>

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Average Wait Time	The average amount of wait time for each lock request that resulted in a wait
Batch Requests	The number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as input/output (I/O), number of users, cache size, or complexity of requests). High batch requests mean good throughput.
Buffer Cache Hit Ratio	<p>The percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Connection Memory (KB)	The total amount of dynamic memory the server is using for maintaining connections

Channel	Description
Database Pages	The number of pages in the buffer pool with database content
Deadlocks	The number of lock requests per second that resulted in a deadlock
Full Scans	The number of unrestricted full scans per second. These can be either base-table or full-index scans.
Lock Requests	The number of new locks and lock conversions per second requested from the lock manager
Logins	The total number of logins started per second
Logouts	The total number of logout operations started per second
Optimizer Memory (KB)	The total amount of dynamic memory the server is using for query optimization
Page Life Expectancy	The number of seconds a page stays in the buffer pool without references
Page Splits	The number of page splits per second that occur as the result of overflowing index pages
SQL Cache Memory (KB)	The total amount of dynamic memory the server is using for the dynamic SQL cache
SQL Compilations	The number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles because of recompiles. After the SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	The number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.
Stolen Pages	The number of pages used for miscellaneous server purposes (including procedure cache)
Table Lock Escalations	The number of times that locks on a table were escalated
Target Server Memory (KB)	The total amount of dynamic memory the server can consume
Total Server Memory (KB)	The total amount of dynamic memory that the server is using

Channel	Description
User Connections	The number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.

KNOWLEDGE BASE

Why does my WMI Microsoft SQL Server 2005 sensor not work anymore?

- <https://kb.paessler.com/en/topic/44713>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Sensor Settings Overview

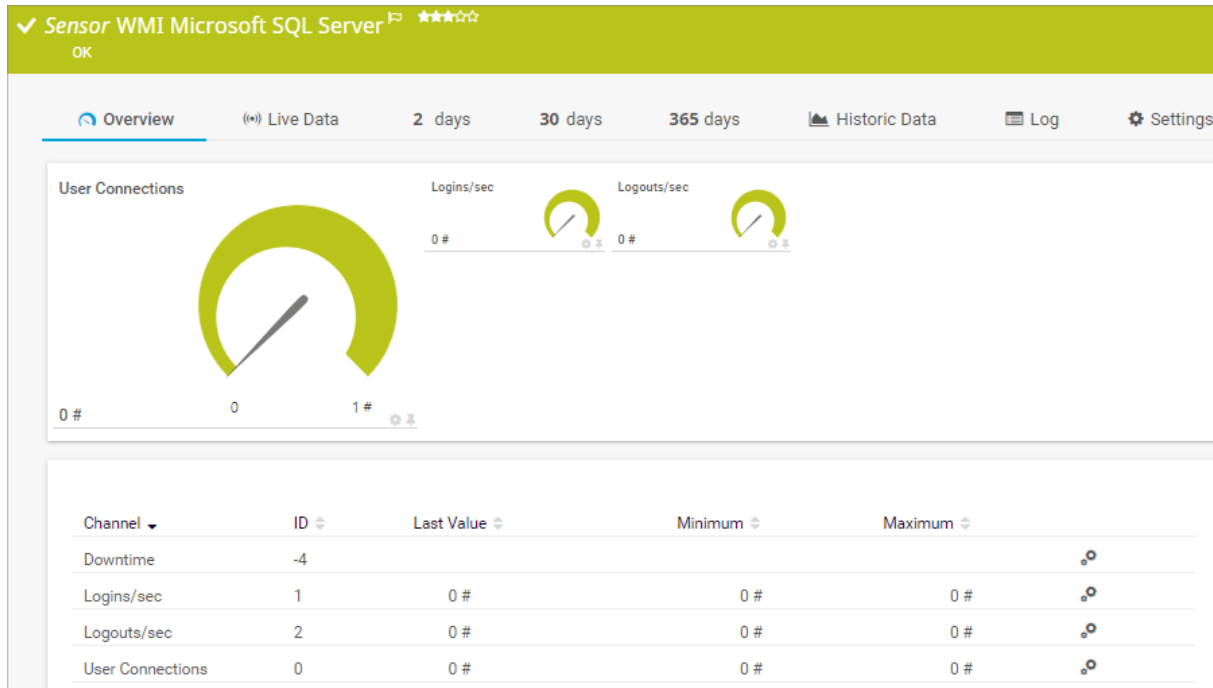

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3957

7.8.262 WMI Microsoft SQL Server 2008 Sensor

The WMI Microsoft SQL Server 2008 sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Microsoft SQL Server 2008 Sensor

Sensor in Other Languages

- Dutch: WMI Microsoft SQL Server 2008
- French: Serveur WMI Microsoft SQL 2008
- German: WMI Microsoft SQL Server 2008
- Japanese: WMI Microsoft SQL Server 2008
- Portuguese: Microsoft SQL Server 2008 WMI
- Russian: WMI Microsoft SQL Server 2008
- Simplified Chinese: WMI Microsoft SQL Server 2008
- Spanish: WMI Microsoft SQL Server 2008

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.

- You can only add this sensor to a device (computer) running a Microsoft SQL database.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

SQL Server Settings

Setting	Description
Server Instances	<p>Select the instances that you want to monitor. PRTG creates one sensor for each instance that you select.</p> <ul style="list-style-type: none"> ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. ⓘ Display name and service name are provided as returned by the SQL Server.

SQL Counter Specific

Setting	Description
SQL Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instances that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here. Choose from:</p> <ul style="list-style-type: none"> ▪ General Statistics: Read general performance counters. This shows the number of user connections and the number of logins and logouts per second. ▪ Access Methods: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second). ▪ Buffer Manager: Read buffer manager counters. This shows the buffer cache hit ratio in percent and the number of database pages and stolen pages.

Setting	Description
	<ul style="list-style-type: none"> ▪ Memory Manager: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb). ▪ Locks: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time. ▪ SQL Statistics: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second). <p>Depending on your selection, PRTG creates a sensor with the specified channels.</p> <p>i To monitor more than one of the listed groups of performance counters, add the sensor several times for the respective instances.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' configuration window. It includes the following elements:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A list of tags with 'exampletag' selected, accompanied by a plus sign to add more.
- Priority:** A star rating system showing 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <ul style="list-style-type: none"> i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). i For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ wmiqlserversensor ▪ wmiqlserversensor2008
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ⓘ).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ⓘ if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ⓘ.

Scanning Interval

Click ⓘ to interrupt the [inheritance](#) ⓘ.

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
Maintenance Window	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p> <p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

 User Group	 Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>For more details on access rights, see section Access Rights Management.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Average Wait Time	The average amount of wait time for each lock request that resulted in a wait
Batch Requests	The number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as input/output (I/O), number of users, cache size, or complexity of requests). High batch requests mean good throughput.
Buffer Cache Hit Ratio	<p>The percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>

Setting	Description
SQL Performance Counters	Shows the performance counter that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type  Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Access Rights

inherit from  Root

User Group Access 

 User Group	 Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Average Wait Time	The average amount of wait time for each lock request that resulted in a wait
Batch Requests	The number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as input/output (I/O), number of users, cache size, or complexity of requests). High batch requests mean good throughput.
Buffer Cache Hit Ratio	<p>The percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Connection Memory (KB)	The total amount of dynamic memory the server is using for maintaining connections

Channel	Description
Database Pages	The number of pages in the buffer pool with database content
Deadlocks	The number of lock requests per second that resulted in a deadlock
Full Scans	The number of unrestricted full scans per second. These can be either base-table or full-index scans.
Lock Requests	The number of new locks and lock conversions per second requested from the lock manager
Logins	The total number of logins started per second
Logouts	The total number of logout operations started per second
Optimizer Memory (KB)	The total amount of dynamic memory the server is using for query optimization
Page Life Expectancy	The number of seconds a page stays in the buffer pool without references
Page Splits	The number of page splits per second that occur as the result of overflowing index pages
SQL Cache Memory (KB)	The total amount of dynamic memory the server is using for the dynamic SQL cache
SQL Compilations	The number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles because of recompiles. After the SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	The number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.
Stolen Pages	The number of pages used for miscellaneous server purposes (including procedure cache)
Table Lock Escalations	The number of times that locks on a table were escalated
Target Server Memory (KB)	The total amount of dynamic memory the server can consume
Total Server Memory (KB)	The total amount of dynamic memory that the server is using

Channel	Description
User Connections	The number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.

KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.264 WMI Microsoft SQL Server 2014 Sensor

The WMI Microsoft SQL Server 2014 sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Microsoft SQL Server 2014 Sensor

Sensor in Other Languages

- Dutch: WMI Microsoft SQL Server 2014
- French: Serveur WMI Microsoft SQL 2014
- German: WMI Microsoft SQL Server 2014
- Japanese: WMI Microsoft SQL Server 2014
- Portuguese: Microsoft SQL Server 2014 WMI
- Russian: WMI Microsoft SQL Server 2014
- Simplified Chinese: WMI Microsoft SQL Server 2014
- Spanish: WMI Microsoft SQL Server 2014

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.

- You can only add this sensor to a device (computer) running a Microsoft SQL database.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

SQL Server Settings

Setting	Description
Server Instances	<p>Select the instances that you want to monitor. PRTG creates one sensor for each instance that you select.</p> <ul style="list-style-type: none"> ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. ⓘ Display name and service name are provided as returned by the SQL Server.

SQL Counter Specific

Setting	Description
SQL Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instances that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here. Choose from:</p> <ul style="list-style-type: none"> ▪ General Statistics: Read general performance counters. This shows the number of user connections and the number of logins and logouts per second. ▪ Access Methods: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second). ▪ Buffer Manager: Read buffer manager counters. This shows the buffer cache hit ratio in percent and the number of database pages and stolen pages.

Setting	Description
	<ul style="list-style-type: none"> ▪ Memory Manager: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb). ▪ Locks: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time. ▪ SQL Statistics: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second). <p>Depending on your selection, PRTG creates a sensor with the specified channels.</p> <p>i To monitor more than one of the listed groups of performance counters, add the sensor several times for the respective instances.</p>

Basic Sensor Settings

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>For more details on access rights, see section Access Rights Management.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Average Wait Time	The average amount of wait time for each lock request that resulted in a wait
Batch Requests	The number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as input/output (I/O), number of users, cache size, or complexity of requests). High batch requests mean good throughput.
Buffer Cache Hit Ratio	<p>The percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Connection Memory (KB)	The total amount of dynamic memory the server is using for maintaining connections

Channel	Description
Database Pages	The number of pages in the buffer pool with database content
Deadlocks	The number of lock requests per second that resulted in a deadlock
Full Scans	The number of unrestricted full scans per second. These can be either base-table or full-index scans.
Lock Requests	The number of new locks and lock conversions per second requested from the lock manager
Logins	The total number of logins started per second
Logouts	The total number of logout operations started per second
Optimizer Memory (KB)	The total amount of dynamic memory the server is using for query optimization
Page Life Expectancy	The number of seconds a page stays in the buffer pool without references
Page Splits	The number of page splits per second that occur as the result of overflowing index pages
SQL Cache Memory (KB)	The total amount of dynamic memory the server is using for the dynamic SQL cache
SQL Compilations	The number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles because of recompiles. After the SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	The number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.
Stolen Pages	The number of pages used for miscellaneous server purposes (including procedure cache)
Table Lock Escalations	The number of times that locks on a table were escalated
Target Server Memory (KB)	The total amount of dynamic memory the server can consume
Total Server Memory (KB)	The total amount of dynamic memory that the server is using

Channel	Description
User Connections	The number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.

KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Sensor Settings Overview

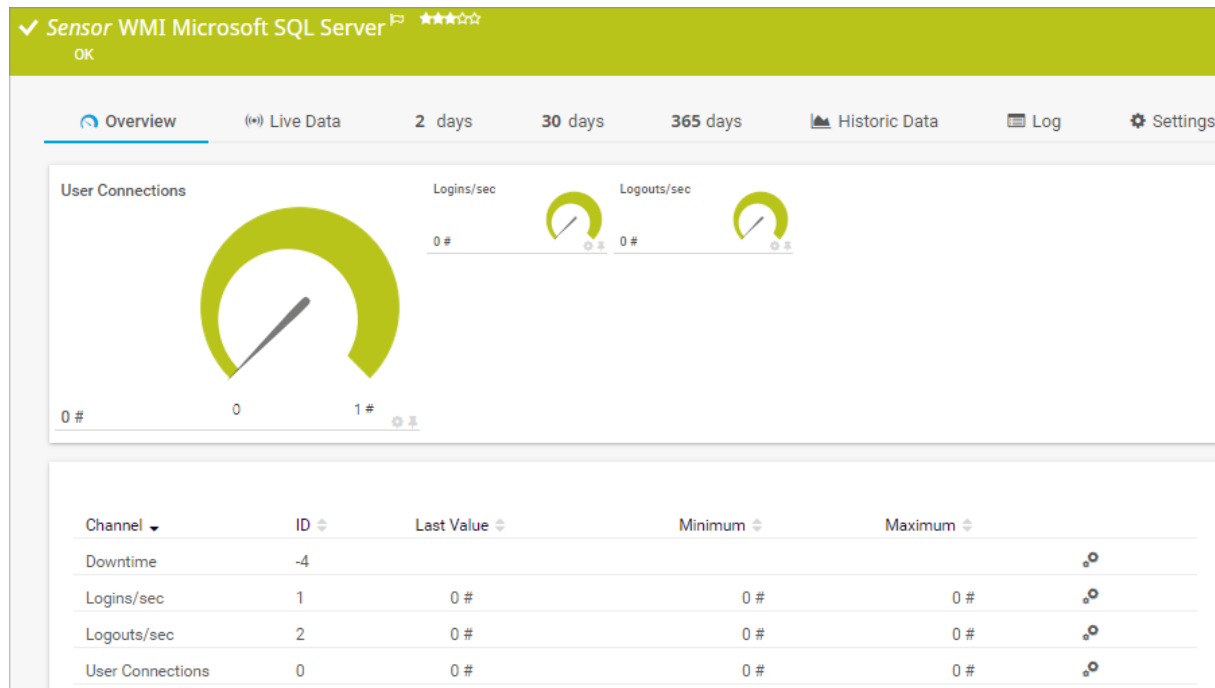

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.265 WMI Microsoft SQL Server 2016 Sensor

The WMI Microsoft SQL Server 2016 sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Microsoft SQL Server 2016 Sensor

Sensor in Other Languages

- Dutch: WMI Microsoft SQL Server 2016
- French: Serveur WMI Microsoft SQL 2016
- German: WMI Microsoft SQL Server 2016
- Japanese: WMI Microsoft SQL Server 2016
- Portuguese: Microsoft SQL Server 2016 WMI
- Russian: WMI Microsoft SQL Server 2016
- Simplified Chinese: WMI Microsoft SQL Server 2016
- Spanish: WMI Microsoft SQL Server 2016

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.

- You can only add this sensor to a device (computer) running a Microsoft SQL database.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

SQL Server Settings

Setting	Description
Server Instances	<p>Select the instances that you want to monitor. PRTG creates one sensor for each instance that you select.</p> <ul style="list-style-type: none"> ❗ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. ❗ Display name and service name are provided as returned by the SQL Server.

SQL Counter Specific

Setting	Description
SQL Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instances that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here. Choose from:</p> <ul style="list-style-type: none"> ▪ General Statistics: Read general performance counters. This shows the number of user connections and the number of logins and logouts per second. ▪ Access Methods: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second). ▪ Buffer Manager: Read buffer manager counters. This shows the buffer cache hit ratio in percent and the number of database pages and stolen pages.

Setting	Description
	<ul style="list-style-type: none"> ▪ Memory Manager: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb). ▪ Locks: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time. ▪ SQL Statistics: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second). <p>Depending on your selection, PRTG creates a sensor with the specified channels.</p> <p>i To monitor more than one of the listed groups of performance counters, add the sensor several times for the respective instances.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' configuration window. It includes the following elements:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A list of tags with 'exampletag' selected, accompanied by a plus sign to add more.
- Priority:** A star rating system showing 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <ul style="list-style-type: none"> i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). i For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ wmiqlserversensor ▪ wmiqlserversensor2016
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Setting	Description
SQL Performance Counters	Shows the performance counter that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click ⓘ to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Average Wait Time	The average amount of wait time for each lock request that resulted in a wait
Batch Requests	The number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as input/output (I/O), number of users, cache size, or complexity of requests). High batch requests mean good throughput.

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ⓘ).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ⓘ if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ⓘ.

Scanning Interval

Click ⓘ to interrupt the [inheritance](#) ⓘ.

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Access Rights

inherit from  Root

User Group Access 

 User Group	 Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Average Wait Time	The average amount of wait time for each lock request that resulted in a wait
Batch Requests	The number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as input/output (I/O), number of users, cache size, or complexity of requests). High batch requests mean good throughput.
Buffer Cache Hit Ratio	<p>The percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Connection Memory (KB)	The total amount of dynamic memory the server is using for maintaining connections

Channel	Description
Database Pages	The number of pages in the buffer pool with database content
Deadlocks	The number of lock requests per second that resulted in a deadlock
Full Scans	The number of unrestricted full scans per second. These can be either base-table or full-index scans.
Lock Requests	The number of new locks and lock conversions per second requested from the lock manager
Logins	The total number of logins started per second
Logouts	The total number of logout operations started per second
Optimizer Memory (KB)	The total amount of dynamic memory the server is using for query optimization
Page Life Expectancy	The number of seconds a page stays in the buffer pool without references
Page Splits	The number of page splits per second that occur as the result of overflowing index pages
SQL Cache Memory (KB)	The total amount of dynamic memory the server is using for the dynamic SQL cache
SQL Compilations	The number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles because of recompiles. After the SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	The number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.
Stolen Pages	The number of pages used for miscellaneous server purposes (including procedure cache)
Table Lock Escalations	The number of times that locks on a table were escalated
Target Server Memory (KB)	The total amount of dynamic memory the server can consume
Total Server Memory (KB)	The total amount of dynamic memory that the server is using

Channel	Description
User Connections	The number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.

KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.267 WMI Microsoft SQL Server 2019 Sensor

The WMI Microsoft SQL Server 2019 sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Microsoft SQL Server 2019 Sensor

Sensor in Other Languages

- Dutch: WMI Microsoft SQL Server 2019
- French: Serveur WMI Microsoft SQL 2019
- German: WMI Microsoft SQL Server 2019
- Japanese: WMI Microsoft SQL Server 2019
- Portuguese: Microsoft SQL Server 2019 WMI
- Russian: WMI Microsoft SQL Server 2019
- Simplified Chinese: WMI Microsoft SQL Server 2019
- Spanish: WMI Microsoft SQL Server 2019

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.

- You can only add this sensor to a device (computer) running a Microsoft SQL database.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

SQL Server Settings

Setting	Description
Server Instances	<p>Select the instances that you want to monitor. PRTG creates one sensor for each instance that you select.</p> <ul style="list-style-type: none"> ❗ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. ❗ Display name and service name are provided as returned by the SQL Server.

SQL Counter Specific

Setting	Description
SQL Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instances that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here. Choose from:</p> <ul style="list-style-type: none"> ▪ General Statistics: Read general performance counters. This shows the number of user connections and the number of logins and logouts per second. ▪ Access Methods: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second). ▪ Buffer Manager: Read buffer manager counters. This shows the buffer cache hit ratio in percent and the number of database pages and stolen pages.

Setting	Description
	<ul style="list-style-type: none"> ▪ Memory Manager: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb). ▪ Locks: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time. ▪ SQL Statistics: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second). <p>Depending on your selection, PRTG creates a sensor with the specified channels.</p> <p>i To monitor more than one of the listed groups of performance counters, add the sensor several times for the respective instances.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag', and a 'Priority' field set to 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <ul style="list-style-type: none"> i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). i For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ wmiqlserversensor ▪ wmiqlserversensor2019
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Average Wait Time	The average amount of wait time for each lock request that resulted in a wait
Batch Requests	The number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as input/output (I/O), number of users, cache size, or complexity of requests). High batch requests mean good throughput.
Buffer Cache Hit Ratio	<p>The percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Connection Memory (KB)	The total amount of dynamic memory the server is using for maintaining connections

Channel	Description
Database Pages	The number of pages in the buffer pool with database content
Deadlocks	The number of lock requests per second that resulted in a deadlock
Full Scans	The number of unrestricted full scans per second. These can be either base-table or full-index scans.
Lock Requests	The number of new locks and lock conversions per second requested from the lock manager
Logins	The total number of logins started per second
Logouts	The total number of logout operations started per second
Optimizer Memory (KB)	The total amount of dynamic memory the server is using for query optimization
Page Life Expectancy	The number of seconds a page stays in the buffer pool without references
Page Splits	The number of page splits per second that occur as the result of overflowing index pages
SQL Cache Memory (KB)	The total amount of dynamic memory the server is using for the dynamic SQL cache
SQL Compilations	The number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles because of recompiles. After the SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	The number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.
Stolen Pages	The number of pages used for miscellaneous server purposes (including procedure cache)
Table Lock Escalations	The number of times that locks on a table were escalated
Target Server Memory (KB)	The total amount of dynamic memory the server can consume
Total Server Memory (KB)	The total amount of dynamic memory that the server is using

Channel	Description
User Connections	The number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.

KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Sensor Settings Overview

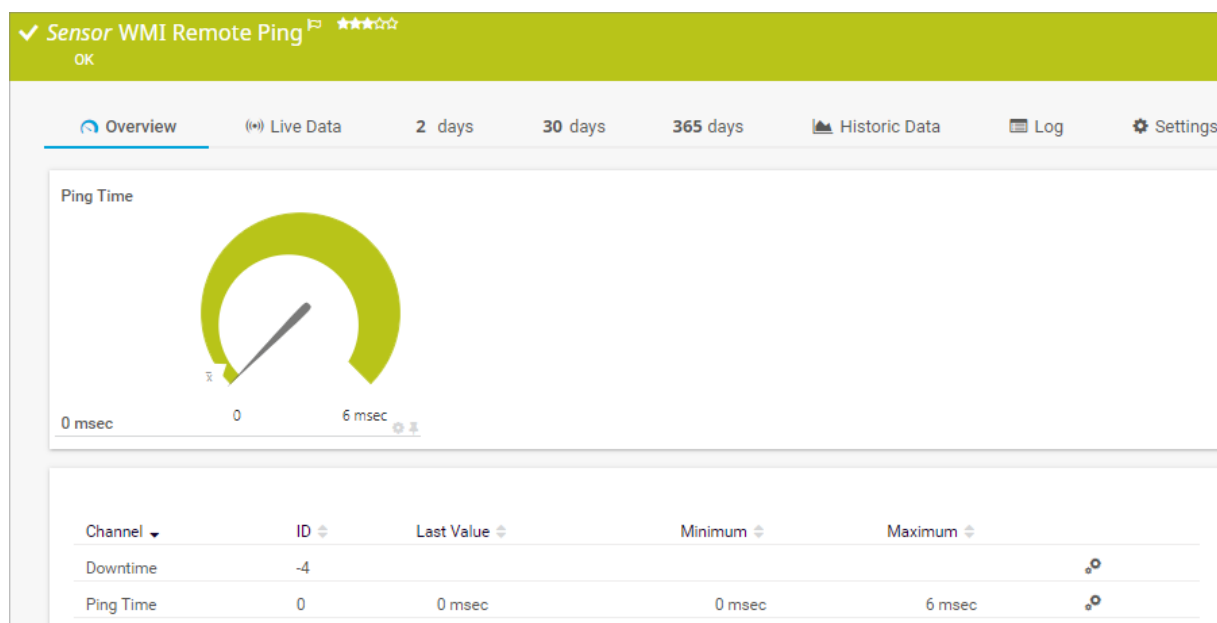

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.268 WMI Remote Ping Sensor

The WMI Remote Ping sensor remotely connects to a Windows system via Windows Management Instrumentation (WMI) and performs an Internet Control Message Protocol (ICMP) echo request (Ping) from this device to a specified target.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Remote Ping Sensor

Sensor in Other Languages

- Dutch: WMI Remote Ping
- French: Ping distant WMI
- German: WMI Remote Ping
- Japanese: WMI リモート Ping 実行
- Portuguese: Ping remoto de WMI
- Russian: WMI
- Simplified Chinese: WMI 远程 Ping
- Spanish: Ping remoto WMI

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A text input field containing "exampletag" with a close button (X) and a plus button (+).
- Priority:** A section with five star icons, all of which are filled, indicating a priority of 5.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>ⓘ This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ pingsensor ▪ wmisensor ▪ wmpingsensor ▪ remotepingsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

WMI Remote Ping Configuration

WMI Remote Ping Configuration

Target **i** 192.0.2.0

Timeout (Sec.) **i** 5

Packet Size (Bytes) **i** 32

WMI Remote Ping Configuration

Setting	Description
Target	<p>Enter the Domain Name System (DNS) name or IP address of the target device that you want to ping. The sensor remotely connects to its parent device via WMI. Then it performs a Ping request from this remote device to the target device or server. Enter a string.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the Ping. If the reply takes longer than this value, PRTG cancels the request and shows an error message. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes)..</p>
Packet Size (Bytes)	<p>Enter the packet size for the Ping in bytes. You can enter any value between 1 and 10000. Enter an integer value.</p> <p>i We recommend that you use the default value.</p>

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel.

Setting	Description
	<ul style="list-style-type: none"> Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁸ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes 30 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ¹⁴².

Access Rights

inherit from  Root

User Group Access ¹	User Group	Rights

- <https://kb.paessler.com/en/topic/61108>

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Sensor Settings Overview

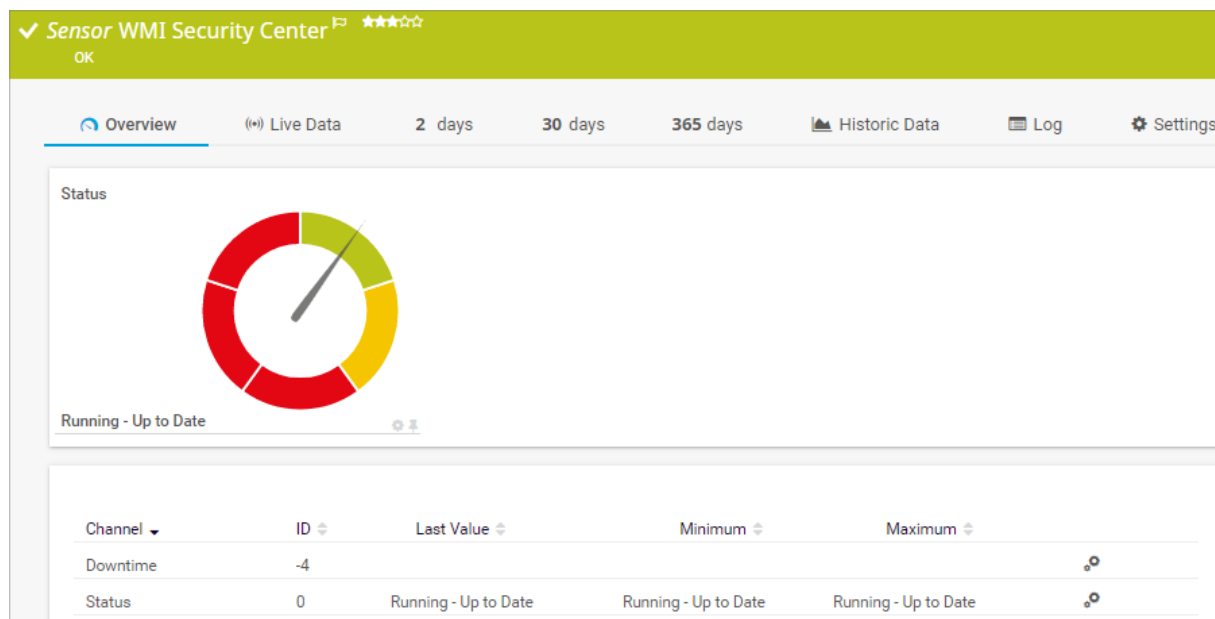

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3957

7.8.269 WMI Security Center Sensor

The WMI Security Center sensor monitors the security status of a Windows client computer via Windows Management Instrumentation (WMI). It can monitor all security products that are controlled by Windows Security Center / Windows Action Center.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Security Center Sensor

Sensor in Other Languages

- Dutch: WMI Security Center
- French: Centre de sécurité WMI
- German: WMI Sicherheits-Center
- Japanese: WMI セキュリティーセンター
- Portuguese: Centro de segurança WMI
- Russian: WMI
- Simplified Chinese: WMI 安全中心
- Spanish: Centro de seguridad WMI

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor requires Windows Vista or later on the target computer.

- This sensor does not run on Windows Server operating systems (Windows Server 2003, 2008, 2012, 2016) because the Windows Security Center / Windows Action Center is only available on client Windows versions.
- This sensor supports the IPv6 protocol.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

 The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

WMI Security Center Specific

Setting	Description
Security Center Products	<p>Select the security center products that you want to monitor. PRTG creates one sensor for each product that you select.</p> <p>You see a list showing the Name and Type of all security products that the sensor finds in the Windows Security Center on the target device. If there are no products, you see a corresponding message.</p> <p> You can also select all items or cancel the selection by using the check box in the table header.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog with the following elements:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' icon to the right and a plus sign icon to the left.
- Priority:** A row of five star icons, with the first four stars filled and the fifth one empty.

Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

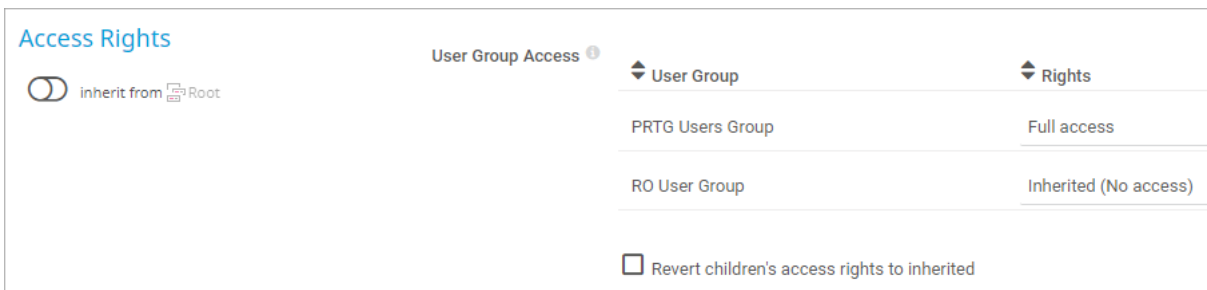

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [421] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Status	<p>The status code of the monitored security product</p> <ul style="list-style-type: none"> Up status¹⁹⁷: Running - Up To Date (status code 4) Warning status: Running - Out Of Date (status code 2) Down status: Not Running - Out Of Date (status code 1), Not Running - Up To Date (status code 3), Unknown (status code 0) <p>i This channel is the primary channel by default.</p>

More

KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Sensor Settings Overview

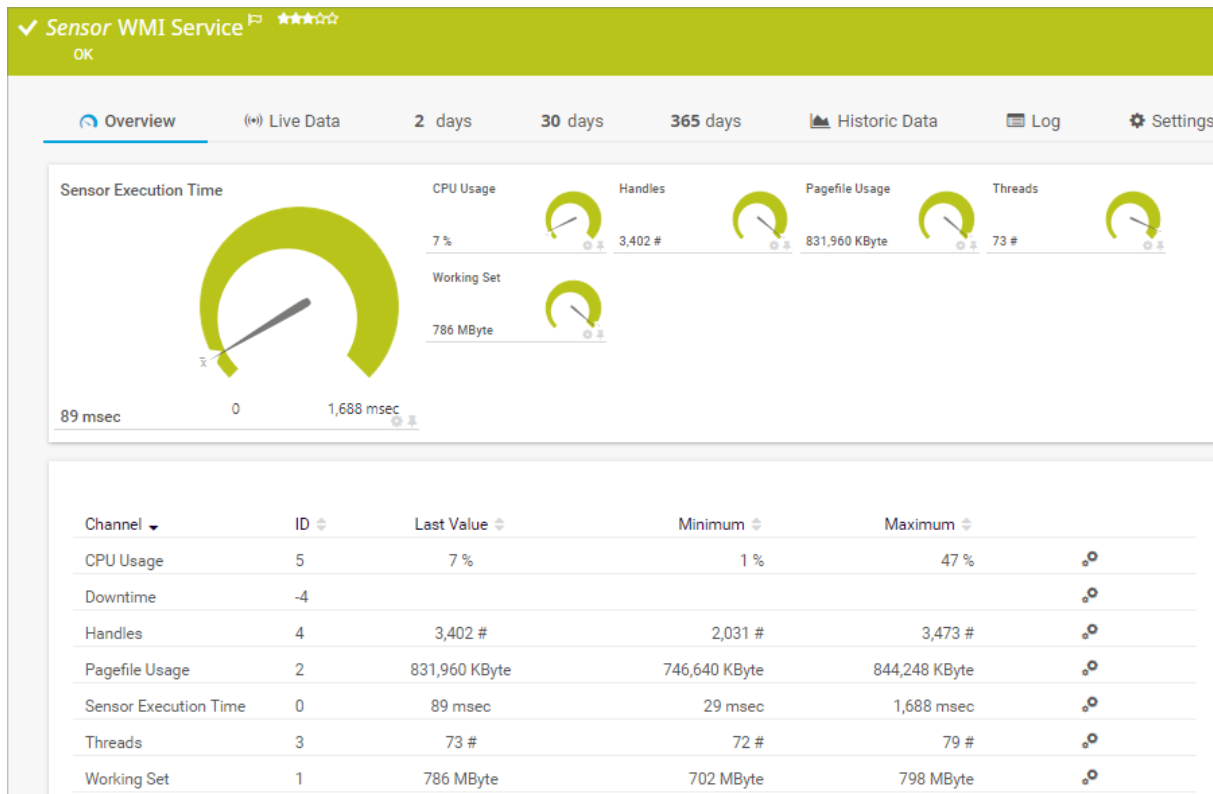

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁶⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁸⁷

7.8.270 WMI Service Sensor

The WMI Service sensor monitors a Windows service via Windows Management Instrumentation (WMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Service Sensor

Sensor in Other Languages

- Dutch: WMI Service
- French: Service WMI
- German: WMI Dienst
- Japanese: WMI サービス
- Portuguese: Serviço WMI
- Russian: WMI
- Simplified Chinese: WMI 服务
- Spanish: WMI servicio

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.

- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

WMI Service Monitor

Setting	Description
Services	<p>Select the services that you want to monitor. PRTG creates one sensor for each service that you select.</p> <ul style="list-style-type: none"> ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. ⓘ The name and description appear in the language of the device's Windows installation. ⓘ After creation, the sensor shows the Down status ¹⁹⁷ if the service does not run.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

WMI Service Monitor

Setting	Description
If Service is Not Running	<p>Select whether you want PRTG to start or restart the service if it is stopped or paused:</p> <ul style="list-style-type: none"> Start/Restart service: PRTG tries to start the service if it is not running when the device is scanned. In combination with a change trigger⁴¹³⁸, you can use this mechanism to trigger a notification³³⁸⁷ whenever PRTG (re)starts the service. Do not start/restart service: PRTG does not automatically start any service on the device. <p>[ⓘ] If you select the Start/Restart service option and the sensor detects that the service does not run, PRTG tries to restart the service during this scan and postpones the next sensor scan for one interval. With the following scan, the sensor checks if the service runs now. If starting the service was not successful or if the service fails again, the sensor shows the Down status and does not try to start the service again. If the service runs after a (re)start attempt, the sensor continues monitoring as usual.</p>
If Service is Restarted	<p>This setting is only visible if you select Start/Restart service above. Define what to do if PRTG restarts the service:</p> <ul style="list-style-type: none"> Ignore changes: No action is taken on change. Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a change trigger, you can use this mechanism to trigger a notification whenever the sensor value changes.
Extended Monitoring	<p>Select whether you want to monitor CPU usage and other performance counters:</p> <ul style="list-style-type: none"> Only check if the service is running: PRTG only monitors the channel Sensor Execution Time. Monitor other performance counters: PRTG also monitors other performance counters.

Setting	Description
	<p>i Extended monitoring might cause a class not found error on some Windows systems.</p>
Service	<p>Shows the Windows service that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Description	<p>Shows the description of the service that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last result of the requested data in the \Logs\sensors subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID]-A.txt, and Result of Sensor [ID].Data.txt. This setting is for debugging purposes, especially in combination with content checks. PRTG overwrites these files with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p>

Setting	Description
	<ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes

Setting	Description
	<ul style="list-style-type: none"> ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

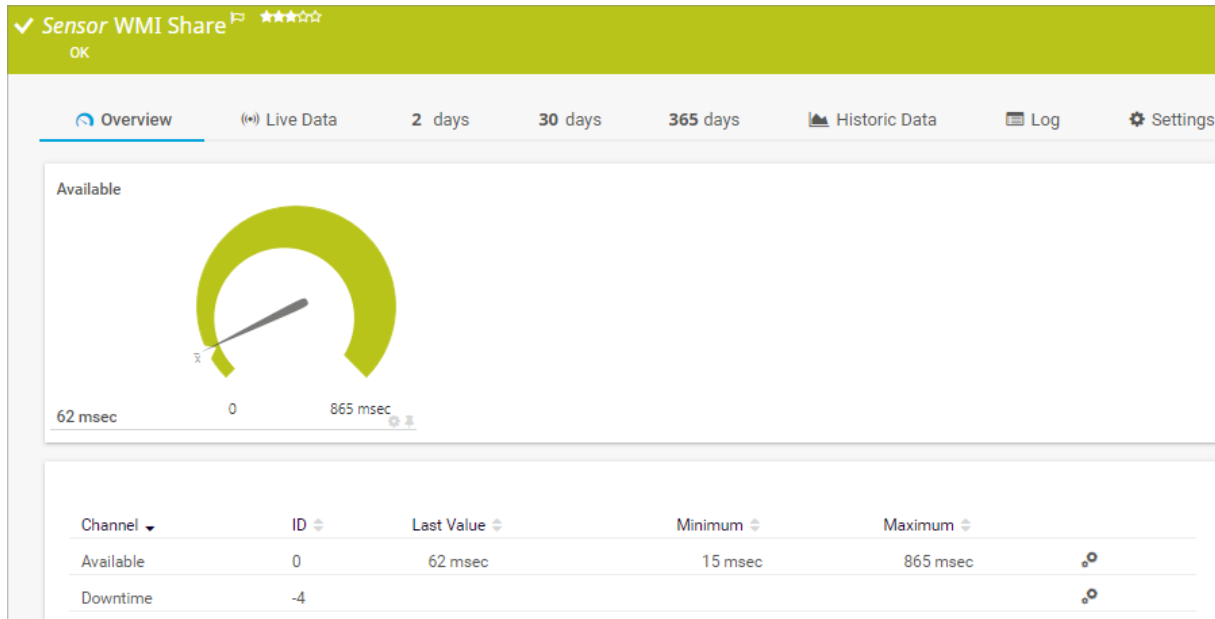

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.271 WMI Share Sensor

The WMI Share sensor monitors a shared resource on a Windows system via Windows Management Instrumentation (WMI).

i You can set the sensor to the Down [status](#)^[197] for different share status messages.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)^[385].

WMI Share Sensor

Sensor in Other Languages

- Dutch: WMI Share
- French: Partage WMI
- German: WMI Freigabe
- Japanese: WMI 共有
- Portuguese: Compartilhamento WMI
- Russian: WMI
- Simplified Chinese: WMI 共享
- Spanish: Recurso compartido WMI

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[450] for load balancing.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.

- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

WMI Shared Resource

Setting	Description
Shares	<p>Select the shares that you want to monitor. PRTG creates one sensor for each share that you select.</p> <ul style="list-style-type: none"> ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. ⓘ To provide any shares, the LanmanServer "Server" Windows service must run on the target computer. If it does not run, there are no shares and you see a No Share available message.

Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

WMI Shared Resource

WMI Shared Resource

Setting	Description
Shared Resource	Shows information about the shared resource that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Description	Shows the description of the shared resource that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Type	Shows the type of the shared resource that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
TypeID	Shows the typeId of the shared resource that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Trigger the Down Status on the Following Conditions

Select under which conditions the sensor shows the Down [status](#)¹⁹⁷. As long as the share returns **OK**, the sensor status shows the Up status. Enable the check box in front of the respective line to select a Down condition. Select none, one, or several of the following conditions.

- i** If the sensor is in the Down status, it does not record any data in any of its channels.

Trigger Down Status on Following Conditions

- Error Alert on this condition
- Degraded Alert on this condition
- Unknown Alert on this condition
- Pred Fail Alert on this condition
- Starting Alert on this condition
- Stopping Alert on this condition
- Service Alert on this condition
- Stressed Alert on this condition
- Nonrecover Alert on this condition
- NoContact Alert on this condition
- LostComm Alert on this condition

Trigger Down Status on Following Conditions

Condition	Description
Error	<p>Set the sensor to the Down status if the share returns an error status. A share in this status is not operational.</p> <p>i This condition is enabled by default.</p>
Degraded	<p>Set the sensor to the Down status if the share returns a degraded status. A share in this status is still operational.</p> <p>i This condition is enabled by default.</p>
Unknown	<p>Set the sensor to the Down status if the share returns an unknown status.</p>
Pred Fail	<p>Set the sensor to the Down status if the share returns a predicted fail status. This indicates that an element works properly but predicts a failure (for example, a SMART-enabled hard drive). A share in this status is still operational.</p>

Condition	Description
	 This condition is enabled by default.
Starting	Set the sensor to the Down status if the share returns a starting status. A share in this status is not operational.
Stopping	Set the sensor to the Down status if the share returns a stopping status. A share in this status is not operational.
Service	Set the sensor to the Down status if the share returns a service status. This can apply during disk mirror-resilvering, reloading a user permissions list, or other administrative work on the device that this sensor monitors. Not all such work is done online, but the managed element is neither OK nor has one of the other states. A share in this status is not operational.
Stressed	Set the sensor to the Down status if the share returns a stressed status.
Nonrecover	Set the sensor to the Down status if the share returns a non recover status.  This condition is enabled by default.
NoContact	Set the sensor to the Down status if the share returns a no contact status.  This condition is enabled by default.
LostComm	Set the sensor to the Down status if the share returns a lost communication status.  This condition is enabled by default.

Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result.

Setting	Description
	<ul style="list-style-type: none"> Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **Downtime**

Graph Type **Show channels independently (default)**

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

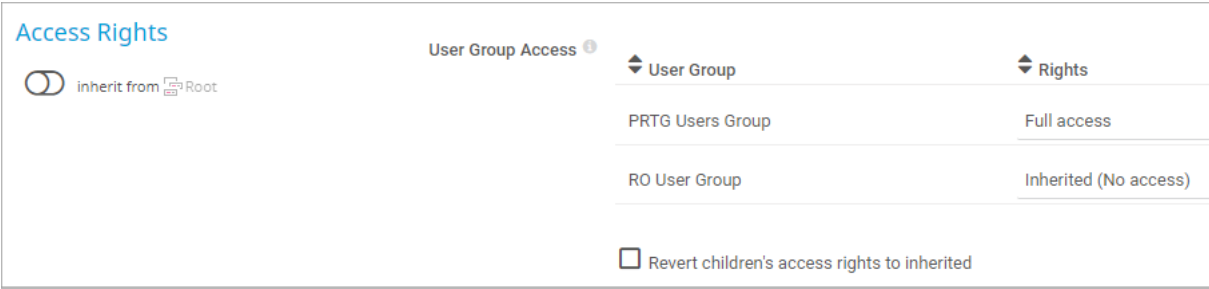

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Sensor Settings Overview

For more information about sensor settings, see the following sections:

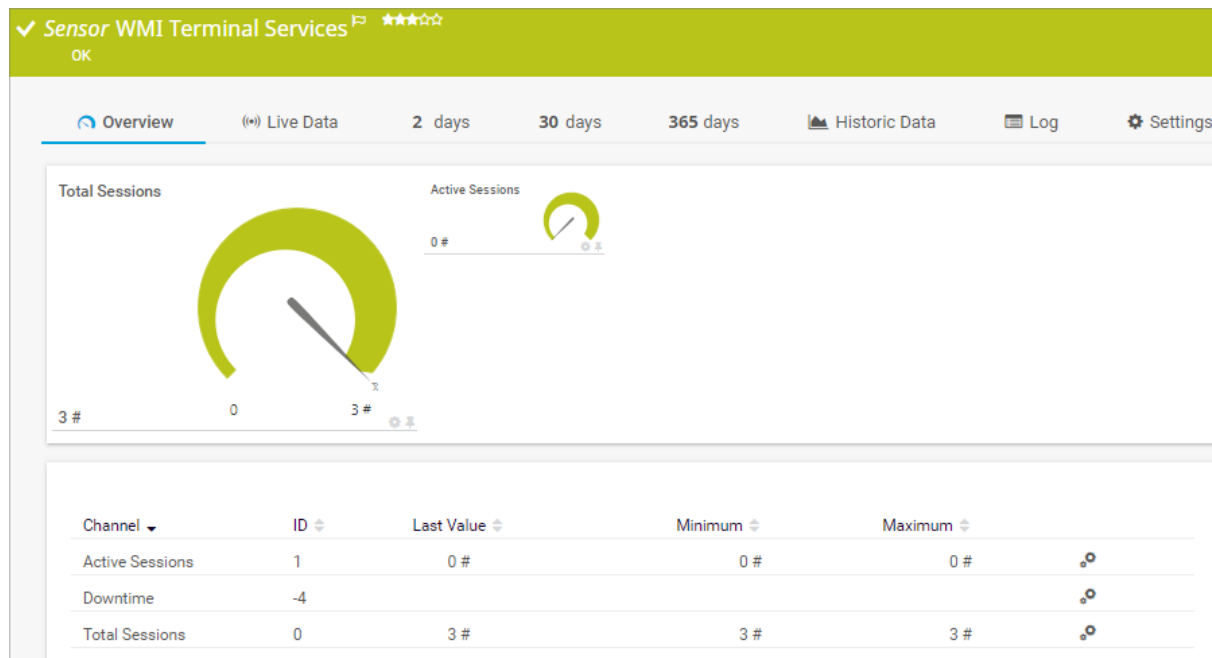

- [List of Available Sensor Types](#)⁴⁵⁹¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁸⁷

7.8.274 WMI Terminal Services (Windows 2008+) Sensor

The WMI Terminal Services (Windows 2008+) sensor monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server via Windows Management Instrumentation (WMI).

i The sensor supports Windows 2008 R2 and later.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Terminal Services (Windows 2008+) Sensor

Sensor in Other Languages

- Dutch: WMI Terminal Services (Windows 2008+)
- French: Services de terminal WMI (Windows 2008+)
- German: WMI Terminaldienste (Windows 2008+)
- Japanese: WMI ターミナルサービス (Windows 2008 以降)
- Portuguese: Serviços de terminal WMI (Windows 2008+)
- Russian: WMI (Windows 2008)
- Simplified Chinese: WMI 终端服务 (Windows 2008+)
- Spanish: WMI Terminal Services (Windows 2008+)

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.

- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports the IPv6 protocol.
- For the Total Sessions channel, the sensor returns the number of active and inactive sessions, plus two additional sessions: one for the console, and one for the services. So, the number of total sessions might actually be higher than expected.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets . i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . i This setting is for your information only. You cannot change it.

Setting	Description

- Spanish: WMI Terminal Services (Windows XP/Vista/2003)

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.

- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports the IPv6 protocol.
- For the Total Sessions channel, the sensor returns the number of active and inactive sessions, plus two additional sessions: one for the console, and one for the services. So, the number of total sessions might actually be higher than expected.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name**: A text input field containing "Example Name".
- Tags**: A list of tags, currently showing "exampletag" with a close button (X) and an add button (+).
- Priority**: A star rating system showing 5 stars, with the first three stars filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>ⓘ This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ¹⁴⁵.</p> <ul style="list-style-type: none"> ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ wmiterminalservicessensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <ul style="list-style-type: none"> ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁹⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴²¹.

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴²¹.

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

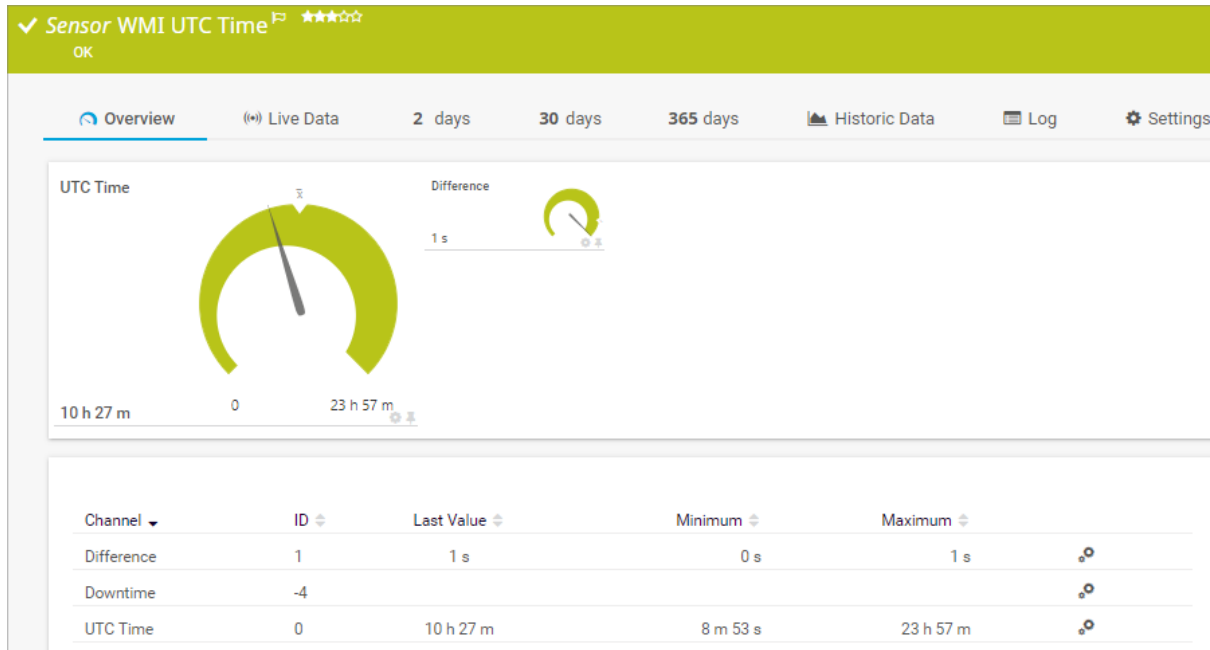

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3672
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.277 WMI Vital System Data v2 Sensor

The WMI Vital System Data v2 sensor monitors vital system parameters via Windows Management Instrumentation (WMI).

i The sensor can monitor CPU, thread, memory, network, or pagefile, for example.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Vital System Data v2 Sensor

Sensor in Other Languages

- Dutch: WMI Vitale Systeem Gegevens V2
- French: Données système vitales WMI v2
- German: WMI Wichtige Systemdaten v2
- Japanese: WMI バイタルシステムデータ (V2)
- Portuguese: WMI Dados vitais do sistema v2
- Russian: WMI v2
- Simplified Chinese: WMI 关键系统数据 v2
- Spanish: Datos vitales de sistema WMI v2

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.

- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes

Setting	Description
	<ul style="list-style-type: none"> ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

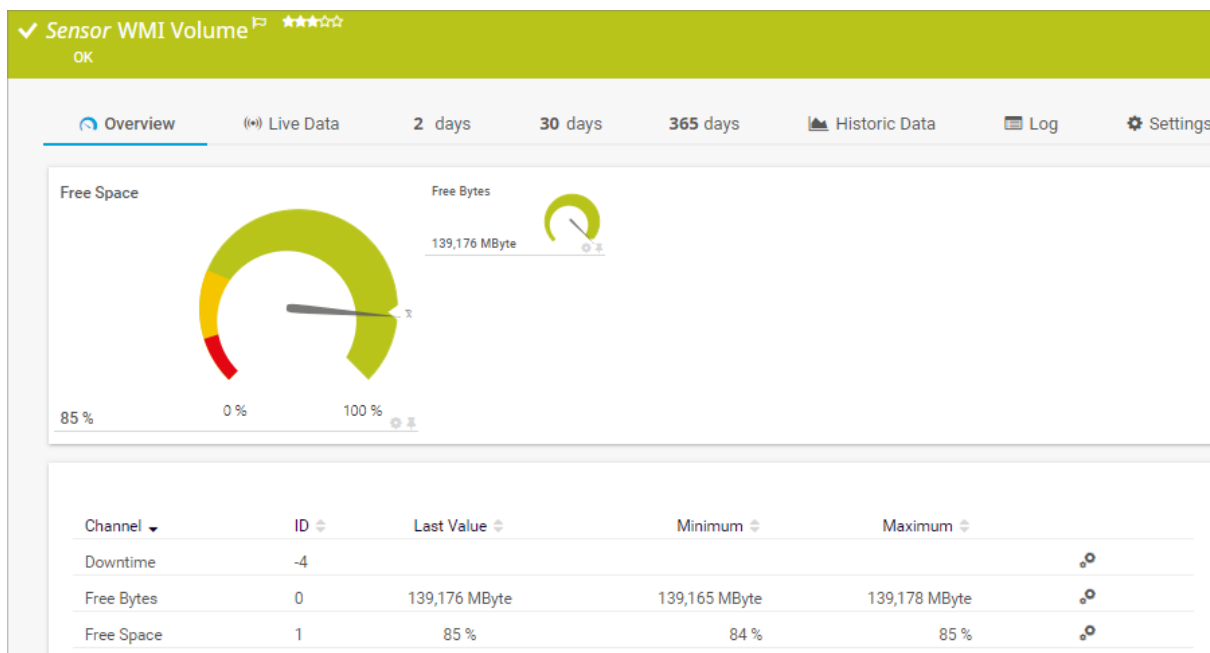

7.8.278 WMI Volume Sensor

The WMI Volume sensor monitors the free disk space on a drive, logical volume, or mount point via Windows Management Instrumentation (WMI).

i The sensor monitors an area of storage on a hard disk. It can monitor local volumes that are formatted, unformatted, mounted, or offline. A volume is formatted by using a file system such as file allocation table (FAT) or New Technology File System (NTFS), and might have a drive letter assigned to it. One hard disk can have multiple volumes, and volumes can span multiple physical disks.

i The sensor does not support disk drive management.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Volume Sensor

Sensor in Other Languages

- Dutch: WMI Volume
- French: Disque WMI
- German: WMI Datenträger
- Japanese: WMI ボリューム
- Portuguese: Volume de WMI
- Russian: WMI
- Simplified Chinese: WMI 卷
- Spanish: WMI Volumen

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[450] for load balancing.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor does not support Windows XP and earlier.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#)^[36] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

WMI Volume Specific

Setting	Description
Volumes	<p>Select the volumes (drives, logical volumes, mount points) that you want to monitor. PRTG creates one sensor for each volume that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Sensor Settings Overview

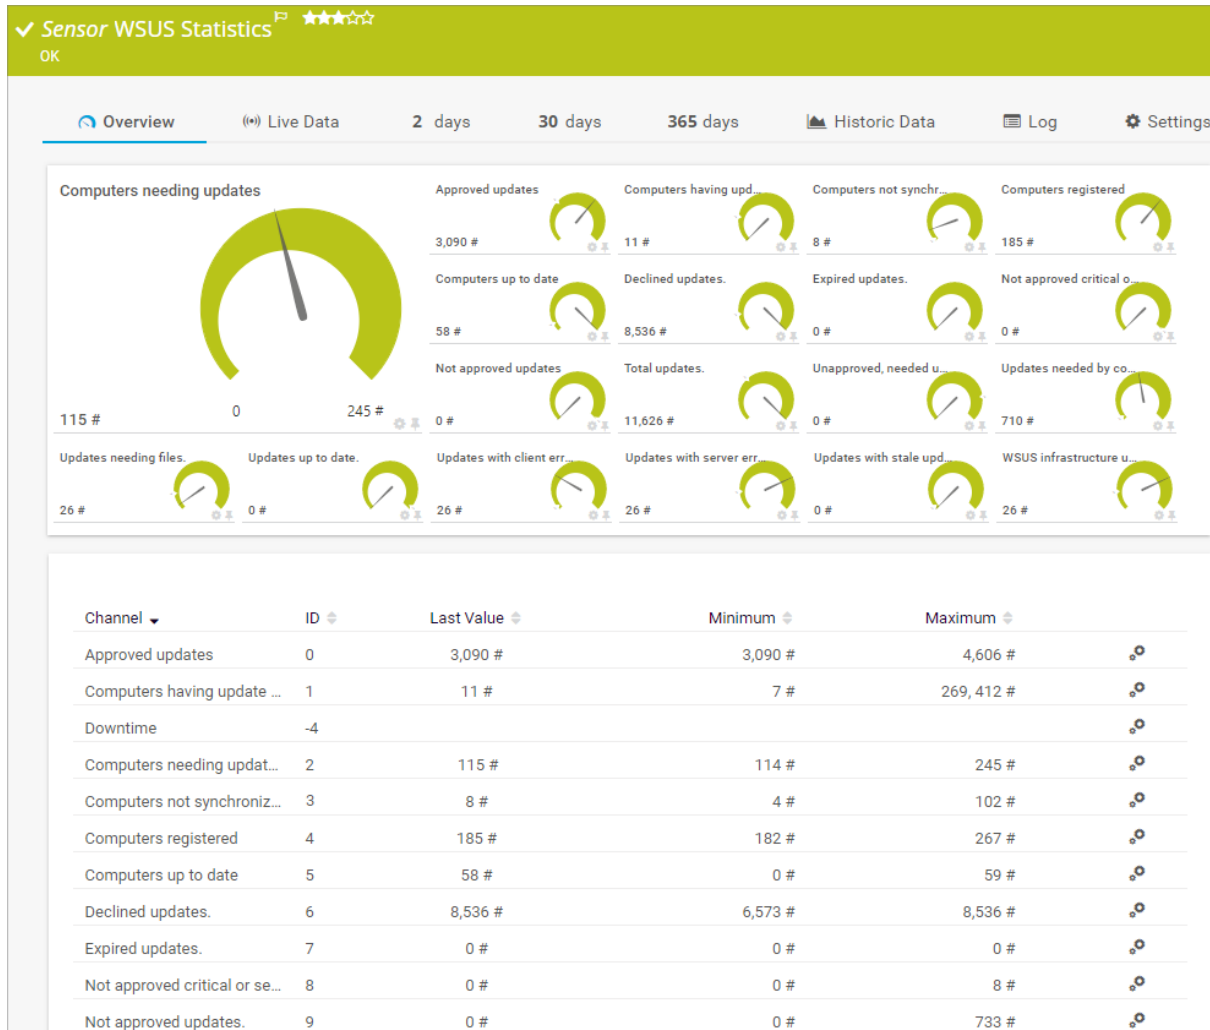

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.279 WSUS Statistics Sensor

The WSUS Statistics sensor monitors various statistics on a Windows Server Update Services (WSUS) server via Windows Management Instrumentation (WMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WSUS Statistics Sensor

Sensor in Other Languages

- Dutch: WSUS Statistieken
- French: Statistiques WSUS
- German: WSUS-Statistiken
- Japanese: WSUS 統計情報
- Portuguese: Estatísticas WSUS
- Russian: WSUS
- Simplified Chinese: WSUS 统计

- Spanish: Estadísticas WSUS

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor [requires](#)^[3947] WSUS 3.0 Administration Console on the probe system.
- This sensor requires .NET 4.7.2 or later on the probe system. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [Can I encrypt connections to my WSUS server?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i If the framework is missing, you cannot create this sensor.</p> <p>■ For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Windows credentials	<p>This sensor requires credentials for Windows systems^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, the sensor cannot correctly connect.</p>
WSUS 3.0 Administration Console	<p>For this sensor to work, the Microsoft WSUS 3.0 Administration Console must be installed on the probe system. In a cluster, it must be installed on every cluster node.</p>

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Sensor Display

Primary Channel **ⓘ** Downtime

Graph Type **ⓘ** Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration^[4187] on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule None ▼

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Sensor Settings Overview

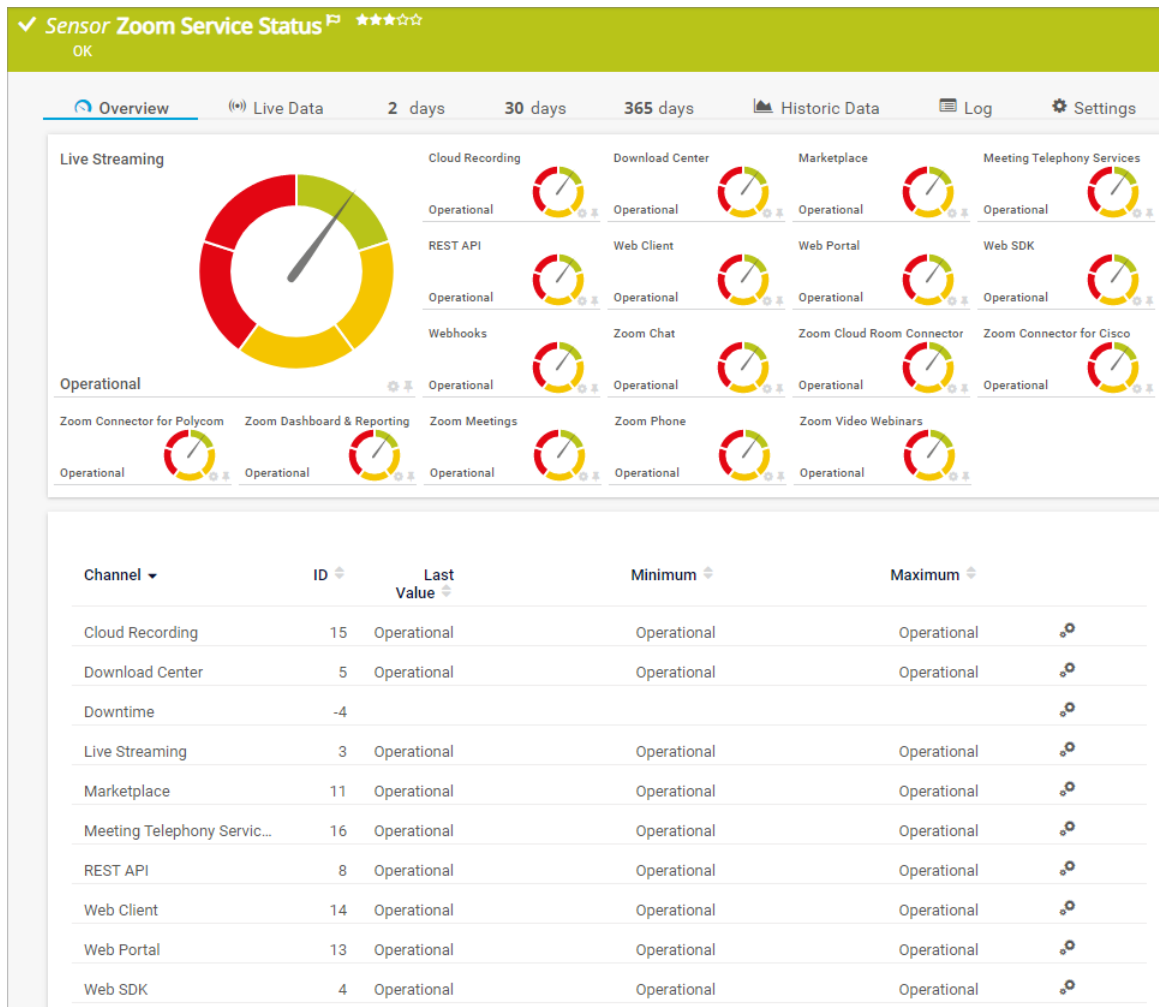

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3957

7.8.280 Zoom Service Status Sensor

The Zoom Service Status sensor monitors the global status of all Zoom services.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Zoom Service Status Sensor

Sensor in Other Languages

- Dutch: Zoom Service Status
- French: Zoom Service Status
- German: Zoom Service Status
- Japanese: Zoom Service Status
- Portuguese: Zoom Service Status
- Russian: Zoom Service Status
- Simplified Chinese: Zoom Service Status
- Spanish: Zoom Service Status

Remarks

- This sensor only supports the global status of Zoom services.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a 'Basic Sensor Settings' dialog box. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A list of tags with 'exampletag' selected. There are 'X' and '+' icons for tag management.
- Priority:** A star rating system showing 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ zoom ▪ zoomsensor

None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

■ KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.9 Additional Sensor Types (Custom Sensors)

You can create and use your own custom sensors in PRTG to extend the standard sensor set. You can create your own sensors by using Windows Management Instrumentation Query Language (WQL), visual basic scripting, PowerShell, batch scripting, Structured Query Language (SQL) queries, by compiling an .exe or .dll file, by running Python scripts, or by translating JavaScript Object Notation (JSON) and Extensible Markup Language (XML) responses of a Representational State Transfer (REST) application programming interface (API) into sensor values.

 You cannot use custom sensors on hosted probes in PRTG Hosted Monitor (except SSH sensors). If you want to use custom sensors, add them to a remote probe device.

Basics

For a general introduction, see the sections about EXE/Script sensors and section [Custom Sensors](#)⁴⁴³⁷, which contains details about the necessary return format for these sensors. WMI Custom sensors allow you to execute WQL requests.

- [EXE/Script sensor](#)¹⁰⁶³
- [EXE/Script Advanced sensor](#)¹⁰⁷⁷
- [Python Script Advanced sensor](#)²⁰⁹²
- [REST Custom sensor](#)²¹⁵¹
- [SSH Script sensor](#)³²⁷³
- [SSH Script Advanced sensor](#)³²⁸⁸
- [WMI Custom sensor](#)³⁵⁹⁶
- [WMI Custom String sensor](#)³⁶⁰⁸

Additionally, some types of SQL sensors execute script files with SQL queries:

- [Microsoft SQL v2 sensor](#)¹⁶⁰⁷
- [MySQL v2 sensor](#)¹⁶⁷⁴
- [Oracle SQL v2 sensor](#)¹⁹²³
- [PostgreSQL sensor](#)²⁰⁶⁴

The [HL7 sensor](#)¹¹⁸⁰ sends messages that are stored in extra files on the probe system.

Custom Sensors in PRTG

After you install PRTG, you can find a selection of custom EXE/Script, Python, and WMI WQL script sensors in the [PRTG program directory](#)⁴⁵²⁶, as well as scripts with SQL queries for specific database sensors, REST configuration files in the JSON template (*.template) format for the REST Custom sensor, and Health Level 7 (HL7) message files for the HL7 sensor. Many of the files are sample projects that you can edit and improve for your needs.

Subfolder of the PRTG Custom Sensors
Program Directory

\\Custom Sensors\\EXE

The following custom sensors are available by default:

- Demo Batchfile - Returns 200.bat
- Demo Batchfile - Set sensorstate to error.bat
- Demo Batchfile - Set sensorstate to warning.bat
- Demo Cmd - Returns 200.cmd
- Demo Dll - Returns a random integer.dll
- Demo EXE - Returns a random integer.exe
- Demo EXE - Returns number of files in folder (parameter).exe
- Demo EXE - Returns user of process.exe
- Demo Powershell Script - Available MB via WMI.ps1
- Demo Powershell Script - InterruptsPerSec via WMI.ps1
- Demo Powershell Script - Powershell Version.ps1
- Demo Powershell Script - Returns a fixed integer value.ps1
- Demo Powershell Script - Returns a random integer value.ps1
- Demo Powershell Script - Returns Random Integer and Warnings.ps1
- Demo VBScript - InterruptsPerSec via WMI.vbs
- Demo VBScript - Multiplies two integers(2 parameters).vbs
- Demo VBScript - Returns a fixed float value.vbs
- Demo VBScript - Returns a fixed integer value.vbs
- Demo VBScript - Returns a random value.vbs
- Demo VBScript - Returns number of svchost processes.vbs
- Demo VBScript - Returns user of process.vbs
- Demo VBScript - Returns warning depending on number of svchost processes.vbs
- Demo VBScript - Timezone via WMI.vbs
- Demo VBScript - UTCTime via WMI.vbs
- Load_Test_CPU_1_Mio_Primes.exe
- Load_Test_CPU_10_Mio_Primes.exe
- Load_Test_Disk_Write_Read_1000_files.exe
- Load_Test_Disk_Write_Read_10000_files.exe
- Load_Test_Memory_Allocate_And_Free_400MB.exe

Subfolder of the PRTG Custom Sensors Program Directory

To create a new sensor based on one of these files, create a new EXE/Script sensor and choose the respective file from the EXE/Script list in the sensor settings.

i We recommend that you not edit the demo files. Create your own new files and make sure to give them unique names that do not start with **Demo**, for example.

\Custom Sensors\EXEXML

The following custom sensor is available by default:

- Demo Batchfile - Returns static values in four channels.bat

To create a new sensor based on one of these files, create a new EXE/Script Advanced sensor and choose the respective file from the EXE/Script list in the sensor settings.

\Custom Sensors\hl7

The following custom sensors are available by default:

- ADT_A08.hl7
- ORM_O01.hl7

Each file contains an HL7 message that is conform to the HL7 message format. To create a new sensor based on one of these files, create a new HL7 sensor and choose the respective file from the HL7 Messages list in the sensor settings. You can override certain message headers in the files via the sensor settings.

\Custom Sensors\python

The following custom sensor is available by default:

- sensor_example.py

This Python example script only returns fixed values in two channels to demonstrate the usage. To create a new sensor based on this file, create a new Python Script Advanced sensor and choose the file from the Python Script list in the sensor settings.

\Custom Sensors\rest

The following custom sensors are available by default:

- kemp.loadbalancer.template: maps values returned by the RESTful API of a KEMP load balancer to channels, for example, CPU usage, memory usage, traffic
- prtg-sensor-stats.template: maps values returned by the PRTG API to channels that show the count of each sensor status on the local probe
- windows.docker.container.stats.template: maps values returned by the Docker Engine API to channels, for example, CPU usage, memory usage, traffic, input/output (I/O)
- underground.template: maps values returned by the Weather Underground API to channels, for example, temperature, dew point, pressure, wind speed, wind direction

Subfolder of the PRTG Program Directory Custom Sensors

To create a new sensor based on one of these files, create a new REST Custom sensor on the device that provides the REST API and choose the file from the REST Configuration File list in the sensor settings.

\Custom Sensors\sql\[dbms]

The following custom sensor is available by default:

- Demo Serveruptime.sql

You can find this demo SQL query script in each subfolder for each supported [database management system \(dbms\)](#): \adosql, \mssql, \mysql, \oracle, \postgresql

To create a new sensor that uses one of the scripts in the dbms folders, create the according sensor ([see above for supported sensors](#)) and choose the respective file from the SQL Query File list in the sensor settings.

\Custom Sensors\WMI WQL scripts

The following custom sensors are available by default:

- Demo WQL Script - Get Win32LogicalDiscFreeMB.wql
- Demo WQL Script - Get Win32OsBuildnumber.wql
- Demo WQL Script - Get Win32PercentProcessorIdleTime.wql
- Demo WQL Script - Get Win32PercentProcessorTime.wql

To create a new sensor based on one of these files, create a new WMI Custom sensor and choose the respective file from the WQL File list in the sensor settings.

Download Custom Sensors

Good resources to find custom sensors that other users and we from Paessler share are the [PRTG Sensor Hub](#) and our Knowledge Base. In the Knowledge Base, search for the tag custom-script-exe to find a lot of custom sensors.

7.10 Channel Settings

A sensor has one or more channels in which it handles the actual monitoring data. In the channel settings, you can define how to display the data from the sensor's different channels displayed in graphs, gauges, and tables. Additionally, the channel data can determine the [sensor status](#)^[197]. Use the limit settings to define desired sensor states for values.

On the sensor's Overview tab, click  below a gauge to change the channel's settings. Click  below a gauge to make this channel the primary channel of the selected sensor.

You can also open the settings of a channel by clicking  in the channels data table.

 For [lookup](#)^[4485] channels, we recommend that you stay below 120 lookup values to get expressive gauges. For non-primary lookup channels, the upper limit is around 40 lookup values.

The Gear Icon of an SNMP Traffic Total Channel to Open Channel Settings

The available options are nearly the same for all sensors. An exception applies to the Downtime channel, which PRTG automatically calculates and which does not offer all settings. Channels with [absolute](#) values additionally have an option to define the Value Mode. Custom channels have a Lookups and Limits setting to distinguish between alerting by lookups or numeric limits.

You can choose a different channel via the dropdown list at the top of the channel settings list.

Channel Settings for a Disk Sensor

Edit Channel

Setting	Description
Name	<p>Enter a meaningful name to identify the channel. The name appears in graphs and tables.</p> <ul style="list-style-type: none"> ⓘ You can automatically add the sensor's ID to the name by using the placeholder [#id]. ⓘ You cannot edit the name for script sensors after sensor creation.

Setting	Description
Unit	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p> <p>This setting is only visible for custom sensors.</p> <p>Enter the unit for the values that this sensor returns. Enter a string. PRTG uses the unit string for display purposes and shows it in graphs, data tables, and gauges.</p> <p>i If you want to change the unit after sensor creation, you can change it in the sensor's channel settings³⁹⁷⁷.</p>
Scaling Multiplication	<p>This setting is only visible for channels with a custom unit. If you want to multiply the received raw data by a certain value, enter the multiplier here. Otherwise, use the default value 1 to not change the received value. Enter an integer value.</p> <p>For example, the following sensors provide the scaling factor for received values with custom units in their settings.</p> <ul style="list-style-type: none"> ▪ Sensor Factory sensor²¹⁸⁰ (you can use multiplication and division in the channel definition) ▪ SNMP APC Hardware sensor²³⁰⁸ ▪ SNMP Custom sensor²⁴⁵⁴ ▪ SNMP Dell Hardware sensor²⁵⁵² ▪ WMI Custom sensor <p>i If the channel uses lookups, the scaling factor does not modify the values that are defined in the lookups. Any applied lookup always uses the raw value as it is retrieved from the target device. If you use a scaling factor for such a channel, you notice the scaling in data graphs, but the channel value appears unmodified in data tables.</p>
Scaling Division	<p>This setting is only visible for channels with a custom unit. If you want to divide the received raw data by a certain value, enter the divisor here. Otherwise, use the default value 1 to not change the received value. Enter an integer value.</p> <p>For example, the following sensors provide the scaling factor for received values with custom units in their settings.</p> <ul style="list-style-type: none"> ▪ Sensor Factory sensor (you can use multiplication and division in the channel definition) ▪ SNMP APC Hardware sensor ▪ SNMP Custom sensor ▪ SNMP Dell Hardware sensor ▪ WMI Custom sensor

Setting	Description
ID	<p>i If the channel uses lookups, the scaling factor does not modify the values that are defined in the lookups. Any applied lookup always uses the raw value as it is retrieved from the target device. If you use a scaling factor for such a channel, you notice the scaling in data graphs, but the channel value appears unmodified in data tables.</p> <p>Shows the ID of the channel. You cannot change the ID. PRTG uses it for unique identification. For example, you need the ID for Sensor Factory sensors.</p> <p>There are a few special, fixed channel IDs.</p> <ul style="list-style-type: none"> ▪ -1 is for sum channels of traffic sensors (for example, of the SNMP Traffic sensor³⁰⁹⁴). ▪ -4 is for the Downtime channel (you can use it, for example, for an uptime percentage calculation in a Sensor Factory sensor). ▪ -2 (coverage) and -3 (error) are internally used.
Limits	<p>i This setting is not available for custom channels.</p> <p>Define if you want to set limits for this channel. The channel can affect the status of the sensor¹⁹⁷ that it is a part of. By setting limits, you can define when the sensor shows the Warning status or the Down status, depending on the channel data. For example, you can use this function to set a traffic sensor (that is usually never in the Down status) to show the Down status when the monitored values reach critical limits.</p> <p>Choose between:</p> <ul style="list-style-type: none"> ▪ Disable limits: Do not use the channel data to define the sensor status. ▪ Enable alerting based on limits: Define limits for the numeric values that are returned by the device. The sensor of which this channel is a part of shows the Warning status or the Down status when limits fall below the defined value or when limits are exceeded. <p>i The Limits option is not available for the Downtime channel.</p> <p>i You can show limits in graphs (highlighted in yellow or red) if you select exactly one channel with a limit in a graph.</p>
Lookups and Limits	<p>i This setting is only available for custom channels.</p> <p>Define when the sensor shows the Down status and alerts you, either based on the lookup definition or based on limits for returned values. Only the option that you select applies. For example, if you select limits as the alerting method, an error status that is defined in the lookups does not show up.</p> <p>Choose between:</p>

Setting	Description
Lookup	<ul style="list-style-type: none"> ▪ Enable alerting based on lookups: Use the lookup definition of the channel to define the sensor status. Make sure that the channel uses a proper Lookup if you use this option. Select the lookup file either in the channel settings or in the sensor settings, depending on the sensor. If you do not want to use the channel data to define the sensor status, select None as Lookup. ▪ Enable alerting based on limits: Define limits for numeric values returned by the device. The sensor of which this channel is a part of shows the Warning status or the Down status when limits fall below the defined value or when limits are exceeded. <p>i If you choose limit-based alerting, errors and warnings that you have defined in the lookup file do not apply.</p> <p>This setting is only visible for custom sensors and if you select lookups-based alerting. Select the lookup file that you want to use with this channel.</p> <p>i Do not use this option for sensors that provide the unit Lookup in the sensor settings. The channel setting is overwritten with the next sensor scan. Define the lookup file that you want to use with this channel on the Settings tab of the sensor. Select the option Lookup for the setting Channel #x Unit (where x is the number of the channel) and define the desired lookup file under Channel #x Lookup. See section Define Lookups^[4485] for affected sensors.</p> <p>i If you choose None, alerting by lookups and limits is disabled and channels do not appear as lookups. If you want to keep the lookup representation without alerting, define the states accordingly in the lookup file.</p>
Upper Error Limit ([unit])	<p>This setting is only visible if you select Enable alerting based on limits above. Specify an upper limit for the Down status. If the channel values exceed this value, the sensor shows the Down status. Enter a valid number into at least one of the limit fields.</p> <p>i The value that you enter here must match the type of value that the device returns, either an integer or a float. See also Absolute Values and Delta Values for Limits^[4039].</p> <p>i While a sensor shows the Down status because of a limit, it still receives data in its channels.</p>
Upper Warning Limit ([unit])	<p>This setting is only visible if you select Enable alerting based on limits above. Specify an upper limit for the Warning status. If the channel values exceed this value, the sensor shows the Warning status. Enter a valid number into at least one of the limit fields.</p> <p>i The value that you enter here must match the type of value that the device returns, either an integer or a float. See also Absolute Values and Delta Values for Limits^[4039].</p>

Setting	Description
Lower Warning Limit ([unit])	<p>This setting is only visible if you select Enable alerting based on limits above. Specify a lower limit for the Warning status. If the channel values fall below this value, the sensor shows the Warning status. Enter a valid number into at least one of the limit fields.</p> <p>i The value that you enter here must match the type of value that the device returns, either an integer or a float. See also Absolute Values and Delta Values for Limits ⁴⁰³⁹.</p>
Lower Error Limit ([unit])	<p>This setting is only visible if you select Enable alerting based on limits above. Specify a lower limit for the Down status. If the channel values fall below this value, the sensor shows the Down status. Enter a valid number into at least one of the limit fields.</p> <p>i The value that you enter here must match the type of value that the device returns, either an integer or a float. See also Absolute Values and Delta Values for Limits ⁴⁰³⁹.</p> <p>i While a sensor shows the Down status because of a limit, it still receives data in its channels.</p>
Error Limit Message	<p>This setting is only visible if you select Enable alerting based on limits above. Enter an additional message. PRTG adds it to the sensor message when the sensor shows the Down status. Enter a string or leave the field empty.</p>
Warning Limit Message	<p>This setting is only visible if you select Enable alerting based on limits above. Enter an additional message. PRTG adds it to the sensor message when the sensor shows the Warning status. Enter a string or leave the field empty.</p>
Graph Rendering	<p>Select if you want to show this channel in data graphs ²⁰⁵:</p> <ul style="list-style-type: none"> ▪ Show in graphs: Sensor graphs contain the data of this channel. ▪ Hide from graphs: Sensor graphs do not contain data of this channel. <p>i If you choose to hide this channel in graphs, it also does not appear in the graphs of reports ⁴⁰⁶⁹ or maps ⁴⁰⁹⁵.</p>
Table Rendering	<p>Select if you want to show this channel in data tables ²⁰¹:</p> <ul style="list-style-type: none"> ▪ Show in tables: Sensor data tables contain the data of this channel. ▪ Hide from tables: Sensor data tables do not contain the data of this channel. This option hides the gauge as well, but the channel is still available in the data table of the sensor's Overview tab. <p>i If you choose to hide this channel in data tables, PRTG also does not use it for the calculation of the Total channel of a sensor. It also does not appear in data tables of a report.</p>

Setting	Description
Line Color	<p>Select the color of the channel display in graphs:</p> <ul style="list-style-type: none"> ▪ Automatic: PRTG automatically sets the color of this channel in graphs. ▪ Manual: Individually define the color of this channel. You can enter the desired color code below.
Color (#rrggbb)	<p>This setting is only visible if you select Manual above. Enter a color in hexadecimal notation as in .html and .css files, or choose a color from the visual color selector. The field with the hexadecimal color value automatically changes to the color you select.</p>
Line Width	<p>Enter the width of the channel line in graphs. Enter an integer value in pixels. The maximum line width is 25, but we recommend that you only use values between 1 and 7 to get optimal results.</p>
Data	<p>This setting is available for most channels. Define how to display data:</p> <ul style="list-style-type: none"> ▪ Display actual values in [unit]: Display the values in the shown unit. ▪ Display in percent of maximum: Calculate and show percent values based on a maximum value. Enter a maximum below. <ul style="list-style-type: none"> ❗ If you choose this option, you cannot display the data of traffic sensors as a positive and negative area graph. ❗ If you choose this option, values in the Limits section are counted as percent values.
Maximum ([unit])	<p>This setting is only visible if you select Display in percent of maximum above. Enter a value to use as the maximum. Consider the unit. PRTG calculates all percent values based on this value. Enter an integer value.</p>
Value Mode	<p>This setting is only available for channels that return absolute values. It is not available for sensors that show difference values, such as traffic channels. Depending on this setting, the channel can not only show averages, but also the minimum or the maximum values in the graphs for the respective time spans.</p> <p>Choose from:</p> <ul style="list-style-type: none"> ▪ Average: The channel shows average values. ▪ Minimum: The channel shows the minimum values. ▪ Maximum: The channel shows the maximum values. <p> For more information about value modes, see the Knowledge Base: What is the Value Mode in channel settings?</p>
Decimal Places	<p>Define how many decimal places of the channel's data that you want to display in graphs and tables:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ Automatic: PRTG automatically defines how many decimal places to use for optimal viewing results. <ul style="list-style-type: none"> ⓘ PRTG rounds values between 10 and –10 to two decimal places. It rounds values that are very close to an integer to the integer, for example, it rounds 3.001 to 3. ▪ All: Display all available decimal places. ▪ Custom: Manually define the number of decimal places. If you choose this option, an additional field appears. Enter an integer value.
Spike Filter	<p>You can use a spike filter to correct faulty monitoring data. Sometimes, sensors report values that are enormously high or far too low. This can be because of an error in data transmission, or because of incompatibilities of the physical device you are monitoring. This can make graphs unreadable. A spike filter can compensate for these flaws.</p> <p>If you enable a spike filter, PRTG disregards values that are above and below a certain limit in the monitoring data for graphs and tables.</p> <p>Choose between:</p> <ul style="list-style-type: none"> ▪ Disable filtering: Display all data as it is received. Do not filter out spikes. ▪ Enable filtering: Enable a filter to remove spike values. Additional fields appear below. <ul style="list-style-type: none"> ⓘ This does not change monitoring data itself but only the presentation of the data. This setting is valid for all data of this channel, including historic data. ⓘ Use the spike filter with care. For overflow values in SNMP sensors, check the SNMP Compatibility Options³⁷⁸ before. ⓘ The spike filter option is not available for the channel Downtime.
Spike Filter Max. Value ([unit])	<p>This setting is only visible if you select Enable filtering above. Enter the maximum value to show in the channel data. PRTG disregards all data above this value in graphs and tables. Enter an integer value or leave the field empty.</p>
Spike Filter Min. Value ([unit])	<p>This setting is only visible if you select Enable filtering above. Enter the minimum value to show in the channel data. PRTG disregards all data below this value in graphs and tables. Enter an integer value or leave the field empty.</p>
Vertical Axis Scaling	<p>Define how to display the vertical axis for the channel in graphs:</p> <ul style="list-style-type: none"> ▪ Automatic scaling: PRTG automatically uses the optimum scaling. Usually the scaling ranges from the minimum to the maximum value. PRTG uses one single scale for each unit label only.

Setting	Description
	<ul style="list-style-type: none"> Manual scaling: Manually define the scaling. Additional fields appear below. If you define manual axis scaling, it can make low values better visible in your graph, but it might result in a graph with multiple vertical axes for the same unit label. <p>i PRTG ignores settings for this option if you select Stack channels on top of each other under Graph Type on the sensor's Settings tab.</p>
Vertical Axis Maximum ([unit])	This setting is only visible if you select Manual scaling above. Enter the maximum value to use on the vertical axis for the channel. Enter an integer value.
Vertical Axis Minimum ([unit])	This setting is only visible if you select Manual scaling above. Enter the minimum value to use on the vertical axis for the channel. Enter an integer value.

i Click OK to save your settings and to close the settings window. Click Apply to save the changed settings while the Edit Channel window remains open, for example if you want to change the settings of other channels of the current sensor as well. You can select a different channel via the dropdown list above the settings. You can close the settings window without saving by clicking Cancel.

i If you change any settings and either click Cancel or select a different channel via the dropdown list, PRTG asks you to confirm this step. Click Save to apply the changes or click Discard Changes to ignore the changes. PRTG closes the window or shows the settings of the selected channel respectively.

- [Notification Triggers Settings](#)  3987

7.11 Notification Triggers Settings

You can use changes in a sensor's status or in the sensor's data to trigger notifications.

Notification Triggers Tab

Although sensors activate notification triggers, you can set notification triggers in the settings of objects that are higher in the [object hierarchy](#)¹³⁸. This allows you to use the [inheritance of settings](#)¹⁴² to define notification triggers for multiple sensors. Objects that inherit notification triggers show them on the Notification Triggers tab.

■ For more information, see section [Triggers That Can Be Inherited From Parent Objects](#)³⁹⁹⁷.

You can also define notification triggers in [libraries](#)⁴⁰⁴⁷. If a sensor is in a library that has notification triggers, the sensor shows them on the Notification Triggers tab.

■ For more information, see section [Triggers That Are Defined in Libraries](#)³⁹⁹⁸.

ⓘ You can also directly edit notification templates on the Notification Triggers tab. To do so, click  next to name of a notification template.

Note

You have to take the following four steps to set up and use notifications:

1. Check and set up the [notification delivery](#)⁴¹⁹⁴ settings if you use PRTG on premises. These settings define how PRTG sends messages.
2. Check and set up [notification contacts](#)⁴¹⁶³ for the user accounts. These contacts define the recipients to which PRTG sends notifications.

3. Check and set up several [notification templates](#)⁴¹³¹. These templates define the notification methods and their content.

i You can also check or edit notification templates via the Notification Triggers tab. For more information, see section [Notification Triggers Settings](#)³⁸⁸⁷.

4. Check and set up [notification triggers settings](#)³⁸⁸⁷ for objects. These triggers define when PRTG sends notifications.

i Usually, there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always set up at least two notifications with different notification methods for a notification trigger, for example, one email notification and one SMS notification. If delivery via email fails, PRTG can still notify you via smartphone as a fallback. For example, use the latency setting of a [state trigger](#)³⁸⁸⁸ to choose a notification with a different notification method than in the first trigger condition, or set up a second trigger with a different notification method for the corresponding object.

See sections [Notifications Based on Sensor Limits Step by Step](#)⁴⁰³⁴ and [Notifications Based on Libraries Step by Step](#)⁴⁰⁴² for step-by-step guides that describe potential notification setups.

Custom notification scripts are also available in the [PRTG Sensor Hub](#).

Notification Triggers

Select the Notification Triggers tab of an object to add or edit notification triggers. You can set up one or more of the following notification triggers:

- [State Trigger](#)³⁸⁸⁸
- [Speed Trigger](#)³⁸⁹⁰
- [Volume Trigger](#)³⁸⁹²
- [Threshold Trigger](#)³⁸⁹⁴
- [Change Trigger](#)³⁸⁹⁶

Different options are available for every notification trigger. You see the Type of notification trigger and the notification Rule that the sensor executes once it activates a notification trigger.

i Which notification triggers are available on the Notification Triggers tab depends on the kind of object you select.

State Trigger

The state trigger performs a notification when a sensor changes its status. Hover over  and select Add State Trigger from the menu to add a new state trigger or click  next to a state trigger to change it.

State Trigger When sensor state is Down ▼ for at least 60 seconds, perform no notification ▼

When sensor state is Down for at least 300 seconds, perform no notification ▼ and repeat every 0 minutes

When sensor state is no longer Down, perform no notification ▼

Add State Trigger

i PRTG includes a state trigger for the [root group](#)^[138] by default. This notification trigger performs the notification Email and push notification to admin if any sensor is in the Down [status](#)^[197] for at least 10 minutes.

Setting	Description
When sensor state is [...]	<p>Select the status that triggers a notification:</p> <ul style="list-style-type: none"> ▪ Down: Trigger a notification if a sensor changes to the Down status. ▪ Warning: Trigger a notification if a sensor changes to the Warning status. ▪ Unusual: Trigger a notification if a sensor changes to the Unusual status. ▪ Down (Partial): Trigger a notification if a sensor changes to the Down (Partial) status. This status is only possible in a cluster^[138]. ▪ Up: Trigger a notification if a sensor changes to the Up status. ▪ Unknown: Trigger a notification if a sensor changes to the Unknown status.
for at least [...] seconds,	<p>Enter the time in seconds that PRTG waits before it sends a notification (latency). This can avoid false alarms if, for example, a sensor changes to the Down status for only a few seconds. Enter an integer value.</p> <p>i Do not define a latency that is shorter than the scanning interval of a sensor that uses this trigger. The notification trigger might not work as expected in this case.</p>
perform [...]	<p>Select the notification that PRTG sends if the sensor is in the selected status and if the defined latency is over. You see all notification templates that you have defined under Setup Account Settings Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p>i You can also directly create and use new notification templates by clicking  in the dropdown list.</p>
When sensor state is [...] for at least [...] seconds	<p>Enter the escalation latency in seconds that PRTG waits before it sends an escalation notification. Use this to automatically escalate a notification if a problem exists for a longer time. Enter an integer value.</p> <p>i PRTG automatically fills in the selected status.</p>
perform [...]	<p>Select the notification that PRTG sends if the sensor is still in the selected status and if the defined escalation latency is over. You see all notification templates that you have defined under Setup Account Settings Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p>

Setting	Description
	<ul style="list-style-type: none"> Select a notification with a different delivery method than in the first trigger condition to make sure that you receive a notification in case the first notification could not be sent. You can also directly create and use new notification templates by clicking  in the dropdown list.
and repeat every [...] minutes	<p>Enter the interval in minutes after which PRTG sends the escalation notification again. Enter an integer value.</p> <ul style="list-style-type: none"> If you enter 0, PRTG does not send the escalation notification again.
When sensor state is no longer [...], perform [...]	<p>Select the notification that PRTG sends if the sensor is no longer in the selected status and if the defined latency is over. You see all notification templates that you have defined under Setup Account Settings Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <ul style="list-style-type: none"> PRTG automatically fills in the selected status. You can also directly create and use new notification templates by clicking  in the dropdown list.

Click  to save your settings or click  to undo your changes.

Speed Trigger

The speed trigger performs a notification if the speed that a sensor monitors changes. Hover over  and select Add Speed Trigger from the menu to add a new speed trigger or click  next to a speed trigger to change it.

Speed Trigger When **Other** channel is **Above** **bit** / **second** for at least seconds, perform **no notification**

When condition clears, perform **no notification**

[Add Speed Trigger](#)

Setting	Description
When [...] channel	<p>Select the channel whose data PRTG uses for the speed comparison. At root, probe, group, or device level or in libraries, the following channels are available:</p> <ul style="list-style-type: none"> Primary: Use the data of the primary channel of the sensor for the comparison.

Setting	Description
	<ul style="list-style-type: none"> ▪ Total: Use the data of the Total channel of the sensor for the comparison. ▪ Traffic In: Use the data of the Traffic In channel of the sensor for the speed comparison. ▪ Traffic Out: Use the data of the Traffic Out channel of the sensor for the speed comparison. <p>At sensor level, the available channels depend on the type of sensor you select.</p> <p> If you set notification triggers at root, probe, group, or device level and you want to know which sensors the notification triggers apply to, see section List of Notification Triggers and Supported Sensors.</p>
is [...]	<p>Select the condition that triggers the notification:</p> <ul style="list-style-type: none"> ▪ Above: Trigger the notification if the value of the selected channel exceeds a defined value. ▪ Below: Trigger the notification if the value of the selected channel falls below a defined value. ▪ Equal to: Trigger the notification if the value of the selected channel is the same as a defined value. ▪ Not equal to: Trigger the notification if the value of the selected channel is different than a defined value.
[value]	<p>Enter the value to which PRTG compares the channel data. Enter an integer value.</p>
[scale]	<p>Select the unit for the [value]:</p> <ul style="list-style-type: none"> ▪ bit ▪ kbit ▪ Mbit ▪ Gbit ▪ Tbit ▪ Byte ▪ KB ▪ MB ▪ GB ▪ TB <p> The available units depend on the type of sensor you select.</p>

Setting	Description
	<p> [scale] and [time] define the unit for [value]. If the channel data has a different unit, PRTG internally converts the values.</p>
[time]	<p>Select the time for the scale to create a scale per time unit:</p> <ul style="list-style-type: none"> ▪ second ▪ minute ▪ hour ▪ day <p> [scale] and [time] define the unit for [value]. If the channel data has a different unit, PRTG internally converts the values.</p>
for at least [...] seconds,	<p>Enter the time in seconds that PRTG waits before it sends a notification (latency). This can avoid false alarms if, for example, a sensor changes to the Down status for only a few seconds.. Enter an integer value.</p> <p> Do not define a latency that is shorter than the scanning interval of a sensor that uses this trigger. The notification trigger might not work as expected in this case.</p>
perform [...]	<p>Select the notification that PRTG sends if the defined [value], [scale], and [time] are true and the defined latency is over. You see all notification templates that you have defined under Setup Account Settings Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p> You can also directly create and use new notification templates by clicking  in the dropdown list.</p>
When condition clears, perform [...]	<p>Select the notification that PRTG sends if the defined [value], [scale], and [time] are no longer true and the defined latency is over. You see all notification templates that you have defined under Setup Account Settings Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p> You can also directly create and use new notification templates by clicking  in the dropdown list.</p>

Click  to save your settings or click  to undo your changes.

Volume Trigger

The volume trigger performs a notification if a sensor reaches a certain volume in a specific time. Hover over  and select Add Volume Trigger from the menu to add a new volume trigger or click  next to a volume trigger to change it.

Volume Trigger When **Other** ▾ channel reaches **0** **Byte** ▾ per **Hour** ▾, perform **no notification** ▾

Add Volume Trigger

Setting	Description
When [...] channel	<p>Select the channel whose data PRTG uses for the volume comparison. At root, probe, group, or device level or in libraries, the following channels are available:</p> <ul style="list-style-type: none"> ▪ Primary: Use the data of the primary channel of the sensor for the comparison. ▪ Total: Use the data of the Total channel of the sensor for the comparison. ▪ Traffic In: Use the data of the Traffic In channel of the sensor for the speed comparison. ▪ Traffic Out: Use the data of the Traffic Out channel of the sensor for the speed comparison. <p>At sensor level, the available channels depend on the type of sensor you select.</p> <p> If you set notification triggers at root, probe, group, or device level and you want to know which sensors the notification triggers apply to, see section List of Notification Triggers and Supported Sensors⁴⁶³⁸.</p>
reaches [value]	<p>Enter the value to which PRTG compares the channel data. Enter an integer value.</p>
[scale]	<p>Select the unit for the [value]:</p> <ul style="list-style-type: none"> ▪ Byte ▪ KB ▪ MB ▪ GB ▪ TB <p> [scale] and [time] define the unit for [value]. If the channel data has a different unit, PRTG internally converts the values.</p>
per [time],	<p>Select the time for the scale to create a scale per time unit:</p> <ul style="list-style-type: none"> ▪ Hour ▪ Day ▪ Week ▪ Month

Setting	Description
	<p>i [scale] and [time] define the unit for [value]. If the channel data has a different unit, PRTG internally converts the values.</p>
perform [...]	<p>Select the notification that PRTG sends if the defined [value], [scale], and [time] are true. You see all notification templates that you have defined under Setup Account Settings Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p>i You can also directly create and use new notification templates by clicking  in the dropdown list.</p>

Click  to save your settings or click  to undo your changes.

Threshold Trigger

The threshold trigger performs a notification if a sensor reaches specific values. Hover over  and select Add Threshold Trigger from the menu to add a new threshold trigger, or click  next to a threshold trigger to change it.

Threshold Trigger When Last Sync Result (#) v channel is Above v 0 for at least 60 seconds, perform no notification v

When condition clears, perform no notification v

Add Threshold Trigger

Setting	Description
When [...] channel	<p>Select the channel whose data PRTG uses for the threshold comparison. At root, probe, group, or device level or in libraries, the following channels are available:</p> <ul style="list-style-type: none"> ▪ Primary: Use the data of the primary channel of the sensor for the comparison. ▪ Total: Use the data of the Total channel of the sensor for the comparison. <p>At sensor level, the available channels depend on the type of sensor you select.</p> <p>i The threshold trigger for a Total channel that you define at group or device level or in libraries only applies to the Total channel of traffic sensors. This channel has the ID -1. The threshold trigger works with the Total channel of the following sensors:</p> <ul style="list-style-type: none"> ▪ Amazon CloudWatch EBS ▪ IPFIX

Setting	Description
	<ul style="list-style-type: none"> ▪ IPFIX (Custom) ▪ jFlow v5 ▪ jFlow v5 (Custom) ▪ NetFlow v5 ▪ NetFlow v5 (Custom) ▪ NetFlow v9 ▪ NetFlow v9 (Custom) ▪ Packet Sniffer ▪ sFlow ▪ sFlow (Custom) ▪ SMTP&IMAP Round Trip ▪ SMTP&POP3 Round Trip ▪ SNMP Traffic (channel Traffic Total) ▪ Windows Network Card <p> If you set notification triggers at root, probe, group, or device level and you want to know which sensors the notification triggers apply to, see section List of Notification Triggers and Supported Sensors.</p>
...is [...]	<p>Select the condition that triggers the notification:</p> <ul style="list-style-type: none"> ▪ Above: Trigger the notification if the value of the selected channel exceeds a defined value. ▪ Below: Trigger the notification if the value of the selected channel falls below a defined value. ▪ Equal to: Trigger the notification if the value of the selected channel is the same as a defined value. ▪ Not equal to: Trigger the notification if the value of the selected channel is different than a defined value.
[value]	<p>Enter the value to which PRTG compares the channel data. Enter values in the smallest (base) unit that is possible, for example, in bytes, milliseconds, or percent. Enter an integer value.</p>
..for at least [...] seconds,	<p>Enter the time in seconds that PRTG waits before it sends a notification (latency). This can avoid false alarms if, for example, a sensor changes to the Down status for only a few seconds. Enter an integer value.</p> <p> Do not define a latency that is shorter than the scanning interval of a sensor that uses this trigger. The notification trigger might not work as expected in this case.</p>

Setting	Description
...perform [...]	<p>Select the notification that PRTG sends if the defined channel condition is true and the defined latency is over. You see all notification templates that you have defined under Setup Account Settings Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p>i You can also directly create and use new notification templates by clicking + in the dropdown list.</p>
When condition clears, perform [...]	<p>Select the notification that PRTG sends if the defined channel condition is no longer true and the defined latency is over. You see all notification templates that you have defined under Setup Account Settings Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p>i You can also directly create and use new notification templates by clicking + in the dropdown list.</p>

Click **✓** to save your settings or click **x** to undo your changes.

Change Trigger

i Before you set up a change trigger, make sure that you enable the Trigger 'change' notification setting in the sensor's settings, otherwise PRTG never sends the notification.

Advanced Sensor Data

Protocol Version **i** HTTP 1.0
 HTTP 1.1

User Agent **i** Use PRTG's default string
 Use a custom string

HTTP Headers **i** Do not use custom HTTP headers
 Use custom HTTP headers

Content Changes **i** Ignore changes
 Trigger 'change' notification

Trigger 'Change' Notification

The change trigger performs a notification if a compatible sensor's value changes. Hover over  and select Add Change Trigger from the menu to add a new change trigger, or click  next to a change trigger to change it.

Change Trigger
When sensor changes, perform

no notification
▼

Add Change Trigger

Setting	Description
When sensor changes, perform [...]	<p>Select the notification that PRTG sends if a compatible sensor triggers a 'change' notification. You can enable this option in the settings^[476] of compatible sensors. You see all notification templates that you have defined under Setup Account Settings Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p> You can also directly create and use new notification templates by clicking  in the dropdown list.</p>

Click  to save your settings or click  to undo your changes.

Triggers That Can Be Inherited from Parent Objects

You see a list of all notification triggers that the selected object inherits from parent objects. The list is empty and shows the message ([no triggers defined](#)) if you have not set any notification triggers for objects that are higher in the [object hierarchy](#)^[138].

Triggers that can be inherited from parent objects

Inherit all triggers from parent objects and use the triggers defined above
 Only use the triggers defined above

Type ^	Rule	Inherited from
State Trigger	When sensor state is Down for at least 60 seconds, perform @ Email to Admin  When sensor state is Down for at least 300 seconds, perform  Assign Ticket  and repeat every 0 minutes When sensor state is no longer Down, perform @ Email to Admin 	 Root

Trigger Inheritance

Setting	Description
Trigger Inheritance	Select the notification triggers that you want to use for the selected object:

Setting	Description
	<ul style="list-style-type: none"> Inherit all triggers from parent objects and use the triggers defined above: Use the inherited notification triggers in section Triggers that can be inherited from parent objects and use the specific triggers for this object in section Notification Triggers. To change settings of the inherited notification triggers, click the name of the monitoring object in the column Inherited from to open its Overview tab and then open the Notification Triggers tab. Only use the triggers defined above: Do not use the inherited notification triggers in section Triggers that can be inherited from parent objects. Only use the triggers that you define for this object in section Notification Triggers. <p>i This setting is valid for all notification triggers that you see here. It is not possible to select only some of the notification triggers.</p> <p>i You can also click a notification template to edit its settings or click the object under Inherited from to go to the object's Overview tab.</p>

Triggers That Are Defined in Libraries

You see a list of all notification triggers that are set in libraries [\[4047\]](#) that contain the selected sensor. The list is empty and shows the message [\(no triggers defined\)](#) if you have not set any notification triggers in libraries that contain the selected sensor.

Triggers that are defined in libraries

Type ^	Rule	Inherited from
State Trigger	When sensor state is Down for at least 60 seconds, perform @ Send Email [4047]	All diskspace sensors
	When sensor state is Down for at least 300 seconds, perform > Send Push Notification [4047] and repeat every 5 minutes	
	When sensor state is no longer Down, perform @ Send Email [4047]	

If you want to change these notification triggers, remove the sensor from the library or edit the notification triggers on the library's Notification Triggers tab.

Triggers in Libraries

Click a notification template to change its settings. Click a library in the column Inherited from to view the library.

i You cannot disable notification trigger usage from a library here. If you do not want to use notification triggers from a library for the selected sensor, open the library and remove the sensor from it or edit the notification triggers on the Notification Triggers [tab \[4064\]](#) of the library.

8.1 Toplists

Packet Sniffer sensors and xFlow (NetFlow, jFlow, sFlow, IPFIX) sensors not only measure the total bandwidth usage, but also break down traffic by IP address, port, protocol, and other parameters. This way, PRTG can tell which IP address, connection, or protocol uses the most bandwidth. PRTG shows the results in [Toplists](#).

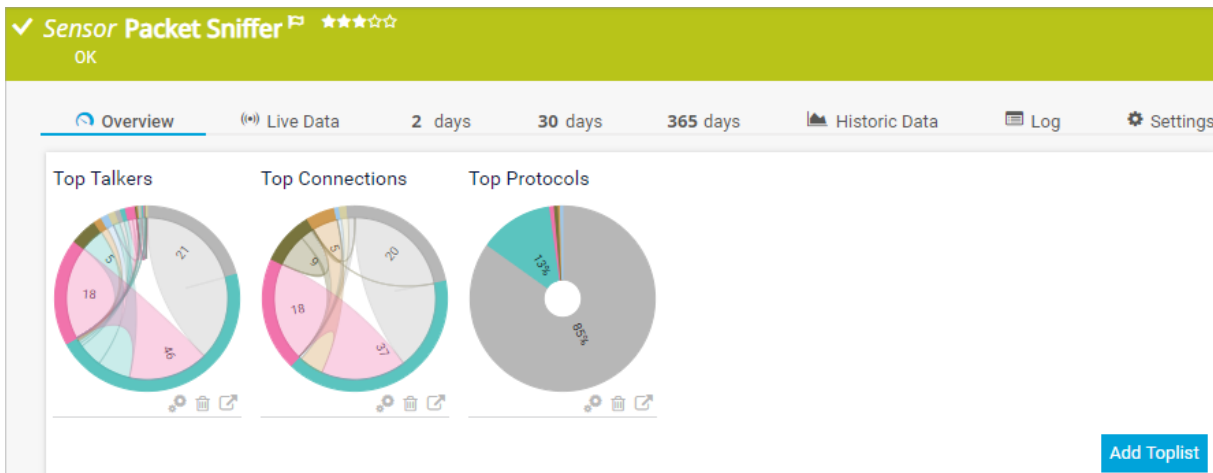

Toplist Storage

PRTG looks at all network packets and collects the bandwidth information for all IPs, ports, and protocols. This creates a huge amount of analysis data. To reduce the amount of data that is actually stored, PRTG only stores the top 100 entries of each Toplist in the database at the end of a specified Toplist period by default.

Toplist Overview

Toplists are only available for [xFlow and Packet Sniffer sensors](#)^[4600]. PRTG displays Toplist on the sensor's Overview [tab](#)^[201].

Toplist Overview for a <%P_Packet_Sniffer%> Sensor

By default, there are three preconfigured Toplists:

Toplist	Description
Top Talkers	Shows bandwidth usage by IP address.
Top Connections	Shows bandwidth usage by connection.
Top Protocols	Shows bandwidth usage by protocol.

Working with Toplists

- Click one of the Toplist names on the sensor's Overview tab or click  below a Toplist to view a distribution chart and a list of source IPs and destination IPs, source ports and destination ports, protocols, or kinds of traffic in different channels, for example. What kind of information is available depends on the selected Toplist.
 - Click an entry in the Toplist periods list on the left side to view data for a specific time period. The default time period is 15 minutes. You can also manually define the start and end time of the Toplist period that you want to view. Use the date time picker to enter the date and time. Additionally, several [table list options](#)^[246] are available.
 - Click Print This Toplist to view a printer-friendly version of your Toplist and use the print dialog of your browser to print the Toplist.
 - Click Sensor Overview to return to the selected sensor's Overview tab. For a quick selection of other Toplists of the selected sensor, click one of the Toplist tiles at the top of the page.

Toplist Tiles

- Click Add Toplist on the sensor's Overview tab to create a new Toplist. The available options are the same as when you [edit](#)^[400a] a Toplist.
- Click  below a Toplist on the sensor's Overview tab and confirm with Delete to delete the Toplist.

Edit Toplists

Click  below a Toplist on the sensor's Overview tab to modify a Toplist.

Setting	Description
Name	<p>Enter a meaningful name to identify the Toplist.</p> <p> If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Toplist Type	<ul style="list-style-type: none"> ▪ Top Talkers (IP address): Shows bandwidth usage by IP address. ▪ Top Connections: Shows bandwidth usage by connection. ▪ Top Protocols: Shows bandwidth usage by protocol. ▪ Custom: Create your own Toplist by selecting one or more Toplist fields.
Toplist Fields	<p>This setting is only visible if you select the Custom option. Select the fields that you want to add to the Toplist by enabling the check box in front of the respective field name. The available options depend on the sensor. They are different for Packet Sniffer, NetFlow v5, NetFlow v9, IPFIX, and sFlow sensors.</p> <p> For performance reasons, only select the fields that you really need to monitor.</p> <p> For more information, see section Performance Considerations  ⁴⁰⁰⁵.</p>
Toplist Period (Minutes)	<p>Define the time span that a Toplist period covers in minutes. Enter an integer value. When a Toplist period is finished, PRTG stores the top results and starts a new Toplist period.</p> <p> To avoid load problems on the probe system, do not set this time period too long. The default setting is 15 minutes.</p> <p> For more information, see section Performance Considerations  ⁴⁰⁰⁵.</p>
Top Count	<p>Define the length of your Toplist. PRTG stores only this number of entries for each Toplist period. Enter an integer value.</p> <p> To avoid load problems on the probe system, set this value as low as possible. The default setting is 100 to store the top 100 entries for each Toplist period.</p> <p> For more information, see section Performance Considerations  ⁴⁰⁰⁵.</p>

Setting	Description
Reverse DNS Lookup	<p>Define if you want to do a reverse Domain Name System (DNS) lookup for IP addresses that are stored in the Toplist:</p> <ul style="list-style-type: none"> Reverse DNS lookup for IP addresses: Determine the domain name that is associated with an IP address and show it in the Toplist. No reverse DNS lookup: Only show IP addresses. Select this option to increase performance.
Data Transfer	<p>Define how the probe sends the Toplist data set to the PRTG core server:</p> <ul style="list-style-type: none"> According to scanning interval (default): Send data in the scanning interval defined in the settings of the sensor for which you create this Toplist. <ul style="list-style-type: none"> i This setting can create a lot of bandwidth usage and CPU load if you have many Packet Sniffer sensors, complex traffic, or long Toplists. At end of Toplist period: Send data once a Toplist period is finished. <ul style="list-style-type: none"> i This setting creates less bandwidth usage and CPU load, but you cannot see the data of the current Toplist in the PRTG web interface. You can only see Toplists with finished time periods. <p>■ For more information, see section Performance Considerations ⁴⁰⁰⁵.</p>
Memory Limit (MB)	<p>Define the maximum amount of memory (in megabytes) that the probe uses to collect the different connection information. Every Toplist adds its amount of used memory to the probe's memory consumption. Increase this value if the number of captured connections is not sufficient. Enter an integer value.</p>

i Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

Performance Considerations

If you create Toplists for data lines with considerable usage (for example, steady bandwidth over 10 megabits per second) or if the traffic is very diverse (for example, many IP addresses or ports with only little traffic each), consider the following aspects:

- The probe gathers all information that is needed for the Toplist in RAM during each Toplist period. By default, only the top 100 entries are transferred to the PRTG core server. Depending on the Toplist type and the traffic patterns, the required memory can consume many megabytes.
- Define Toplist periods that are as short as possible to minimize memory usage. This is especially important when the traffic is highly diverse.
- Memory requirements can grow almost exponentially with each Toplist field that you use in the Toplist definition (depending on the traffic pattern). Avoid complex Toplists for high and diverse traffic. For example, the Toplist Top Connections with 5 Toplist fields needs a lot more memory than the Toplist Top Talkers with 1 Toplist field.

- If you notice a high bandwidth usage between the PRTG core server and the probe, try the At end of Toplist period option in the [Toplist settings](#) .
- If you get **Data incomplete, memory limit was exceeded** messages, try to increase the memory limit in the Toplist settings but keep an eye on the memory usage of the probe process.
- To increase the performance of a Toplist, disable the reverse DNS lookup setting.

Notes

- When you work with Toplists, be aware that privacy issues can come up for certain configurations of this feature. Using Toplists, you can track all single connections of an individual system to the outside world and you must make sure that it is legal for you to configure PRTG like this.
- Keep in mind that Toplists can be viewed in the PRTG web interface. You might not want to show lists of domains that are used in your network to others, so restrict [access rights](#)  to sensors that have Toplists.
- Toplist charts, for example for top connections, are not meant to be used for detailed analysis. Instead, they should indicate if there is an uncommon, bigger change in this Toplist.

- [Setup](#) 

8.2 Move Objects

There are several options for moving objects in the device tree or for moving objects from one probe or group to a different probe or group.

Probes or Groups: Management Tab

The Management tab is available when you view probes or groups. After you click this tab, you can directly move devices and sensors in the device tree via drag-and-drop.

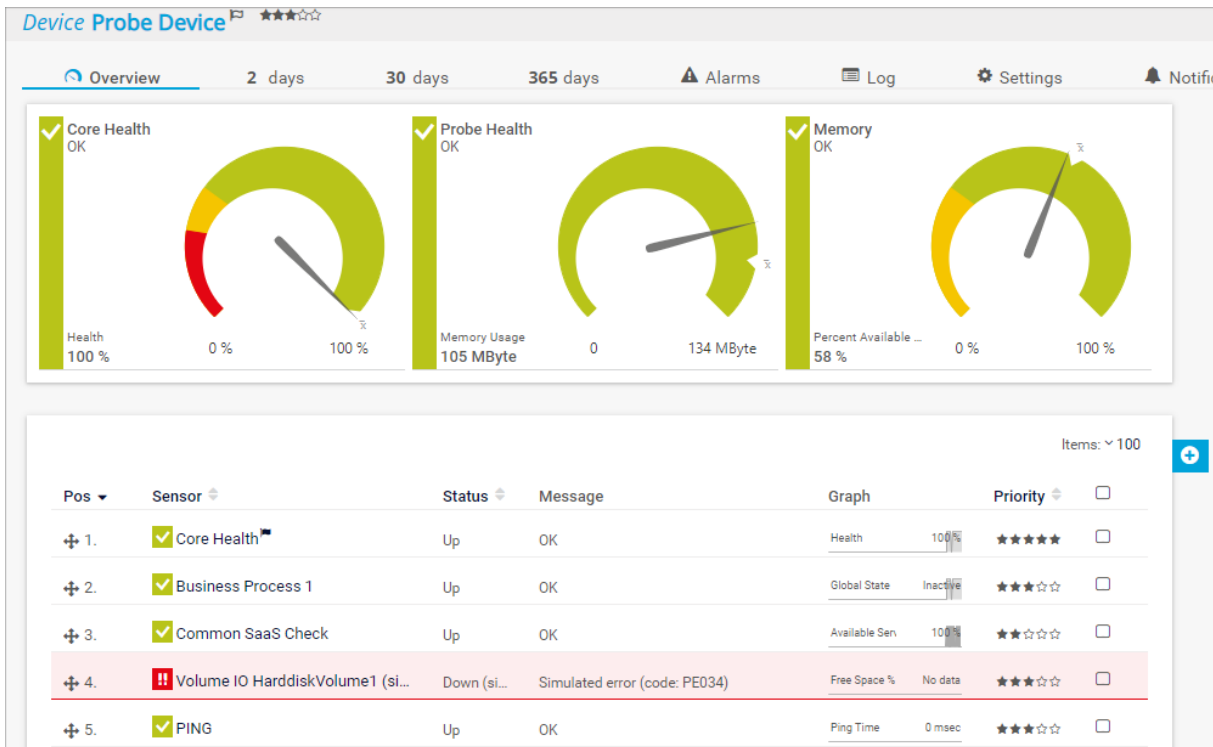

Move Objects on a Probe or Group

i If it is not possible to move an object, PRTG automatically starts a [clone](#) process.

■ For more information, see section [Manage Device Tree](#).

Devices: Overview Tab

When you view the Overview tab of a device, you see a list of all sensors on the device.

Move Sensors on a Device

Click the column headers Pos, Sensor, Status, or Priority to sort the sensor list. To change a sensor's position, click at the beginning of the row, drag the sensor to the new position, and drop it.

Context Menu: Move Option

Right-click any object in the device tree to show its [context menu](#)²⁵⁹. Hover over Move to open the Move menu. The following actions are available:

- Top: Move the object to the top of the parent object.
- Up: Move the object one entry up.
- Down: Move the object one entry down.
- Bottom: Move the object to the bottom of the parent object.
- Management: Open the [Management](#)³⁶⁴ tab of the object. This setting is only available for probes and groups.

- [Setup](#)  4121

8.3 Clone Object

If you want to duplicate an object with the same settings, you can clone it. Cloning is available for groups, devices, and sensors.

Rules

The following rules for cloning apply:

- The new object takes over all settings of the original object. This means, for example, that an [auto-discovery](#) starts automatically on a cloned device if this setting is enabled on the original device.
- A cloned device contains all objects of the original device, regardless of whether they produce working sensors or not. This often depends on the settings of the cloned device.
i This behavior is different from [creating a device template](#).
- Cloned sensors initially show the Paused [status](#) to give you the chance to change any settings before monitoring starts. Check the settings and [resume](#) monitoring.
- You cannot clone [fixed](#) objects such as the root group, a probe device, or PRTG system-internal sensors.
- The [user account](#) that clones an object must have at least [read access](#) to this object and all objects underneath in the [object hierarchy](#). The user group to which this user account belongs must have the [permission](#) to create all sensors that run on the device or group that they want to clone.

Clone an Object

Right-click an object in the device tree and select Clone from the [context menu](#) to open an assistant.

i If you want to clone a [sensor](#), a faster way is to use the [manage device tree](#) function.

Duplicate Sensors by Cloning

To duplicate a sensor by creating a clone of the sensor, select a parent device and enter a new name for the sensor.

Note: After you clone a sensor, PRTG sets the new sensor to the **Paused** status so that you can edit the sensor's settings before you actually start monitoring.

Clone Dialog for a Sensor

Clone Object Settings

[Object] To Be Cloned

Several fields show information about the object that you want to clone. The available information varies depending on whether you clone a group, a device, or a sensor.

Name for New [Object]

Enter information for the new object as described below.

Field	Description
New [Object] Name	<p>Enter a meaningful name for the new object to identify it later, for example, in the device tree or in table lists. By default, PRTG uses the old name with the prefix Clone of.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
New IP Address/DNS Name	<p>This setting is only available when you clone a device. Enter the IP address or Domain Name System (DNS) name for the new device.</p>
Service URL	<p>This setting is only available when you clone a device. Specify a URL that you want to open directly when you select Device Tools Go To Service URL from the context menu of the device. For example, you can configure this option to call the address http://www.example.com/service.html. Enter a valid URL or leave the field empty.</p>

Parent [Object] for New [Object]

Use the [object selector](#)^[251] to select the object to which you want to add the cloned object. If you clone a group or a device, select a group. If you clone a sensor, select a device.

Click Continue to clone the object.

Results

After you clone an object, you can see the following:

- If you clone a sensor, the Overview [tab](#)^[201] of the new sensor opens.
- If you clone a group or a device, you stay on the same page.
- Cloned sensors initially show the Paused [status](#)^[256] to give you the chance to change any settings before monitoring starts. Check the settings and [resume](#)^[256] monitoring.

- [Setup](#)  4121

8.4 Multi-Edit

[Table lists](#) ^[246] offer the multi-edit functionality. With this, you can bulk edit the properties of many objects. Multi-edit is also available on the Management tab of probes or groups when you hold down the **Ctrl** key to select multiple objects. See also section [Manage Device Tree](#) ^[364].

- ❗ You cannot change every setting with multi-edit. PRTG only displays settings that all selected objects have in common.

Multi-Edit in Table Lists

In a table list, you can select several objects by enabling the check boxes on the right. You can also select all objects on the page at once by enabling the check box in the table header.

- ❗ Selecting all objects via the check box in the table header does not select all objects across multiple pages. It only selects all objects on the first page in most cases.

Sensor	Probe Group Device	Status	Last Value	Message	Graph	Priority	Fav.	Perf. Impact	
<input checked="" type="checkbox"/> (001) Alias 1 Traffic	Local Probe (Local Probe) » Servers » SNMP V3 DES Por...	Up	92 kbit/s	OK	Traffic Total 92 kbit/s	★★★★★	🔒	🟢	<input checked="" type="checkbox"/>

Example of a Table List with Some Selected Objects

Use the Items option in the upper-right corner to view more items per page.

When you select one or more objects, the multi-edit menu appears in which different functions are available. The available menu options depend on the selected objects. For sensor lists, for example, some frequently used functions are Pause (⏸), Resume (▶), Scan Now (🔄), Delete (🗑), or Settings (⚙). Click a button to apply the respective function to all selected objects.

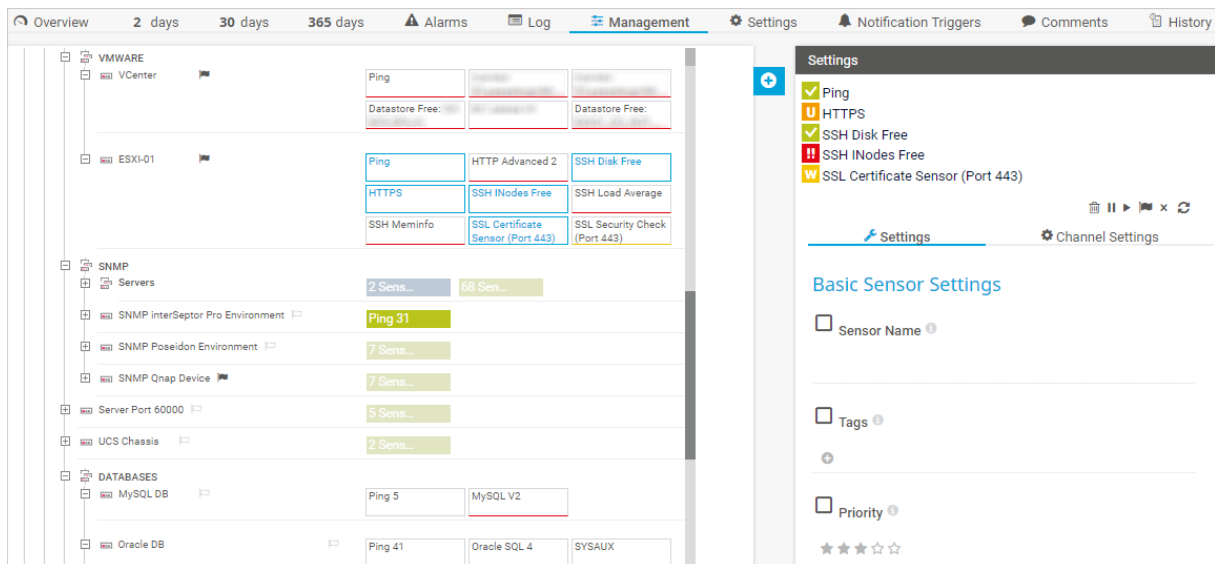

Multi-Edit Menu

Multi-Edit on the Management Tab

The Management tab is available for probes and groups.

You can use multi-edit for object settings:

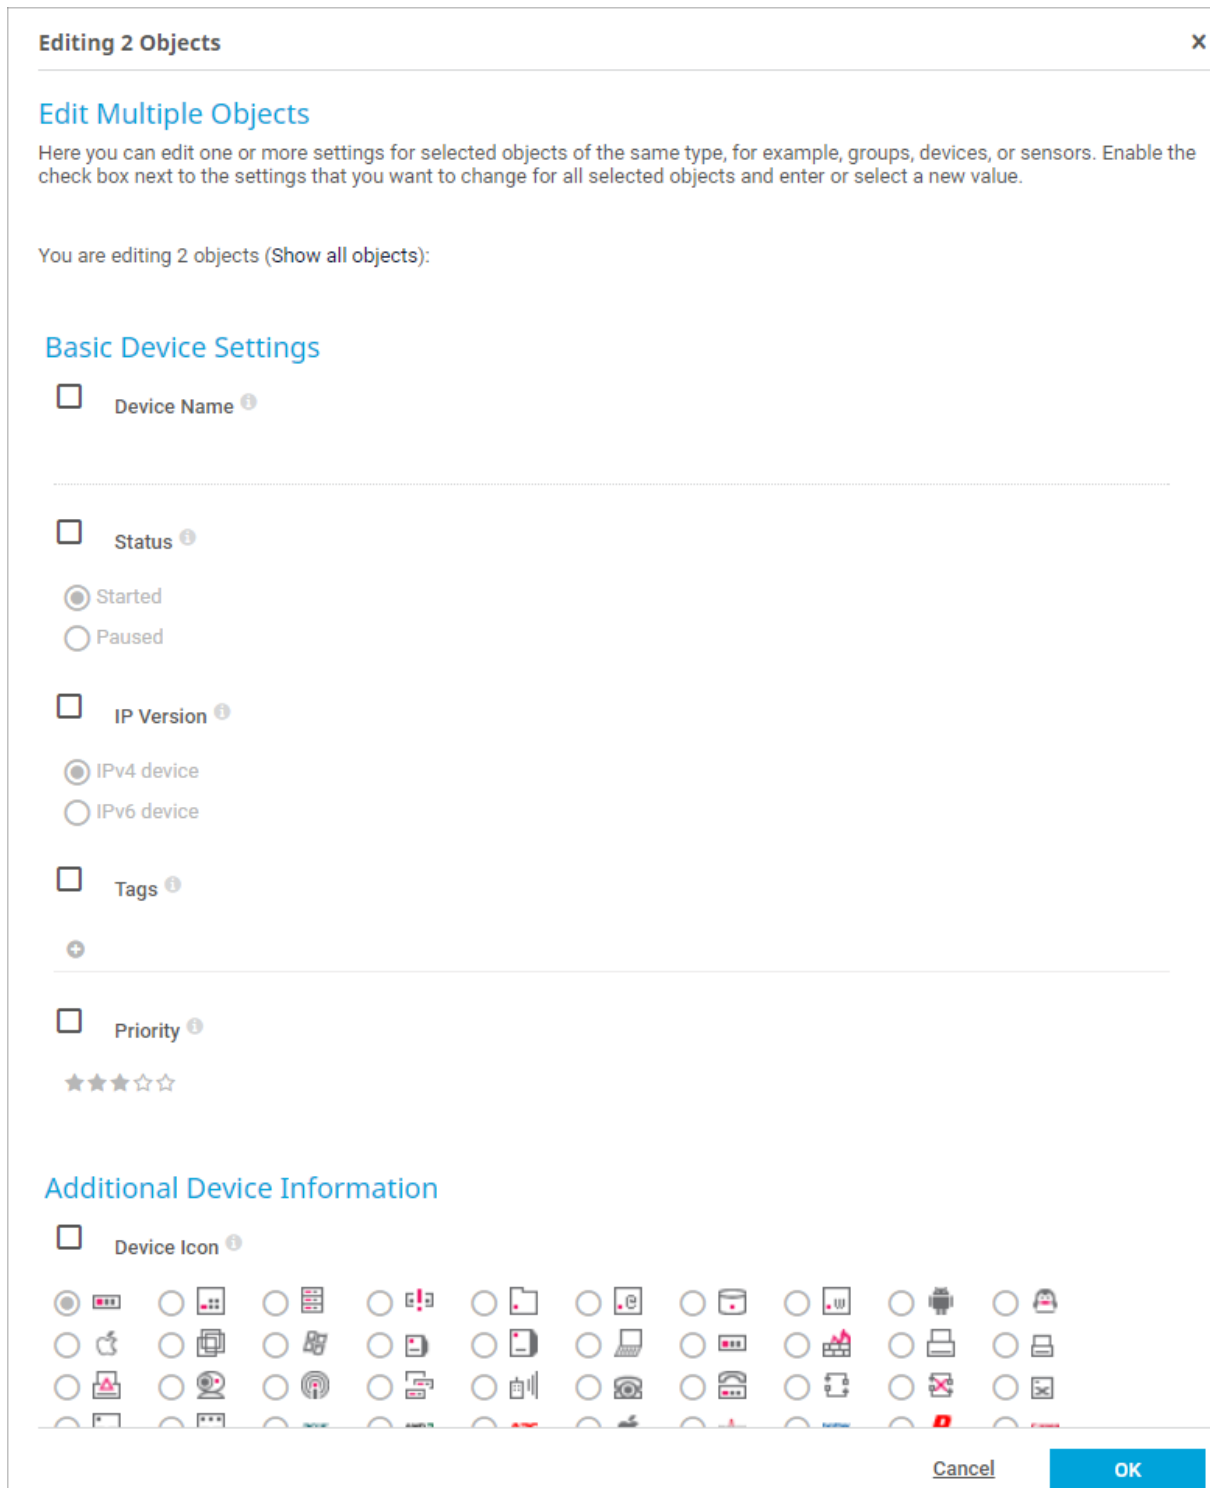

- Hold down the **Ctrl** key and select multiple objects of the same type, for example, multiple groups, devices, or sensors.
- In the dialog that appears, select the properties that you want to edit, change the respective settings, and click Save. The changes are applied to all selected objects.

Multi-Edit on the Management Tab

Edit Object Settings

Click  in the multi-edit menu to open the Edit Multiple Objects dialog. This dialog shows most of the settings that the selected objects have in common. For example, you can edit the name, tags, priority, scanning interval, or access rights. The available options depend on the selected objects.

Example of Device Settings in Multi-Edit Mode

To change a property, enable the check box in front of the respective setting and then change the setting. New settings are applied to all selected objects. All properties with a disabled check box remain unchanged.

i Click OK to save your settings. If you close the dialog without saving, all changes to the settings are lost.

Edit Channel Settings

The Channel Settings tab in the Edit Multiple Objects dialog is only available when you edit multiple sensors. The available settings depend on the selected sensors. You can edit the settings of all channels that the selected sensors have in common. Select a channel name from the Channel list. You can then edit display settings, colors, scaling, and limits, for example.

Editing 2 Objects
✕

Edit Multiple Objects

This page allows to edit one or more settings for a selection of objects (groups, devices, sensors, etc.). First enable the checkbox in the first column for each setting that you want to change for all selected objects. Then enter/select your new value.

You are editing 2 objects (Show all objects):

8.5 Create Device Template

To add a specific device several times, you can create a device template from this device. When you create a device template, PRTG saves information for nearly all sensors on this device to a template file that you can later use in combination with the [auto-discovery](#) (restrictions apply for a few sensors). Custom device templates are also available in the [PRTG Sensor Hub](#).

In the device template, PRTG saves all relevant [sensor settings](#) except for settings that you set on other objects, such as [schedules](#), [notification triggers](#), and [access rights](#). PRTG automatically sets these settings to inherited settings.

To create a device template, right-click a device in your device tree. From the [context menu](#), select Create Device Template to open the Creating Device Template dialog.

Create Device Template for Probe Device ✕

Create Device Template

To create a device template that you can use for auto-discovery, you have to provide a template name in clear text. PRTG uses this name in the template list in the auto-discovery assistant. A device template contains an entry for every sensor of the selected device. This entry includes all relevant sensor settings except settings that refer to other objects like schedules, triggers, or access rights. PRTG reverts these settings to inherited settings when you create a sensor via a device template.

Note: There are sensors that you cannot save in a device template. For a list of these sensors, see the [PRTG Manual: Create Device Template](#).

Enter Template Name

Template Name ⓘ

Example Device Template

You can exclude sensors from the device template. Enable the check box in front of a sensor that you want to exclude.

Note: Sensors that you cannot save in a device template do not appear in this list.

Note: Sensors that dynamically scan for available monitoring items when you add the sensor to a device do not appear in this list. PRTG automatically includes these sensors in the device template if they support the device template functionality. You cannot exclude these sensors from the device template.

Create Device Template Assistant

Template Settings

Setting	Description
Template Name	<p>Enter a meaningful display name for the device template.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Exclude Sensors	<p>Enable the check box in front of the sensors that you want to exclude from the device template.</p> <p>i Sensors that you cannot save in device templates do not appear in this list.</p> <p>i Sensors that dynamically scan for available monitoring items when you add the sensor to a device do not appear in this list. PRTG automatically includes these sensors in the device template if they support the device template functionality. You cannot exclude these sensors from the device template.</p>

i Click OK to save your settings. If you close the dialog without saving, all changes to the settings are lost.

i Device templates only save the sensors on the device and the sensors' settings including the [channel settings](#)³⁹⁷⁷. They do not save the device itself or the device's settings. To successfully create a device template, you must add sensors to the device (either [manually](#)³⁶¹ or via the auto-discovery) and the sensors must be [device template capable](#)⁴⁰²¹.

After you save your device template file, you see a message where you can review the sensors that the new device template contains. Click OK to finish. PRTG stores the device template in the \devicetemplates subfolder of the [PRTG program directory](#)⁴⁵²⁶. Your device template file contains all sensors of the original device, including the sensors' settings.

Before the next auto-discovery, choose the Auto-discovery with specific device templates setting and select the name of your new device template from the list. PRTG then tries to discover the stored sensors. If the physical device answers to a sensor request, the sensor is added to the respective device in PRTG.

i For more information, see section [Auto-Discovery](#)²⁹⁶.

Restrictions

There are a few settings that you cannot save in a device template so PRTG uses the default settings:

- The Dependency Type setting Master sensor for parent in the Schedules, Dependencies, and Maintenance Window section,
- The Result Handling setting Store result because this setting is only intended for debugging purposes,
- Settings in the Access Rights section to avoid security flaws, and

- Notification triggers settings that you set on other objects, for example, a device or group. PRTG saves, however, notification triggers settings that you set directly on a sensor.
- ❗ In general, you cannot save all sensor settings and channel settings (for example, channel limits of dynamically created channels) of sensors that dynamically scan for available monitoring items when you add the sensor.

Furthermore, because of internal restrictions, PRTG does not save every sensor in a device template.

■ For more information, see section [List of Sensors without Device Template Capability](#) 

Device Template Updates

Once a device template is created, it is not possible to add additional sensors to it via the PRTG web interface. If you want to create a device template with an extended set of sensors, you need to create a new template.

❗ When you save a new device template, PRTG updates all internal sensor IDs in this template. Because of this, PRTG creates all sensors that the new device template contains anew on the device to which you apply the template, even if the same sensors have already been created on this device with a different device template.

❗ You cannot delete device templates via the PRTG web interface.

☁ You cannot edit device template files in PRTG Hosted Monitor.

Device Template Filtering

You can include and exclude sensors from existing device templates. For details, see the Knowledge Base: [How can I include and exclude sensors from device templates?](#)

8.6 Show Dependencies

The [Dependencies](#) ¹⁴⁸ functionality gives an overview of the dependencies that are configured for the objects in your setup.

To see an object's dependencies, select **Devices | Dependencies** from the [main menu bar](#) ²⁷⁹.

Dependencies Graph View

Tab	Description
Overview	Shows the dependencies graph ⁴⁰²³ . This is a visualization of device, group, and sensor dependencies. i To show the dependencies graph, you need to access the PRTG web interface as an administrator.
Selected Dependencies	Shows a table list of manually set dependencies (see the Dependency setting in section Schedules, Dependencies, and Maintenance Window in any object's settings).
Master Dependencies	Shows a table list of master dependencies.

Dependencies Graph

The Overview [tab](#) ¹⁸⁶ shows the device tree in the dependencies graph view. The lines in the dependencies graph symbolize dependencies between the monitoring objects in the device tree. Additionally, PRTG uses different [line colors](#) ⁴⁰²⁴ for the dependencies. You can also view the dependencies in different table lists on the Select Dependencies tab or the Master Dependencies tab.

i To show the dependencies graph, you need to access the PRTG web interface as an administrator.

You can take the following actions:

- Enable the Show or Hide option to show or hide master dependencies. Hide is enabled by default to only show parent dependencies, selected dependencies, and broken dependencies.
i For technical reasons, the Show and Hide radio buttons are not available in Internet Explorer. Use Google Chrome 72 or Mozilla Firefox 65 instead.

- Click  or  in the upper-left corner to zoom in or out of the dependencies graph.
- Click probe and group nodes to show the respective dependencies.
- Click device or sensor nodes to open the corresponding Overview tab.
- Click  or  to expand or collapse probe and group nodes.
- The numbers in parentheses indicate how many child nodes of an object are shown.

Legend of Dependencies Graph

The line's colors show the kind and source of a dependency. This represents the Dependency Type as defined in the Schedule, Dependencies, and Maintenance Window settings of a [probe](#)^[405], [group](#)^[439], [device](#)^[470], or [sensor](#)^[476].

 You can also find the legend for the line colors in the graph header bar.

Color	Description
Gray	<p>Gray lines show a dependency by inheritance (Use parent setting). The source of the dependency is the parent object on the left end of the line, for example, Root is the parent of Local Probe.</p>  <p>Gray Line for Parent Dependency</p>
Green	<p>Green lines show a master dependency for a device (Master sensor for parent setting). The sensor that is set as the master points to the dependent device with a green arrow head at the line's end. The arrow head from the dependent device to its master sensor is pink.</p>  <p>Green Line for Master Dependency</p>
Pink	<p>Pink lines show a dependency that you set manually (Select a sensor setting). The source of the dependency points to the dependant with a pink arrow at the line's end.</p>  <p>Pink Line for Selected Dependency</p>
Red	<p>Red lines indicate broken dependencies, for example, if the master sensor is not available.</p>

8.7 Geo Maps

With the [Geo Maps](#) feature, you can visualize geographical information about monitored objects that are located at different sites worldwide on one page. You can display the location of probes, groups, and devices in a geographical map on the Overview [tab](#)^[4095] of an object or in [Maps](#)^[4095].

Global Status of a Network in a Geographical Map

Prerequisites

To use geographical maps and view them in the PRTG web interface, make sure that your PRTG core server has access to the internet to obtain map tiles. If a proxy is mandatory in your network, configure the according proxy settings.

- For more information, see section [Core & Probes](#)^[4203].
- For more information about map tile server domains, see the Knowledge Base: [Which domains and ports does the Geo Maps feature use?](#)

Geo Maps Concepts

The Geo Maps feature works as follows:

Concept	Description
Location information	<p>Enter Location information, for example, a city name, an address, or coordinates, for each probe, group, or device in the object's settings²²⁶¹. The PRTG core server resolves your location specification to global geographical coordinates with the help of an external map service provider. PRTG uses this information to query a geographical map that shows your objects.</p> <p>i You can use the first line of the location information field to label⁴⁰²⁷ your locations.</p>
Geo Maps settings	<p>Select a map service provider and the type of map that you want to view in the User Interface⁴¹⁷⁶ settings in section Geo Maps. You can also disable the integration of Geo Maps there.</p> <p>PRTG connects to the specified maps service provider to get map tiles. These map tiles provide the geographical background map. PRTG then marks defined locations with a corresponding location marker that consists of an object icon and the object's status color⁴⁰²⁹.</p>
Geographical maps display	<p>You can display geographical maps in the device tree on an object's Overview tab. PRTG automatically adjusts the zoom level of a geographical map so that it can show all locations of a selected object.</p>

Geographical Map on an Object's Overview Tab

You can also add geographical maps to Maps. To do so, open the [Map Designer](#)⁴¹⁰³ and click Geo Maps in the properties menu on the right.

Location Labels

You can define your own labels for locations of objects. To do so, enter the desired label in the [first line](#) of the Location field in an object's settings and provide the geo coordinates of the location in the [second line](#). The object appears with the defined label in geographical maps. It is also possible to define the same label for different locations as long as the coordinates differ from each other.

For example, enter the following information:

Big Apple
40.712778,-74.005833

Location

inherit from

Location (for Geo Maps) [?] Big Apple
40.712778,-74.005833

Location New York with Geo Coordinates and Label Big Apple

The location **New York** appears on the geographical map with the label **Big Apple**:

Geo Map for Root

Device	!!	!	✓	W	
SSH	13		15		
avocado	12		2	1	
DNS/ADS	4		38		
Cluster Probe Device	3		14	1	
DHCP	3		15	1	
Exchange	2		3	2	
Gateway	2		2		
Probe Device	2		10	1	

Location New York with Label Big Apple

Status Color of Location Markers

The location markers use different colors to show the overall monitoring status at this location. In the following table, you can see all possible monitoring states sorted by priority:

Object Marker	Color	Location Status	Meaning
	Red	Down	At least one sensor at this location shows the Down status. Hover over the location marker to view the total number of alarms at this location.
	Light Pink	Down (Acknowledged)	At least one sensor at this location shows the Down status and a user acknowledged this status via the Acknowledge Alarm function. The Down states of all sensors at this location must be acknowledged. If at least one Down status is not acknowledged, this location shows the Down status.
	Yellow	Warning	At least one sensor at this location shows the Warning status. There is no sensor in the Down or Down (Acknowledged) status at this location.
	Orange	Unusual	At least one sensor at this location shows the Unusual status. There is no sensor in the Down, Down (Acknowledged), or Warning status at this location.
	Green	Up	All sensors at this location are in the Up status. There is no sensor in the Down, Down (Acknowledged), Warning, Paused, or Unusual status at this location.
	Blue	Paused	All sensors at this location show the Paused status. There is no sensor in the Down, Down (Acknowledged), Warning, Unusual, or Up status at this location.
	Grey	Unknown	All sensors at this location show the Unknown status. There is no sensor in the Down, Down (Acknowledged), Warning, Unusual, Paused, or Up status at this location.

For more information, see section [Sensor States](#) ¹⁹⁷.

8.8 Notifications

PRTG uses notifications to send you an alert, for example, whenever PRTG discovers a defined [sensor status](#)¹⁹⁷ or when channels breach specific limits. You can define an unlimited number of notifications using one or more [notification methods](#)⁴⁰³¹. PRTG sends notifications to a user's [notification contacts](#)⁴¹⁶³ that you can define for each user account.

▶ For more information, see the video tutorial: [Notifications](#)

Overview

PRTG sends a notification when a defined event triggers it. The following events can trigger notifications:

Event	Examples
Sensor status change	<ul style="list-style-type: none"> ▪ A sensor changes from the Up status to the Down or the Warning status because responses are slow. ▪ A sensor changes to the Unusual status.
Sensor value threshold breach	<ul style="list-style-type: none"> ▪ A sensor shows a request time that is higher than 1,000 ms for more than 30 minutes. ▪ Free disk space is below 10%.
Speed threshold breach	A traffic sensor shows more than 1 Mbit/s for more than 5 minutes.
Volume threshold breach	A traffic sensor shows more than 1 GB transferred in 24 hours.
Sensor value change	A specific value changes, for example, when the sensor monitors files on a hard disk drive.

Notification Methods

A notification can use one or more of the following notification methods:

- [Send Email](#)⁴¹³⁸
- [Add Entry to Event Log](#)⁴¹⁴¹
- [Send SMS/Pager Message](#)⁴¹⁴²
- [Execute HTTP Action](#)⁴¹⁴⁴
- [Execute Program](#)⁴¹⁴⁵
- [Send Syslog Message](#)⁴¹⁴⁷
- [Send SNMP Trap](#)⁴¹⁴⁸
- [Send Amazon Simple Notification Service Message](#)⁴¹⁵⁰
- [Assign Ticket](#)⁴¹⁵¹

- [Send Push Notification](#) 
 - [Send Microsoft Teams Message](#) 
 - [Send Slack Message](#) 
 - [Send MQTT Publish Notification](#)
- For more information, see section [Notification Templates](#) .

Placeholders

Notifications can contain valuable sensor information that you can define via placeholders, for example:

- Last error message
- Last successful or failed request
- Total downtime
- Total uptime
- Recent sensor history
- A direct link to the PRTG web interface

■ For available placeholders, see section [List of Placeholders for Notifications](#) .

Notifications Setup

You have to take the following four steps to set up and use notifications:

1. Check and set up the [notification delivery](#)  settings if you use PRTG on premises. These settings define how PRTG sends messages.
2. Check and set up [notification contacts](#)  for the user accounts. These contacts define the recipients to which PRTG sends notifications.
3. Check and set up several [notification templates](#) . These templates define the notification methods and their content.
 - ❗ You can also check or edit notification templates via the Notification Triggers tab. For more information, see section [Notification Triggers Settings](#) .
4. Check and set up [notification triggers settings](#)  for objects. These triggers define when PRTG sends notifications.

❗ Usually, there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always set up at least two notifications with different notification methods for a notification trigger, for example, one email notification and one SMS notification. If delivery via email fails, PRTG can still notify you via smartphone as a fallback. For example, use the latency setting of a [state trigger](#)  to choose a notification with a different notification method than in the first trigger condition, or set up a second trigger with a different notification method for the corresponding object.

■ See sections [Notifications Based on Sensor Limits Step by Step](#)  and [Notifications Based on Libraries Step by Step](#)  for step-by-step guides that describe potential notification setups.

■ Custom notification scripts are also available in the [PRTG Sensor Hub](#).

8.8.1 Notifications Based on Sensor Limits Step by Step

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

This section gives you an example of how to set up a notification for exceeded disk free limits. Take the following steps to set up notifications based on limits:

- [Step 1](#)⁴⁰³⁴: Provide necessary information about the delivery of notifications (Simple Mail Transfer Protocol (SMTP) and SMS).
- [Step 2](#)⁴⁰³⁴: Specify the recipients of notifications for each user account.
- [Step 3](#)⁴⁰³⁴: Specify the notification methods and content to create the actual notifications.
- [Step 4](#)⁴⁰³⁶: Define limits that change a sensor's status (this is not necessary for every kind of notification).
- [Step 5](#)⁴⁰⁴⁰: Add suitable triggers to objects that trigger notifications if there is an issue in your network.
- [Step 6](#)⁴⁰⁴¹: Test if PRTG correctly triggers and delivers the created notifications.

Step 1: Set up Notification Delivery Settings (PRTG on premises)

Before you can create actual notifications, you have to define how PRTG delivers the notifications to your email account, mobile phone, or pager. To do so, select Setup | System Administration | Notification Delivery from the [main menu bar](#)²⁸⁹. Specify the mechanism for SMTP delivery, the sender email address and name, as well as the HELO ident. For SMS delivery, select your service provider and enter the corresponding credentials.

 For more information, see section [Notification Delivery](#)⁴¹⁹⁴.

Step 2: Set up Notification Contacts

Create notification contacts to define how you want to receive notifications. Recipients can be email addresses, phone numbers (only available for PRTG on premises), or push devices (Android or iOS devices with the corresponding [PRTG app](#)⁴²⁷⁶).

You can define as many recipients as you want for each user account. By default, the recipient [Primary Email Address](#) is available. This is the email address that you provide in your [account settings](#)⁴¹²³.

 For more information, see section [Notification Contacts](#)⁴¹⁶³.

Step 3: Specify Notification Methods and Content

To get an informative message when a disk is running out of free space, create a corresponding notification:

1. Select Setup | Account Settings | Notification Templates from the main menu bar.
2. Hover over  and click Add Notification Template.

3. Enter a meaningful name for the notification template, for example, [Disk Free Limit Notification](#).
i If you want to trigger this notification on a global level, for example for a probe or group, so that it does not only apply to breached disk free limits, a general name might be more suitable (like the predefined notification [Email to Admin](#), for example).
4. You can optionally create a Schedule to activate notifications only at specific times, for example, only on weekdays. In section Notification Summarization, you can choose from various options to avoid message floods. Furthermore, you can define the User Group Access to this notification.
5. Select a notification method. In this case, enable next to Send Email.

Send Email

Sender i Default
 Custom

The three recipient settings below (user, user group, email address) work independently. So every contact and address selected by any of these settings will receive the notification.

Send to User i None v

Send to User Group i None v

Send to Email Address i

Subject i [%sitename] %device %name %status %down (%message)

Format i HTML
 Text
 Text with custom content

Priority i highest v

Create an Email Notification

■ You can select any other notification method, of course. For more information, see section [Notification Templates](#) 4138.

6. Specify who receives a notification, for example, select a specific user and PRTG sends the notification to all notification contacts that you defined for this user account in [step 2](#) 4034.
7. Enter the Subject of the email notification or use the predefined placeholders.
■ For available placeholders, see section [List of Placeholders for Notifications](#) 4062.
8. Specify the Format and the Priority of the notification.
9. Click Create. PRTG opens the Notifications Templates tab.

You can now use the new notification for every trigger on every object in your device tree.

Step 4: Define Limits

Before you create triggers that initiate notifications, you need to specify the limits that you want to apply to your disks. For example, if you want to get a notification when a disk has exceeded 80% of its capacity, set the sensor to the Warning status if it reaches this limit. You have the following options to set limits for disk free sensors:

- [Step 4.1](#)⁴⁰³⁶: Set limits that are checked against all disks in the settings of multi-drive sensors such as the [WMI Free Disk Space \(Multi Disk\)](#)³⁶⁸⁵ sensor, the [SNMP Linux Disk Free](#)²⁸¹¹ sensor, or the [SSH Disk Free](#)³¹⁵⁴ sensor.
- [Step 4.2](#)⁴⁰³⁶: Enable limits in the [channel settings](#)³⁹⁷⁷ of single sensors.

i You can also use the [multi-edit](#)⁴⁰¹⁴ functionality to set limits for multiple sensors at once.

Step 4.1: Define Limits in Sensor Settings (Multi-Disk Free Sensors Only)

You can set limits for sensors that monitor multiple disks directly via the sensor's Settings tab. Multi-edit for sensors is also possible.

Set Limits Checked For ALL Disks Use the particular channel settings to set separate error limits or warning limits for each disk.

Percentage Limit Check **i** Only use the limits in the settings of the percentage channels
 Use the limits of both the sensor and the channel settings

Upper Error Limit **i**

Upper Warning Limit **i**

Lower Warning Limit **i**

Lower Error Limit **i**

Size Limit Check **i** Only use the limits in the settings of the byte size channels
 Use the limits of both the sensor and the channel settings

Alarm on Missing/Removed Disk **i** Deactivate alarm (default)
 Activate alarm

Set Limits for All Disks in the Sensor Settings

1. Open the settings of the selected sensor and go to section Set Limits Checked For ALL Disks.
2. Enable Use the limits of both the sensor and the channel settings.
3. In the field Lower Warning Limit, enter the percentage that suits your needs. In our example, this is **20**. This limit applies to all channels of the selected sensors that represent disks.
 - i** Alternatively, you can use bytes to define a limit. However, we recommend that you use percentage values for more flexibility.
4. Click Save to save your settings.

Step 4.2: Define Limits in Channel Settings

To set specific limits for single disks, use the sensors' channel settings. You can open the channel settings via  below the channel gauge or via  in the channels table.

Edit Channel "Free Space C:"

Name ⓘ
Free Space [#disk]

ID ⓘ
5

Limits ⓘ
 Disable limits
 Enable alerting based on limits

Upper Error Limit (%) ⓘ

Apply OK Cancel

Set Limits in the Channel Settings

1. Under Limits, select Enable alerting based on limits.
2. Enter the desired Lower Warning Limit. This limit only applies to the respective channel.
3. Click OK to save your settings.

i If you define channel limits when you also use the sensor's limit setting on the sensor's Settings tab, PRTG takes the first limit that applies. This way, you can individually define harder limits for single disks in a multi-disk sensor. All defined limits are valid.

You **have** to take the approach via channel settings for sensors that monitor only one (logical) disk, for example, the [SNMP Disk Free sensor](#)^[258]. For these sensors, you can use multi-edit if you want to automatically apply the same limits to each of these sensors.

Set Limits for Channels in Multi-Edit Mode

1. To see all SNMP Disk Free sensors, filter for the sensor type. Select Sensors | By Type | SNMP Disk Free from the main menu bar.
2. Enable the check boxes next to the sensors for which you want to set a limit.
3. Click .
4. Select the Channel Settings tab.
5. Select the channel to which you want to add a limit. In this case, select the channel [Free Space](#).

6. Enable the check box next to Limits.
7. Select Enable alerting based on limits.
8. Enter the desired Lower Warning Limit.
9. Click OK to save your settings.

The new limit applies to all Free Space channels of all selected sensors.

Absolute Values and Delta Values for Limits

The value type that you need to configure for limits depends on the type of data that the channel delivers:

Value Type	Description
Absolute values	For channels that measure absolute values, for example, for free disk space, you have to set limits with absolute values like 20 .
Delta values	For channels that measure delta values, that is, measurements per second (x.xx/sec), you have to set delta values according to the formula number of errors/scanning interval in seconds .

For example, you have an [SNMP Traffic sensor](#) 3094 and want to receive an alert when the sensor reports errors:

- Set the sensor to the Warning status when [1](#) error occurs.
- Set the sensor to the Down status when [30](#) errors occur.

The following screenshot shows how to configure the limits for delta channels. You could set the following limits for the channel Errors in with a standard scanning interval of 60 seconds:

Edit Channel "Errors in"

Name ⓘ
Errors in

ID ⓘ
10

Limits ⓘ
 Disable limits
 Enable alerting based on limits

Upper Error Limit (#/s) ⓘ
0.5

Upper Warning Limit (#/s) ⓘ
0.1

Lower Warning Limit (#/s) ⓘ

Lower Error Limit (#/s) ⓘ

Error Limit Message ⓘ

Warning Limit Message ⓘ

Graph Rendering ⓘ
 Show in Graphs
 Hide from Graphs

Table Rendering ⓘ
 Show in Tables

Apply
Ok
Cancel

Setting Channel Limits with Delta Values

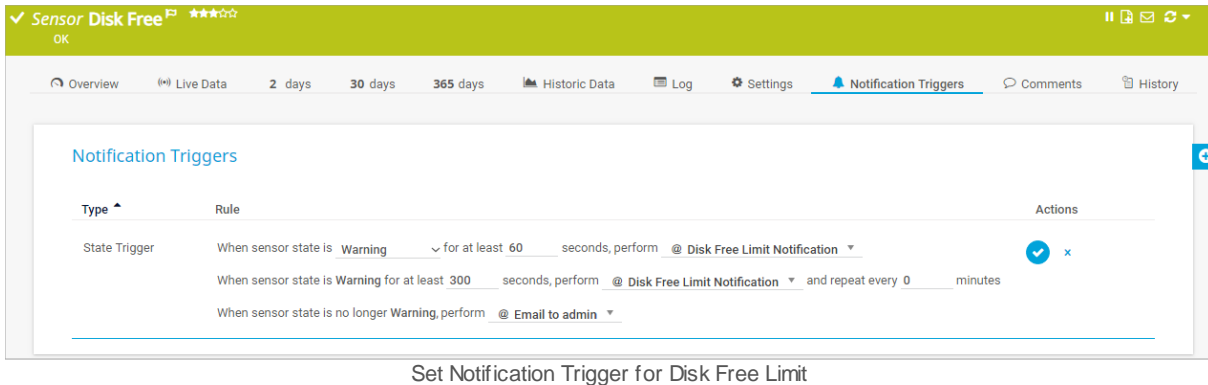

Because this channel uses per second (delta) measurements, the sensor reports a single error that occurs over a standard 60-second scanning interval as 0.016 # per second. So the warning limit for one single error within a scanning interval is 0.1 (errors/sec). To get an alert when there are 30 errors within a scanning interval, the limit needs to be 0.5 (errors/sec).

ⓘ If no new errors occur in the next scanning interval, the sensor shows the Up status again. To ensure that you do not miss any notifications for this sensor, set a notification trigger with 0 seconds.

Step 5: Set up the Notification Trigger

You specified limits to define when a sensor shows the Warning (or the Down) status. Now you can create suitable notification triggers. The notification trigger for this example is the [state trigger](#)³⁰⁸⁸.

For more information about available triggers, see section [Notification Triggers Settings](#) ³⁹⁸⁷.

1. Go to the sensor's Notification Triggers tab.
2. Hover over and select Add State Trigger from the menu.
3. Set the notification trigger to When sensor state is **Warning** and select the notification template that you created before from the dropdown list.
4. Adjust the other notification triggers settings to your needs.
5. Click to save the notification trigger.

Now you immediately receive a notification when the capacity of one of your disks falls below the defined limit, in this case 20% of free disk space.

Step 6: Test the Notification

Finally, test the notification that you created. You can immediately trigger a notification for test purposes:

1. From the main menu bar, select Setup | Account Settings | Notification Templates.
2. Click next to the respective notification template to send a test notification.
3. Check if the notification was correctly triggered and delivered based on the notification contacts and the notification method that you defined before. If you do not get a notification or if a defined action is not executed, check the notification logs. To do so, select Logs | System Events | Notification Related from the main menu bar. Look for the triggered notification in the table list and check that you correctly set up the notification delivery.

For more information, see section [Logs](#) ²³⁷.

Notifications

- [Notifications Based on Sensor Limits Step by Step](#) ⁴⁰⁴²
- [Notifications Based on Libraries Step by Step](#) ⁴⁰⁴²

8.8.2 Notifications Based on Libraries Step by Step

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

This section gives you an example of how you can reorganize the objects from your device tree in a [library](#)⁴⁰⁴⁷ to create a customized view of your CPU sensors. This way, you can monitor an entire section of your network with a single set of [notifications](#)⁴⁰³¹.

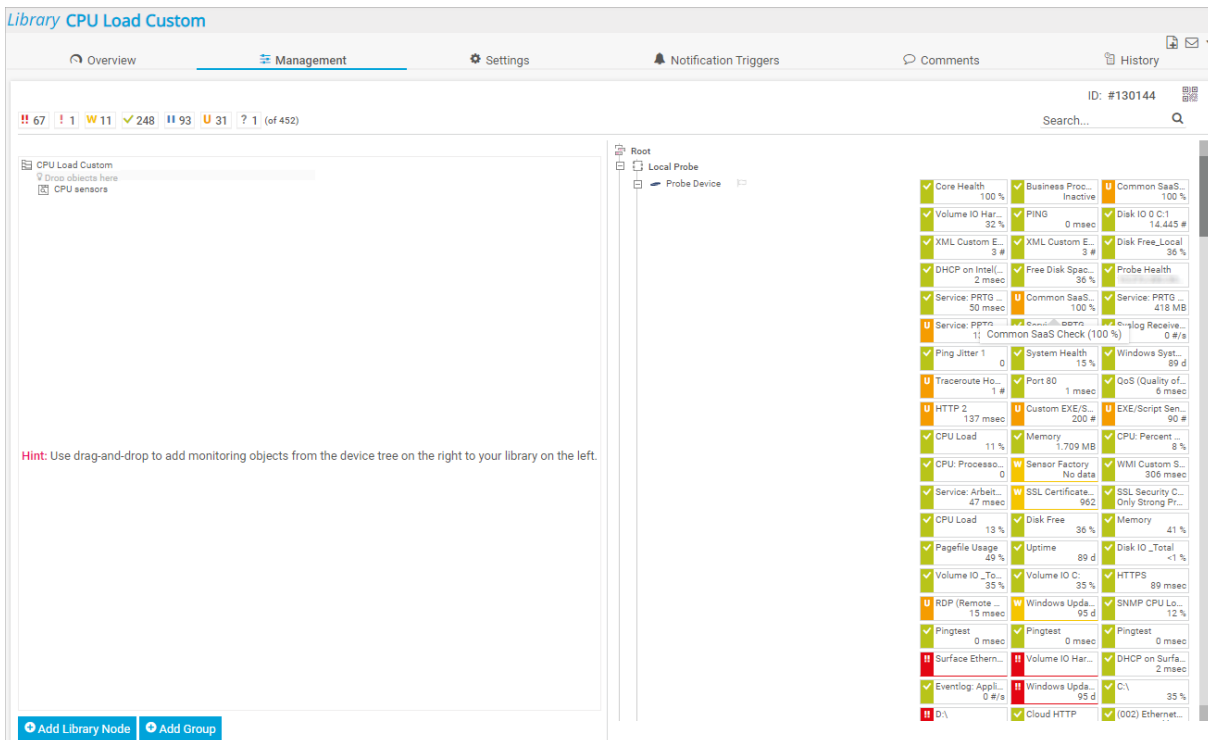

Take the following steps to set up notifications based on libraries:

- [Step 1: Add a New Library](#)⁴⁰⁴²
- [Step 2: Add Sensors to the Library](#)⁴⁰⁴³
- [Step 3: Define Notification Triggers](#)⁴⁰⁴⁵
- [Step 4: Test the Notification](#)⁴⁰⁴⁵
- [Step 5: Troubleshooting](#)

Step 1: Add a New Library

First, create a new library:

1. Hover over Libraries in the [main menu bar](#)²⁸¹ and select Add Library.
2. Give the library a meaningful name, for example [CPU Load Custom](#), and define a security context⁴⁰⁵⁹ for it. You can also add some tags¹⁴⁵ for organizational purposes.
3. Optionally, assign access rights to your predefined user groups to grant or restrict permissions to view the library.
4. Click Create to create the new library. The [Management](#)⁴⁰⁵⁶ tab of the library opens.

New , Empty Library

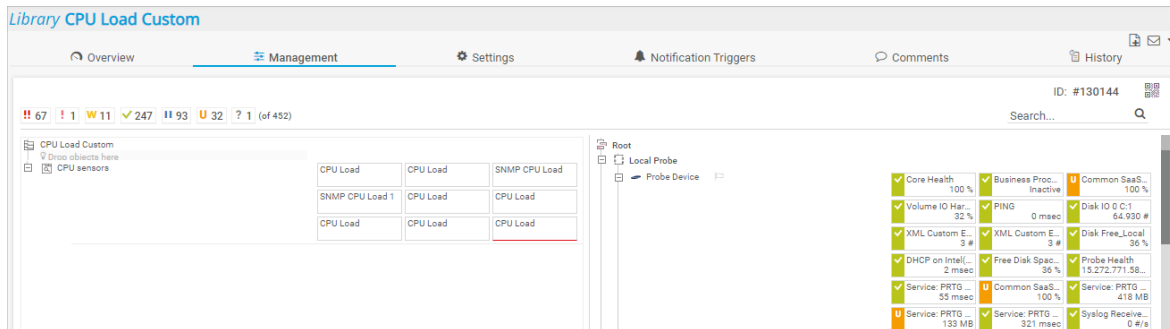

For more information, see section [Libraries and Node Settings](#)

Step 2: Add Sensors to the Library

The new library is empty in the beginning, so to add your CPU sensors to it, you need to take the following steps:

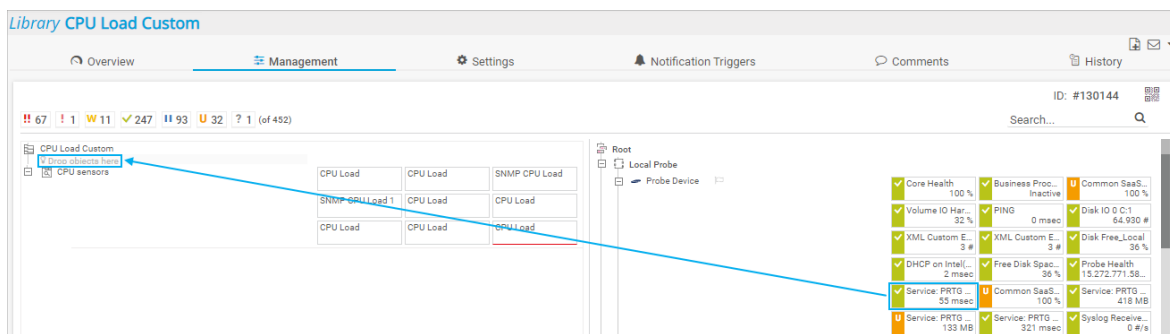

1. Click Add Library Node in the lower-left corner.
2. Give the library node a meaningful name, for example **CPU sensors**, and define a security context for it. You can also add some tags¹⁴⁵ for organization purposes.
3. Select a linked object from your device tree that the library node references. The default object is the root group.
4. For the Library Node View setting, select Show a collection of filtered sensors.
5. To filter the sensors further, select Show only sensors with specific tags under Filter by Tag.

- Enter one or more tags, for example `cpu`, to include your CPU sensors in the library node.
 - i** Libraries are dynamic. When you add or remove sensors from your device tree that have the tag that you specified, the library automatically updates the displayed sensors.

Library Node with Sensors Filtered by Tag

- You can also manually add sensors to the library via drag-and-drop.

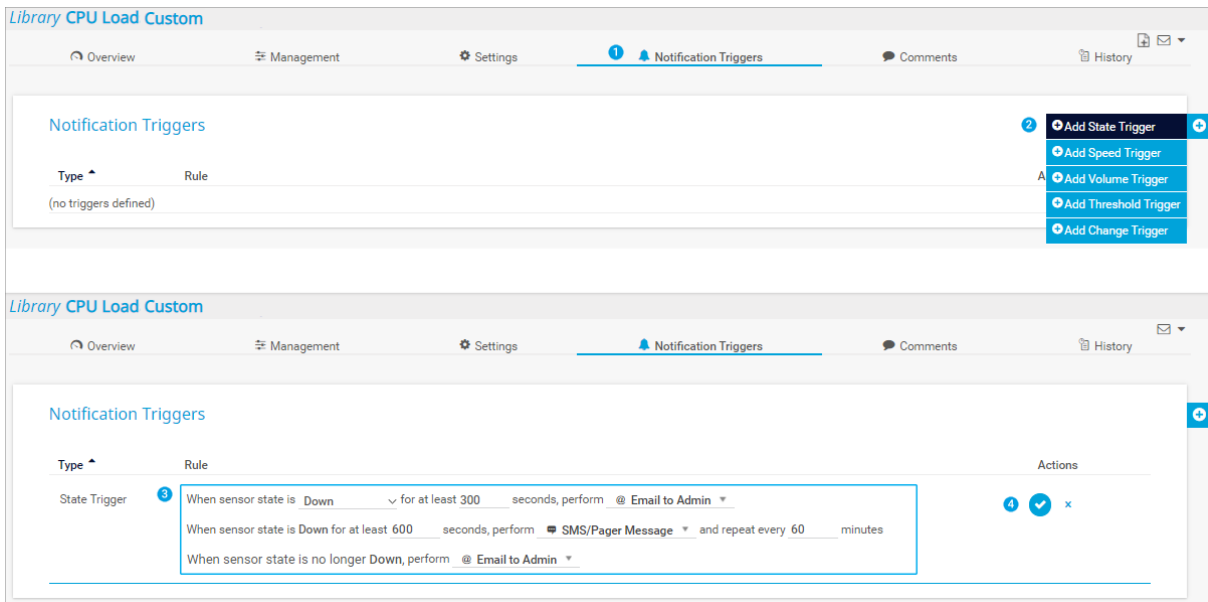

Manually Add Sensors to the Library

For more information, see section [Libraries and Node Settings](#) ⁴⁰⁵⁹.

Step 3: Define Notification Triggers

Add a [state trigger](#) ³⁹⁸⁸ to your library so that you are notified when a CPU has been running at more than 90% load for more than 5 minutes.

Set a Notification Trigger for a Library

1. Click the Notification Triggers tab (1).
2. Hover over  and select Add State Trigger (2).
3. Enter the notification triggers settings (3). These include initial parameters like the sensor status and the duration of the sensor status that triggers the notification, escalation parameters if the sensor status persists, and an action for when the trigger parameters no longer apply.
4. Click  to save the notification trigger (4).

 You can set up multiple triggers of the same type so that you can define increasingly serious notifications that also use different [notification methods](#)⁴¹³⁸. For system-critical network components, we recommend that you always define two different notification triggers with two different notification methods, for example, an email and an SMS.

 For more information, see sections [Notification Triggers Settings](#)³⁹⁸⁷ and [Notification Templates](#)⁴¹³¹.

Step 4: Test the Notification

To make sure that your notification setup works as intended, you can trigger test notifications:

1. Go to Setup | Account Settings | Notification Templates.
2. Enable the check box next to a notification and click , or click  next to the notification status.
3. Check if the test email and/or SMS have arrived.

 In test notification messages, PRTG does not resolve any placeholders.

Step 5: Troubleshooting

If a test notification does not arrive as intended, take the following steps:

1. Select Setup | Account Settings | Notification Templates from the main menu bar.

2. Go to the notification templates that you assigned to the notification triggers in the library and check the following:
 - The notifications are in the Active status.
 - The notifications have a [schedule](#)  that does not conflict with the library you set up.
 - The summarization method collects alarms for a specific time period. Also consider the Time Span for Summarizing Messages (in Minutes) value.
3. Select the Notification Contacts tab and check that the email addresses or phone numbers that you specified as [notification contacts](#)  for each user account are correct
4. Check the [notification delivery settings](#)  under Setup | System Administration | Notification Delivery.

 This only applies to PRTG on premises installations, not to PRTG Hosted Monitor instances.

5. Review the [logs](#)  for system events of the type **Notification** and the respective notification's name.

 Sensors can simulate an error. Go to the library's Overview [tab](#) , right-click a sensor, and select Simulate Error Status from the context menu. You see that the sensor status changes to the Down status and sends the following message: **The sensor shows a Down status because of a simulated error. To resolve this issue, right-click the sensor and select Resume from the context menu. (code: PE034).** This also triggers a notification for test purposes.

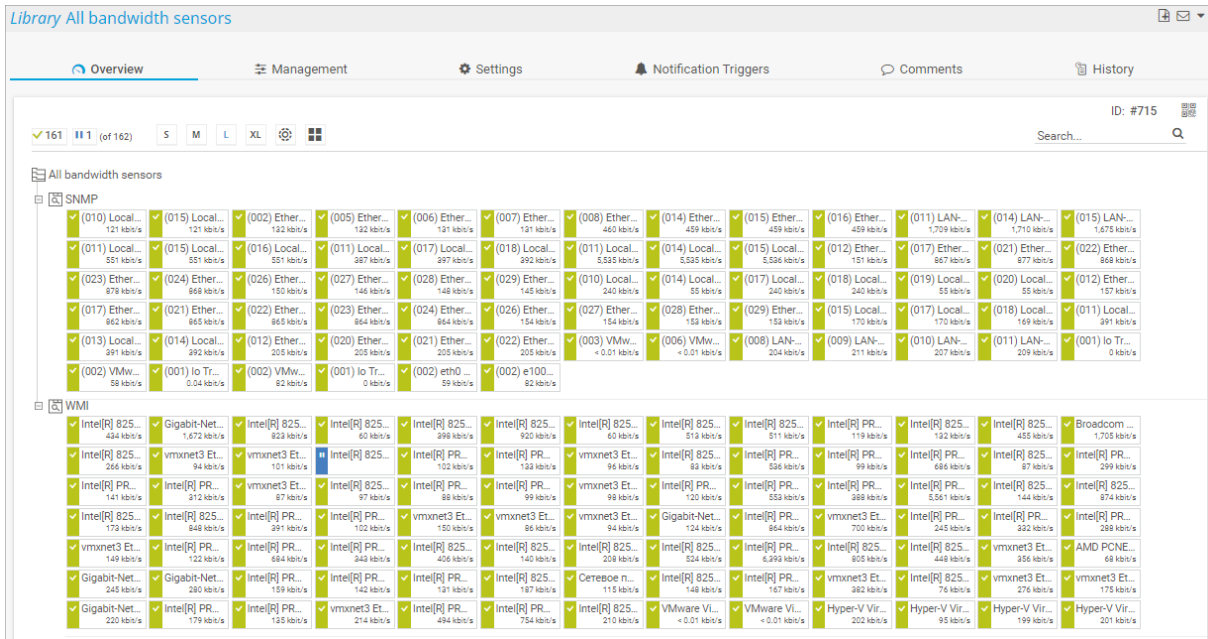

Notifications

- [Notifications Based on Sensor Limits Step by Step](#) 
- [Notifications Based on Libraries Step by Step](#) 

8.9 Libraries

With the **Libraries** feature, you can create additional, customized views of your device tree.

▶ For more information, see the video tutorial: [Libraries in PRTG](#)

Example of a Library

In this section:

- [Introduction](#) ⁴⁰⁴⁷
- [Preconfigured Libraries](#) ⁴⁰⁴⁸
- [Libraries Menu](#) ⁴⁰⁴⁸
- [Libraries List](#) ⁴⁰⁴⁹
- [Working with Libraries](#)

Introduction

With libraries, you can create custom device tree views of your network's status and monitoring data. PRTG updates these views in the same interval as your device tree. The library views display the same monitoring data, but arranged the way you want, for example, based on target groups or a specific use case. For example, you can create a library that contains an overview of all your bandwidth monitoring sensors, regardless of the device that they run on.

The Libraries feature includes the following options:

- Create libraries that contain library nodes with objects from your entire configuration.
- Show data from different probes in one library.
- Show different branches of your device tree right next to each other.
- Arrange sensors in a tree-like view regardless of the device that they run on.

- Filter your entire device tree or parts of it by sensor type, status, or tag, and only show matching sensors.

Preconfigured Libraries

PRTG provides several preconfigured libraries that you can also edit or delete.

- ① Preconfigured libraries are only visible to administrators.

Object	Security Context	
All bandwidth sensors	PRTG System Administrator	<input type="checkbox"/>
All CPU load sensors	PRTG System Administrator	<input type="checkbox"/>
All diskspace sensors	PRTG System Administrator	<input type="checkbox"/>
All memory sensors	PRTG System Administrator	<input type="checkbox"/>
All sensors grouped by state	PRTG System Administrator	<input type="checkbox"/>
All VMware sensors	PRTG System Administrator	<input type="checkbox"/>
Sensors grouped by priority	PRTG System Administrator	<input type="checkbox"/>

List of Preconfigured Libraries

The following libraries are automatically created when you install PRTG for the first time. Some of these libraries are initially empty, but as you add more sensors, PRTG automatically fills them according to the filter settings defined for the library nodes:

- All bandwidth sensors
- All CPU load sensors
- All diskspace sensors
- All memory sensors
- All sensors grouped by state
- All VMware sensors
- Sensors grouped by priority

- ① Sensors that you add to libraries do not count against the maximum number of sensors of your license.

Libraries Menu

Click Libraries in the [main menu bar](#) ²⁸¹ to open an overview list of all libraries. Hover over Libraries to show other options.

Option	Description
All	Open the Libraries list where you can view or add custom device tree views of your network status and monitoring data.
Add Library	Open a dialog to create ⁴⁰⁵¹ a new library.
Select Library	Open a library. Hover over Select Library to show more options. Follow the alphabetical menu path that is specific to your setup to view your libraries. Click a library to open it.

Libraries List

In the All view, you see a list of all libraries. Enable the check box next to a library and use the quick action buttons to perform the following actions:

- Used by (clone⁴⁰¹⁰ of this library.
- Delete (settings⁴⁰⁵⁹ of the library and its library nodes.

To add a new library, hover over  and select Add Library from the menu.

 See also sections [Working with Table Lists](#)²⁴⁶ and [Multi-Edit](#)⁴⁰¹⁴.

Working with Libraries

For detailed information on how to create and edit libraries, see the following sections.

- [Libraries Step by Step](#)⁴⁰⁵¹
- [Library Management](#)⁴⁰⁵⁶
- [Libraries and Node Settings](#)⁴⁰⁵⁹
- [Library Context Menus](#)⁴⁰⁶⁶

8.9.1 Libraries Step by Step

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

To create and review a new library, take the following steps:

- [Step 1: Add a Library](#) ⁴⁰⁵¹
- [Step 2: Add Library Nodes](#) ⁴⁰⁵²
- [Step 3: Set Library Node Display Settings](#) ⁴⁰⁵³
- [Step 4: View the Library](#)

Step 1: Add a Library

First, you need to create a new library.

1. Click Libraries in the [main menu bar](#) ²⁸¹ to show an overview list of all libraries.
2. Hover over  and select Add Library from the menu to open the Add Library dialog.
3. Enter a meaningful Library Node Name.
4. Optionally, define the Security Context, enter Tags, and set the User Group Access for the new library.
5. Click Create.

 For more information, see section [Libraries and Node Settings](#) ⁴⁰⁵⁹.

i When a user with administrative rights creates a new object, only other users with administrative rights can view or edit the new object by default. When a read/write user creates a new object, all members of the read/write user's primary group can view and edit the new object as well. This behavior applies to [libraries](#) ⁴⁰⁴⁷, [maps](#) ⁴⁰⁹⁵, [reports](#) ⁴⁰⁶⁹, [notification templates](#) ⁴¹³¹, and [schedules](#) ⁴¹⁶⁹. For more information, see section [Access Rights Management](#) ¹⁵⁵.

Step 2: Add Library Nodes

Because the new library is empty in the beginning, you need to add library nodes to fill the library with content.

1. Click the new library in the Libraries list. The library's Overview tab opens.
2. Click the Management tab. You see a split screen:
 - On the left side, you can see your library. If you create a new library, it is empty in the beginning.
 - On the right side, you see your device tree.

Bandwidth Library in Management Mode

3. From the device tree on the right side, drag objects and drop them on the library on the left side. Each dropped object is immediately added as a new library node. Repeat this procedure as often as you wish until you have added all desired items to the library.

i Library nodes can contain up to 1,000 sensors. However, if you add single sensors to the library via the Management tab, there can only be one sensor in one library node.

4. Click Add Library Node or Add Group in the bottom-left corner of the split screen to create nested library nodes.
5. Drag and drop library nodes to change their position. If you want to change the monitoring object that is associated with a library node, you can change the Linked Object in the library node's settings.

For more information, see section [Libraries and Node Settings](#).

Step 3: Set Library Node Display Settings

After you set up your library and filled it with content, you can edit the library nodes' display settings.

Right-click the name of a library node and select Edit | Settings from the [context menu](#) to change the Library Node Display Settings. In the dialog that appears, you can change the name of the library and its tags, as well as the linked object, the library node view, and filters. These settings are available for each library node.

The screenshot shows a dialog box titled "Edit Object NetFlow" with a close button (X) in the top right corner. The dialog is divided into two main sections:

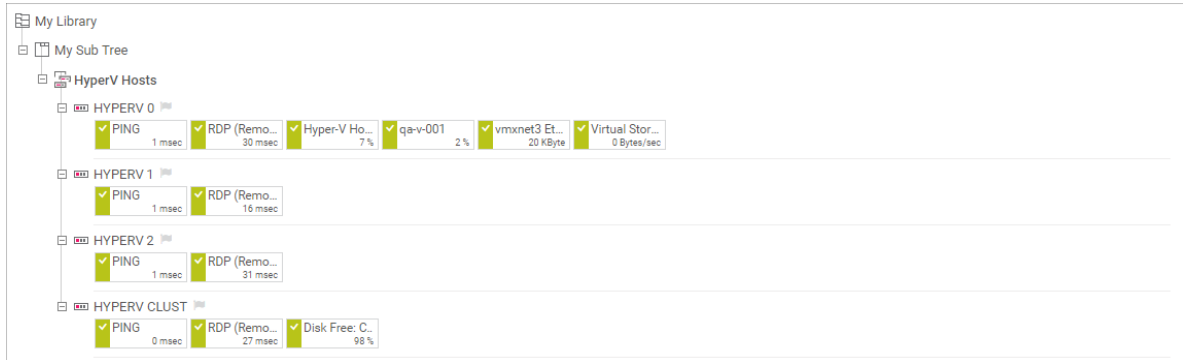

- Basic Library Node Settings:**
 - Library Node Name:** A text input field containing "NetFlow".
 - Security Context:** A dropdown menu currently showing "PRTG System Administrator".
 - Tags:** A list of tags with "bandwidthsensor" and "netflow" selected, each with an 'x' to remove it, and a "+" button to add more.
- Library Node Display Settings:**
 - Linked Object:** A search field containing "Root" with a magnifying glass icon on the right.
 - Library Node View:** Two radio button options: "Show a subtree of the device tree" (unselected) and "Show a collection of filtered sensors" (selected).
 - Filter By Type:** Two radio button options: "Show all sensor types" (unselected) and "Show only specific sensor types" (selected).
 - Select Sensor Types:** A search field with "Search..." and a magnifying glass icon. Below it, a list of sensor types with checkboxes: "Name" (unchecked) and "Active Directory Replication E..." (unchecked).

At the bottom right of the dialog, there are "Cancel" and "OK" buttons.

Edit Library Node Display Settings

You can either show the Linked Object as a subtree of your device tree including probes, groups, and devices, or you can view all sensors underneath the Linked Object.

- When you select Show a subtree of the device tree, the library node called **My Sub Tree**, for example, looks like a branch in your device tree.

Library with One Node that Shows a Branch of the Device Tree

- When you select Show only specific sensor types, PRTG only shows the sensors that are underneath the Linked Object in the device tree without probes, groups, and devices. You can additionally filter for certain sensor types, states, and tags. PRTG then only shows matching sensors. In the example screenshot, you can see the library node **My Sub Tree** where only bandwidth sensors are shown.

Library with One Node that Only Shows a Collection of Bandwidth Sensors

For more information, see section [Libraries and Node Settings](#) ⁴⁰⁵⁹.

Step 4: View the Library

Click the Overview tab to see the final appearance of your library.

- It depends on the group access rights defined for the library and the logged in user account if the library is visible to users other than administrators.

View Library

You can take the following actions:

- Hover over an object to view a [hover popup](#) ²⁷⁵ with recent monitoring and object status data.
- Use the [sensor status bar](#) ¹⁸⁷ to select which sensors you want to display in the library. You can hide sensors that are in a certain status by clicking the respective status icon. To show the sensors again, click the status icon again.
 - This setting is reset the next time you open the library.

- Use the different [viewing options](#)¹⁸⁷ to change the size of the library display.
- Use the [search box](#)¹⁸⁷ to search the library for a string in object names. PRTG shows matching objects in full color and grays out all other objects while the filter is active.
- Click an object in the library, for example, a sensor, to show more detailed information about the object.
 - ❶ If a user does not have enough permissions to view the detailed information, for example, because they are a member of a user group that does not have the respective group access rights, they get an error message.
- Right-click a library or a library node to open its context menu where further options are available.

 You can also set up notifications for entire libraries, see section [Notifications Based on Libraries Step by Step](#)⁴⁰⁴².

Libraries

- [Libraries Step by Step](#)⁴⁰⁵¹
- [Library Management](#)⁴⁰⁵⁶
- [Libraries and Node Settings](#)⁴⁰⁵⁹
- [Library Context Menus](#)⁴⁰⁶⁶

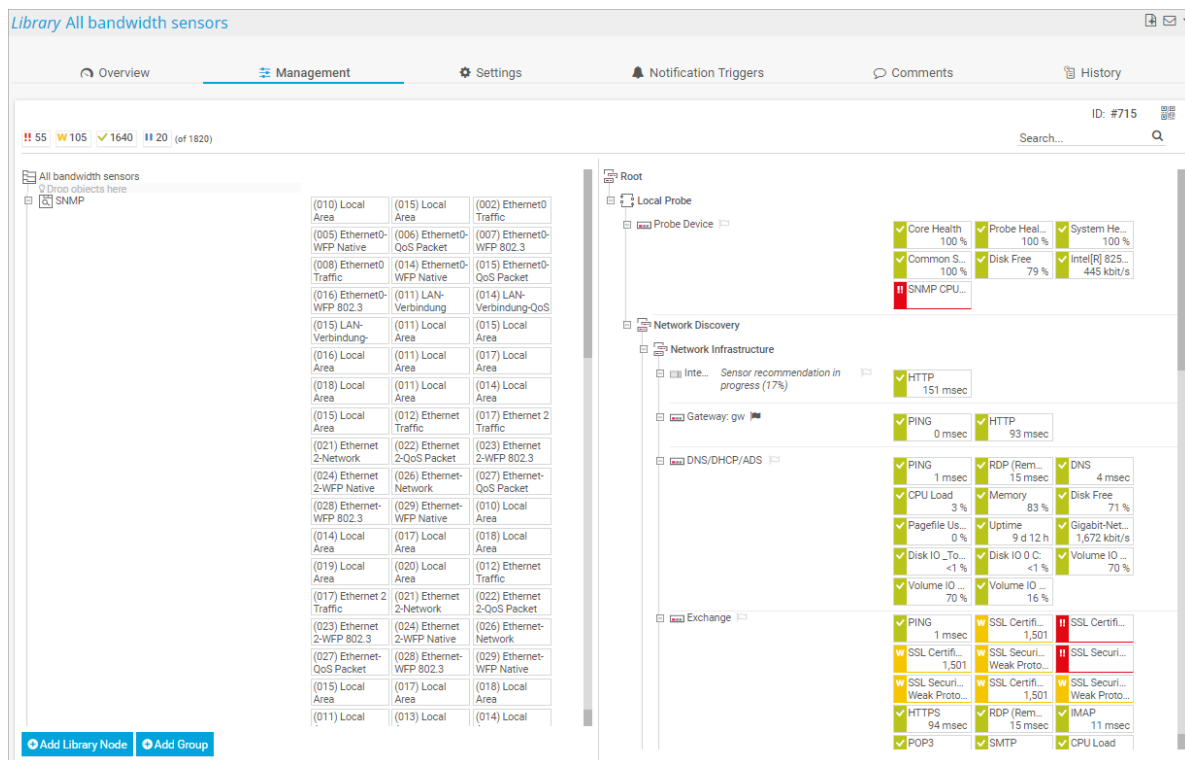

8.9.2 Library Management

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

You can manage your libraries by adding and editing library nodes and by defining which objects you want to see on a library node.

Click the Management tab. You see a split screen:

- On the left side, you can see your library. If you create a new library, it is empty in the beginning.
- On the right side, you see your device tree.

Bandwidth Library in Management Mode

Add and Change Library Nodes

From the device tree on the right side, drag objects and drop them on the library on the left side. Each dropped object is immediately added as a new library node. Repeat this procedure as often as you wish until you have added all desired items to the library.

i Library nodes can contain up to 1,000 sensors. However, if you add single sensors to the library via the Management tab, there can only be one sensor in one library node.

Click Add Library Node or Add Group in the bottom-left corner of the split screen to create nested library nodes.

Drag and drop library nodes to change their position. If you want to change the monitoring object that is associated with a library node, you can change the Linked Object in the library node's settings.

Set Library Node Display Settings

Right-click the name of a library node and select Edit | Settings from the [context menu](#) to change the Library Node Display Settings. In the dialog that appears, you can change the name of the library and its tags, as well as the linked object, the library node view, and filters. These settings are available for each library node.

The screenshot shows a dialog box titled "Edit Object NetFlow" with a close button (X) in the top right corner. The dialog is divided into two main sections:

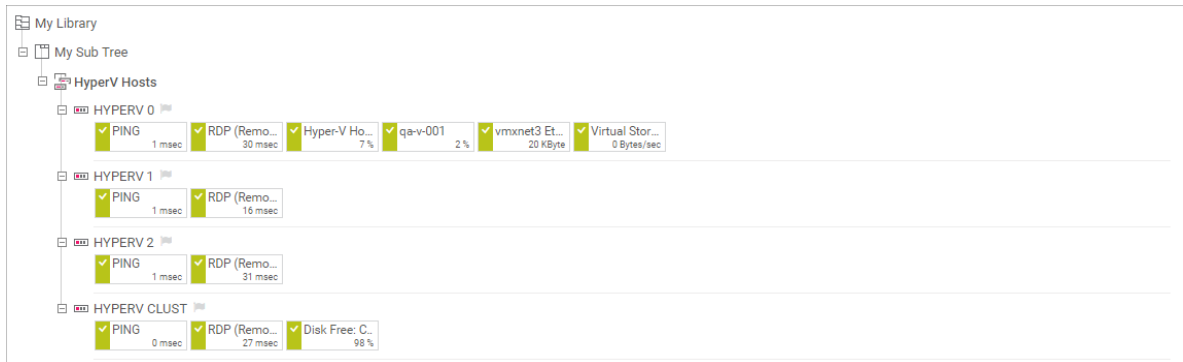

- Basic Library Node Settings:**
 - Library Node Name:** A text input field containing "NetFlow".
 - Security Context:** A dropdown menu showing "PRTG System Administrator".
 - Tags:** A list of tags with "bandwidthsensor" and "netflow" selected, each with a close (X) button, and a plus (+) button to add more.
- Library Node Display Settings:**
 - Linked Object:** A search field containing "Root" with a search icon (Q) on the right.
 - Library Node View:** Two radio button options: "Show a subtree of the device tree" (unselected) and "Show a collection of filtered sensors" (selected).
 - Filter By Type:** Two radio button options: "Show all sensor types" (unselected) and "Show only specific sensor types" (selected).
 - Select Sensor Types:** A search field with "Search..." and a search icon (Q). Below it, a list of sensor types with checkboxes: "Name" (unchecked) and "Active Directory Replication E..." (unchecked).

At the bottom right of the dialog, there are "Cancel" and "OK" buttons.

Edit Library Node Display Settings

You can either show the Linked Object as a subtree of your device tree including probes, groups, and devices, or you can view all sensors underneath the Linked Object.

- When you select Show a subtree of the device tree, the library node called **My Sub Tree**, for example, looks like a branch in your device tree.

Library with One Node that Shows a Branch of the Device Tree

- When you select Show only specific sensor types, PRTG only shows the sensors that are underneath the Linked Object in the device tree without probes, groups, and devices. You can additionally filter for certain sensor types, states, and tags. PRTG then only shows matching sensors. In the example screenshot, you can see the library node **My Sub Tree** where only bandwidth sensors are shown.

Library with One Node that Only Shows a Collection of Bandwidth Sensors

For more information, see section [Libraries and Node Settings](#) ⁴⁰⁵⁹.

Context Menu

You can right-click any object on a library's Overview tab or Management tab to open its context menu.

For more information, see section [Library Context Menus](#) ⁴⁰⁶⁶.

Libraries

- [Libraries Step by Step](#) ⁴⁰⁵¹
- [Library Management](#) ⁴⁰⁵⁶
- [Libraries and Node Settings](#) ⁴⁰⁵⁹
- [Library Context Menus](#) ⁴⁰⁶⁶

8.9.3 Libraries and Node Settings

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Use the library tabs to access all functionalities and settings of a library.

Overview

Click the Overview tab to show the status of your library.

Management

Click the Management tab to edit the contents of your library, for example, to add items to the library via drag-and-drop.

■ For more information, see section [Library Management](#) ⁴⁰⁵⁶.

Library Node Settings

To change the settings of a library node, go to a library's Overview tab and click the name of a library node. You can also open the library node settings on the Management tab via the library node's [context menu](#) ⁴⁰⁶⁶.

i You can only change the settings of a library node if it already contains monitoring objects like groups, devices, or sensors.

Basic Library Node Settings

Setting	Description
Library Node Name	<p>Enter a meaningful name for the library node.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Security Context	<p>Define the security context for the Overview tab of the library. Select a user account from the dropdown list to define which objects are visible. All users with access to the library can only see the objects that the selected user account has the rights to view.</p> <p>i Only sensors that are visible in the library trigger a notification ⁴⁰⁴².</p>

Setting	Description
	<p>i Basically, the security context defines the minimum access rights to objects like libraries, reports, or maps, that a user account has. If the security context of an object is PRTG System Administrator, for example, every user sees all objects in a library, in a report, or on a map, no matter what the particular user access rights are.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Library Node Display Settings

Setting	Description
Linked Object	<p>Click  and use the object selector^[257] to change the object in the device tree that the library node references.</p>
Library Node View	<p>Select how you want to view the objects that PRTG shows underneath the library node:</p> <ul style="list-style-type: none"> ▪ Show a subtree of the device tree: View all objects underneath the linked object as you can see them in the device tree, including probes, groups, and devices. ▪ Show a collection of filtered sensors: Only view the sensors underneath the linked object without probes, groups, and devices. You can use filters to show only specific sensors. <p>i The library node can show up to 1,000 sensors. PRTG discards further sensors.</p>
Filter by Sensor Type	<p>This setting is only visible if you select Show a collection of filtered sensors above. Select if you want to filter the displayed sensors by specific sensor types:</p> <ul style="list-style-type: none"> ▪ Show all sensor types: Do not filter by sensor types. ▪ Show only specific sensor types: Filter the displayed sensors by specific sensor types.

Setting	Description
Sensor Types	<p>i PRTG applies this filter in real time. If the configuration underneath the linked object changes, the library node accordingly shows matching sensors.</p> <p>This setting is only visible if you select Show only specific sensor types above. You can see a list of all sensor types. PRTG displays sensors that are in use in bold print.</p> <p>Enable the check box in front of a sensor type that you want to include in the library node view.</p> <p>i You can also select all items or cancel the selection by using the check box in the table header.</p> <p>i PRTG applies this filter in real time. If the configuration underneath the linked object changes, the library node accordingly shows matching sensors.</p> <p>i You cannot filter for sensor types that are defined in mini probes.</p>
Filter by Sensor Status	<p>This setting is only visible if you select Show a collection of filtered sensors above. Select if you want to filter the displayed sensors by specific sensor states:</p> <ul style="list-style-type: none"> ▪ Show all sensor states: Do not filter by sensor status. ▪ Show only sensors specific states: Filter the displayed sensors by specific sensor states.
Sensor States	<p>This setting is only visible if you select Show only sensors in specific states above. You can see a list of all sensor states.</p> <p>Enable the check box in front of a sensor status to include all sensors that show this status in the library node view:</p> <ul style="list-style-type: none"> ▪ Unknown ▪ Up ▪ Warning ▪ Down ▪ Paused by user ▪ Unusual ▪ Down (Acknowledged) ▪ Down (Partial) <p>i You can also select all items or cancel the selection by using the check box in the table header.</p>

Setting	Description
Filter by Tag	<p>i PRTG applies this filter in real time. If the configuration underneath the linked object changes, the library node accordingly shows matching sensors.</p> <p>This setting is only visible if you select Show a collection of filtered sensors above. Select if you want to filter the displayed sensors by specific tags:</p> <ul style="list-style-type: none"> ▪ Show all tags: Do not filter by tag. ▪ Show only sensors with specific tags: Filter the displayed sensors by specific tags.
Tags	<p>This setting is only visible if you select Show only sensors with specific tags above. Enter one or more tags for sensors that you want to include in the library node view. You can also use the plus sign (+) or the minus sign (-) to categorize tags as must have or must not have, for example, +snmp;-wmi (must have the tag snmp and must not have the tag wmi).</p> <p>i The tag of a sensor can also be inherited from a parent object.</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>i PRTG applies this filter in real time. If the configuration underneath the linked object changes, the library node accordingly shows matching sensors.</p>
Filter by Priority	<p>This setting is only visible if you select Show a collection of filtered sensors above. Select if you want to filter the displayed sensors by specific priorities ^[253]:</p> <ul style="list-style-type: none"> ▪ Show all priorities: Do not filter by priority. ▪ Show only sensors with specific priorities: Filter the displayed sensors by specific priorities. <p>i PRTG ignores the priority settings of a parent object. It only regards the priority setting of the sensor itself.</p>
Priorities	<p>This setting is only visible if you select Show only sensors with specific priorities above. You can see a list of all available priorities.</p> <p>Enable the check box in front of a priority to include all sensors that have this priority in the library node view:</p> <ul style="list-style-type: none"> ▪ ***** (highest priority) ▪ **** ▪ *** ▪ ** ▪ * (lowest priority)

Setting	Description
	<p>i PRTG applies this filter in real time. If the configuration underneath the linked object changes, the library node accordingly shows matching sensors.</p>

i Click OK to save your settings. If you close the dialog without saving, all changes to the settings are lost.

i After you apply filters, it might take several seconds for the changes to become visible. This is because of internal filter processes that run in the background.

Settings

Click the Settings tab to open a library's general settings.

Basic Library Node Settings

Setting	Description
Library Node Name	<p>Enter a meaningful name for the library.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Security Context	<p>Define the security context for the Overview tab of the library. Select a user account from the dropdown list to define which objects are visible. All users with access to the library can only see the objects that the selected user account has the rights to view.</p> <p>i Only sensors that are visible in the library trigger a notification⁴⁰⁴².</p> <p>i Basically, the security context defines the minimum access rights to objects like libraries, reports, or maps, that a user account has. If the security context of an object is PRTG System Administrator, for example, every user sees all objects in a library, in a report, or on a map, no matter what the particular user access rights are.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited¹⁴⁵¹.</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ No access: Users in this user group cannot see or edit the object. The object does not show up in lists. ▪ Read access: Users in this user group can see the object and view its settings. ▪ Write access: Users in this user group can see the object and view and edit its settings. However, they cannot edit the object's access rights settings. ▪ Full access: Users in this user group can see the object, view and edit its settings, and edit its access rights settings. <p> You can create new user groups in the User Groups  settings.</p>

 When you give access rights to a user group, all user group members can see the objects in the respective library.

 Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

Notification Triggers

You can define notification triggers for any kind of library, also for dynamic libraries that can change with every scanning interval, for example, when you filter a library by sensor status or priority.

 For more information, see section [Notifications Based on Libraries Step by Step](#) .

Comments

On the Comments tab, you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

History

On the History tab, all changes in the settings of an object are logged with a time stamp, the name of the user who made the change, and a message. The history log retains the last 100 entries.

Delete

You can delete the entire library at any time. Right-click a library's name and select Delete from the context menu.

More

KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

8.9.4 Library Context Menus

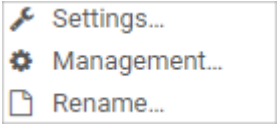

Right-click a library or a library node on a library's Overview tab or Management tab to show its context menu.

Library Menu

The Library Menu contains actions for your libraries.

Library Menu

Action	Description
Details	Show the Overview tab ⁴⁰⁶¹ of the object.
Edit	<p>Hover over Edit to show the Edit menu. The following actions are available:</p>  <p>Edit Context Menu</p> <ul style="list-style-type: none"> ▪ Settings: Open a dialog to edit the library settings⁴⁰⁶³. ▪ Management: Open the Management⁴⁰⁵⁶ tab of the library. ▪ Rename: Open a dialog to edit the name of the object.
Delete	Delete the object. PRTG asks for confirmation before it actually deletes an object.
Add Library Node	Add a new library node to the library.
Add Group	Add a group to the library to create nested library nodes.
Send Link by Email	Send a link to the object by email. Click to create a new email with your system's standard email client. The email contains a direct link to the Overview tab of the object.

Library Node Menu

The Library Node Menu contains actions for your library nodes.

Library Node Menu

Action	Description
Details	Show the Overview tab ⁴⁰⁵¹ of the object.
Edit	<p>Hover over Edit to show the Edit menu. The following actions are available:</p> <ul style="list-style-type: none"> ▪ Settings: Open a dialog to edit the library node settings⁴⁰⁵⁹. ▪ Rename: Open a dialog to edit the name of the object.
Delete from Library	Delete the object. PRTG asks for confirmation before it actually deletes an object.
Move	<p>Hover over Move to open the Move menu. The following actions are available:</p> <div data-bbox="480 1312 759 1480" data-label="Image"> </div> <p>Move Context Menu</p> <ul style="list-style-type: none"> ▪ Top: Move the library node to the top of the library. ▪ Up: Move the library node one entry up. ▪ Down: Move the library node one entry down. ▪ Bottom: Move the library node to the bottom of the library.
Send Link by Email	Send a link to the object by email. Click to create a new email with your system's standard email client. The email contains a direct link to the Overview tab of the object.

8.10 Reports

With the Reports feature, you can view and analyze historic monitoring results for a specific period of time or for your system configuration. You can create reports for all sensors or only for specific sensors.

Example of a Report

i The report above shows the report data for devices on a local probe. You can see graphs for the preceding week and data tables with numeric results.

In this section:

- [Introduction](#) 
- [Reports Menu](#) 
- [Reports List](#) 
- [Configuration Reports](#) 
- [Automatic Averaging](#) 
- [Working with Reports](#)

Introduction

You can generate reports on demand or via schedules in HTML and PDF format, as well as in comma-separated values (CSV) and Extensible Markup Language (XML) format. Furthermore, you can create reports for a single sensor or for a whole range of sensors. It is also possible to [create HTML reports of your system configuration](#) .

Report templates define the overall look of your report and in which detail the report shows monitoring data.

Preconfigured Reports

PRTG provides several preconfigured reports that you can also edit or delete.

- Summary report for all sensors
- Top 100 Busy/Idle Processor Sensors
- Top 100 Fastest/Slowest HTTP Sensors
- Top 100 Fastest/Slowest Ping Sensors
- Top 100 Free/Full Disk Space Sensors
- Top 100 Most/Least Used Bandwidth Sensors
- Top 100 Most/Least Used Memory Sensors
- Top 100 Uptime/Downtime Report

Reports Menu

Click Reports in the [main menu bar](#)  to open an overview list of all reports about monitoring data. Hover over Reports to show other options.

Option	Description
All	Open the Reports list where you can view or add reports about your monitoring data.
Add Report	Open a dialog to create  a new report.

Option	Description
Select Report	Hover over Select Report to show a list of your reports about monitoring data. Click a report to open it.
Configuration Reports	Hover over Configuration Reports to see the available configuration reports ⁴⁰⁷² . Select an item to create reports for maps, reports, users and user groups, and system configuration to document changes to the configuration.

Reports List

In the All view, you see a list of all reports about monitoring data.

Reports				
Object ▾	Template ↕	Security Context ↕	Period ↕	Schedule ↕
<input checked="" type="checkbox"/> Summary report for all sensors	List of sensors (with 1 h graph)	PRTG System Admi...	Day	None
<input checked="" type="checkbox"/> Top 100 Busy/Idle Processor Sensors	Top 100 highest and lowest (5 ...	PRTG System Admi...	Day	None
<input checked="" type="checkbox"/> Top 100 Fastest/Slowest HTTP Sensors	Top 100 highest and lowest (5 ...	PRTG System Admi...	Day	None
<input checked="" type="checkbox"/> Top 100 Fastest/Slowest Ping Sensors	Top 100 highest and lowest (5 ...	PRTG System Admi...	Day	None
<input checked="" type="checkbox"/> Top 100 Free/Full Disk Space Sensors	Top 100 highest and lowest (5 ...	PRTG System Admi...	Day	None
<input checked="" type="checkbox"/> Top 100 Most/Least Used Bandwidth S...	Top 100 highest and lowest (5 ...	PRTG System Admi...	Day	None
<input checked="" type="checkbox"/> Top 100 Most/Least Used Memory Sen...	Top 100 highest and lowest (5 ...	PRTG System Admi...	Day	None
<input checked="" type="checkbox"/> Top 100 Uptime/Downtime Report	Top 100 uptime and downtime...	PRTG System Admi...	Day	None

List of Reports

Section	Description
Object	Shows the name of the report.
Template	Shows the name of the template that this report uses.
Security Context	Shows the user account that PRTG uses to run the report. This user account defines which objects are visible in the report. ■ For more information, see section Reports Settings ⁴⁰⁸³ .
Period	Shows the time span that the report covers.

Section	Description
Schedule	Shows if you set a schedule to automatically run the report in a regular interval. ■ For more information, see section Reports Settings ⁴⁰⁸³ .
Email	Shows the email address to which PRTG automatically sends the report if you set a schedule and entered an email address in the report settings.
Status	Shows the status of the report.
Next Run	Shows the date and time at which PRTG runs the report the next time if you set a schedule in the report settings.
Last Run	Shows the date and time at which PRTG ran the report the last time if you set a schedule in the report settings.
# Sensors in Last Run	Shows the number of sensors whose data was included when PRTG last ran the report.

Click the name of a report about monitoring data to open the Run Now tab.

i You can only run configuration reports via the main menu bar.

Enable the check box next to a report and use the quick action buttons to perform the following actions:

- Clone (clone ⁴⁰¹⁰ of this report.
- Delete (settings ⁴⁰⁸³.

To add a new report, hover over  and select Add Report from the menu.

■ See also sections [Working with Table Lists](#) ²⁴⁶ and [Multi-Edit](#) ⁴⁰¹⁴.

Configuration Reports

Configuration reports show the PRTG configuration. They are available for Maps, Reports, Users & User Groups, and System Configuration. PRTG directly displays a configuration report in a new browser window as an HTML page. You can use configuration reports, for example, to file and document changes to the PRTG configuration.

Configuration reports contain the same information as you can see on the [Maps](#) ⁴⁰⁹⁵ overview, the [Reports](#) ⁴⁰⁶⁵ overview, and on the [User Accounts](#) ⁴²¹¹ and [User Groups](#) ⁴²¹⁹ tabs of the system administration settings. The configuration report System Configuration includes the system administration settings of the [User Interface](#) ⁴¹⁷⁵, [Monitoring](#) ⁴¹⁸⁷, [Notification Delivery](#) ⁴¹⁹⁴, [Core & Probes](#) ⁴²⁰², and [Cluster](#) ⁴²²⁹ tabs.

- ❶ Configuration reports are interactive. You can click available links to go to the corresponding pages in the PRTG web interface.

Automatic Averaging

For performance reasons, PRTG automatically averages monitoring data when it calculates data for large periods of time.

Period of Time in Report	Minimum Level of Detail (Averaging Interval)
Up to 40 days	Any
40 to 500 days	60 minutes/1 hour or longer

- ❶ Reports for periods that are longer than 500 days are not possible. If you enter a longer period, PRTG automatically shortens it to 500 days.
- ❶ In some cases, the generated report might contain a period of time that differs from the defined start and end date for the report because of internal averaging processes. When averaging intervals are longer than 1 hour and do not equal 24 hours, and when they are combined with specific periods of time, the resulting data points might be asynchronous to the periods of time. Consider this behavior particularly if you use [application programming interface \(API\) calls](#) ⁴³⁸⁹ to generate reports.

Working With Reports

For detailed information on how to create, edit, and schedule reports, see the following sections:

8.10.1 Reports Step by Step

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

To run a report or to create a new report, follow the steps in this section.

In this section:

- [Step 1: Add a Report](#)  4075
- [Step 2: Select a Report Template](#)  4077
- [Step 3: Select Cluster Nodes and Sensors](#)  4077
- [Step 4: Define a Report Schedule and Additional Settings](#)  4077
- [Step 6: Check and Adjust the Included Sensors](#)  4078
- [Step 7: Run Report](#)  4078

Step 1: Add a Report

First, you need to create a new report:

1. Click Reports in the [main menu bar](#)  281 to show an overview list of all reports.
2. Hover over  and select Add Report from the menu to open the Add Report dialog.

Add Report

< Cancel

Add Report Dialog

3. Enter a meaningful Report Name.
4. Optionally, enter Tags for the new report and define the Security Context, your Time Zone for all dates in the report, as well as the Page Format and the Page Orientation if you want to generate PDF files.

■ For more information, see section [Reports Settings](#) ⁴⁰⁸³.

ⓘ You can also add a report via the [context menu](#) ²⁵⁹ of an object. In this case, the selected object is automatically included in the report.

i When a user with administrative rights creates a new object, only other users with administrative rights can view or edit the new object by default. When a read/write user creates a new object, all members of the read/write user's primary group can view and edit the new object as well. This behavior applies to [libraries](#)^[4047], [maps](#)^[4095], [reports](#)^[4069], [notification templates](#)^[4131], and [schedules](#)^[4169]. For more information, see section [Access Rights Management](#)^[155].

Step 2: Select a Report Template

Select a Report Template from the list of available templates. This template defines the overall look of your report and in which detail the report includes monitoring data. There are templates that offer optional data tables in addition to graphs. You can also specify the calculation interval for graphs.

■ For more information, see section [Reports Settings](#)^[4083].

Step 3: Select Cluster Nodes and Sensors

Select the cluster nodes and sensors that you want to include in the report:

1. This step is only necessary if you run PRTG in a cluster^[135]. Select a Cluster Node from which PRTG takes the monitoring data.
 - i** If you select All cluster nodes, PRTG creates a report with data from all of your cluster nodes, but only the **primary** channel of every sensor appears in the report.
2. Reports show monitoring results based on sensor data. You can either add sensors manually or by tag. If you want to add sensors by tag, go to the Included Sensors section. Enter one or more tags separated by a comma or space in the Sensors by Tag field to include all sensors that have at least one of these tags in the report. For example, enter the tag **bandwidthsensor** to include all sensors that measure bandwidth.
3. Use the Filter Included Sensors by Tag setting to explicitly filter for sensors with specific tags, or to additionally filter sensors that you manually added by tag. You can also leave the field empty.

■ For more information, see section [Tags](#)^[145].

Step 4: Define a Report Schedule and Additional Settings

Define more detailed settings like a report schedule or a report period:

1. In the Report Schedule section, select No schedule if you only want to run the report on demand, or choose a schedule if you want to automatically run the report on a regular basis.
 - i** By default, PRTG does not run scheduled reports on [failover nodes](#)^[4513].
2. Set a Report Period that suits your needs.
3. Define how you want to handle percentiles. If you choose Show percentiles, the report displays an overview table with the percentiles of **each** channel for the whole report period, and the percentiles of the **primary** channel in the table for each scanning interval.
4. In section Data Files, select if you want to include .csv and .xml data files in the report in addition to a .pdf file. You can only generate data files for reports that include data tables.
5. Optionally, add custom Report Comments for the beginning and the end of your report.
6. Define individual Access Rights for your user groups. These access rights specify which user groups can view or edit the report.

i Save your settings. If you leave the page, all changes to the settings are lost.

■ For more information, see section [Reports Settings](#) .

Step 6: Check and Adjust the Included Sensors

After you save the settings, PRTG opens the Select Sensors Manually tab where you can [manually add](#)  entire probes, groups, devices, or individual sensors via drag-and drop in addition to the sensors that you selected by tag. You can also remove sensors from the selection.

Go to the Sensors Selected by Tag tab to see a list of all sensors that you added by tag. To change tags, go back to the Settings tab.

 The final report includes both manually selected sensors and sensors selected by tag.

■ For more information, see section [Reports Settings](#) .

Step 7: Run Report

Open the Run Now tab, select a period, and in section Report Processing, select View report as HTML. Click Run Report. PRTG immediately generates the report in a new browser window or tab. Depending on the number of selected sensors and the used template, it might take a few minutes until you see the report. If you do not want to wait, close the newly opened browser window or tab and select a PDF option. Click Run Report again. The report is then generated in the background and you get a ToDo ticket or email once it is finished.

8.10.2 Run Reports

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Use the reports tabs to access all functionalities and settings of a report.

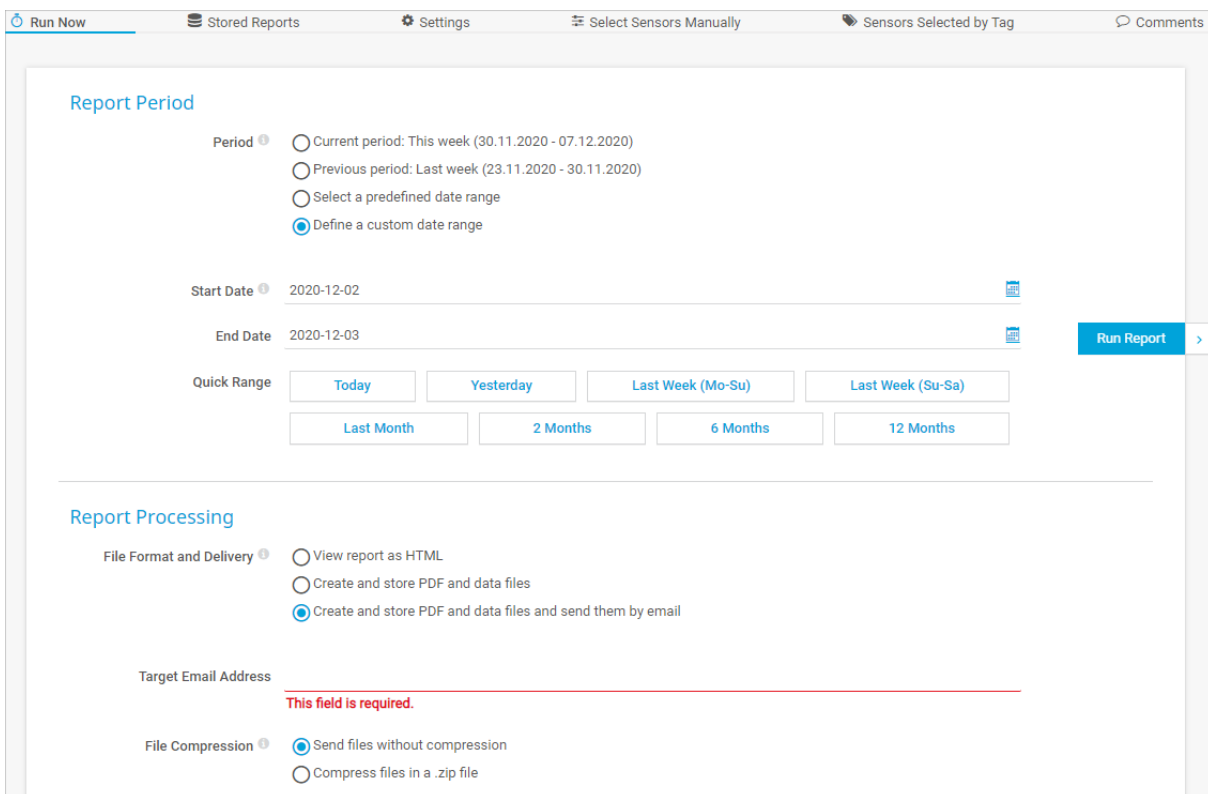

Report Tabs

Click Go to all reports at the bottom of the page to open the overview list of all reports.

Run Now

On the Run Now tab, you can immediately run a report with the settings that you defined before.

i When you set up or run a report, also keep in mind the [remarks for reports](#) ⁴⁰⁸².

Run Report on Demand

Report Period

Setting	Description
Period	Define the time span that the report covers:

Setting	Description
	<ul style="list-style-type: none"> ▪ Current period: This week [date range]: Use monitoring data of the current period. The actual time span depends on the report period that you define in the report settings. It can be today, this week, this month, or this year. ▪ Previous period: Last week [date range]: Use monitoring data of the last period. The actual time span depends on the report period that you define in the report settings. It can be yesterday, last week, last month, or last year. ▪ Select a predefined date range: Use monitoring data of a predefined period other than the current or the previous period. Select from a list of date ranges below. ▪ Define a custom date range: Use monitoring data of a custom period. Set the start and end date below or choose from several quick range buttons.
Date Range	This setting is only visible if you select Select a predefined date range above. From the list, select a date range for which PRTG generates the report. The shown time spans depend on the available monitoring data and on the report period that you define in the report settings. It can be days, weeks, months, or years.
Start Date	This setting is only visible if you select Define a custom date range above. Set the start date of the time span for which PRTG generates the report. Use the date time picker to enter the date and time. Make sure that you define a valid period.
End Date	This setting is only visible if you select Define a custom date range above. Set the end date of the time span for which PRTG generates the report. Use the date time picker to enter the date and time. Make sure that you define a valid period.
Quick Range	<p>This setting is only visible if you select Define a custom date range above. You can use several buttons to quickly set the start and end dates for the report. You can choose between Today, Yesterday, Last Week (Mo-Su), Last Week (Su-Sa), Last Month, 2 Months, 6 Months, and 12 Months.</p> <p>i PRTG sets the date range to the last matching period. It starts at 00:00 and ends at 00:00 of the following day.</p>

Report Processing

Setting	Description
File Format and Delivery	Define how you want to view the report:

Setting	Description
	<ul style="list-style-type: none"> ▪ View report as HTML: Directly view the report in a new browser window or tab. ▪ Create and store PDF and data files: Create a .pdf file and, depending on the Data Files ⁴⁰⁷⁹ setting, create data files of the report and store it. You find the stored report files on the Stored Reports tab. You also receive a ToDo ticket. By default, PRTG sends out a notification email to administrators in this case. ▪ Create and store PDF and data files and send them by email: Create a .pdf file and, depending on the Data Files setting, create data files of the report, store the files, and send them via email to the email address that you define below. You can find the stored report files on the Stored Reports tab. <p>i PRTG only generates .csv and .xml data files for report templates that include data tables.</p> <p>i To create .pdf files, make sure that the print spooler service runs on the PRTG core server system.</p> <p>i Some special characters, for example, 4-byte unicode characters, might not be displayed correctly in PDF reports. As a workaround, we recommend that you generate an HTML report and save it as a .pdf file.</p> <p>i If you generate reports with Internet Explorer 11, we recommend that you use one of the PDF options for optimal results.</p>
Target Email Address	<p>This setting is only visible if you select Create and store PDF and data files and send them by email above. Enter one or more valid email addresses to which PRTG sends the report. Use commas to separate email addresses.</p> <p>i PRTG sends an email to all recipients. All recipients appear in the To field of the email.</p> <p>i You can change the configuration for outgoing emails in the Notification Delivery ⁴¹⁹⁴ settings.</p>
File Compression	<p>This setting is only visible if you select Create and store PDF and data files and send them by email above. Define if PRTG compresses the attached report files before it sends them:</p> <ul style="list-style-type: none"> ▪ Send files without compression: PRTG sends the report files by email in their original size. ▪ Compress files in a .zip file: PRTG compresses the report files to a .zip file before they are sent by email.

Click Run Report to start the report generation. Depending on the number of selected sensors, this might take a while. If it takes a long time to generate HTML reports, consider using one of the PDF options.

Remarks for Reports

- Any sensor graph in your report only shows channels that you enable via the Show in graphs option in the [channel settings](#) .
- Reports show statistics for the uptime (the Up and Down [states](#)  in percent) and for requests (Good and Failed in percent). PRTG rounds values between 5% and 95%, as well as 100% and 0%, to whole numbers without decimal places. Other values are shown with 3 decimal places.
- Because PRTG rounds values, the statistics in the report section Sensor Status History can differ from the values in the report section Uptime Stats by a few seconds.
- PRTG limits data reporting to 5 requests per minute.
- Reports cannot show uptime or downtime data for the [Sensor Factory sensor](#) .
- Create reports that include an appropriate amount of data. Reports might not work as expected if PRTG has to process too many sensors with short scanning intervals. Adjust your report size and the time span that the report covers, if necessary.

Stored Reports

On the Stored Reports tab, you can view all PDF reports and data files that you created and stored.

Click a name to open the report. PRTG stores reports until they are deleted according to the [data purging settings](#)  of your PRTG configuration.

Other Tabs

For all other tabs, see section [Report Settings](#) .

- [Basic Report Settings](#) 
- [Included Sensors](#) 
- [Report Schedule](#) 
- [Report Period](#) 
- [Percentile Handling](#) 
- [Data Files](#) 
- [Report Comments](#) 
- [Access Rights](#) 
- [Select Sensors Manually](#) 
- [Sensors Selected by Tag](#) 
- [Comments](#)

Run Now

On the Run Now tab, you can immediately run a report with the settings that you defined before.

 For more information, see section [Run Reports](#) .

Stored Reports

On the Stored Reports tab, you can view reports that you created.

 For more information, see section [Run Reports](#) .

Settings

Click the Settings tab to open the settings of a report.

i When you set up or run a report, also keep in mind the [remarks for reports](#) ⁴⁰⁸².

Basic Report Settings

Setting	Description
Report Name	<p>Enter a meaningful name for the report. PRTG uses the name in reports lists ²⁸⁶ and as the title of generated reports.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ¹⁴⁵.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>
Report Template	<p>Select a template for the report from the dropdown list. The template defines the overall look of your report and in which detail the report shows monitoring data. PRTG includes several preconfigured report templates. You can choose templates from the following categories:</p> <ul style="list-style-type: none"> ▪ Graph with data table (data files available): Create a report with graphs and data tables. Choose from different intervals. Reports that use one of these templates also generate .csv and .xml files if you enable the respective setting in the Data Files section. ▪ Data table only (data files available): Create a report with data tables. Choose from different intervals. Reports that use one of these templates also generate .csv and .xml files if you enable the respective setting in the Data Files section. ▪ Graph only (data files not available): Create a report with graphs. Choose from different intervals. Reports that use one of these templates cannot generate .csv or .xml files. ▪ List of sensors (data files not available): Create a report in a compact sensor list style. The list is available with and without graphs. Reports that use one of these templates cannot generate .csv or .xml files. ▪ Top 100 highest and lowest (data files not available): Create a report with up to 100 objects with the highest and lowest average values. Choose from different intervals. Reports that use one of these templates cannot generate .csv or .xml files.

Setting	Description
	<ul style="list-style-type: none"> ▪ Top 10 uptime and downtime (data files not available): Create a report with up to 10 objects with the highest uptime and downtime for each object. You can choose between data in percent and hours. Reports that use one of these templates cannot generate .csv or .xml files. ▪ Top 100 uptime and downtime (data files not available): Create a report with up to 100 objects with the highest uptime and downtime for each object. You can choose between data in percent and hours. Reports that use one of these templates cannot generate .csv or .xml files. <p>i PRTG automatically averages⁴⁰⁷³ monitoring data within an interval.</p>
Security Context	<p>Define the security context that the report uses for access to monitoring data. Select a user account from the dropdown list to define which objects are visible in the report. The report only contains objects that the selected user has the rights¹⁵³ to view. By default, the security context is the user account that creates the report.</p> <p>i Basically, the security context defines the minimum access rights to objects like libraries, reports, or maps, that a user account has. If the security context of an object is PRTG System Administrator, for example, every user sees all objects in a library, in a report, or on a map, no matter what the particular user access rights are.</p>
Time Zone	<p>Select a time zone from the dropdown list. PRTG uses this time zone for all date-specific settings in the report.</p>
Page Format	<p>Define the page size in which PRTG creates PDF files.</p> <ul style="list-style-type: none"> ▪ None: Do not specify a page format. PRTG automatically sets a size. ▪ DIN A4: Use the German DIN A4 format. ▪ DIN A3: Use the DIN A3 format. ▪ DIN A2: Use the DIN A2 format. ▪ Legal: Use the North American legal page format. ▪ Letter: Use the North American letter page format. ▪ Ledger: Use the North American ledger page format.
Page Orientation	<p>Define the page orientation for the data in PDF reports:</p> <ul style="list-style-type: none"> ▪ Portrait: Use the portrait orientation. ▪ Landscape: Use the landscape orientation to show data tables of sensors with many channels. Other parts of the report remain in the portrait orientation and do not resize to the landscape orientation.

Included Sensors

Setting	Description
Cluster Node	<p>This setting is only visible if you run PRTG in a cluster¹³⁵. Select the cluster node from which the report takes monitoring data from the dropdown list. The available options are specific to your configuration.</p> <p>By default, the master node is set. Select All cluster nodes to create a report that includes data from all of your cluster nodes.</p> <ul style="list-style-type: none"> i A report for all cluster nodes only includes data for the primary channels. Be careful with big reports for all cluster nodes because the report generation might significantly slow down your monitoring. i If you select a failover node, report and data files do not show data from the local probe or from a remote probe and might be empty or show 0 values. i You can generate .csv and .xml data files only for a single failover node. If you select the option All cluster nodes, the report does not create data files.
Sensors by Tag	<p>Select the sensors that you want to include in the report by tag. Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited¹⁴⁵. The report covers all sensors that have at least one of the tags. You can also leave the field empty.</p> <p>You can also use the plus sign (+) or the minus sign (-) to categorize tags as must have or must not have, for example, +snmp -wmi (must have the tag snmp and must not have the tag wmi).</p> <ul style="list-style-type: none"> i For performance reasons, it can take some minutes until you can filter for new tags that you added. i The report automatically includes all channels of sensors that you add by tag, unless you run a cluster and select All cluster nodes in the Cluster Node setting above. i If you want to manually select the sensors to include in the report, save your settings and go to the Select Sensors Manually⁴⁰⁹² tab.
Filter Included Sensors by Tag	<p>Filter the included sensors further. Use this option, for example, if you manually add entire probes, groups, or devices to the report and do not want to include all sensors that have these objects as their parent objects. PRTG then only includes the sensors in the report that have at least one of the tags that you enter here.</p> <p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited¹⁴⁵. You can also leave the field empty.</p>

Setting	Description
	<p>You can also use the plus sign (+) or the minus sign (-) to categorize tags as must have or must not have, for example, +snmp -wmi (must have the tag snmp and must not have the tag wmi).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Report Schedule

Setting	Description
Schedule	<p>Define the time at which you want to automatically run the report:</p> <ul style="list-style-type: none"> ▪ No schedule: Only use the options on the Run Now tab to manually start the report generation. ▪ Every full hour: Run the report every 60 minutes. ▪ Every day at a specific hour: Run the report every 24 hours. Specify the exact time below. ▪ Every specific day of the week: Run the report every 7 days. Specify the exact time below. ▪ Every specific day of the month: Run the report on a specific day every month. Specify the exact time below. ▪ First day after the quarter: Run the report on the first day after the end of the quarter. This means, for example, on April 1st for the first quarter of the year (January 1st - March 31st). ▪ Every specific date: Run the report on a specific date every year. Specify the exact date below.
Specific Hour	<p>This setting is only visible if you select Every day at a specific hour above. From the list, select the hour at which you want to run the report.</p>
Specific Day	<p>This setting is only visible if you select Every specific day of the week above. From the list, select a day of the week or a day of the month for which you want to run the report.</p> <p>i If you select Last, the report always runs on the last day of the month, regardless of how many days the month has. If you select a date that does not exist in every month, for example, 30th, PRTG automatically runs the report on the last day of the month.</p>
Specific Date	<p>This setting is only visible if you select Every specific date above. Enter a valid date in the format DD.MM., for example, 31.12. The report runs on this date every year.</p>

Setting	Description
Report Handling	<p>This setting is only visible if you select one of the schedule options above. Define what you want to do with a finished report:</p> <ul style="list-style-type: none"> ▪ Store report and send it by email: Create a .pdf file and, depending on the Data Files setting, create data files of the report, store the files, and send them via email to the email address that you define below. You can find the stored report files on the Stored Reports tab. ▪ Store report: Create a .pdf file and, depending on the Data Files ⁴⁰⁹¹ setting, create data files of the report and store it. You find the stored report files on the Stored Reports tab. You also receive a ToDo ticket. By default, PRTG sends out a notification email to administrators in this case. ▪ Send report by email: Create a .pdf file and, depending on the Data Files setting, create data files of the report and send them via email to the email address that you define below. PRTG does not permanently store the report files. <ul style="list-style-type: none"> ❗ PRTG only generates .csv and .xml data files for report templates that include data tables. ❗ To create .pdf files, make sure that the print spooler service runs on the PRTG core server system. ❗ Some special characters, for example, 4-byte unicode characters, might not be displayed correctly in PDF reports. As a workaround, we recommend that you generate an HTML report and save it as a .pdf file.
Target Email Address	<p>This setting is only visible if you select one of the email options above. Enter one or more valid email addresses to which PRTG sends the report. Use commas to separate email addresses.</p> <ul style="list-style-type: none"> ❗ PRTG sends an email to all recipients. All recipients appear in the To field of the email. ❗ You can change the configuration for outgoing emails in the Notification Delivery ⁴¹⁹⁴ settings.
Email to User Group	<p>This setting is only visible if you select one of the email options above. From the list, select a user group to which you send an email with the report. All members of this group receive the email. You can edit user groups in the User Groups ⁴²¹⁹ settings.</p> <ul style="list-style-type: none"> ❗ If you define both individual email addresses and select a user group, PRTG sends the report to the individual email addresses as well as to the members of the selected user group. ❗ PRTG sends an email to all recipients. All recipients appear in the To field of the email.
File Compression	<p>This setting is only visible if you select one of the email options above. Define if PRTG compresses the attached report files before it sends them:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ Disable (default): PRTG sends the report files by email in their original size. ▪ Enable: PRTG compresses the report files to a .zip file before they are sent by email.

Report Period

Setting	Description
Report Period Type	<p>Define the type of period for which you want to create the report:</p> <ul style="list-style-type: none"> ▪ Current period: Use monitoring data of the current period. ▪ Previous period: Use monitoring data of the previous period. <p>i This setting works in combination with the Period setting below. For example, Previous period means yesterday if you select the Day option.</p>
Period	<p>Define the period that the report covers:</p> <ul style="list-style-type: none"> ▪ Day ▪ Week ▪ Month ▪ Quarter of year ▪ Year
Day Period	<p>This setting is only visible if you select Day above. From the list, select the hours at which a day starts and ends. The default setting is 0:00-23:59.</p>
Week Period	<p>This setting is only visible if you select Week above. From the list, select the days of the week when the week starts and ends:</p> <ul style="list-style-type: none"> ▪ Monday-Sunday: A reported week starts on the Monday and ends on the Sunday of the week. ▪ [Day-Day]: A reported week starts on the [Day] of the week and ends on the [Day] of the following week.
Month Period	<p>This setting is only visible if you select Month above. From the list, select the days of the month when the month starts and ends:</p> <ul style="list-style-type: none"> ▪ first-last day: A reported month starts on the first day and ends on the last day of the month.

Setting	Description
	<ul style="list-style-type: none"> ▪ [15.-14.]: A reported month starts on the 15th of the month and ends on the 14th of the following month.
Year Period	<p>This setting is only visible if you select Year above. From the list, select when the year starts and ends:</p> <ul style="list-style-type: none"> ▪ 1/1-12/31: A reported year starts on January 1st and ends on December 31st. ▪ 7/1-6/30: A reported year starts on July 1st and ends on June 30th the following year.
Report Schedule	<p>From the list, select a specific time span for which you want to generate the report. The report only includes monitoring data for specific hours or weekdays within the defined period.</p> <p>Select None to include all available monitoring data in the report, or choose a schedule, for example Weekdays, to exclude all weekends from the report. The available schedules depend on your configuration.</p> <p> For more information, see section Schedules .</p>

Percentile Handling

Setting	Description
Percentile Results	<p>Define if you want to include an additional percentile calculation  of your data in the report:</p> <ul style="list-style-type: none"> ▪ Do not show percentiles: PRTG does not use a percentile formula to calculate your monitoring results. It only shows the standard values. ▪ Show percentiles: PRTG displays an overview table with the percentiles of each channel for the whole report period, and the percentiles of the primary channel in the table for each scanning interval. <p> Percentiles are not available for all report templates. If a template does not support percentiles, they do not show up in the report, even if you enable this setting.</p> <p> Percentiles are also not available for a cluster if you select All cluster nodes in the Cluster Node setting in section Included Sensors. Select a failover node to include percentiles.</p>
Percentile Type	<p>This setting is only visible if you enable Show percentiles above. Enter the percentile type that you want PRTG to use for the calculation. If you choose, for example, to calculate the 95th percentile, enter 95 here and 5% of peak values are discarded. Enter an integer value.</p>

Setting	Description
Percentile Averaging Interval	This setting is only visible if you enable Show percentiles above. Enter a value to define the averaging interval on which PRTG bases the percentile calculation. The default value is 300 seconds (5 minutes). This means that PRTG takes 5-minute averages as basic values for the percentile calculation. Enter an integer value.
Percentile Mode	This setting is only visible if you enable Show percentiles above. Select the mode for percentile calculation: <ul style="list-style-type: none"> ▪ Discrete: PRTG takes discrete values to calculate percentile results. ▪ Continuous: PRTG interpolates between discrete values and bases the calculation on interpolated values.

Data Files

Setting	Description
Files in CSV / XML Format	Define if you want to generate .csv and .xml files for data tables in the report in addition to the .pdf file: <ul style="list-style-type: none"> ▪ Do not include data files: PRTG does not generate .csv or .xml files for the report. It only creates a .pdf file. ▪ Include only .csv files: PRTG generates and stores .csv files in addition to the .pdf file. The data files are only generated if the report uses a report template that includes data tables. ▪ Include only .xml files: PRTG generates and stores .xml files in addition to the .pdf file. The data files are only generated if the report uses a report template that includes data tables. ▪ Include all data files: PRTG generates and stores .csv and .xml files in addition to the .pdf file. The data files are only generated if the report uses a report template that includes data tables. <p> If you run PRTG in a cluster, the report does not generate data files if you select All cluster nodes in the Cluster Node setting. Select a failover node to get data files.</p>

Report Comments

Setting	Description
Introductory Comment	Enter a custom text that the report displays at the top of the first page. Enter a string or leave the field empty.

Final Comment	Enter a custom text that the report displays below the last data table or graph on the last page. Enter a string or leave the field empty.
---------------	--

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ No access: Users in this user group cannot see or edit the object. The object does not show up in lists. ▪ Read access: Users in this user group can see the object and view its settings. ▪ Write access: Users in this user group can see the object and view and edit its settings. However, they cannot edit the object's access rights settings. ▪ Full access: Users in this user group can see the object, view and edit its settings, and edit its access rights settings. <p> You can create new user groups in the User Groups⁴²¹⁹ settings.</p>

 Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

Select Sensors Manually

Click the Select Sensors Manually tab to manually add sensors that you want to include in the report.

You see a split screen: On the left side, there is a list of objects that the report already contains, and on the right side, you see your device tree. You can add objects to the report via drag-and-drop.

 You can also add a report via the [context menu](#)²⁵⁹ of an object. In this case, the selected object is automatically included in the report.

Manual Selection of Sensors

You can take the following actions:

Action	Description
Add items	<p>From the device tree on the right side, drag objects and drop them onto the list on the left side. You can add entire probes, groups, devices, or single sensors. PRTG adds each dropped object as a new list item.</p> <p>i The objects you drop on the left side are always added to the end of the list, you cannot directly add objects in a different order.</p>
Select channels	<p>If you add a sensor to the selection, you can specify the channels that the report includes. By default, PRTG selects all channels. To exclude a channel from the report, disable the check box in front of a channel name.</p> <p>i If you run PRTG in a cluster, you can only choose between single channels if you select a specific Cluster Node in the report settings. If you select All cluster nodes, the report contains only the primary channel of each sensor.</p>
Change order	<p>You can change the order of list items on the left side via drag-and-drop. Click + in the upper-right corner of a selected object, drag it to the desired position, and drop it there.</p>
Remove	<p>To remove any objects from the report, click 🗑 next to the respective list item, or select several list items while holding down the Ctrl key, then click 🗑.</p>

i PRTG automatically saves your selection. There is no undo function.

i The final report includes both manually selected sensors and sensors selected by tag.

Sensors Selected by Tag

Click the Sensors Selected by Tag tab to view all sensors that you added to the report by tag in section Included Sensors of the report settings. This is for your information only, you cannot change sensors here.

To edit the sensor selection, go to the Settings tab of the report and change the tags that the report uses to include sensors. Additionally, you can also exclude sensors with specific tags there.

For sensors that you add by tag, PRTG automatically includes all channels in the report unless you use a cluster and select All cluster nodes in the Cluster Node setting of the report. In this case, the report only includes the [primary](#) channel of each sensor.

 The final report includes both manually selected sensors and sensors selected by tag.

Comments

On the Comments tab, you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

8.11 Maps

With the **Maps** feature, you can create dashboards with monitoring information in a customizable layout. You can also make live data overviews publicly available.

Example of a Map

In this section:

- [Introduction](#) ⁴⁰⁹⁵
- [Maps Menu](#) ⁴⁰⁹⁶
- [Maps List](#) ⁴⁰⁹⁶
- [Maps in the Home Menu](#) ⁴⁰⁹⁷
- [Working with Maps](#)

Introduction

There are a lot of different options for the implementation of maps. For example, you can use this feature to:

- Create network maps with status icons for each device.
- Create views of your network that can be shown on network operations center screens.
- Create network overviews that you can publish on the intranet for colleagues or the management.
- Create custom views of the most important sensors in your monitoring setup.
- Create Top 10 lists of the sensors of a specific group or device.

Map Technology

In technical terms, a map is a common HTML web page. A map can consist of the following elements:

- Map items including device icons, sensor status icons, graphs, data tables, sensor lists, connection lines, geographical maps, or custom HTML code.
- An optional background image in JPG, PNG, or GIF format, for example, your company logo or a graphical view of your network.

Preconfigured Map

PRTG provides the preconfigured map [Sample Dashboard](#) that you can also edit or delete. The map is only visible to administrators. Define a lower [priority](#) [253] for the map to not show it under Home in the [main menu bar](#) [278].

Maps Menu

Click Maps in the main menu bar to open an overview list of all maps. Hover over Maps to show other options.

Option	Description
All	Open the Maps list where you can view or add custom views of your network status and monitoring data.
Add Map	Open a dialog to create [4099] a new map.
Select Map	Hover over Select Map to show a list of your maps. Click a map to open it.

Maps List

In the All view, you see a list of all maps. Click the name of a map to view it. Enable the check box next to a map and use the quick action buttons to perform the following actions:

- Map Rotation (): [Rotate](#) [4119] between maps.
- Clone (): Create a [clone](#) [4010] of this map.
- Delete (): Delete this map.
- Settings (): Open the map's [settings](#) [4114].

Hover over  and select Add Map from the menu to add a new map.

You can also define the priority of a map. Maps with a 5-star priority (★★★★★) appear in the main menu bar under Home so that you can directly select them. PRTG can show up to 10 entries in the Home menu.

 For more information, see section [Maps in the Home Menu](#) [4097].

 See also sections [Working with Table Lists](#) [246] and [Multi-Edit](#) [4014].

Maps in the Home Menu

You can add any map to the Home menu in the main menu bar of the PRTG web interface. This way, you can gain quick access to your most important maps.

i If you open a map via the Home menu, it appears as a dashboard without the tabs that are available when you open a map via the Maps menu. Furthermore, in contrast to a map that you open via a URL, the map is embedded in the PRTG web interface with the global header area and page footer.

You can define whether a map appears in the Home menu via the priority setting. Every map with a 5-star priority (★★★★★) appears as a menu item under Home.

Add Map to Home Menu

1. Open the Maps overview via the main menu bar (1).
2. In the overview list, look for the map that you want to add to the Home menu (2).
3. In the Priority column, select ★★★★★ for the desired map (3).

The map appears in the Home menu (4). To immediately see the change, manually refresh the page with **F5**.

- i** You can include up to 10 map entries in the Home menu.
- i** PRTG provides a sample dashboard in the Home menu by default. You can remove the sample dashboard and other dashboards from the menu by changing their priority to ★★★★★ or lower.

Working with Maps

For detailed information on how to create and edit maps, and on how to make the maps available to other people, see the following sections:

8.11.1 Maps Step By Step

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

To create and review a map, take the following steps:

- [Step 1: Add a Map](#)  4099
- [Step 2: Add Map Items](#)  4101
- [Step 3: View and Share the Map](#)  4101
- [Create Advanced Maps](#)

Step 1: Add a Map

First, you need to create a new map:

1. Click Maps in the [main menu bar](#)  285 to show an overview list of all maps.
2. Hover over  and select Add Map from the menu to open the Add Map dialog.

Add Map Dialog

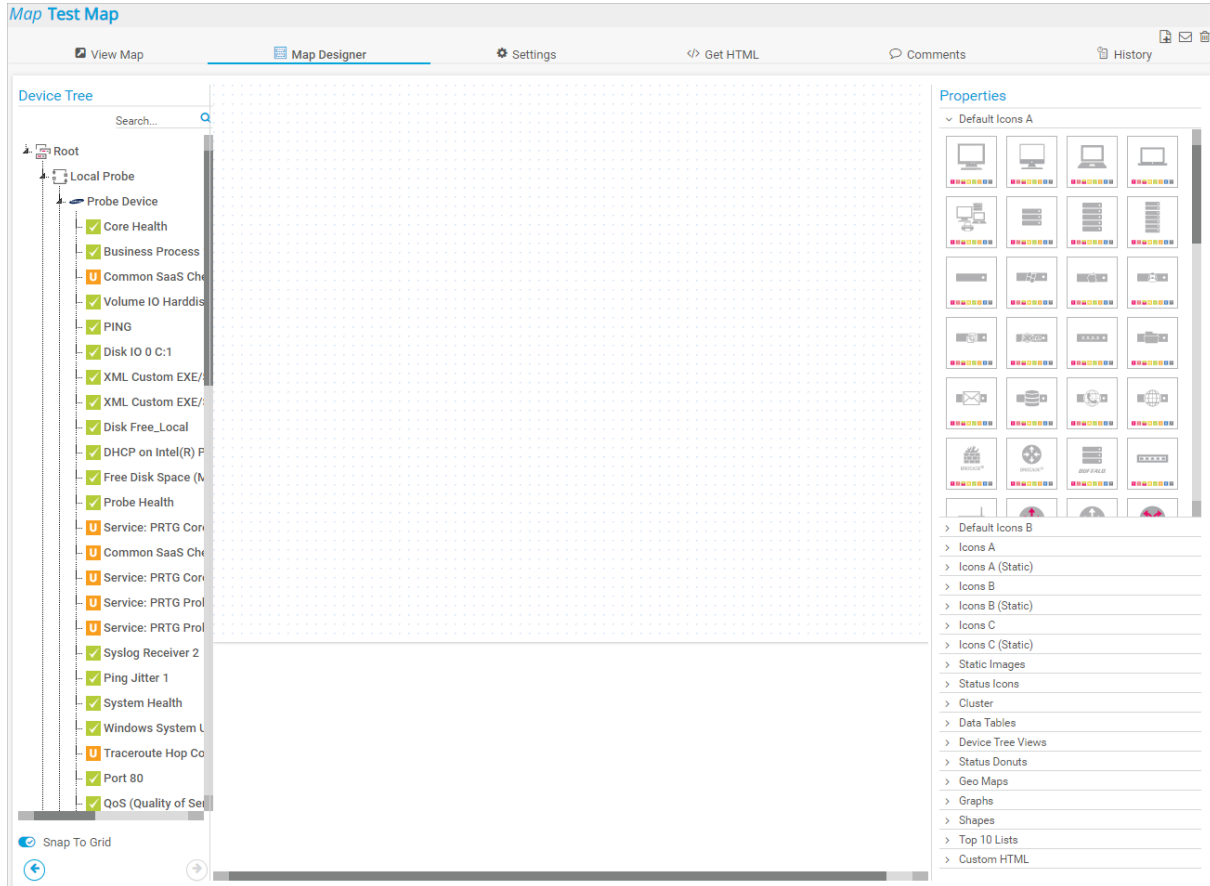

3. Enter a meaningful Map Name.
4. Enter the Map Width and the Map Height in pixels. Optionally, you can upload a background image.
5. In the Map Access section, define the accessibility to your map.
6. Click Create.

■ For more information, see section [Maps Settings](#)⁴¹¹⁴.

ⓘ When a user with administrative rights creates a new object, only other users with administrative rights can view or edit the new object by default. When a read/write user creates a new object, all members of the read/write user's primary group can view and edit the new object as well. This behavior applies to [libraries](#)⁴⁰⁴⁷, [maps](#)⁴⁰⁹⁵, [reports](#)⁴⁰⁶⁹, [notification templates](#)⁴¹³¹, and [schedules](#)⁴¹⁶⁹. For more information, see section [Access Rights Management](#)¹⁵⁵.

Step 2: Add Map Items

Because the new map is empty in the beginning, you need to add map items to fill the map with content.

Map Designer with Empty Map

1. When you create a new map, the Map Designer tab opens.
2. Select an object from the Device Tree section on the left.
3. Drag and drop an object from the Properties section on the right onto the map design area in the middle.
4. Select the new map item to edit its attributes in the Properties section.
5. Click Save.
6. Repeat this procedure as often as you wish until you added all desired items to the map.
7. Drag items to change their position. You can also draw connection lines between items.

For more information, see section [Map Designer](#) ⁴¹⁰³.

Step 3: View and Share the Map

You can always preview your map:

1. Click the View Map tab to show your map.

2. Click different object names to get more detailed information.
 It depends on the access rights of an object and the logged in user account if a user can get more detailed information about the object or if they get an error message that indicates insufficient access rights.
Map items of the type Data Tables also behave differently depending on the defined security context and the logged in user account.
3. Click the Get HTML tab to get a direct URL of your map that you can share with others.
4. You can also [add your map as a dashboard](#)  to the Home menu of the PRTG web interface.
5. You can change the interval until a new map appears. Hover over  in the lower-right corner and choose from 10s, 30s, 60s (seconds), 10m (minutes), and Refresh (now).

Create Advanced Maps

Maps provide the possibility to publish data from various sources. You can always use the default map items, or you can create completely customized maps in any design.

 For more information, see [More](#)  below.

8.11.2 Map Designer

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

With the [Map Designer](#) feature, you can create custom web pages as maps, or dashboards, that represent your network.

In this section:

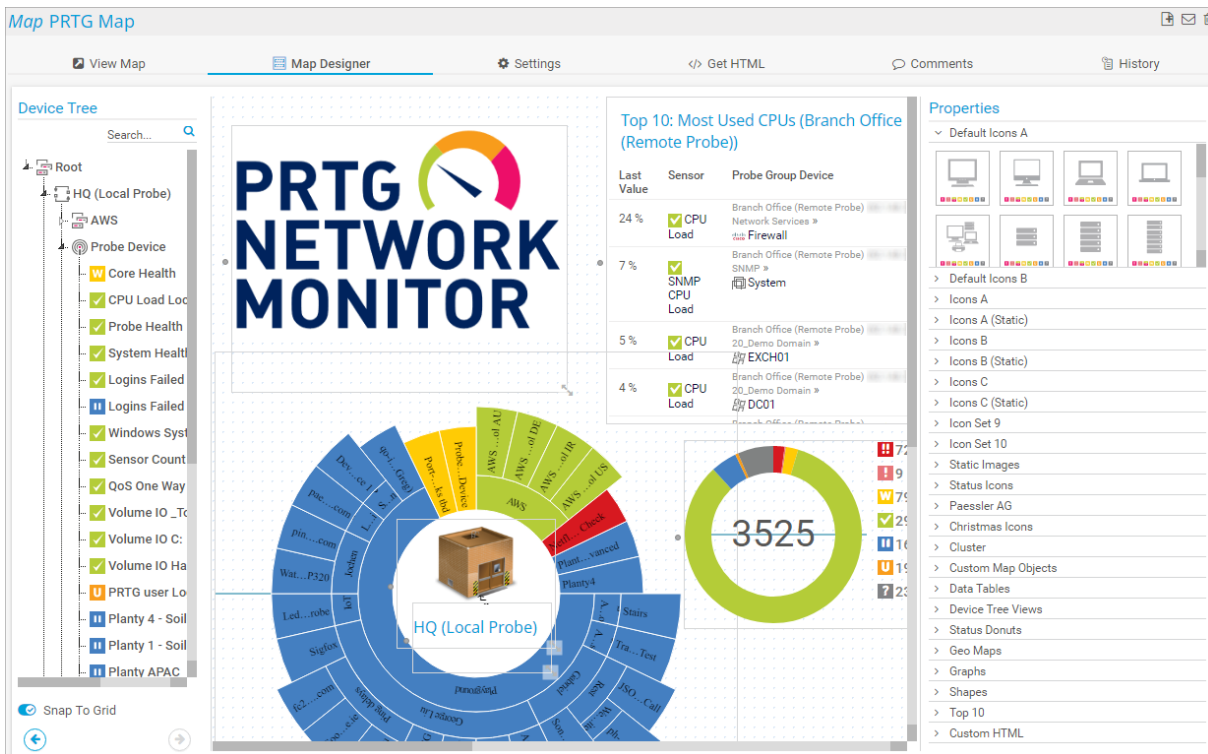

- [Browser Compatibility](#)  4103
- [Basic Design Concept](#)  4103
- [Device Tree Section](#)  4104
- [Properties Section](#)  4106
- [Properties Object Types](#)  4107
- [Edit Map Items](#)  4109
- [Draw Connection Lines Between Items](#)  4112
- [Snap To Grid](#)  4113
- [Undo and Redo](#)  4113
- [More](#)

Browser Compatibility

Because of the map designer's extensive scripting capability, it is important that you use a compatible browser when you edit maps. We recommend that you use Google Chrome 72. You can also use Mozilla Firefox 65 or Microsoft Internet Explorer 11. The map designer is **not** fully compatible with earlier versions of Internet Explorer, or Opera browsers.

Basic Design Concept

Click the Map Designer tab to open the map editor. It might take a few moments to load. Here, you can add or change map items to create your individual map.

Map Designer General Layout

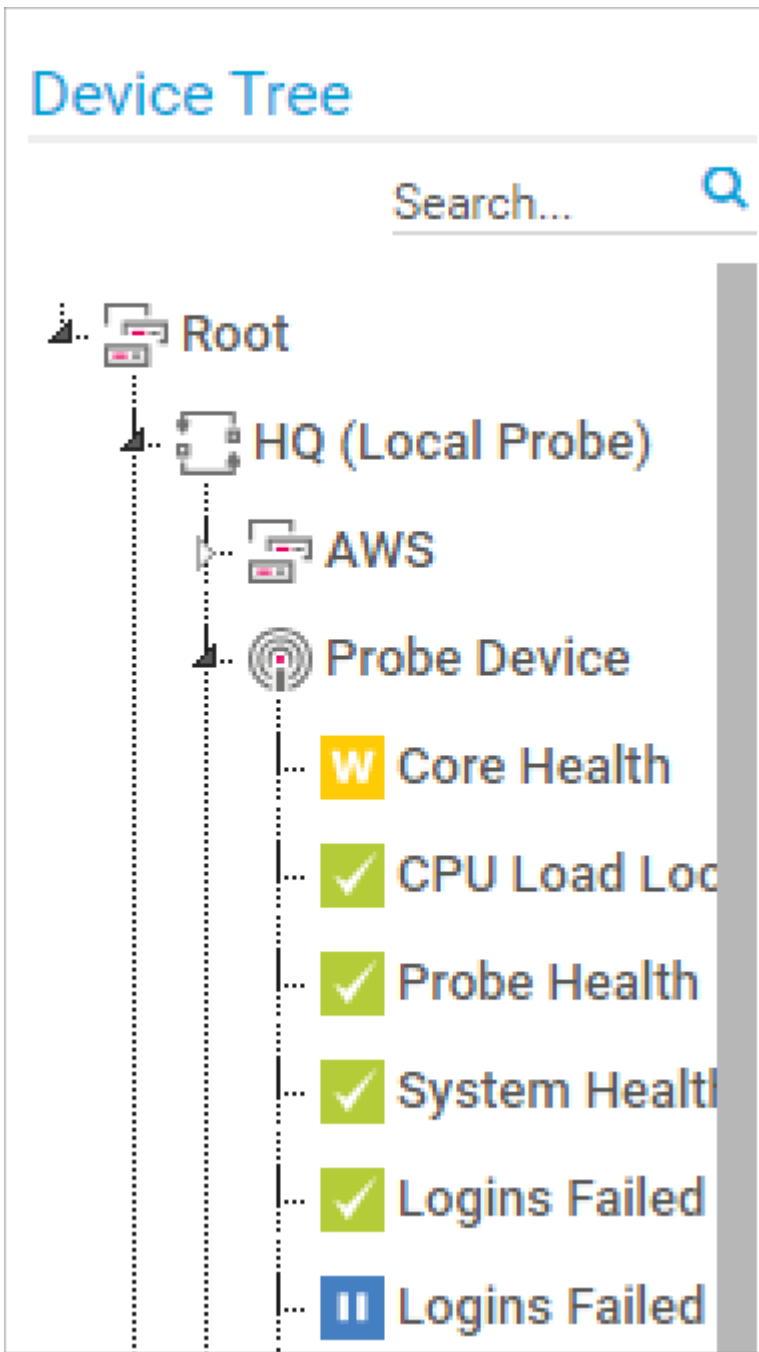

The map designer consists of three main sections:

- The Device Tree section on the left side. Here you can select the object whose data you want to show on the map.
- The map design area in the middle that has the size in pixels that you specified in the [map settings](#) ⁴¹¹⁵.
- The Properties section on the right side. Here you can define how a map item is displayed, for example, as an icon or a data table.

Drag and drop any object from either side onto the map, or double-click an object. You always see all changes immediately.

Device Tree Section

Use the Device Tree section to select the object whose data you want to show on the map. This can be a probe, a group, a device, or a single sensor.

Device Tree Section in the Map Designer

You can take the following actions:

Actions	Description
Find an object	<p>To find the desired object, you have the following options:</p> <ul style="list-style-type: none"> Click ► at the beginning of a line to expand objects in the device tree and show objects below probes, groups, and devices. Click ▲ to collapse the object again.

Actions	Description
	<ul style="list-style-type: none">▪ Enter a few characters into the Search box to search for names or parts of names of objects in your configuration. You immediately get the search results. Click X to clear your search.
Drag-and-drop	<p>You can always drag any object from the device tree onto a free area of the map to create a new map item.</p> <p>If you drag the object onto an existing map item, the displayed device tree object is replaced while the property and size stay the same.</p>
Double-click	<p>Double-click an object in the device tree to add a new map item.</p> <p>If you select a map item and double-click an object in the device tree, the map designer replaces the map item.</p>
Change size	<p>You can adapt the size of the Device Tree section. Drag the right border to the left to make the section smaller. To enlarge the section, drag the right border to the right.</p>

Properties Section

Use the Properties section to define how to display the map item, for example, as an icon, a map, a table, or a graph. Select the appearance of a map item from different categories.

Properties
> Default Icons A
> Default Icons B
> Icons A
> Icons A (Static)
> Icons B
> Icons B (Static)
> Icons C
> Icons C (Static)
> Static Images
> Status Icons
> Cluster
> Data Tables
> Device Tree Views
> Status Donuts
> Geo Maps
> Graphs
> Shapes
> Top 10 Lists
> Custom HTML

Properties Section in the Map Designer

You can take the following actions:

- Hover over an object to get a live preview of it, if available.
 - Drag an object onto a free area of the map to create a new map item. If you drag the object onto an existing map item, the property is replaced while the device tree object attributes and size stay the same.
 - Double-click an object to add it to the map, or select an existing map item and double-click an object to replace the map item.
- ⓘ If a specific Properties object is not available for a selected Device Tree object, you see a corresponding note in the live preview of the Properties object.

Properties Object Types

Many different object types are available. Click one of the categories to show all available types.

Object Type	Description
Default Icons A, Default Icons B	Choose from various icons that represent typical network devices in the style of the PRTG web interface. Default icons from category A also display object data. You can see the object name and a sensor overview for the object. This indicates how many sensors show a specific status. For some sensors, a mini graph is shown as well.
Icons A, Icons B, Icons C	Choose from various icons that represent typical network devices. Icons from this category also display object data. You can see the object name and a sensor overview for the object. This indicates how many sensors show a specific status. For some sensors, a mini graph is shown as well.
Icons A (Static), Icons B (Static), Icons C (Static)	Choose from the same icons as in the category described above. Here, only the icon is displayed without additional object data.
Static Images	<p>Choose from various free or public domain geographical maps from different sources.</p> <ul style="list-style-type: none"> i Use the category Geo Maps if you want to show geographical maps that include monitoring locations. i The items in this category are independent from the selected objects in the device tree.
Status Icons	<p>Choose from various sensor status icons in different styles. You can see the object name and a sensor overview for the object. This indicates how many sensors show a specific status. For some sensors, a mini graph is shown as well. Additionally, you can add traffic lights or the QR code of an object to your map. A map item for an audible alert that plays a sound when the number of alarms of the monitored object is > 0 is also available.</p> <ul style="list-style-type: none"> i Your browser must support playing embedded sounds for the status icon that includes an audible alert. <ul style="list-style-type: none"> ■ For more information, see the Knowledge Base: Which audible notifications are available in PRTG? Can I change the default sound? ■ If you experience issues with audible notifications in Google Chrome, see the Knowledge Base: Why are audible alerts in public maps not working in Chrome?
Cluster	<p>These map items are only available if you run PRTG in a cluster¹³⁵. Choose between a map and a status table.</p> <ul style="list-style-type: none"> i The Map item does not scale automatically. You need to manually enlarge the item in the map design area. i If you do not have a cluster, you only see white boxes instead of map previews.

Object Type	Description
Data Tables	Choose from various table lists [246] that show sensors for the selected object. You can also choose from several lists that only show sensors in a specific status.
Device Tree Views	Choose from various device tree views [190], including gauges [201] for the selected object.
Status Donuts	Choose from various status donuts that either show all alarms or all sensor states for the selected object. These are the same status donuts that you see on the Welcome [174] page.
Geo Maps	<p>These map items are only available if you enable the Geo Maps [4026] feature and enter location information in the selected device tree object's settings. Choose between a globe and a geographical map.</p> <p>i If the Geo Maps feature is disabled, you only see white boxes instead of map previews.</p>
Graphs	Choose from various graph styles that differ in font size and detail. You can also select graphs that include a legend or sensor states.
Shapes	<p>Choose from various geometrical shapes.</p> <p>i The items in this category are independent from the selected objects in the device tree.</p>
Top 10 Lists	<p>Choose from various tables that show the top 10 sensors in specific categories like the highest bandwidth usage or the best availability.</p> <p>i The items in this category are independent from the selected objects in the device tree.</p>
Custom HTML	<p>Use this property, for example, to add custom text [4111], external images, or applets to your map.</p> <p>Drag the item to the map design area and select it to edit [4109] it. You can then copy your custom code into the HTML Before and HTML After fields.</p>

Edit Map Items

Properties Section

Click a map item to select it. You can then edit its attributes in the upper part of the Properties section.

Properties

Top:	Left:	Width:	Height:	Layer:
100	50	350	460	2

External Link: Select object

HTML Before:

HTML After:

Edit Map Items in the Properties Section

Property	Description
Top Left	<p>Enter position values to directly position the item on the map. Enter a positive integer value.</p> <p>i You can also use the mouse to move a map item.</p>
Width Height	<p>Enter size values to give the item a predefined size. Enter a positive integer value.</p> <p>i You can also use the mouse to resize a map item.</p>
Layer	<p>Enter a layer value that defines if an item appears in front of or behind a different item if the items overlap. The item with the higher value appears in front. Enter a positive integer value.</p> <p>i You can also use the context buttons of a map item to bring it an item to the front (⬆) or send it back one layer (⬇).</p>
External Link	<p>Enter the address of any web page. If you click the map item while you view the map, PRTG opens the web page in a browser window. Enter the full URL of an external website, for example, https://www.paessler.com, or the address of a subpage of your PRTG installation, for example, devices.htm.</p> <p>i To make a map interactive, you need to define a suitable public access setting for the map.</p>
HTML Before HTML After	<p>Enter custom HTML code to embed an object in the map. Any HTML code you enter in these fields is added before or after the map item and your HTML object is inserted into the map. For example, you can enter <code></code> to insert an image of a Paessler logo.</p>

i Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

Context Buttons

Hover over a map item to show its context buttons.

Edit Map Items via Context Buttons

Context Button	Description
Bring to front	Move this item one layer to the front. This is useful when you add several items to a map that overlap each other.
Send to back	Move the item one layer to the back. This is useful when you add several items to a map that overlap each other.
Delete	<p>Delete the item.</p> <ul style="list-style-type: none"> The item is immediately deleted without notice. You cannot undo this action. You can also select the item and press the Delete key on your keyboard.
Drop Connections	Delete all connection lines <small>4112</small> to the item.

Cursor Keys

Select a map item and use the cursor keys to move the item one pixel at a time. Hold down the [Shift](#) key in combination with the cursor keys to move the object 10 pixels at a time.

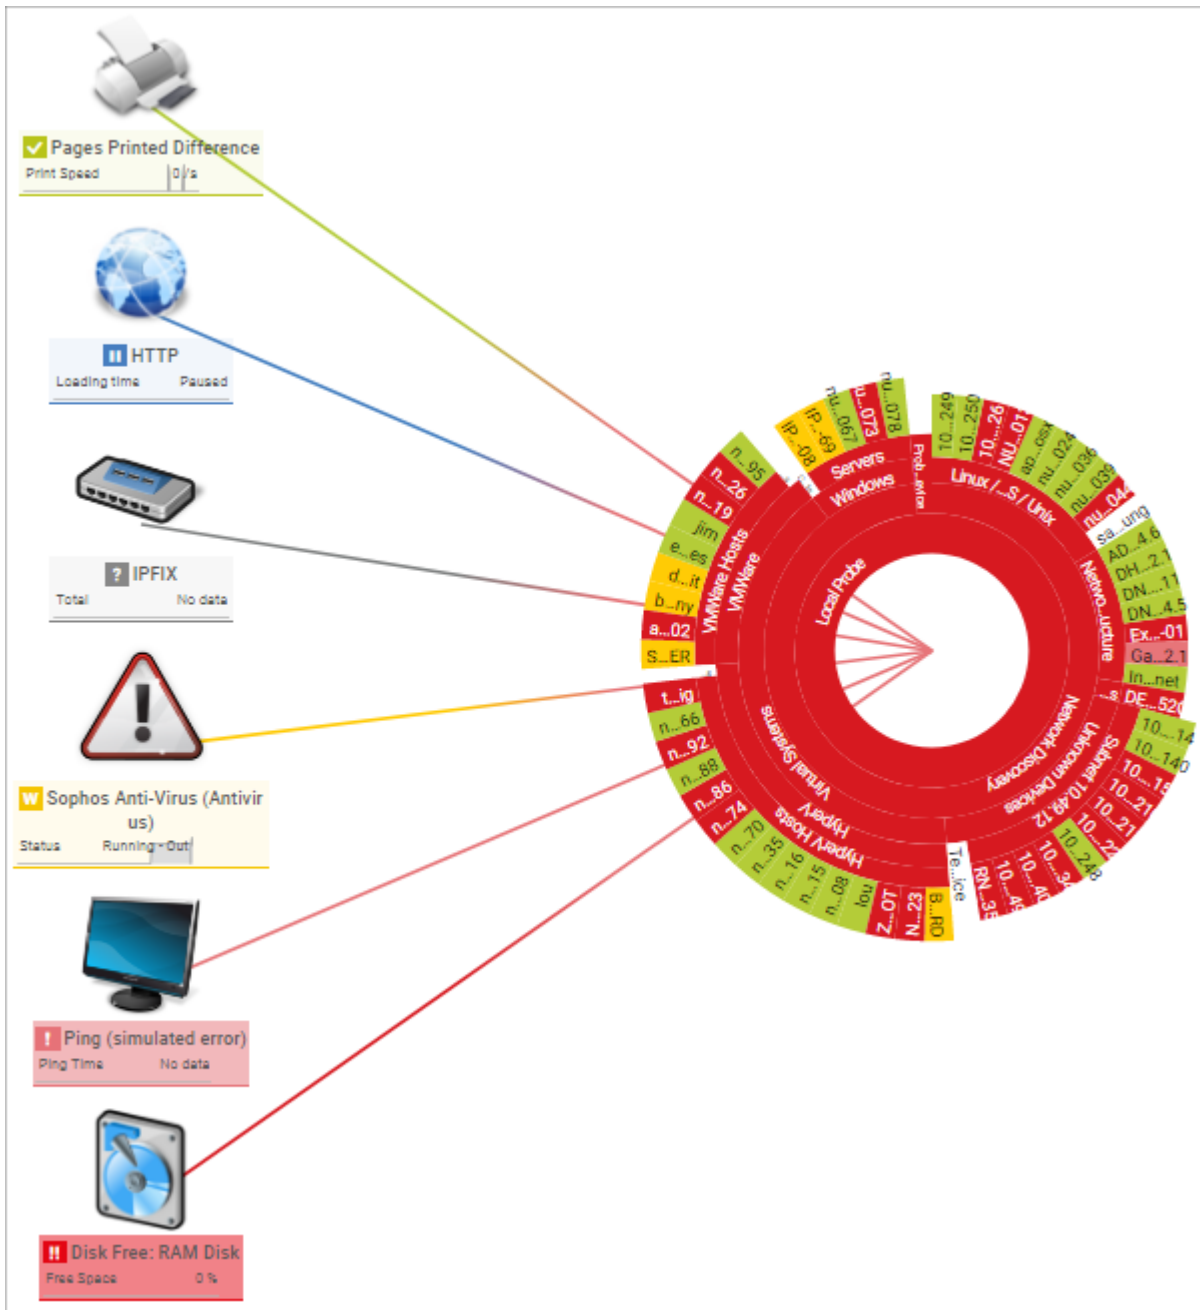

Add Custom Text

You can add custom text with individual styling to your map with the Custom HTML Element.

For more information, see the Knowledge Base: [How to add text to a map?](#)

Connection Lines between Map Items

You can draw connection lines between any map items via drag-and-drop to indicate, for example, network connections or a logical coherence between two items.

Map with Connection Lines

- Click the gray handle to the left of an item and drag it onto the item with which you want to create a connection to create a connection line.
- Hover over a connection line and click  to delete it.

 The map designer dynamically colors the lines between items depending on the [status](#)¹⁹⁷ of the linked objects. A line is red, for example, if the linked objects both show the Down status. Connection lines can also have two colors. For example, if one linked object shows the Down status and the second linked object shows the Warning status, one half of the line is red and the other half is yellow.

Snap to Grid

With the Snap To Grid setting, you can define how map items are positioned when you add or remove them via drag-and-drop.

Click  at the bottom of the Device Tree section to enable Snap To Grid so that you can only place items aligned with the grid. Click  to disable Snap To Grid to place map objects freely.

Undo and Redo

You can undo previous changes to the map and its items by clicking  (Ctrl+Z) at the bottom of the Device Tree section. To redo actions, click  (Ctrl+Y). You can undo and redo up to 50 changes when you work on a map. Because PRTG saves changes persistently in your configuration, you can even revert changes at a later point in time.

 Both buttons are only available if they can apply, otherwise they are grayed out.

8.11.3 Maps Settings

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Use the maps tabs to access all functionalities and settings of a map.

View Map

Click the View Map tab to show a preview of your map.

Map Designer

Click the Map Designer tab to edit the contents of your map.

■ For more information, see section [Map Designer](#) ⁴¹⁰³.

Settings

Click the Settings tab to open the general settings of a map.

i In the Add Map dialog, not all of these settings are available. You can change the settings later via the Settings tab.

Basic Map Settings

Setting	Description
Map Name	<p>Enter a meaningful name for the map.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ¹⁴⁵.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
Security Context and Color Mode	<p>Define the security context that the map uses for access to monitoring data. Select a user account from the dropdown list to define which objects are visible on the map. The map only contains objects that the selected user has the rights^[155] to view. By default, the security context is the user account that creates the map.</p> <p>i Basically, the security context defines the minimum access rights to objects like libraries, reports, or maps, that a user account has. If the security context of an object is PRTG System Administrator, for example, every user sees all objects in a library, in a report, or on a map, no matter what the particular user access rights are.</p> <p>i This setting also affects the color mode^[4127] of public maps^[4116]. PRTG takes the color mode setting of the security context user account.</p>
Time Zone	<p>Define the time zone that the map uses for all date-related settings. Select a time zone from the dropdown list.</p>
Filter by Tag	<p>This setting applies to table map objects. Enter one or more tags separated by a space or comma to include sensors in map data tables. Only sensors that have one of the specified tags appear in the tables, including sensors that inherit^[142] tags from parent objects. Enter a string or leave the field empty.</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>i For some map objects, for example for sunburst and treemap objects, the tag filter applies only to probes, groups, and devices. If you only enter tags of sensors, these map objects do not appear on the map. Filtering sunburst and treemap objects with multiple tags might not work properly and is not officially supported.</p> <p>i Use this setting with caution because it affects all tables of the map.</p>

Map Layout

Setting	Description
Map Width	Define the width of the map in pixels. Enter an integer value.
Map Height	Define the height of the map in pixels. Enter an integer value.
Automatic Scaling	Define if you want the map to automatically adapt to your screen size:

Setting	Description
	<ul style="list-style-type: none"> Scale map view to fit browser size: The size of the map automatically adapts to the size of your screen. We recommend that you use this option if you display the map on different screens with different resolutions. <ul style="list-style-type: none"> i This setting does not apply to the map designer. Do not automatically scale map view: The map always uses the specified width and height settings.
Background Image	<p>Define if you want to use a background image for the map:</p> <ul style="list-style-type: none"> Use a background image: Use a custom background image, for example, your company logo. Do not use a background image: Use a background that shows the color that you define in the Background Color setting.
Custom Image	<p>This setting is only visible if you select Use a background image above. Click Select File and select an image from your system or network.</p> <ul style="list-style-type: none"> i PRTG only supports images in JPG, PNG, and GIF format. The file size must be smaller than 20 MB.
Background Color	<p>Select a background color for this map. Either enter a hex color code or choose a color from the color selector. The hex color code field always displays the defined color.</p>

Map Access

Setting	Description
Public Access	<p>Define who can view the map:</p> <ul style="list-style-type: none"> No public access: Do not allow public access to the map. Users who want to view the map first need to log in to PRTG. They also need sufficient access rights to the map. Allow public access: Allow access to the map via a unique URL. The URL contains a secret key that you can change. The map is an interactive public map. Allow public access but disable all links except for Geo Maps: Allow access to the map via a unique URL. The URL contains a secret key that you can change. If you select this option, all links on the map are disabled so that you get a non-interactive public map. <ul style="list-style-type: none"> i It is not possible to disable the links in map objects that contain an embedded geographical map⁴⁰²⁶. As a workaround, place an empty, transparent square object over the Geo Map object and link it to an unrelated URL.

Setting	Description
Secret Key	<p>PRTG displays maps with public access in the color mode defined for the security context user account.</p> <p>This setting is only visible if you select a public access option above. The secret key is automatically generated. It is part of the public URL for the map. You can also enter a customized string.</p> <p>We recommend that you use the default value.</p> <p>For more information on public access, see section Get HTML.</p> <p>The characters comma (,) and colon (:) are not allowed in the secret key field.</p>

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> No access: Users in this user group cannot see or edit the object. The object does not show up in lists. Read access: Users in this user group can see the object and view its settings. Write access: Users in this user group can see the object and view and edit its settings. However, they cannot edit the object's access rights settings. Full access: Users in this user group can see the object, view and edit its settings, and edit its access rights settings. <p>You can create new user groups in the User Groups settings.</p>

Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

Get HTML

Your map is a standard HTML page. You can make it available to other people via a unique URL. Depending on the map's Public Access [setting](#), a visitor needs to provide login credentials for PRTG to view the map, or they immediately see the map.

You have different options to link to the map:

- Option 1: Link To The Map With Required Login
A user who wants to view the map via the shown URL first needs to log in to PRTG.
 In the URL, PRTG usually specifies the IP address under which the page is reachable. If a network address translation (NAT) is set in your firewall, or if you want to use a domain name or a name from a dynamic Domain Name System (DNS) service for public access, customize the URL according to your needs.
- Option 2: Link To The Map Without Login
People who want to view the map via the shown URL do not need login credentials. Allow public access to the map to make it available to the public.
 In the URL, PRTG usually specifies the IP address under which the page is reachable. If a NAT is set in your firewall, or if you want to use a domain name or a name from a dynamic DNS service for public access, customize the URL according to your needs.
- Option 3: Show the Map on Other Webpages via an Iframe
Here you can find the HTML code to embed an [iframe](#) in your web page. It includes a URL for direct access to the map. Allow public access to the map to make it available to the public.
 In the URL, PRTG usually specifies the IP address under which the page is reachable. If a NAT is set in your firewall, or if you want to use a domain name or a name from a dynamic DNS service for public access, customize the URL according to your needs.

Comments

On the Comments tab, you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

History

On the History tab, all changes in the settings of an object are logged with a time stamp, the name of the user who made the change, and a message. The history log retains the last 100 entries.

Delete

You can delete a map at any time. To do so, click  in the upper-right corner of the screen.

More

KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Maps

- [Maps Step by Step](#)  4099
- [Map Designer](#)  4103
- [Maps Settings](#)  4114
- [Map Rotation](#)  4119

8.11.4 Map Rotation

With the [Map Rotation](#) feature, you can rotate between several maps on one page. This is similar to a slide show.

Map Rotation Setup

To configure your custom map rotation, take the following steps:

Object	Security Context	Public Access	Priority	
Magic Map	PRTG System Administrator	No	★★★★☆	<input checked="" type="checkbox"/>
Map	PRTG System Administrator	No	★★★★☆	<input type="checkbox"/>
Map 1	PRTG System Administrator	Yes	★★★★☆	<input checked="" type="checkbox"/>
Map 2	PRTG System Administrator	No	★★★★★	<input type="checkbox"/>
Map 3	PRTG System Administrator	No	★★★★☆	<input checked="" type="checkbox"/>
Global Status	PRTG System Administrator	No	★★★★☆	<input type="checkbox"/>
My Map	PRTG System Administrator	No	★★★★☆	<input type="checkbox"/>
Sample Dashboard	PRTG System Administrator	No	★★★★☆	<input type="checkbox"/>

Map Rotation Setup

1. Open the Maps overview from the main menu bar.
2. Select the maps that you want to rotate by enabling the check box next to the respective maps. The [multi-edit](#) menu appears.
3. Click .
4. PRTG now rotates the selected maps on a new page in a specific interval.
5. You can change the interval until a new map appears. Hover over  in the lower-right corner and choose from 10s, 30s, 60s (seconds), 10m (minutes), and Refresh (now).

 To view the maps that you specified for the map rotation, you need login credentials for PRTG.

Public Map Rotation

You can also set up a [public](#) map rotation that you can use without login credentials. For this purpose, you have to create a custom URL that includes the map IDs and the maps' secret keys.

1. In the Public Access [settings](#) of all maps that you want to include in the map rotation, select Allow public access. The Secret Key setting appears.
2. Note the secret keys of all maps that you want to include in the map rotation.
3. Find the map IDs and note them as well. To find the ID of a map, open the map with your browser. The map ID is included in the URL of the map as the value of the parameter `id`. In the URL <https://<yourprtgserver>/map.htm?id=2124>, for example, the number 2124 is the needed ID.

4. Create the public map rotation URL. The complete URL has the following format:
`https://yourprtgserver/public/mapshow.htm?ids=mapid1:secretkey1,mapid2:secretkey2,mapid3:secretkey3.`
 Make sure that you connect each map ID and the respective secret key with a colon, and that you separate each `mapid:secretkey` token from the next `mapid:secretkey` token with a comma.

This is an example URL for the public rotation of two maps with the map IDs 9507 and 9358:
<https://prtg.example.com/public/mapshow.htm?ids=9507:4049BEA1-B89C-4B5D-ACC4-3C8E00566EB8,9358:718D3CE1-DF00-4B92-AE8A-E0253B912C37>

5. Open the URL in your browser to start the public map rotation.
6. You can change the interval until a new map appears. Hover over  in the lower-right corner and choose from 10s, 30s, 60s (seconds), 10m (minutes), and Refresh (now).

8.12.1 Account Settings

To open the account settings of the user, select Setup | Account Settings from the [main menu bar](#).
Select the various tabs to change the different settings.

You can define the following aspects of your account settings:

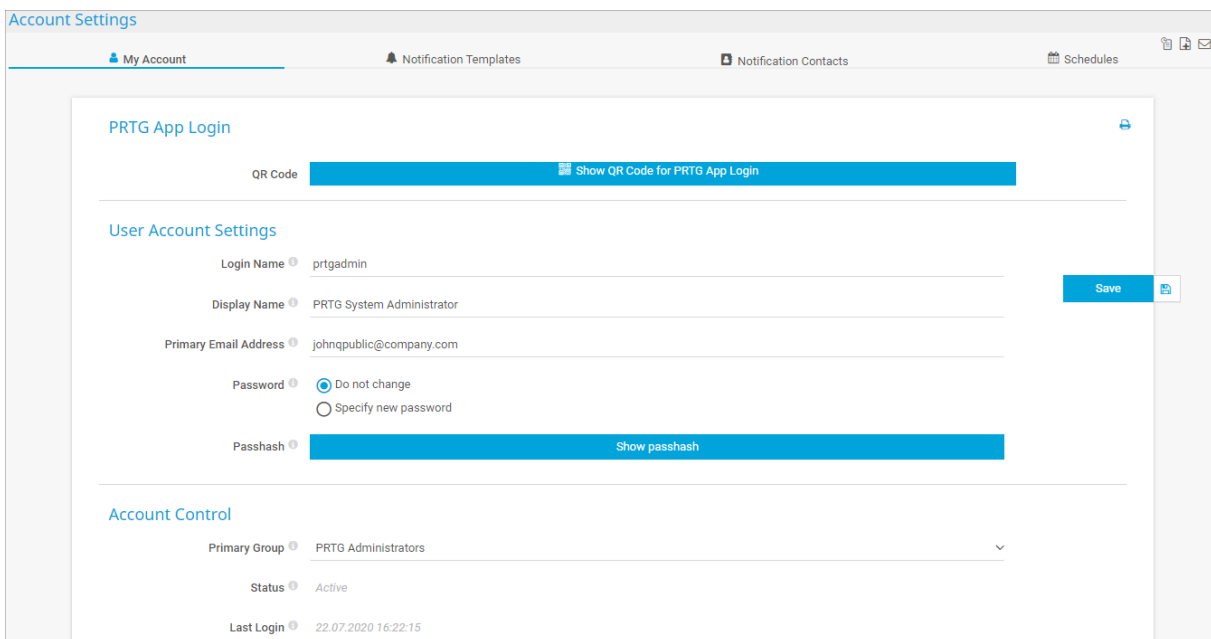

- [My Account](#)
- [Notification Templates](#)
- [Notification Contacts](#)
- [Schedules](#)

8.12.1.1 My Account

In the My Account settings, you can define and edit settings for the user account. All settings in this section are specific to the user account.

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

☁ If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

Web Interface

Setting	Description
Automatic Refresh	<p>Define if you want PRTG to automatically reload web pages in the PRTG web interface for the user:</p> <ul style="list-style-type: none"> Automatically refresh pages (recommended): PRTG automatically refreshes single page elements on web pages in the PRTG web interface. Do not automatically refresh pages: PRTG does not automatically refresh web pages in the PRTG web interface.
Refresh Interval (Sec.)	<p>This setting is only visible if you select Automatically refresh pages (recommended) above. Enter the number of seconds that PRTG waits between two refreshes. We recommend that you use 30 seconds or more. The minimum value is 20 seconds.</p> <p>i Shorter refresh intervals create more CPU load on the probe system. If you experience load issues while using the PRTG web interface (or maps), set a longer refresh interval.</p>
Audible Alarms	<p>Define whether PRTG plays an audible alarm on web pages in the PRTG web interface when there is a new alarm:</p> <ul style="list-style-type: none"> Do not play audible alarms: PRTG does not play sound files on any web pages. Play audible alarms on dashboard pages only: When there is a new alarm, PRTG plays a predefined sound on dashboard pages only. The sound is played with every refresh of the dashboard page if there is at least one new alarm. Play audible alarms on all pages: When there is a new alarm, PRTG plays a predefined sound on all web pages. PRTG plays the sound with every page refresh if there is at least one new alarm. <p>i PRTG only plays audible alarms if the New Alarms value in the global header area of the PRTG web interface is greater than 0 after a page refresh. PRTG does not consider the number of old alarms.</p> <p>■ For more information, see the Knowledge Base: Which audible notifications are available in PRTG? Can I change the default sound? and Why are audible alerts in public maps not working in Chrome?</p>
Home Page URL	<p>Define the user's default home page in the PRTG web interface. This is the page that the user sees after logging in or when selecting Home from the main menu. Enter a PRTG-internal web page.</p>
Time Zone	<p>Define the time zone for the user account. Depending on the time zone that you select, PRTG shows the local time zone of the user account in all data tables and graph legends.</p> <p>i PRTG receives the Coordinated Universal Time (UTC) from the system time of the PRTG core server for this purpose.</p>

Setting	Description
	<p> If you get a warning message about differing time zones, see the Knowledge Base: Why do I get a warning message when time zones differ?</p>
Date Format	<p>Select the date format for the user from the dropdown menu:</p> <ul style="list-style-type: none"> ▪ Use System Settings: Use the date format of the PRTG core server system. ▪ DD.MM.YYYY HH:MM:SS (24h) ▪ DD.MM.YYYY HH:MM:SS (A.M./P.M.) ▪ MM/DD/YYYY HH:MM:SS (24h) ▪ MM/DD/YYYY HH:MM:SS (A.M./P.M.) ▪ YYYY-MM-DD HH:MM:SS (24h) ▪ YYYY-MM-DD HH:MM:SS (A.M./P.M.) <p> This setting takes effect after the next login.</p>
Color Mode	<p>Select a color mode for the PRTG web interface:</p> <ul style="list-style-type: none"> ▪ Light ▪ Dark

Ticket System

Ticket System

Email Notifications 
 Receive an email when a ticket changes
 Do not receive any emails from the ticket system

Ticket System

Setting	Description
Email Notifications	<p>Define if the user receives emails from the ticket system:</p> <ul style="list-style-type: none"> ▪ Receive an email when a ticket changes: The user receives an email each time a ticket is assigned to the user or to the user group they are a member of, or if a ticket is changed. <ul style="list-style-type: none">  If the user edits tickets that are assigned to them or the user group they are a member of, or if they assign a ticket to themselves or their user group, they do not get an email. ▪ Do not receive any emails from the ticket system: The user does not receive any emails from the ticket system.

 Save your settings. If you leave the page, all changes to the settings are lost.

- [Overview](#) 
- [Notification Template Settings](#) 
- [Basic Settings](#) 
- [Notification Summarization](#) 
- [Access Rights](#) 
- [Notification Methods](#) 

Note

You have to take the following four steps to set up and use notifications:

1. Check and set up the [notification delivery](#)  settings if you use PRTG on premises. These settings define how PRTG sends messages.
2. Check and set up [notification contacts](#)  for the user accounts. These contacts define the recipients to which PRTG sends notifications.
3. Check and set up several [notification templates](#) . These templates define the notification methods and their content.
 -  You can also check or edit notification templates via the Notification Triggers tab. For more information, see section [Notification Triggers Settings](#) .
4. Check and set up [notification triggers settings](#)  for objects. These triggers define when PRTG sends notifications.

 Usually, there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always set up at least two notifications with different notification methods for a notification trigger, for example, one email notification and one SMS notification. If delivery via email fails, PRTG can still notify you via smartphone as a fallback. For example, use the latency setting of a [state trigger](#)  to choose a notification with a different notification method than in the first trigger condition, or set up a second trigger with a different notification method for the corresponding object.

 See sections [Notifications Based on Sensor Limits Step by Step](#)  and [Notifications Based on Libraries Step by Step](#)  for step-by-step guides that describe potential notification setups.

 Custom notification scripts are also available in the [PRTG Sensor Hub](#).

Overview

Click the Notification Templates tab to show a list of all notification templates, what actions they perform, and their status (active or paused). To edit a notification template, enable the check box next to the notification template and choose from the following options.

Option	Description
Send test notification ()	Triggers the notification immediately for testing purposes.  When you test notifications, PRTG does not resolve the placeholders, but rather sends the original variables instead.

Option	Description
Used by 	Show all objects that trigger the notification.
Pause 	Pauses the notification. ⓘ If you manually pause ²⁵⁶ a notification, PRTG does not send messages when this notification is triggered.
Resume 	Resumes the notification.
Clone 	Creates a clone of the notification.
Delete 	Deletes the notification. ⓘ You cannot delete predefined notifications.
Settings 	Opens the settings ⁴¹³³ of a notification template.

ⓘ You can also use the quick action buttons Send test notification () , Used by () , Pause () or Resume () next to the status of a notification template.

■ See also sections [Working with Table Lists](#) ²⁴⁶ and [Multi-Edit](#) ⁴⁰¹⁴.

Notification Template Settings

Hover over  and select Add Notification Template from the menu to add a new notification template. You can also click the name of a notification template to edit it.

ⓘ When a user with administrative rights creates a new object, only other users with administrative rights can view or edit the new object by default. When a read/write user creates a new object, all members of the read/write user's primary group can view and edit the new object as well. This behavior applies to [libraries](#) ⁴⁰⁴⁷, [maps](#) ⁴⁰⁹⁵, [reports](#) ⁴⁰⁶⁹, [notification templates](#) ⁴¹³¹, and [schedules](#) ⁴¹⁶⁹. For more information, see section [Access Rights Management](#) ¹⁵⁵.

- Send first DOWN message ASAP, then summarize
- Send first DOWN and UP message ASAP, then summarize
- Send all DOWN messages ASAP, summarize the others
- Send all DOWN and UP messages ASAP, summarize the others
- Always summarize messages, regardless of type

Subject for Summarized Email or SNS Messages **i** [%sitename] %summarycount Summarized Notifications

Time Span for Summarizing Messages (in Minutes) **i** 1

Notification Summarization

Setting	Description
Method	<p>Define if and how PRTG collects and summarizes several notifications into one or more messages with a maximum of 1,000 characters. Choose from:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ Always notify ASAP, never summarize: PRTG always sends out one notification for each notification trigger that it receives as soon as possible, for example, immediately. ▪ Send first DOWN message ASAP, then summarize: When PRTG receives several DOWN triggers, it sends the first notification immediately, then it continues to summarize notification triggers into one message, regardless of the sensor status. ▪ Send first DOWN and UP message ASAP, then summarize: When PRTG receives several DOWN or UP triggers, it sends each first notification immediately, then it continues to summarize notification triggers into one message, regardless of the sensor status. ▪ Send all DOWN messages ASAP, summarize the others: When PRTG receives several DOWN triggers, it sends out one notification for each trigger that it receives, but it summarizes notifications for all non-DOWN triggers into one message. ▪ Send all DOWN and UP messages ASAP, summarize the others: When PRTG receives several DOWN or UP triggers, it sends out one notification for each trigger that it receives, but it summarizes the notifications for all non-DOWN and non-UP triggers into one message. ▪ Always summarize notifications, regardless of type: When PRTG receives several notification triggers, it summarizes the notifications, regardless of the kind of trigger that it receives. <ul style="list-style-type: none"> ⓘ The maximum number of notifications (see below) still applies. ⓘ Regardless of the option that you choose, PRTG never summarizes notifications of the types Send Slack Message, Send Microsoft Teams Message, Execute HTTP Action, Execute Program, and Assign Ticket because it always sends them immediately. PRTG can summarize the messages of all other notification types. ⓘ 'first DOWN' and 'first UP' messages refer to the trigger condition and the clear condition respectively. You can also define 'WARNING' or 'UNUSUAL' states as trigger conditions or even thresholds or other triggers notification summarizations. The condition clear triggers, if applicable, are defined in the respective trigger conditions as well. The triggers all qualify as "first DOWN" or "first UP" messages. ⓘ PRTG collects up to 25 single notifications for one summarization and sends out the message as soon as this number is reached (or when the gathering time passes). If PRTG receives more than 25 notifications within the defined time span, you receive more than one message with up to 25 entries each. For example, if PRTG collects 74 notifications, this results in 3 summarized messages with 25, 25, and 24 collected notifications.
Subject for Summarized Email or SNS Messages	Define a subject that PRTG includes when it sends summarized notifications. The default subject is <code>[%sitename%] %summarycount Summarized Notifications</code> .

Setting	Description
	<p>i PRTG only uses the subject for the notification methods Send Email and Send Amazon Simple Notification Service Message.</p> <p>■ You can use placeholders. For more information, see section List of Placeholders for Notifications ⁴⁶⁶².</p>
Time Span for Summarizing Messages (in Minutes)	<p>Define a time span in minutes to define how long PRTG collects notifications for summarization. Enter an integer value.</p> <p>i If you enter a long time span, for example, 60 minutes, PRTG collects notifications for one hour before it sends them out summarized unless other features (see above) require an earlier message dispatch.</p>

Access Rights

Access Rights	
User Group Access ⁱ	Rights
User Group	
RO User Group	No access
PRTG Users Group	No access

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the notification template. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ No access: Users in this user group cannot see or edit the notification template. The object does not show up in lists. ▪ Read access: Users in this user group can see the notification template and view its settings. ▪ Write access: Users in this user group can see the notification template and view and edit its settings. However, they cannot edit its access rights settings. ▪ Full access: Users in this user group can see the notification template, view and edit its settings, and edit its access rights settings. <p>i You can create new user groups in the User Groups ⁴²¹⁹ settings.</p>

Notification Methods

With the following settings, you can add one or more methods for how PRTG sends out a notification message. You can choose one method or combine several methods. Whenever the notification is triggered, PRTG sends out messages or performs actions for all configured methods at once.

To select a notification method, click  in front of it. You can then see and set the options as described in this section. The following notification methods are available.

 Some notification types are only available for PRTG on premises (marked with ). You cannot use these on PRTG Hosted Monitor instances.

HTTP Version
 HTTP 1.1 (default)
 HTTP 1.0

Send SMS/Pager Message

Setting	Description
Send to User	Select a user account from the dropdown list. PRTG sends the SMS/pager message to every SMS notification contact ⁴¹⁶⁵ for the user account. Leave None to not use this option.
Send to User Group	Select a user group from the dropdown list. PRTG sends the SMS/pager message to every SMS notification contact for every member of the user group ⁴²¹⁹ . Leave None to not use this option. If you select a user group and a specific member of this user group as recipients at the same time, this user receives the SMS/pager message only once. This also applies if you enter an individual phone number below that is already defined as an SMS notification contact for the selected user.
Send to Phone Number	Enter a phone number to send the SMS/pager message to. If you enter more than one phone number, use commas as separators. The format depends on the SMS provider. Usually, you use a plus sign (+), followed by the country code and the number. For example, +1555012345 . Make sure that the number format meets the requirements of the SMS provider or the hardware that you use in combination with an application programming interface (API) call. Sometimes, a plus sign is not required. The wrong format might result in undelivered messages. We recommend that you use Send to User and/or Send to User Group instead because you can then manage the notification contacts of users.
Message	Define the SMS/pager message. The default message is [%sitename] %device %name %status %down (%message) . To reset this field to the default value, enter only an asterisk (*). You can use placeholders. For more information, see section List of Placeholders for Notifications ⁴⁶⁶² .

Setting	Description
HTTP Version	<p>Define the HTTP version that PRTG uses to send the SMS/pager message:</p> <ul style="list-style-type: none"> ▪ HTTP 1.1 (default): Use HTTP version 1.1. ▪ HTTP 1.0: Use HTTP version 1.0.

Execute HTTP Action://

i Regardless of the Notification Summarization method that you use, PRTG always sends notifications of the type Execute HTTP Action as soon as possible (ASAP). PRTG never summarizes them.

■ This notification method uses the central proxy settings that you define for the PRTG core server. For more information, see section [Core & Probes](#)⁴²⁰³ (section Proxy Configuration).

■ For more details, see section [Custom Notifications](#)⁴⁴⁵². You can find ready-to-use custom notifications in the [PRTG Sensor Hub](#), see [below](#)⁴¹⁶¹.

Execute HTTP Action

URL **i** www.example.com

SNI Handling **i**

Do not send SNI (default)
 Send SNI

HTTP Method **i**

GET
 POST
 PUT
 PATCH

Execute HTTP Action

Setting	Description
URL	<p>Enter the URL that PRTG sends the request to.</p> <p>i HTTP notifications work with or without Secure Sockets Layer (SSL).</p> <p>■ You can use placeholders. For more information, see section List of Placeholders for Notifications⁴⁰⁶².</p>
SNI Handling	<p>Define if PRTG sends the Server Name Identification (SNI) extension to the Transport Layer Security (TLS) protocol along with the HTTP request:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ Do not send SNI (default): PRTG does not send the SNI when it executes the HTTP action. ▪ Send SNI: PRTG sends the SNI when it calls the target URL. Specify the SNI below.
SNI Name	This setting is only visible if you select Send SNI above. Enter the SNI name that the endpoint configuration requires. Usually, this is the fully qualified domain name (FQDN) of the virtual host.
HTTP Method	Select the HTTP method that the notification uses: <ul style="list-style-type: none"> ▪ GET: Use the GET method. ▪ POST: Use the POST method. ▪ PUT: Use the PUT method. ▪ PATCH: Use the PATCH method.
Payload	<p>This setting is only visible if you select POST, PUT, or PATCH above. Enter a payload. The payload is the data that PRTG transmits to the URL.</p> <ul style="list-style-type: none"> ⓘ You cannot use Extensible Markup Language (XML) or JavaScript Object Notation (JSON). ⓘ Only the content type <code>application/x-www-form-urlencoded</code> is supported. ⓘ You can use line breaks. ■ You can use placeholders. For more information, see section List of Placeholders for Notifications.
HTTP Version	<p>This setting is only visible if you select POST above. Select the HTTP version that PRTG uses to execute the HTTP action:</p> <ul style="list-style-type: none"> ▪ HTTP 1.1 (default): Use HTTP 1.1. ▪ HTTP 1.0: Use HTTP 1.0. <p>ⓘ Make sure that the target supports the HTTP version that you select.</p>

Execute Program

ⓘ Regardless of the Notification Summarization method that you use, PRTG always sends notifications of the type Execute Program as soon as possible (ASAP). PRTG never summarizes them.

ⓘ To remotely run PowerShell scripts, make sure that you set the according Execution Policy. For more information, see the Knowledge Base: [PowerShell 32 Bit and 64 Bit and Execution Policy](#).

For more details, see section [Custom Notifications](#)⁴⁴⁶². You can find ready-to-use custom notifications in the [PRTG Sensor Hub](#), see [below](#)⁴¹⁶¹.

 This option is not available in PRTG Hosted Monitor.

 Execute Program

Executable File ⁴⁴⁶²	Demo exe notification - outfile.bat
Parameters ⁴⁴⁶²	[%sitename] %device %name %status %down (%message)
Domain or Computer Name ⁴⁴⁶²	
User Name ⁴⁴⁶²	
Password ⁴⁴⁶²	
Timeout (Sec.) ⁴⁴⁶²	60

Execute Program

Setting	Description
Executable File	<p>Select an executable file from the list. PRTG runs it every time the notification is triggered.</p> <p> You see the files that are in the corresponding \Notifications\EXE subfolder of the PRTG program directory⁴⁵²⁶. For files to appear in this list, store them as .bat, .cmd, .exe, .com, .ps1, or .vbs.</p> <p> In a cluster, copy the files to every cluster node. This makes sure that PRTG can execute the notification even when the master node fails. If your custom notification executes an external program, install it on all cluster nodes as well.</p>
Parameters	<p>Enter the parameters that the notification passes to the executable. For example, if you use a batch file that contains a %1 variable, you can provide a value for this variable. The default parameters are [%sitename] %device %name %status %down (%message).</p> <p> You can use placeholders. For more information, see section List of Placeholders for Notifications⁴⁶⁶².</p> <p> You need to escape special characters and whitespaces in your parameters and surround them with double quotes. See section Escape Special Characters and Whitespaces in Parameters⁴¹³¹ for details.</p>
Domain or Computer Name	Enter a Windows authority if you want to use a different security context for the program than the security context of the PRTG probe service.
User Name	Enter the user name for Windows access.
Password	Enter the password for Windows access.

Setting	Description
Timeout (Sec.)	Enter a timeout in seconds. After this time passes, PRTG stops the process if it is still running. Enter an integer value.

Send Syslog Message

 This option is not available in PRTG Hosted Monitor.

Send Syslog Message

Host/IP Address  192.0.2.0

For more information, see section List of Placeholders for Notifications.</p>
When Condition Clears	<p>Define how PRTG handles the notification ticket when the defined trigger condition clears:</p> <ul style="list-style-type: none"> ▪ Close the notification ticket (recommended): Automatically close the notification ticket if the trigger condition is not met anymore. ▪ Do not close the notification ticket: Do not close the notification ticket after the condition clears.

Send Push Notification

 Push notifications only work with the apps [PRTG for Android](#) and [PRTG for iOS](#). You must activate push notifications in the settings of the app first. For more information about the setup, see the Knowledge Base: [How can I use push notifications with PRTG?](#)

 This notification method uses notification contacts to deliver push notifications. Set up notification contacts in advance in the [notification contacts](#) settings.

 The PRTG core server needs to communicate with the PRTG Cloud on port 443 to send push notifications. It uses <https://api.prtgcloud.com:443>, which is the same as for the [Cloud HTTP sensor](#), the [Cloud HTTP v2 sensor](#), the [Cloud Ping sensor](#), the [Cloud Ping v2 sensor](#), and [support tickets](#).

 Send to User and Send to User Group both work simultaneously. Because of this, you can define more than one user as a recipient of push notifications. PRTG sends push notifications to the active [push notification contacts](#) of the user that you select, and to the active push notification contacts of all members of the user group that you select.

 **Send Push Notification**

Send to User and Send to User Group both work simultaneously. This means that every push device of the user or user group receives the push notifications.

Note: The PRTG core server must be able to reach the PRTG Cloud on TCP port 443 to send push notifications.

Send to User 	PRTG System Administrator
Send to User Group 	None
Message 	[%sitename] %device %name %status %down (%message)
HTTP Version 	<input checked="" type="radio"/> HTTP 1.1 (default) <input type="radio"/> HTTP 1.0

Send Push Notification

Send MQTT Publish Notification

Setting	Description
MQTT Broker	Enter the address for the connection to the MQTT broker (server).
Port	Enter the port for the connection to the MQTT broker. The default port for secure connections is 8883 and the default port for unsecure connections is 1883 .
Timeout (Sec.)	Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).
User Authentication	Select if you want to connect without credentials or define credentials for access to the MQTT broker. <ul style="list-style-type: none"> None (default): Connect without credentials. User name and password: Define credentials for the connection.
User Name	This setting is only visible if you select User name and password above. Enter the user name for access to the Message Queue Telemetry Transport (MQTT) broker.
Password	This setting is only visible if you select User name and password above. Enter the password for access to the MQTT broker.
Transport-Level Security	Select if you want to use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection:

Setting	Description
	<ul style="list-style-type: none"> Do not use transport-level security: Establish the connection without connection security. Use transport-level security: Establish the connection with the strongest SSL/TLS method that the target device provides.
Server Authentication	<p>This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for server authentication.</p> <ul style="list-style-type: none"> Disable (default): Do not use a certificate for server authentication. Enable: Use a certificate for server authentication.
CA Certificate	<p>Paste the certificate authority (CA) certificate for the verification of the MQTT broker.</p> <p> The certificate must be in Privacy-Enhanced Mail (PEM) format.</p>
Client Authentication	<p>This setting is only visible if you select Use transport-level-security above. Select if you want to use a certificate for client authentication.</p> <ul style="list-style-type: none"> Disable (default): Do not use a certificate for client authentication. Enable: Use a certificate for client authentication.
Client Certificate	<p>Paste the certificate that you created for authenticating the sensor against the MQTT broker.</p> <p> The certificate must be in PEM format.</p>
Client Key	<p>Enter the client key for access to the MQTT broker.</p> <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	<p>Enter the password for the client key certificate.</p>
MQTT Topic	<p>Enter the topic for the MQTT publish notifications. The default topic is PRTG/%sitename/notifications.</p> <p> MQTT clients that are subscribed to this topic receive the MQTT publish notifications.</p>
ClientID	<p>Enter the ClientID for the connection to the MQTT broker (server). The default ClientID is PRTG - %sitename.</p>
Message	<p>Define the message of the MQTT publish notifications. The default message is PRTG - [%sitename] %device %name %status %down (%message).</p> <p> To reset this field to the default value, enter only an asterisk (*).</p>

Setting	Description
	<p> You can use placeholders. For more information, see section List of Placeholders for Notifications .</p>

 Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

PRTG Sensor Hub Notifications

In addition to the standard notifications, you can also create custom notifications. To do so, write a script or a program and use it with an Execute Program notification or an Execute HTTP Action notification. There are also many free scripts, plugins, and add-ons for PRTG in the [PRTG Sensor Hub](#).

Others

 For information about the Comments and History tabs, see section [Object Settings](#) .

Escape Special Characters and Whitespaces in Parameters

You need to escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure that the characters are correctly interpreted. PowerShell scripts in particular require adequate escaping so that the parameters are passed in a valid PowerShell syntax. PRTG automatically does most of the escaping for you.

Follow these rules to escape special characters and whitespaces in the parameters fields:

- Use quotes for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotes for parameters that contain single quotes.

```
-name "Mr 'John Q' Public"
```

- Use single quotes for parameters that contain double quotes.

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quote.

```
-name pub\"lic
```

- Use double quotes for parameters that contain double and single quotes and escape double quotes.

```
-name "pu'b\"lic"
```

 In SSH scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.

 We recommend that you do not pass passwords in parameters. Use placeholders instead. See section [Custom Sensors](#)  for details.

- [PRTG Administration Tool on Remote Probe Systems](#)  4371

8.12.1.3 Notification Contacts

In the Notification Contacts settings, you can define and change the notification contacts of the user account.

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

 If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

Notification Contacts Tab

Notification contacts are unique for each user account. This means that every user can individually define how they want to receive [notifications](#) ⁴⁰³¹ from PRTG. Recipients of notifications are email addresses, phone numbers, push devices (with [PRTG for Android](#) ⁴²⁷⁸ or [PRTG for iOS](#) ⁴²⁷⁸), and users of certain instant messaging services.

The [notification methods](#) ⁴¹³⁸ Send Email, Send SMS/Pager Message, and Send Push Notification let you define a user who receives notifications for every **active** notification contact. If you select a user group, PRTG sends the notifications to **all active** notification contacts of **all** users that are in the user group. To exclude notification contacts from the notification delivery, use the Pause button to deactivate them.

Note

You have to take the following four steps to set up and use notifications:

1. Check and set up the [notification delivery](#) ⁴¹⁹⁴ settings if you use PRTG on premises. These settings define how PRTG sends messages.
2. Check and set up [notification contacts](#) ⁴¹⁶³ for the user accounts. These contacts define the recipients to which PRTG sends notifications.
3. Check and set up several [notification templates](#) ⁴¹³¹. These templates define the notification methods and their content.
 - i** You can also check or edit notification templates via the Notification Triggers tab. For more information, see section [Notification Triggers Settings](#) ³⁹⁸⁷.
4. Check and set up [notification triggers settings](#) ³⁹⁸⁷ for objects. These triggers define when PRTG sends notifications.

i Usually, there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always set up at least two notifications with different notification methods for a notification trigger, for example, one email notification and one SMS notification. If delivery via email fails, PRTG can still notify you via smartphone as a fallback. For example, use the latency setting of a [state trigger](#) ³⁹⁸⁸ to choose a notification with a different notification method than in the first trigger condition, or set up a second trigger with a different notification method for the corresponding object.

See sections [Notifications Based on Sensor Limits Step by Step](#) ⁴⁰³⁴ and [Notifications Based on Libraries Step by Step](#) ⁴⁰⁴² for step-by-step guides that describe potential notification setups.

Custom notification scripts are also available in the [PRTG Sensor Hub](#).

Notification Contacts Overview

Click the Notification Contacts tab to show a list of all notification contacts for the user account. You have the following options:

Option	Description
Pause (⏸)	Pauses the notification contact. If a notification contact is paused ^[256] , PRTG does not send any messages to the contact when a notification for this user is triggered.
Resume (▶)	Resumes the notification contact. When a notification for this user is triggered, PRTG sends a message to this user.
Edit (✎)	Open the settings of the notification contact ^[4165] and change its description and recipient. ⓘ This is not possible for predefined notification contacts, for example, for Primary Email Address . You can change the primary email address under My Account ^[4123] .
Delete (🗑)	Delete the notification contact. ⓘ This is not possible for predefined notification contacts, for example, for Primary Email Address .

Notification Contacts Settings

Hover over  and select Add Email Contact or Add SMS Contact from the menu to add a new notification contact. You can also click the  next to a notification contact to edit it.

ⓘ PRTG automatically adds push contacts for the corresponding user when you install a PRTG app for iOS or Android on your smartphone or tablet, connect to PRTG, and activate push notifications. You cannot manually add push contacts. If your mobile device actively rejects push notifications for a push contact, for example, because you deactivate push on the target device or reset it, PRTG automatically pauses the push contact. The affected user account receives a [ToDo ticket](#)^[240] in this case.

8.12.1.4 Schedules

In the Schedules settings, you can define or change schedules for the user account. You can use schedules to [pause](#) monitoring and notifications for certain time periods with the period lists option. Also, you can activate monitoring and notifications at certain times with the time table option. You can also use schedules to define the time periods that PRTG covers when you create [reports](#).

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

☁ If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

Schedules Settings

Schedules Settings

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

i When a user with administrative rights creates a new object, only other users with administrative rights can view or edit the new object by default. When a read/write user creates a new object, all members of the read/write user's primary group can view and edit the new object as well. This behavior applies to [libraries](#), [maps](#), [reports](#), [notification templates](#), and [schedules](#). For more information, see section [Access Rights Management](#).

Click the Schedules tab to show a list of all schedules. To edit a schedule, enable the check box next to a schedule and choose from the following options:

Option	Description
Used by	Shows a list of objects that use this schedule.

Option	Description
Delete (🗑️)	Deletes the schedule. ⓘ This is not possible for predefined schedules.
Settings (⚙️)	Opens the settings of the schedule.

See also sections [Working with Table Lists](#)²⁴⁶ and [Multi-Edit](#)⁴⁰¹⁴.

Hover over  and select Add Schedule from the menu. You can also click the name of a schedule to edit it.

Edit Schedule Time Table

Setting	Description
Schedule Name	<p>Enter a meaningful name for the schedule.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited¹⁴⁵.</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>■ For more information, see section Tags¹⁴⁵.</p>
Selection Method	<p>Select the method that you want to use to define a schedule:</p> <ul style="list-style-type: none"> Use weekday/hour time table: Select specific days of the week or specific hours in which the schedule is active. This means that monitoring objects, notifications, and reports are not paused. Use list of period definitions: Enter a list of period definitions in which the schedule is inactive. This means that monitoring objects, notifications, and reports are paused.
Time Table (active time slots)	<p>This setting is only visible if you select Use weekday/hour time table above. Enable or disable check marks or use buttons to define the schedule. You have the following options:</p> <ul style="list-style-type: none"> Weekday buttons (<input type="text" value="Mo"/>): Use the weekday buttons Mo, Tu, We, Th, Fr, Sa, and Su to define the days of the week in which the schedule is active. For example, click the Mo button to set the schedule to active for all hours every Monday. This enables all check boxes under the Mo column. Hour buttons (<input type="text" value="0:00"/>): Use the hour buttons 0:00 - 23:00 to define the hours of the day in which the schedule is active. For example, if the 0:00 button is blue, click it to set the schedule to active for the hour 0:00 of all days of the week. If the 0:00 button is white, click it to set the schedule to inactive for the hour 0:00 of all days of the week. All off button (<input type="text" value="All off"/>): Use the All off button to disable all check marks, and to deselect all weekday buttons and hour buttons. All on button (<input type="text" value="All on"/>): Use the All on button to enable all check marks, and to select all weekday buttons and hour buttons. <p>■ For more information, see also Schedules and Time Zones⁴¹⁷² below.</p>

Setting	Description
Period List (inactive time slots)	<p>This setting is only visible if you select Use list of period definitions above. Enter the date and time periods in which the schedule is inactive. The periods must have the following format:</p> <p><code>ww:hh:mm-ww:hh:mm</code></p> <p>i Make sure that you enter each period exactly in this format. Otherwise you receive an error message. Go back to the schedule and correct the period in this case. For details and examples, see Period Definition Syntax ⁴¹⁷³ below.</p> <p>i For more information, see also Schedules and Time Zones ⁴¹⁷² below.</p>

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ No access: Users in this user group cannot see or edit the object. The object does not show up in lists. ▪ Read access: Users in this user group can see the object and view its settings. ▪ Write access: Users in this user group can see the object and view and edit its settings. However, they cannot edit the object's access rights settings. ▪ Full access: Users in this user group can see the object, view and edit its settings, and edit its access rights settings. <p>i You can create new user groups in the User Groups ⁴²¹⁹ settings.</p>

i Click OK to save your settings. If you close the dialog without saving, all changes to the settings are lost.

Schedules and Time Zones

- i** Schedules use the time zone of the PRTG core server system. This might be different from other time displays in PRTG that are saved in UTC.
- If you select Use weekday/hour time table, PRTG converts the time in which the schedule is active to the time zone of [the user account](#) ⁴¹²³. This means that the schedule applies according to the time that the user account shows.

- If you select Use list of period definitions, PRTG does **not** adjust the time in which the schedule is inactive to the time zone of the user account. The schedule applies according to the time on the PRTG core server system in this case. Because of this, you encounter time shifts for schedules if there are changes to the time zone on the server or because of daylight saving and standard time changes.

Period Definition Syntax

Define one or more periods of time during which the object that uses this schedule is **inactive**. In each line, enter one range in the format **ww:hh:mm-ww:hh:mm**. The following values are possible:

- **ww**: mo, tu, we, th, fr, sa, su.
- **hh**: Enter the hour in the 24-hour format. For example, a number between 00 and 23.
 You must use the 24-hour format. You cannot use A.M./P.M.
- **mm**: Enter the minute. For example, a number between 00 and 59.

Example

This example shows a schedule that pauses an object during the weekend as well as on Wednesday evenings.

```
fr:19:30-mo:06:05  
we:18:45-we:23:00
```

Any object that uses this schedule is inactive (paused) from Friday, 7:30 P.M. to Monday, 6:05 A.M. as well as on Wednesday from 6:45 P.M. to 11 P.M. It is active during the other times.

Others

Others

There are some settings that you must make in the [PRTG Administration Tool](#)  4346. For more details, see the sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)  4347
- [PRTG Administration Tool on Remote Probe Systems](#)  4371

8.12.2 System Administration

To open the system administration, select Setup | System Administration from the [main menu bar](#)²⁸⁹. Select the various tabs to change the different settings.

You can define the following aspects of your PRTG system setup:

- [User Interface](#)⁴¹⁷⁵
- [Monitoring](#)⁴¹⁸⁷
- [Notification Delivery](#)⁴¹⁹⁴
- [Core & Probes](#)⁴²⁰²
- [User Accounts](#)⁴²¹¹
- [User Groups](#)⁴²¹⁹
- [Administrative Tools](#)⁴²²⁵
- [Cluster](#)⁴²²⁹
- [Single Sign-On](#)⁴²³²

8.12.2.1 User Interface

In the user interface settings, you can define global settings regarding the PRTG web interface, PRTG web server settings and performance, Geo Maps, and graph settings.

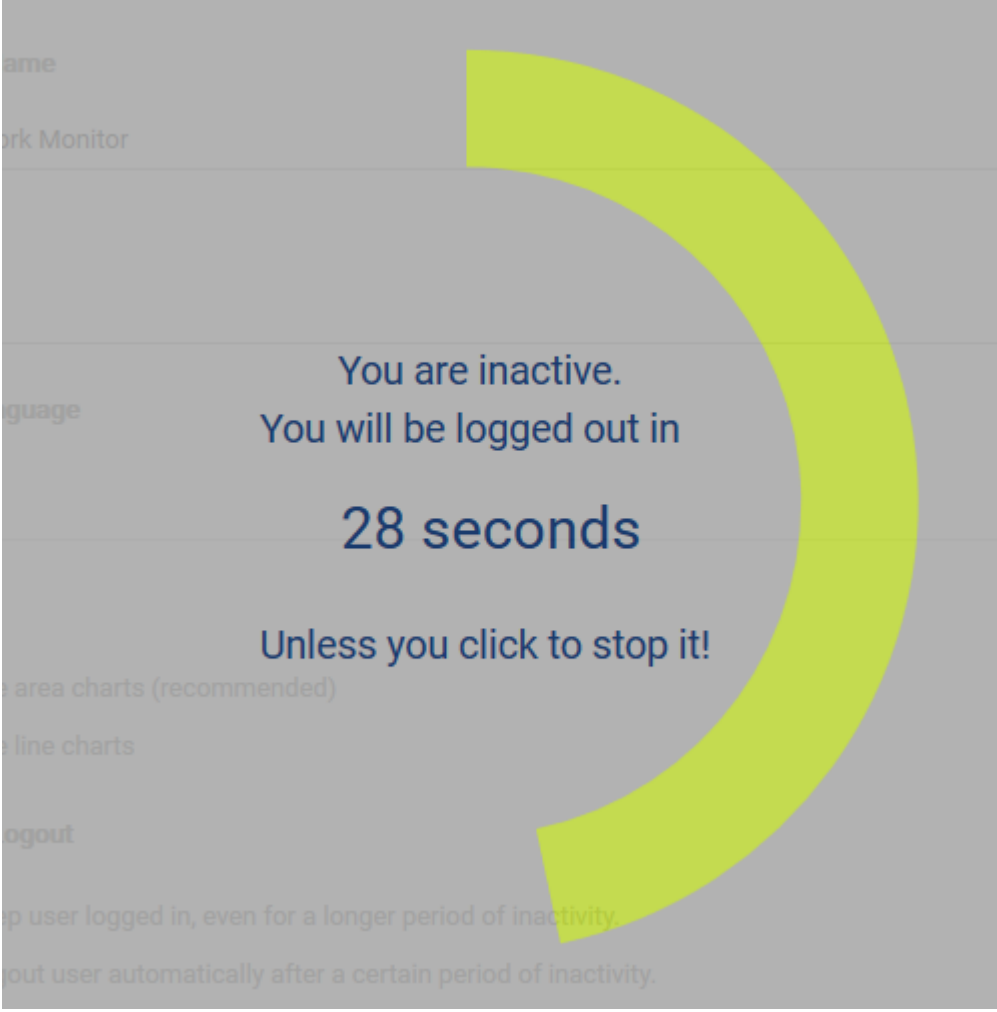

☁ If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

Website

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Setting	Description
PRTG Site Name	<p>When using the PRTG web interface, the site name is shown in the title bar of your browser window. It is also used in notification emails by default. Enter a string.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
DNS Name	<p>If your PRTG web interface is (additionally) reachable via a Domain Name System (DNS) name, enter it here. It is used, for example, by default in notification emails to generate links. Enter a string.</p> <p>i The special characters " and \ are not allowed in the DNS name.</p> <p>i In a cluster, the DNS name you enter here is only used by the master node. You cannot enter a DNS name for a failover node.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Website Language	<p>Select the system language. The default is English. Depending on your installation, you might be able to choose other languages here. This setting defines the language of the PRTG web interface and the PRTG Administration Tool⁴³⁴⁶.</p> <p>i If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of PRTG Desktop⁴²⁷⁵, or of PRTG Apps for Mobile Network Monitoring⁴²⁷⁸ are disconnected and reconnected.</p>
Graph Type	<p>Select how graphs are displayed throughout the PRTG web interface and in reports⁴⁰⁶⁵.</p> <ul style="list-style-type: none"> ▪ Use area graphs (recommended): Display filled graphs. ▪ Use line graphs: Display graphs using single lines only. <p>We recommend that you use area charts, as they are better to read.</p> <p>i Graphs containing data from more than one cluster node are automatically displayed with line graphs.</p>
Automatic Logout	<p>Define if a user who is inactive for a certain period of time is automatically logged out of the PRTG web interface for security reasons:</p> <ul style="list-style-type: none"> ▪ Keep user logged in, even for a longer period of inactivity ▪ Log out user automatically after a certain period of inactivity
Automatic Logout after Minutes	<p>This setting is only visible if you select Log out user automatically after a certain period of inactivity above. Specify a period of inactivity in minutes after which a user is automatically logged out.</p> <p>Enter an integer value. PRTG redirects to the login page once this time has expired.</p> <p>If the value you enter here is greater than 1 minute, a logout countdown appears 1 minute before you are logged out. If the value is 1 minute, you see the logout countdown 30 seconds before you are logged out. Click in the browser to stop the countdown and stay logged in.</p>

Setting	Description
	 <p>Logout Countdown</p>
Google Analytics Tracking ID	<p>You can track the usage of pages in the PRTG web interface with Google Analytics by entering your Google Universal Analytics Tracking ID into this field. You need a Google Analytics account for this feature. Create a tracking ID within the Google Analytics portal and provide it here. PRTG then dynamically integrates it into the PRTG web interface.</p> <p>Enter a string or leave the field empty. The string looks like this: UA-xxxxxx-xx</p> <ul style="list-style-type: none">■ For more information, see the Knowledge Base: How can I integrate Google Analytics in PRTG? <p>☁ This option is not available in PRTG Hosted Monitor.</p>

Geo Maps

Setting	Description
Map Service Provider	<p>Select if and how you want to integrate the Geo Maps feature into the PRTG web interface. If enabled, PRTG uses the first line of the location setting of an object ^[226] to show it on a geographical map. Choose a map provider:</p> <ul style="list-style-type: none"> ▪ Do not show maps (disables Geo Maps integration): Disable the Geo Maps feature and do not show geographical maps in the PRTG web interface. ▪ Default (recommended): As default option, PRTG uses HERE Maps to show geographical maps. ▪ HERE Maps: Use HERE Maps to show geographical maps. ▪ Google Static Maps (API key required): Use Google Static Maps to show geographical maps. Sign up for a Google Maps API v3 key to use this service as of PRTG 13. <p>■ For more information about the different map providers, see the Knowledge Base: Which provider should I use for the Geo Maps feature of PRTG?</p>
Map Type	<p>The options that are available depend on the provider you select above. Default (recommended), HERE Maps, and Google Static Maps (API key required) all have the following options:</p> <ul style="list-style-type: none"> ▪ Road map: Show geographical maps in a road map view. ▪ Satellite: Show geographical maps in a satellite view. <p>In addition to these options, Google Static Maps (API key required) also has the following options:</p> <ul style="list-style-type: none"> ▪ Terrain: Show geographical maps in a terrain view. ▪ Hybrid (satellite and road map): Show geographical maps in a hybrid view.
API Key	<p>This option is only visible if you select Google Static Maps (API key required) above. Obtain your personal key and paste it here.</p> <p>■ For more information on how to get a Google API key, see the Knowledge Base: How do I get a Google Maps API key for use in PRTG?</p>

Web Server

Setting	Description
Performance Strategy	<p>Select if you want to enable performance improvements for the PRTG web interface.</p> <ul style="list-style-type: none"> ▪ All Features: Show all features and live data (recommended): Provide full functionality and show all menu items. ▪ More Speed: Limit features and delay display: Improve the reaction time and speed of the PRTG web interface by delaying the display of monitoring data and hiding some features. <p> For more information on how to speed up the PRTG web interface, see the Knowledge Base: How can I speed up PRTG—especially for large installations?</p>
IP Address for Web Server	<p>The PRTG web server provides access via the PRTG web interface and PRTG Desktop⁴²⁷⁵. Specify on which IP address the PRTG web server runs. Later, you can log in to PRTG by pointing your browser to the specified IP address.</p> <p>Choose from:</p> <ul style="list-style-type: none"> ▪ Localhost, 127.0.0.1 (PRTG is not accessible from other computers): Use 127.0.0.1 only. The PRTG web interface and PRTG Desktop are only accessible from the PRTG core server system. Either the selected port or at least one port in the range from 8080 to 8089 has to be available on 127.0.0.1. <ul style="list-style-type: none">  If you run PRTG on localhost, do not use the DNS name http://localhost to log in to the PRTG web server, as this might considerably slow down the PRTG web interface. Use your local IP address or http://127.0.0.1 instead. ▪ All IP addresses: Use all IP addresses available on this computer (recommended): Use all IP addresses that are available on this computer and enable access to the PRTG web server for all of these IP addresses. <ul style="list-style-type: none">  The selected Transmission Control Protocol (TCP) port for the PRTG web server must be free on every available IP address. ▪ Specify IP addresses: Select specific IP addresses on which the PRTG web server runs. The list is specific to your system. Add a check mark in front of every IP address you want the PRTG web server to be available at. You can also select all addresses by clicking the Select all IP addresses button or deselect all addresses by clicking the Deselect all IP addresses button. Either the selected port or at least one port in the range from 8080 to 8089 has to be available on the specified IP address. <ul style="list-style-type: none">  Regardless of the selected setting above, one port in the range from 8080 to 8180 has to be available on the specified IP address so PRTG can create reports. The report engine tries to connect to the PRTG core server on one of these ports.

Setting	Description
TCP Port for Web Server	<p data-bbox="483 371 1345 533">  If PRTG does not find a network card on startup, it switches the IP setting to Localhost, 127.0.0.1 (PRTG is not accessible from other computers). This setting remains even if a network card is available later on. If you disabled or removed the network card on the PRTG core server system, check this setting again. </p> <p data-bbox="483 562 1345 748">  If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of PRTG Desktop⁴²⁷⁵, or of PRTG Apps for Mobile Network Monitoring⁴²⁷⁸ are disconnected and reconnected. </p> <p data-bbox="483 792 1139 822">  This option is not available in PRTG Hosted Monitor. </p> <p data-bbox="483 898 1345 963"> The PRTG web server provides access via the PRTG web interface and PRTG Desktop⁴²⁷⁵. Specify on which port the PRTG web server runs: </p> <ul data-bbox="483 985 1345 1921" style="list-style-type: none"> <li data-bbox="483 985 1345 1299"> <p data-bbox="483 985 1345 1108">  Secure HTTPS server (port 443, recommended, mandatory for internet access): This setting is required if you want to access the PRTG core server via the internet. Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured HTTPS connection on port 443. </p> <p data-bbox="483 1108 1345 1299">  Although the connection is secure, you see an SSL certificate warning¹⁶⁹ in your browser when you log in to the PRTG web interface because the default certificate is unknown to your browser. You can install a different SSL certificate for PRTG. For more information, see section Using Your Own SSL Certificate with the PRTG Web Server⁴⁵³⁷. </p> <li data-bbox="483 1332 1345 1680"> <p data-bbox="483 1332 1345 1680">  If port 80 is available, PRTG reserves it as well. If port 80 is not available, PRTG tries port 8080 as fallback. If this port is also not available, PRTG searches from port 8081 upwards for a free port. PRTG sends a ticket²⁴⁰ that shows you the currently used port number and switches back to port 80 as soon as it is available again. When users try to connect on port 80 via HTTP, they are redirected to port 443 via HTTPS. You can change this behavior by using a registry setting. If port 443 is not available, PRTG tries port 8443 as fallback. If this port is also not available, PRTG searches from port 8444 upwards for a free port. PRTG sends a ticket that shows you the currently used port number and switches back to port 443 as soon as it is available again. </p> <li data-bbox="483 1713 1345 1921"> <p data-bbox="483 1713 1345 1792">  Unsecure HTTP server (default port 80, not recommended): Use the PRTG web server without SSL/TLS on port 80. This setting is not recommended for WAN connections. </p> <p data-bbox="483 1792 1345 1921">  If you use the PRTG web server without connection security on the internet, attackers could potentially spy on credentials that you enter in PRTG. We strongly recommend that you use this option only in a LAN. </p>

Setting	Description
Web Server Port	<ul style="list-style-type: none"> ▪ Expert configuration: Specify a custom port for the PRTG web server and the security of the connection. This option is intended for systems that already have a web server on the standard port. <ul style="list-style-type: none"> ❗ If PRTG always uses a fallback port after a server restart, check for other programs that use the same port as PRTG. For example, the Microsoft Microsoft Internet Information Services (IIS) web server also uses port 80 (port 443 for secure connections) by default and blocks it. Please disable such programs and services on startup. ❗ If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of PRTG Desktop⁴²⁷⁵, or of PRTG Apps for Mobile Network Monitoring⁴²⁷⁸ are disconnected and reconnected. <p>☁ This option is not available in PRTG Hosted Monitor.</p> <p>This setting is only visible if you select Expert configuration above. Enter the TCP port number that you want the PRTG web server to run on. Enter an integer value.</p> <ul style="list-style-type: none"> ❗ If you use a secure connection and port 80 is free, PRTG reserves it as well. When users try to connect on port 80 via HTTP, they are redirected to the custom port via HTTPS. You can change this behavior by using a registry setting. ❗ If the defined port for a secure connection is not available, PRTG tries port 8443 as fallback. If this port is also not available, PRTG searches from port 8444 upwards for a free port. PRTG sends a ticket²⁴⁰ that shows you the currently used port number and switches back to the original port as soon as it is available again. ❗ If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of PRTG Desktop⁴²⁷⁵, or of PRTG Apps for Mobile Network Monitoring⁴²⁷⁸ are disconnected and reconnected. <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Web Server Security	<p>This setting is only visible if you select Expert configuration above. Specify if you want to use connection security:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ Use HTTPS (secured with SSL/TLS): Use a SSL/TLS secured HTTPS connection on a custom port as defined above. <ul style="list-style-type: none"> ❗ Although the connection is secure, you see an SSL certificate warning in your browser when you log in to the PRTG web interface, because the default certificate is unknown to your browser. You can install a different SSL certificate for PRTG later. For more information, see Using Your Own SSL Certificate with the PRTG Web Server⁴⁵³⁷. ▪ Do not use connection security (not recommended): This setting is not recommended for WAN connections. Use the PRTG web server without SSL/TLS on a custom port as defined above. <ul style="list-style-type: none"> ❗ If you use the PRTG web server without connection security on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend that you use this option in a LAN only. ❗ If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of PRTG Desktop⁴²⁷⁵, or of PRTG Apps for Mobile Network Monitoring⁴²⁷⁶ are disconnected and reconnected. <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Connection Security	<p>Specify the security level that is used for connections from and to the PRTG web server:</p> <ul style="list-style-type: none"> ▪ High security (TLS 1.2): The PRTG web server only accepts high security connections from clients like web browser, apps, PRTG Desktop, or API clients. These clients must support modern forward secrecy cipher suites. ▪ Default security (TLS 1.2) (recommended): The PRTG web server only accepts high security connections from clients like web browsers, apps, PRTG Desktop, or API clients. These clients must support modern forward secrecy cipher suites. ▪ Weakened security (SSLv3, TLS 1.0, TLS 1.1, TLS 1.2): If you have clients that do not support the high or default security setting, you can choose this security level to connect. This might be necessary, for example, for older browsers, browsers running on old network components, or some default browsers on Android systems. Weakened security accepts SSLv3, TLS 1.0, TLS 1.1, and TLS 1.2 connections. <ul style="list-style-type: none"> ❗ We strongly recommend that you update your clients and then use the Default security (TLS 1.2) (recommended) or High security (TLS 1.2) setting.

Setting	Description
	<p>i If you set a registry key in previous PRTG versions to override the Secure Sockets Layer (SSL)/Transport Layer Security (TLS) version and cipher suites of PRTG web server or probe connections, the High security setting overrides the registry setting and only TLS 1.2 is allowed. If you select the Default security setting, the registry value overrides the default security setting and the connection security defined in the registry applies.</p> <p>i PRTG displays the SSL/TLS versions and cipher suites that are used for connections to and from the PRTG web server under Setup PRTG Status⁴²³⁶.</p> <p>i If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of PRTG Desktop⁴²⁷⁵, or of PRTG Apps for Mobile Network Monitoring⁴²⁷⁸ are disconnected and reconnected.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Active IP Address/Port Combinations	<p>Shows all active combinations of IP addresses and ports on which the PRTG web server listens for web requests.</p> <p>i This setting is for your information only. You cannot change it.</p> <p>i PRTG internally uses port 8085 for report generation.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>

Graph Settings

PRTG shows several graphs on the Overview tab of an object in the PRTG web interface. These are kept in RAM for fast display without causing extra CPU load or disk usage. The longer the time frames and the shorter the intervals are, the more memory is used for this. You can adapt the details for all four graphs. This setting also changes the caption of the objects' tabs in the [PRTG web interface](#)¹⁶³¹ and PRTG Desktop.

i If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of [PRTG Desktop](#)⁴²⁷⁵, or of [PRTG Apps for Mobile Network Monitoring](#)⁴²⁷⁸ are disconnected and reconnected.

Setting	Description
Live Graph	<p>The live graph is available for sensors only. For the live graph, no fixed time span is specified, but you can define how many values are displayed. The actual time span covered by the live graph depends on the scanning interval set for the sensor you're viewing and is calculated automatically. By default, 120 Values is set. This results in a graph covering a time span of two hours if a 60-second scanning interval is set for the sensor. Other scanning intervals result in graphs covering different time spans. Choose from:</p> <ul style="list-style-type: none"> ▪ 60 Values: This corresponds to a live graph that covers a time span of one hour if a 1-minute scanning interval is set. This setting uses least RAM. We recommend this setting for installations with 10,000 sensors or more. ▪ 120 Values: This corresponds to a live graph that covers a time span of two hours if a 1-minute scanning interval is set. ▪ 240 Values: This corresponds to a live graph that covers a time span of four hours if a 1-minute scanning interval is set. ▪ 480 Values: This corresponds to a live graph that covers a time span of eight hours if a 1-minute scanning interval is set. ▪ 960 Values: This corresponds to a live graph that covers a time span of 16 hours if a 1-minute scanning interval is set. This setting uses most RAM.
Graph 1	<p>By default, this is the 2 days graph in the PRTG web interface. You can change it to more or less detail by choosing a time span and a monitoring interval average associated with it. Monitoring results are averaged regardless of the actual scanning interval set for the sensors. Choose from:</p> <ul style="list-style-type: none"> ▪ 1 day with 1 minute averages: Results in 1440 values. ▪ 1 day with 5 minutes averages: Results in 288 values. ▪ 1 day with 15 minutes averages: Results in 96 values. This setting uses least RAM. We recommend this setting for installations with 10,000 sensors or more. ▪ 2 days with 1 minute averages: Results in 2880 values. This setting uses most RAM. ▪ 2 days with 5 minutes averages: Results in 576 values. ▪ 2 days with 15 minutes averages: Results in 192 values. ▪ 4 days with 1 hour averages: Results in 96 values. This setting uses least RAM. We recommend this setting for installations with 10,000 sensors or more.
Graph 2	<p>By default, this is the 30 days graph in the PRTG web interface. You can change it to more or less detail by choosing a time span covered and a monitoring interval average associated with it. Choose from:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ 10 days with 1 hour averages: Results in 240 values. ▪ 20 days with 1 hour averages: Results in 480 values. ▪ 30 days with 1 hour averages: Results in 720 values. ▪ 30 days with 6 hour averages: Results in 120 values. This setting uses least RAM. We recommend this setting for installations with 10,000 sensors or more. ▪ 40 days with 1 hour averages: Results in 960 values. ▪ 40 days with 6 hour averages: Results in 160 values. ▪ 60 days with 1 hour averages: Results in 1440 values. This setting uses most RAM. ▪ 60 days with 6 hour averages: Results in 240 values.
Graph 3	<p>By default, this is the 365 days graph in the PRTG web interface. You can change it to more or less detail by choosing a time span covered and a monitoring interval average associated with it. Choose from:</p> <ul style="list-style-type: none"> ▪ 100 days with 1 day averages: Results in 100 values. This setting uses least RAM. We recommend this setting for installations with 10,000 sensors or more. ▪ 200 days with 1 day averages: Results in 200 values. ▪ 365 days with 1 day averages: Results in 365 values. ▪ 400 days with 1 day averages: Results in 400 values. ▪ 750 days with 1 day averages: Results in 750 values. This setting uses most RAM.

i Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

Others

There are some settings that you must make in the [PRTG Administration Tool](#) . For more details, see the sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#) 
- [PRTG Administration Tool on Remote Probe Systems](#) 

8.12.2.2 Monitoring

In the monitoring settings, you can define global settings regarding scanning intervals, unusual and similar sensors detection, auto-discovery, and uptime threshold.

 If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

Scanning Intervals

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

 This option is not available in PRTG Hosted Monitor.

Setting	Description
Available Intervals	<p>Define the intervals available in the dropdown list of every object's settings . In the text field, enter one value in each line. Use s, m, h, and d to define seconds, minutes, hours, and days. By default, the following scanning intervals are available:</p> <ul style="list-style-type: none"> ▪ 30s: 30 seconds ▪ 1m: 60 seconds ▪ 5m: 5 minutes ▪ 10m: 10 minutes ▪ 15m: 15 minutes ▪ 30m: 30 minutes ▪ 1h: 1 hour ▪ 4h: 4 hours ▪ 6h: 6 hours ▪ 12h: 12 hours

Setting	Description
	<ul style="list-style-type: none"> ▪ 1d: 24 hours <p>i We recommend that you do not use intervals below 10 seconds to prevent system overload. Intervals below 10 seconds are not officially supported. The maximum supported scanning interval is 10 days.</p> <p>i PRTG might convert values that you enter to a more readable equivalent of the values. For example, if you enter 24h (24 hours), PRTG displays this as 1d (one day) in the dropdown list.</p> <p>i Valid values are positive integers followed by s, m, h, and d. You can also define specific points in time to indicate when PRTG executes scanning actions. Enter up to 50 concrete Coordinated Universal Time (UTC) points in time according to the formula @ UTC hh:mm , hh:mm. You do not need to use a space before and/or after the comma. However, PRTG always saves the entries with a space both before and after the comma.</p> <p>i Your local time might be different from the UTC time.</p> <p>■ For more information on how to set specific points in time as a scanning time for sensors, see the Knowledge Base: Can I set a sensor to run at a specific time?</p>

Unusual Detection

The Unusual Detection feature can set sensors to the Unusual [status](#)^[197] when there are values that are not typical for the time span in which they are measured. PRTG compares the current average values to the historic monitoring results for this purpose. If the current values show a big difference to the values that are normally retrieved by a sensor, this sensor indicates this with the Unusual status.

You can define the granularity of the unusual detection here (this means, how big the difference must be to cause the Unusual status). If you disable the unusual detection by setting both settings to Never, sensors never show the Unusual status.

- i** You can enable and disable unusual detection for specific devices, entire groups, and probes in the respective [object settings](#)^[226].
- i** Unusual detection requires sensor data from at least four weeks (28 to 34 days) to have enough data available for comparison. If less data is available, PRTG cannot calculate the Unusual status.

Setting	Description
Show Unusual When	<p>Define when a sensor shows the Unusual status by comparing the weekday. If you enable the detection here, the average of the values that were measured on the day before is compared to the average of the same weekday in previous weeks. Choose from:</p> <ul style="list-style-type: none"> ▪ Never: Disable unusual detection for weekday average.

Setting	Description
Show Unusual When	<ul style="list-style-type: none"> ▪ 24h average is <80% or >120% of weekday average: The average of the values measured on the day before is either lower than 80% or higher than 120% than usual on the same weekday. ▪ 24h average is <50% or >200% of weekday average: The average of the values measured on the day before is either lower than 50% or higher than 200% than usual on the same weekday. ▪ 24h average is <20% or >500% of weekday average (recommended): The average of the values measured on the day before is either lower than 20% or higher than 500% than usual on the same weekday. ▪ 24h average is <10% or >1,000% of weekday average: The average of the values measured on the day before is either lower than 10% or higher than 1,000% than usual on the same weekday. ▪ 24h average is <1% or >10,000% of weekday average: The average of the values measured on the day before is either lower than 1% or higher than 10,000% than usual on the same weekday. <p>For example, consider a traffic sensor that usually measures 100 MB average traffic on a weekday. If you choose the first option, the sensor would show the Unusual status if the average from the day before is below 80 MB or above 120 MB.</p> <p>Define when a sensor shows the Unusual status by comparing the hour of the day. If you enable the detection here, the average of the values that were measured in the hour before is compared to the average of the same hour on the same weekday in previous weeks. Choose from:</p> <ul style="list-style-type: none"> ▪ Never: Disable unusual detection for hour-of-day average. ▪ Hourly average is <80% or >120% of hour-of-day average: The average of the values measured in the hour before is either lower than 80% or higher than 120% than usual in this hour of this weekday. ▪ Hourly average is <50% or >200% of hour-of-day average: The average of the values measured in the hour before is either lower than 50% or higher than 200% than usual in this hour of this weekday. ▪ Hourly average is <20% or >500% of hour-of-day average (recommended): The average of the values measured in the hour before is either lower than 20% or higher than 500% than usual in this hour of this weekday. ▪ Hourly average is <10% or >1,000% of hour-of-day average: The average of the values measured in the hour before is either lower than 10% or higher than 1,000% than usual in this hour of this weekday. ▪ Hourly average is <1% or >10,000% of hour-of-day average: The average of the values measured in the hour before is either lower than 1% or higher than 10,000% than usual in this hour of this weekday.

Setting	Description
	Consider a traffic sensor that usually measures 10 MB average traffic within an hour. If you choose the first option, the sensor would show the Unusual status if the average from the hour before is below 8 MB or above 12 MB.
Record Unusual Events	<p>Define if you also want to record unusual events and display them on the Log tab of a sensor that shows the Unusual status:</p> <ul style="list-style-type: none"> ▪ Do not record unusual events ▪ Record and display unusual events on a sensor's Log tab (default)

Similar Sensors Detection

The Similar Sensors Detection feature enables PRTG to analyze sensor data for similarities. The detection runs in the background with low priority. The recommended setting for the analysis depth is to let PRTG automatically decide how many channels are analyzed. However, you can also override this setting.

i Similar sensors analysis requires sensor data from at least seven days to have enough data for comparison. If not enough data is available, no data is shown on the Similar Sensors Overview or in the Similar Sensors section on a sensor's Overview tab. For more information, see section [Similar Sensors](#) ^[217].

i When similar sensors analysis is turned off or if you have exceeded 1,000 sensors and have chosen the automatic analysis depth option, the Similar Sensors Overview is not shown in the [main menu bar](#) ^[282].

Setting	Description
Analysis Depth	<p>Define the number of channels PRTG analyzes to detect similarities between sensors or turn the analysis off:</p> <ul style="list-style-type: none"> ▪ Manage automatically based on sensor count (recommended): The analysis depth depends on the total number of sensors you have configured. PRTG analyzes all channels for up to 500 sensors, and only the primary channels for up to 1,000 sensors. For more than 1,000 sensors, the analysis is turned off. This is the default setting in PRTG on premises. ▪ Analyze primary channels only: Only the primary channels of sensor are analyzed. Be aware of potentially high CPU load on the PRTG core server system when choosing this setting for more than 1,000 sensors. ▪ Analyze all channels (higher CPU load): Similarity detection is applied to all channels. Be aware of potentially high CPU load on the PRTG core server system when choosing this setting for more than 500 sensors.

Setting	Description
	<ul style="list-style-type: none"> ▪ Turn analysis off: No similarity detection takes place. Choose this option if you are not interested in the analysis results or if you want to keep the CPU load on the PRTG core server system at a minimum. <p>☁ This is the default setting in PRTG Hosted Monitor.</p>

Recommended Sensors Detection

The Recommended Sensors Detection feature enables PRTG to analyze devices in your network and suggest sensors that are still missing for a complete monitoring setup. The analysis runs with low priority in the background when you add a new device, when the last analysis was executed more than 30 days ago, or when you [manually start](#)^[222] it.

■ See section [Recommended Sensors](#)^[221] for more information, for example, on [SNMP settings](#)^[222], on the [results](#)^[222] you get and on how to [add the suggested sensors](#)^[223].

☁ This option is not available in PRTG Hosted Monitor.

Setting	Description
Detection Engine	<p>Define if you want PRTG to analyze your devices to recommend useful sensors:</p> <ul style="list-style-type: none"> ▪ Manage automatically based on sensor count (recommended): PRTG runs the detection engine for installations with up to 5,000 sensors by default. If you exceed this threshold, PRTG disables the detection engine for performance reasons. We recommend that you set this option so you do not miss any important monitoring data about your network, without risking running into performance issues. ▪ Always show recommendations: PRTG always analyzes your devices even if your installation exceeds 5,000 sensors and you never miss any suggestion to complete your monitoring. If you enable this option, keep this setting in mind in case you encounter performance issues. ▪ Turn recommendations off: PRTG never recommends sensors. Select this option if you have performance issues with PRTG or if you do not want to see this information on devices' Overview tabs^[201]. Moreover, you do not find the option Recommend Now in device context menus^[266] or on Overview tabs anymore.

Auto-Discovery

Setting	Description
Run Discovery At	Define the time when PRTG automatically runs an auto-discovery ^[296] in your network if you configured a daily or weekly Schedule in the auto-discovery group settings ^[296] . Choose a full hour between 0:00 and 23:00. We recommend that you choose a time when there is little user activity in your network because auto-discoveries can produce a certain amount of load.

Experimental Features

Setting	Description
Beta Sensors	<p>Select if you want to enable or disable sensors in beta status:</p> <ul style="list-style-type: none"> ▪ Disable (default): Disable sensors in beta status. ▪ Enable: Enable sensors in beta status. <ul style="list-style-type: none"> ⓘ Beta sensors then become available in the Add Sensor^[367] dialog. <ul style="list-style-type: none"> ⓘ If you disable beta sensors, existing beta sensors change to the Unknown status. ⓘ The operating methods and the available settings of sensors in beta status can change at any time. Do not expect that all functions work properly, or that this sensor works as expected at all. Be aware that sensors in beta status can be removed from PRTG at any time.
PowerShell Security Enhancement	<p>Select if you want to improve PowerShell security by hiding command-line parameters in the process explorer and the event log:</p> <ul style="list-style-type: none"> ▪ Enable (default): Enable PowerShell security enhancement. <ul style="list-style-type: none"> ⓘ Enabling this feature can also improve the performance of PowerShell sensors. ⓘ The operating methods of this feature can change at any time. Do not expect that all functions work properly, or that this feature works as expected at all. Be aware that this feature can be removed from PRTG at any time. ▪ Disable: Disable PowerShell security enhancement.

Uptime Threshold

Setting	Description
Desired Minimum Uptime	Define which uptime in percent PRTG regards as 100 percent. This setting affects the colors shown next to the sensor icons in reports. Select one of the predefined values between 90 % and 99.999 %.

 Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

Others

There are some settings that you must make in the [PRTG Administration Tool](#)  4346. For more details, see the sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)  4347
- [PRTG Administration Tool on Remote Probe Systems](#)  4371

8.12.2.3 Notification Delivery

In the Notification Delivery settings, you can define and test global settings for notification delivery. If you do not want to use a specific notification method, leave the respective fields empty.

 If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

Note

You have to take the following four steps to set up and use notifications:

1. Check and set up the [notification delivery](#)  4194 settings if you use PRTG on premises. These settings define how PRTG sends messages.
2. Check and set up [notification contacts](#)  4163 for the user accounts. These contacts define the recipients to which PRTG sends notifications.
3. Check and set up several [notification templates](#)  4131. These templates define the notification methods and their content.
 -  You can also check or edit notification templates via the Notification Triggers tab. For more information, see section [Notification Triggers Settings](#)  3987.
4. Check and set up [notification triggers settings](#)  3987 for objects. These triggers define when PRTG sends notifications.

i Usually, there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always set up at least two notifications with different notification methods for a notification trigger, for example, one email notification and one SMS notification. If delivery via email fails, PRTG can still notify you via smartphone as a fallback. For example, use the latency setting of a [state trigger](#) ³⁸⁸⁸ to choose a notification with a different notification method than in the first trigger condition, or set up a second trigger with a different notification method for the corresponding object.

■ See sections [Notifications Based on Sensor Limits Step by Step](#) ⁴⁰³⁴ and [Notifications Based on Libraries Step by Step](#) ⁴⁰⁴² for step-by-step guides that describe potential notification setups.

■ Custom notification scripts are also available in the [PRTG Sensor Hub](#).

SMTP Delivery

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Setting	Description
SMTP Delivery Mechanism	<p>Define how PRTG sends emails using the Simple Mail Transfer Protocol (SMTP):</p> <ul style="list-style-type: none"> ▪ Direct delivery using built-in email relay server (default): Use the SMTP relay server built into PRTG. This server manages its own email queue. For each email, it looks up the target SMTP server via the MX record of the target domain, and sends the email. ▪ Use SMTP relay server (recommended in LANs/NATs): Set up your own SMTP relay server to send emails. Enter data below. ▪ Use two SMTP relay servers (primary and fallback server): Set up two SMTP relay servers with one as primary and one as fallback server. Enter data below. <p>i If you monitor the IT infrastructure in your network address translation (NAT) or LAN, using your own LAN-based relay server ensures faster delivery of notification emails.</p> <p>☁ This option is not available in PRTG Hosted Monitor. PRTG Hosted Monitor uses SendGrid for email notifications. For more information, see the Paessler website: FAQ – PRTG Hosted Monitor.</p>
Sender Email	<p>Enter an email address to use as sender of all emails. This setting is global and applies to all email notifications by default. You can override the sender email in the settings of individual notifications ⁴¹³⁸.</p>
Sender Name	<p>Enter a name to use as sender of all emails. This setting is global and applies to all email notifications by default. You can override the sender name in the settings of individual notifications.</p>

Setting	Description
	<p> If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
HELO Ident	<p>Enter the HELO Ident for SMTP. This must be a unique name, preferably the Domain Name System (DNS) name of the PRTG core server system. See SMTP RFC 2821: The sender-SMTP must ensure that the domain parameter in a HELO command is a valid principal host domain name for the client host.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
SMTP Relay Server	<p>This setting is only visible if you select SMTP relay server above. Enter the IP address or DNS name of the SMTP relay server.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
SMTP Relay SMTP Port	<p>This setting is only visible if you select SMTP relay server above. Enter the port number that the SMTP relay server runs on. The standard port is 25.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
SMTP Relay Authentication	<p>This setting is only visible if you select SMTP relay server above. Select the kind of authentication required for the SMTP server:</p> <ul style="list-style-type: none"> ▪ No authentication is required: Use SMTP without authentication. ▪ Use standard SMTP authentication: Use standard authentication. ▪ SASL authentication is required: Use secure authentication via Simple Authentication and Security Layer (SASL). <p> This option is not available in PRTG Hosted Monitor.</p>
SMTP Relay User Name	<p>This setting is only visible if you select Use standard SMTP authentication above. Enter a valid user name.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
SMTP Relay Password	<p>This setting is only visible if you select Use standard SMTP authentication above. Enter a valid password.</p> <p> This option is not available in PRTG Hosted Monitor.</p>

Setting	Description
Connection Security	<p>This setting is only visible if you select SMTP relay server above. Define the connection security for SMTP connections:</p> <ul style="list-style-type: none"> ▪ Use SSL/TLS if supported (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. ▪ Do not use connection security: Use an unsecured connection with plain text transfer. <p>☁ This option is not available in PRTG Hosted Monitor.</p>
SSL/TLS Method	<p>This setting is only visible if you select SMTP relay server and connection security above. It is only relevant for secure connections. Select the SSL or TLS version that your SMTP device supports. We recommend that you use this option. If you do not get a connection, try with a different setting. Choose from:</p> <ul style="list-style-type: none"> ▪ SSLv2 or SSLv3 (default) ▪ SSLv3 ▪ TLS 1.0 ▪ TLS 1.1 ▪ TLS 1.2 <p>☁ This option is not available in PRTG Hosted Monitor.</p>
SMTP Relay Server (Fallback)	
SMTP Relay SMTP Port (Fallback)	
SMTP Relay Authentication (Fallback)	<p>These fields are only visible if you select the option for two SMTP relay servers above. See also the settings that you made for your primary SMTP relay server.</p>
Connection Security (Fallback)	<p>☁ This option is not available in PRTG Hosted Monitor.</p>
SSL/TLS Method (Fallback)	
SMTP Relay User Name (Fallback)	
SSL Method (Fallback)	

Setting	Description
SMTP Relay User Name (Fallback)	
SMTP Relay Password (Fallback)	
Test SMTP Settings	<p>Click Test SMTP Settings to test your SMTP notification delivery configuration.</p> <ul style="list-style-type: none"> ▪ Email Address: Enter an email address to send the test email notification to. ▪ Subject: Enter a subject for the test email notification. <p>☁ This option is not available in PRTG Hosted Monitor.</p>

SMS Delivery

i Although PRTG has built-in support for the application programming interface (API) of some SMS providers, we cannot officially provide support regarding these SMS service providers. If you have technical questions about SMS delivery beyond PRTG, contact your SMS provider directly.

i Instead of using a preconfigured provider, you can always use a custom URL that enables you to use extended parameters (this is also an alternative when using providers for which we offer preconfigured options).

i You need an internet connection to send text messages via the HTTP API.

■ For information about sending SMS via separate hardware using third-party software, see the Knowledge Base: [How can I send SMS text message notifications via a modem or a mobile phone with PRTG?](#)

Setting	Description
Configuration Mode	<p>Define a mode for the SMS delivery configuration:</p> <ul style="list-style-type: none"> ▪ Disable SMS delivery: Do not use SMS delivery. ▪ Select an SMS provider from a list of providers: Select a provider from a list below. ▪ Enter a custom URL for a provider not listed: Use a different provider and manually enter the service URL below.
Service Provider	<p>This setting is only visible if you select Select an SMS provider from a list of providers above. Select a service provider from the list. Choose between:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ BulkSMS All regions (except South Africa): Enter a User Name and Password below. <ul style="list-style-type: none"> ▫ URL: <code>https://www.bulksms.co.uk:443/eapi/submission/send_sms/2/2.0</code> ▫ Port: 443 ▪ BulkSMS South Africa: Enter a User Name and Password below. <ul style="list-style-type: none"> ▫ URL: <code>https://bulksms.2way.co.za:443/eapi/submission/send_sms/2/2.0</code> ▫ Port: 443 ▪ Agile Telecom: Enter a User Name and Password below. <ul style="list-style-type: none"> ▫ URL: <code>http://agiletelecom.com/smshurricane3.0.asp</code> ▫ Port: 80 ▪ Esendex: Enter a User Name, Password, and Account below. <ul style="list-style-type: none"> ▫ URL: <code>https://www.esendex.com/secure/messenger/formpost/SendSMS.aspx</code> ▫ Port: 443 <p>i Some providers might require a port configuration in your firewall. Use the respective port from the list above.</p>
User Name	This setting is only visible if you select Select an SMS provider from a list of providers above. Enter a user name for the service provider account.
Password	This setting is only visible if you select Select an SMS provider from a list of providers above. Enter a password for the service provider account.
Account	This setting is only visible if you select Select an SMS provider from a list of providers and Esendex above. Enter the account number or the API ID to connect your account if your provider asks you to register. Enter a string or leave the field empty.
Custom URL	<p>This setting is only visible if you select Enter a custom URL for a provider not listed above. From the documentation of your SMS provider, enter the service URL that is used to send SMS messages.</p> <p>Use the following placeholders for the recipient phone number and the text message:</p> <ul style="list-style-type: none"> ▪ %SMSNUMBER ▪ %SMSTEXT

Setting	Description
	<p>i Use the GET method to request the custom URL. POST requests are not supported.</p>
HTTP Authentication	<p>This setting is only visible if you select Enter a custom URL for a provider not listed above. Select if PRTG uses HTTP basic authentication when it calls the custom URL of your SMS provider:</p> <ul style="list-style-type: none"> ▪ Do not use HTTP basic authentication (default) ▪ Use HTTP basic authentication <p>i HTTP basic authentication is necessary if the custom URL reads like https://[username]:[password]@my.custom.sms.provider/.</p>
Custom SNI	<p>This setting is only visible if you select Enter a custom URL for a provider not listed above.</p> <p>Define if PRTG sends the Server Name Identification (SNI) extension to the Transport Layer Security (TLS) protocol along with the HTTP request:</p> <ul style="list-style-type: none"> ▪ Do not send SNI (default): PRTG does not send the SNI when it executes the HTTP action. ▪ Send SNI: PRTG sends the SNI when it calls the target URL. Specify the SNI below.
Encoding for SMS	<p>This setting is only visible if you select Enter a custom URL for a provider not listed above. Define the encoding of the URL string that PRTG sends to your provider:</p> <ul style="list-style-type: none"> ▪ ANSI local system code page (default) ▪ UTF-8 ▪ UTF-16
Virtual Host (SNI)	<p>Enter the SNI name that the endpoint configuration requires. Usually, this is the fully qualified domain name (FQDN) of the virtual host.</p>
Maximum Length of Text	<p>Some SMS providers do not allow SMS messages that exceed a certain amount of characters. PRTG restricts the number of characters according to the length specified in this field. A value of 0 means the SMS is sent at its full length.</p>
Test SMS Settings	<p>Click Test SMS Settings to test your SMS notification delivery configuration.</p> <ul style="list-style-type: none"> ▪ Number: Enter a phone number to send the test SMS notification to. ▪ Message: Enter a message for the test SMS notification.

 The notification methods Send SMS/Pager Message and Execute HTTP Action use the central proxy settings defined for your PRTG core server. For details, see section [Core & Probes](#)⁴²⁰³ (section Proxy Configuration).

 Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

- [PRTG Administration Tool on PRTG Core Server Systems](#)  4347
- [PRTG Administration Tool on Remote Probe Systems](#)  4371

8.12.2.4 Core & Probes

On the Core & Probes tab, you can define settings for the PRTG core server as well as for probe connections if you use remote probes or mini probes.

 If you cannot save changes to Core & Probes settings because you get an Error (Bad Request) with the message [Active Directory Domain not accessible](#), ensure that you provide the correct access type for your domain in section [Active Directory Integration](#)  4207. For example, change Use the PRTG core server service account (usually Local System) to Use explicit credentials and provide correct credentials for the domain. PRTG automatically sets the access type to Use the PRTG core server service account (usually Local System) by default, so you might need to change this.

☁ If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

ⓘ This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Proxy Configuration

☁ This option is not available in PRTG Hosted Monitor.

Setting	Description
Use Proxy Server	<p>We recommend that you use PRTG with a direct internet connection. However, if you need to use a proxy, you can configure the relevant settings here. Choose between:</p> <ul style="list-style-type: none"> ▪ No, use direct connection to the internet (default): Do not use a proxy. Use this setting if a direct internet connection to the PRTG core server system is available. ▪ Yes, in our network a proxy is mandatory: Define proxy settings below. <p>ⓘ Proxy settings are valid for auto-update⁴²⁵⁷, activating the product¹¹⁰, obtaining Geo Maps⁴⁰²⁶ tiles, and for sending out HTTP, push, and SMS text message notifications⁴¹³⁸.</p>
Proxy Server	<p>This setting is only visible if you enable Yes, in our network a proxy is mandatory above. Enter the address of the proxy server that you use for outbound connections. Enter a valid address.</p>
Port	<p>This setting is only visible if you enable Yes, in our network a proxy is mandatory above. Enter the port number of the proxy server that you use for outbound connections. Enter an integer value.</p>
Use Proxy Credentials	<p>This setting is only visible if you enable Yes, in our network a proxy is mandatory above. Determine whether the proxy server needs credentials or not:</p> <ul style="list-style-type: none"> ▪ No, there are no credentials necessary: Do not use credentials for proxy connections. ▪ Yes, the proxy server requires credentials: Define credentials (username and password) below.
User Name	<p>This setting is only visible if you enable Yes, the proxy server requires credentials above. Enter a user name for proxy authentication. Enter a string.</p>

Setting	Description
Password	This setting is only visible if you enable Yes, the proxy server requires credentials above. Enter a password for proxy authentication. Enter a string.

Probe Connection Settings

Setting	Description
Probe Connections IP Addresses	<p>Define how PRTG handles incoming connections from probes:</p> <ul style="list-style-type: none"> Local Probe only, 127.0.0.1 (PRTG is not accessible for remote probes): The PRTG core server^[131] only accepts local probe connections. You cannot use remote probes^[450] with this setting enabled. This is the default setting in PRTG on premises. All IP addresses available on this computer: The PRTG core server accepts incoming connections from remote probes, no matter on which IP address of the PRTG core server they come in. <p>☁ This is the default setting in PRTG Hosted Monitor.</p> <ul style="list-style-type: none"> Specify IP addresses: The PRTG core server accepts incoming connections from remote probes only on the selected IP address(es) of the PRTG core server. In the list, select the IP addresses by adding a check mark in front of the desired IPs. <p>i You can also change this setting in the PRTG Administration Tool on PRTG Core Server Systems^[435].</p> <p>i If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of PRTG Desktop^[427], or of PRTG Apps for Mobile Network Monitoring^[427] are disconnected and reconnected.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Access Keys	<p>Enter a list of access keys for remote probe connections. Enter one access key per line. Every remote probe that wants to connect to this PRTG installation has to use one of these keys.</p> <ul style="list-style-type: none"> For more information on how to set an access key for a remote probe, see section PRTG Administration Tool^[437].

Setting	Description
Allow IP Addresses	<p>Enter a list of remote probe IPs or Domain Name System (DNS) names that are accepted when connecting to this PRTG core server. Enter one IP address or DNS name per line. The local probe (127.0.0.1) is always allowed automatically. PRTG checks the list of allowed addresses before the list of denied addresses.</p> <p><i>[Empty]</i> : An empty field does not allow any remote probes (only the local probe). Enter IP addresses or DNS names to allow remote probe connections.</p> <ul style="list-style-type: none"> ❗ We recommend that you use IP addresses instead of DNS names because DNS name resolution might be cached. ▪ any: Enter the word any to automatically allow all remote probe connections. <p>☁ This is the default setting in PRTG Hosted Monitor.</p> <ul style="list-style-type: none"> ❗ We recommend that you only use this option in intranets in PRTG on premises. ❗ If the IP address of a remote probe changes regularly (for example, because of an internet provider assigning IP addresses dynamically), enter the potential IP range for the remote probe or use the any option. ❗ You can use the PRTG syntax for IP address ranges here. For more information, see section Define IP Address Ranges⁴⁴⁸³.
Deny IP Addresses	<p>Enter a list of remote probe IPs or DNS names that are not accepted when connecting to this PRTG core server. Enter one IP address or DNS name per line. You can use this to explicitly deny connections from remote probes that you do not want to include in your setup either at all or for a certain time.</p> <p>Access to IP addresses or DNS names that you enter in Allow IP Addresses is denied if you enter them here. You can use this to allow access to an IP address range in Allow IP Addresses, but to deny access to a single IP address from this IP address range here. You can use the PRTG syntax for IP address ranges here (see section Define IP Address Ranges⁴⁴⁸³).</p> <ul style="list-style-type: none"> ❗ If you deny the IP address or DNS name of a remote probe, you must restart the PRTG core server to apply your changes. ❗ We recommend that you use IP addresses rather than DNS names, because DNS name resolution might be cached.
Deny GIDs	<p>Enter a list of global IDs (GID) Enter one GID per line. PRTG denies access to matching GIDs. If you remove a remote probe from the device tree or if you deny a remote probe after installation, its GID is automatically entered here. The remote probe is no longer able to connect. Denying GIDs is more precise than denying IPs, where other remote probes at the same location could be excluded, too.</p>

Setting	Description
Connection Security	<p data-bbox="483 371 1348 439">i A GUID is the ID that PRTG attributes to every probe that you include in your monitoring.</p> <p data-bbox="483 483 1348 551">Specify the security level for connections to and from the PRTG core server:</p> <ul data-bbox="483 566 1348 920" style="list-style-type: none"> <li data-bbox="483 566 1348 633">▪ High security (TLS 1.2): The PRTG web server only accepts high security connections from probes. <li data-bbox="483 649 1348 745">▪ Default security (TLS 1.1, TLS 1.2) (recommended): The PRTG web server additionally accepts connections secured with TLS 1.1 from probes. <li data-bbox="483 761 1348 920">▪ Weakened security (SSLv3, TLS 1.0, TLS 1.1, TLS 1.2): If you have probes that do not support high or default security connections because you updated from an older PRTG version, you can use this security level to connect and to update older probes. After updating, we recommend that you use the default or high security setting. <p data-bbox="483 943 1348 1167">i If you set a registry key in previous PRTG versions to override the Secure Sockets Layer (SSL)/Transport Layer Security (TLS) version and cipher suites of PRTG web server or probe connections, the High security setting overrides the registry setting and only TLS 1.2 is allowed. If you select the Default security setting, the registry value overrides the default security setting and the connection security defined in the registry applies.</p> <p data-bbox="483 1189 1348 1379">i If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of PRTG Desktop, or of PRTG Apps for Mobile Network Monitoring are disconnected and reconnected.</p> <p data-bbox="483 1424 1348 1458"> This option is not available in PRTG Hosted Monitor.</p>
Mini Probes	<p data-bbox="483 1536 1348 1659">Define if you want to allow mini probe connections to your PRTG core server. If you want to use mini probes, you need to configure the PRTG web server to accept connections from mini probes here and choose the secure HTTPS server option in the web server settings.</p> <p data-bbox="483 1682 1348 1890">Choose from:</p> <ul data-bbox="483 1682 1348 1890" style="list-style-type: none"> <li data-bbox="483 1682 1348 1749">▪ No Mini Probes: Mini probes cannot connect to the PRTG web server. You are not able to monitor with mini probes if you choose this option. <li data-bbox="483 1765 1348 1890">▪ Allow Mini Probes to connect to the web server: Mini probes can connect to the PRTG web server and use the defined TCP port for the web server for this purpose. The default port for secure connections is 443.

Setting	Description
	<ul style="list-style-type: none"> Allow Mini Probes to connect to an extra port: Mini probes can connect to the PRTG web server via a specific port. Use this if you do not want the whole PRTG web server to be reachable from other networks all the time only because of mini probes. <ul style="list-style-type: none"> SSL/TLS must be enabled on the mini probe port. For more information, see section Mini Probe API⁴⁴⁵⁵. See also the Knowledge Base: Where can I find PRTG Mini Probes which are ready to use? If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of PRTG Desktop⁴²⁷⁵, or of PRTG Apps for Mobile Network Monitoring⁴²⁷⁸ are disconnected and reconnected. This option is not available in PRTG Hosted Monitor.
Mini Probe Port	<p>This setting is only visible if you select Allow Mini Probes to connect to an extra port above. Enter the number of the port for mini probe connections. Ensure that SSL is available on this port.</p> <ul style="list-style-type: none"> If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of PRTG Desktop⁴²⁷⁵, or of PRTG Apps for Mobile Network Monitoring⁴²⁷⁸ are disconnected and reconnected. This option is not available in PRTG Hosted Monitor.

Active Directory Integration

This option is not available in PRTG Hosted Monitor.

Setting	Description
Domain Name	<p>To use the Active Directory integration, enter the name of your local domain. Enter a string or leave the field empty.</p> <ul style="list-style-type: none"> PRTG does not support trusted domains or AD subdomains. For more important notes about AD integration, see section Active Directory Integration⁴³⁸⁶, section Notes and Limitations.

Setting	Description
Domain Access	<p>Define how PRTG performs Active Directory queries:</p> <ul style="list-style-type: none"> ▪ Use domain name: Use the entry in the Domain Name field above. ▪ Specify domain controllers: Use specific domain controllers. Specify the domain controllers below.
Primary Domain Controller	<p>This setting is only visible if you select Specify domain controllers above. Enter the DNS name of the primary domain controller.</p>
Backup Domain Controller (optional)	<p>This setting is only visible if you select Specify domain controllers above. Optionally enter the DNS name of the backup domain controller or leave the field empty.</p>
LDAP Connection Security	<p>Define if you want to use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection to the LDAP server:</p> <ul style="list-style-type: none"> ▪ Use LDAP without connection security: Do not use an SSL/TLS-secured connection. ▪ Use LDAP over SSL: Use an SSL/TLS-secured connection.
Access Type	<p>Define which user account PRTG uses to configure Active Directory (AD) access:</p> <ul style="list-style-type: none"> ▪ Use the PRTG core service account (usually LOCAL SYSTEM): Use the same Windows user account configured for the PRTG core server service. In a default installation, this is the "local system" Windows user account. If this account does not have the right to query all groups of your Active Directory, do not use this option. ▪ Use explicit credentials: Define a user account that PRTG uses to authenticate against the Active Directory. This should be a user account with full access to all of your Active Directory groups. <p>PRTG uses this account to query the AD for available groups.</p>
Access User Name	<p>This setting is only visible if you select Use explicit credentials above. Enter the Windows user account name that PRTG uses to authenticate for Active Directory configuration.</p>
Access Password	<p>This setting is only visible if you select Use explicit credentials above. Enter the password for the Windows user account that PRTG uses to authenticate for Active Directory configuration.</p>

Historic Data Purging

Data purging enables you to automatically delete unnecessary data to free up disk space and improve system performance. You can define different time spans for several kinds of data. Select here for how many days historic data remains accessible.

For more information on storage locations, see section [Data Storage](#).

PRTG Hosted Monitor purges historic data using the default purging limits of PRTG on premises (see the table below). You cannot modify historic data purging limits in PRTG Hosted Monitor.

Setting	Description
Log File Records	<p>Define how long records in the system logfile Log Database.db are kept. Enter a value in days. All entries older than this value are deleted from the logfile automatically. This also affects the content of the Logs tab of monitoring objects like sensors. Keep this value as low as possible to enhance system performance.</p> <p>i The default value is 30 days.</p>
Web Server Log Records	<p>PRTG creates one web server logfile every day. Define how many web server logfiles are kept. Enter a value in days. All web server logfiles older than this value are deleted automatically.</p> <p>i The default value is 30 days.</p>
Historic Sensor Data	<p>Define for how many days historic sensor data is kept for all sensors. It is used to create reports of monitoring data. Enter a value in days.</p> <p>Depending on the used intervals and the number of sensors in your setup, the file containing this data can become large. For smaller installations (up to 500 sensors) a value of 365 is usually fine.</p> <p>i Historic sensor data is the basis for reports on monitoring data. If you decrease this value, less historic monitoring data is available.</p> <p>i The default value is 365 days.</p> <p>i The maximum value is 9999 days.</p>
Toplist Records	<p>Define how long toplist records for xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors are kept. Enter a value in days. We recommend that you use 30 days here.</p> <p>i Old toplist data is deleted automatically as soon as a limit of 2 GB is reached. The oldest data is deleted from the database first.</p> <p>i The default value is 30 days.</p>
Closed Tickets	<p>Define how long tickets that are in status closed are kept. Enter a value in days.</p> <p>i The default value is 365 days.</p>
Reports	<p>Reports generated in PDF format are stored on disk for later reference. Define the maximum age for these reports. Enter a value in days. All reports that are older than this value are deleted automatically.</p>

Setting	Description
	<p> The default value is 365 days.</p>
Configuration Auto-Backups	<p>PRTG creates one backup of your configuration every day. Define the maximum age for these backups. Enter a value in days. All configuration backup files that are older than this value are deleted automatically.</p> <p> The default value is 365 days.</p>
Screenshots of HTTP Full Web Page Sensor	<p>Define how long the screenshots of the HTTP Full Web Page sensor¹²⁷⁷ (PhantomJS browser engine) are kept. Enter a value in days. PRTG deletes older screenshots with every sensor scan.</p> <p> The default value is 10 days.</p>

 Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

Remote Probe Setup

For more information about setting up remote probes, see section [Add Remote Probe](#)⁴⁵⁰¹.

Others

There are some settings that you must make in the [PRTG Administration Tool](#)  4346. For more details, see the sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)  4347
- [PRTG Administration Tool on Remote Probe Systems](#)  4371

8.12.2.5 User Accounts

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

 If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

Administrators can add new user accounts, edit user accounts, and define which user groups that users are members of.

User Accounts Overview

The User Accounts tab shows a list of all user accounts in this PRTG installation and various types of information about each user.

- **Object:** The name of the user account. Click the user account to open its [settings](#)  4212.
- **Type:** The user type, for example, [read-only user](#).
- **Email:** The primary email address of the user account.
- **Primary Group:** The primary group of the user account. Click the user group name to open its [settings](#)  4220.

- **Group Memberships:** All user groups that the user account belongs to.
- **Active/Paused:** The status of this user account. This can be [active](#) or [paused](#).

For more information, see also section [Working with Table Lists](#) ⁴²⁴⁶.

Add User Accounts

You have several options to add user accounts:

-  To add a new user to PRTG on premises, hover over  and select Add User from the menu. The options are almost the same as for editing users.
 -  To add a new user to PRTG Hosted Monitor, click Invite User. The options are almost the same as for editing users, but the initial account password is automatically generated. The new user can change it later. Click Send Invite to save your settings and to send the invitation per email to the defined primary email address.
 - To batch-add several users at once, hover over  and select Add Multiple Users from the menu. In the dialog box that appears, select a [user group](#) ⁴²¹⁹ from the dropdown menu and enter or paste a list of email addresses. Separate them by a space, comma, semicolon, or a new line. Click OK to confirm. For each email address, PRTG creates a new, local user account in the user group, using the email address as value for Login Name, Display Name, and Primary Email Address. A new password is automatically generated and sent to the email address.
 - Access rights to device tree objects, libraries, maps, reports, or the ticket system are defined in user groups. Make sure that the user is a member of the correct user group with the required group access rights.
 - To change a user's account settings, click the user's name in the [list of user accounts](#) ⁴²¹¹.
- i** You cannot delete [predefined](#) objects such as the [PRTG System Administrator](#) user account, the [PRTG Users Group](#), or the [PRTG Administrators](#) group.

User Account Settings

Setting	Description
Login Name	<p>Enter the login name for the user. The following characters are not allowed: ' / [] : ; = , \ + * ? < ></p> <p> This option is not available in PRTG Hosted Monitor.</p>
Display Name	<p>Enter a name that the user recognizes. It is for display purposes only.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Primary Email Address	Enter the user's email address.

Setting	Description
	<p> Make sure that your email client can show HTML emails, otherwise you cannot read emails from PRTG.</p>
Password	<p>Define the user password or decide whether to change a password:</p> <ul style="list-style-type: none"> ▪ Do not change ▪ Specify new password <p> For security reasons, PRTG does not display the password.</p> <p>If you choose to specify a new password, enter the old password, then enter the new password twice.</p> <p> The new password must be at least 8 characters long. It must contain a number and a capital letter. Leading and trailing whitespaces are removed. The password of an administrator can only be changed by the same administrator.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
Passhash	<p>Click Show passhash to display the passhash for the user. The passhash is necessary, for example, when using the PRTG API⁴³⁸⁸.</p> <p> This setting is for your information only. You cannot change it.</p> <p> This option is not available in PRTG Hosted Monitor.</p>

API Access

 These settings are only available in PRTG Hosted Monitor.

Setting	Description
API User Name	<p>Shows the user name of the user account. The user name is necessary when using the PRTG API.</p> <p> This setting is for your information only. You cannot change it.</p>
API Passhash	<p>Click Show passhash to display the passhash of the user. The passhash is necessary when using the PRTG API.</p> <p> This setting is for your information only. You cannot change it.</p>
Generate API Passhash	<p>Click Generate new passhash to reset the passhash of the user.</p>

Account Settings

Setting	Description
User Type	<p>This setting is only visible to administrators. Define the user type.</p> <ul style="list-style-type: none"> ▪ Read/write user: The user can view monitoring results, libraries, maps, reports, and also edit the according settings. In addition, they can add and delete objects, libraries, maps, and reports. The user can acknowledge alarms, edit notification templates, notification contacts, and schedules. ▪ Read-only user: The user can only view monitoring results, libraries, maps, reports, and the according settings. The user can acknowledge alarms and change their own password if allowed. This is a good choice for public or semi-public logins. <p>i Read-only users cannot be members of groups with administrative rights.</p> <p>i This setting is not available for the PRTG System Administrator user account.</p>
Acknowledge Alarms	<p>This setting is only visible if you enable Read-only user above. Acknowledging an alarm is an action that requires write access. However, you can explicitly allow the read-only user to acknowledge alarms^[223]. Choose between:</p> <ul style="list-style-type: none"> ▪ User can acknowledge alarms: Allow the read-only user to acknowledge alarms. ▪ User cannot acknowledge alarms (default): Do not allow the read-only user to acknowledge alarms.
Password Change	<p>This setting is only visible if you select Read-only user above. Define if the user can change their account password or not. If you allow the user to change their account password, this option is available in the My Account^[4123] settings of the user. Choose between:</p> <ul style="list-style-type: none"> ▪ User can change the account password ▪ User cannot change the account password (default)
Primary Group	<p>This setting is only visible to administrators. Select the primary group for the user.</p> <p>i Every user has to be a member of a primary group to make sure there is no user without group membership. Membership in other user groups is optional. For user experience, there is no difference between the primary group and other user groups.</p> <p>Select Create new user group for this user to create a user group for the new user. This option is only visible when you add a new user account. The default name of the new user group is the Display Name of the new user.</p>

Setting	Description
	<p>i You cannot change the primary group of Active Directory users. Users that you add via Active Directory integration can only have the respective Active Directory group as their primary group.</p>
Status	<p>This setting is only visible to administrators. Define the status of the user:</p> <ul style="list-style-type: none"> Active: The user can log in to the PRTG web interface. Paused: The user cannot log in to the PRTG web interface. Use this option to temporarily deny access for this user. <p>i This setting is not available for the PRTG System Administrator user account.</p>
Last Login	<p>Shows the time stamp of the user's last login.</p> <p>i This setting is for your information only. You cannot change it.</p>

Group Membership

Setting	Description
Member of	<p>Shows the user groups that the user is a member of.</p> <p>i This setting is for your information only. You cannot change it.</p>

Web Interface

Setting	Description
Automatic Refresh	<p>Define if you want PRTG to automatically refresh web pages in the PRTG web interface for the user:</p> <ul style="list-style-type: none"> Automatically refresh pages (recommended): PRTG automatically refreshes single page elements on the web pages in the PRTG web interface. Do not automatically refresh pages: PRTG does not automatically refresh web pages in the PRTG web interface.
Refresh Interval (Sec.)	<p>This setting is only visible if you select Automatically refresh pages (recommended) above. Enter the number of seconds that PRTG waits between two refreshes. We recommend that you use 30 seconds or more. The minimum value is 20 seconds.</p>

Setting	Description
Audible Alarms	<p> Shorter refresh intervals create more CPU load on the probe system. If you experience load issues while using the PRTG web interface (or maps ⁴⁰⁹⁵), set a longer refresh interval.</p> <p>Define whether PRTG plays an audible alarm on web pages in the PRTG web interface when there is a new alarm ²²⁸:</p> <ul style="list-style-type: none"> ▪ Do not play audible alarms: PRTG does not play sound files on any web pages. ▪ Play audible alarms on dashboard pages only: When there is a new alarm, PRTG plays a predefined sound on dashboard ²⁷⁸ pages only. PRTG plays the sound with every refresh of the dashboard page if there is at least one new alarm. ▪ Play audible alarms on all pages: When there is a new alarm, PRTG plays a predefined sound on all web pages. PRTG plays the sound with every page refresh if there is at least one new alarm. <p> PRTG only plays audible alarms if the New Alarms value in the global header area ¹⁸⁵ of the PRTG web interface is greater than 0 after a page refresh. PRTG does not consider the number of old alarms.</p> <p> For more information, see the Knowledge Base: Which audible notifications are available in PRTG? Can I change the default sound? and Why are audible alerts in public maps not working in Chrome?</p>
Home Page URL	<p>Define the user's default homepage in the PRTG web interface. This is the page that the user sees after logging in or when selecting Home ²⁷⁸ from the main menu. Enter a PRTG-internal web page.</p>
Time Zone	<p>Define the time zone for the user. Depending on the time zone you select here, PRTG shows the user's local time zone in all data tables and graph legends.</p> <p> PRTG receives the Coordinated Universal Time (UTC) from the system time set on the PRTG core server for this purpose.</p> <p> If you get a warning message about differing time zones, see the Knowledge Base: Why do I get a warning message when time zones differ?</p>
Date Format	<p>Select the date format for the user:</p> <ul style="list-style-type: none"> ▪ Use System Settings: Use the date format of the PRTG core server system. ▪ DD.MM.YYYY HH:MM:SS (24h) ▪ DD.MM.YYYY HH:MM:SS (A.M./P.M.) ▪ MM/DD/YYYY HH:MM:SS (24h) ▪ MM/DD/YYYY HH:MM:SS (A.M./P.M.)

Setting	Description
	<ul style="list-style-type: none"> ▪ YYYY-MM-DD HH:MM:SS (24h) ▪ YYYY-MM-DD HH:MM:SS (A.M./P.M.) <p>i This setting takes effect after the next login.</p>
Color Mode	<p>Select a color mode for the PRTG web interface:</p> <ul style="list-style-type: none"> ▪ Light ▪ Dark

Ticket System

Setting	Description
Email Notifications	<p>Define if the user receives emails from the ticket system:</p> <ul style="list-style-type: none"> ▪ Receive an email when a ticket changes: The user receives an email each time a ticket is assigned to the user or to the user group they are a member of, or if a ticket is changed. <ul style="list-style-type: none"> i If the user edits tickets that are assigned to them or the user group they are a member of, or if they assign a ticket to themselves or their user group, they do not get an email. ▪ Do not receive any emails from the ticket system: The user does not receive any emails from the ticket system.

i Save your settings. If you leave the page, all changes to the settings are lost.

Notification Contacts

On the [Notification Contacts](#) ⁴¹⁶³ tab, you can define contact methods for each user account. Contact methods can be email addresses, phone numbers, or push devices (iOS and Android devices with the corresponding [PRTG app](#) ⁴²⁷⁸).

Comments

On the Comments tab, you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

History

On the History tab, all changes in the settings of an object are logged with a time stamp, the name of the user who made the change, and a message. The history log retains the last 100 entries.

8.12.2.6 User Groups

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

 If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

You define access rights for monitoring objects, libraries, maps, and reports at user group level. This means that group membership determines what a user can do and which monitoring objects, libraries, maps, or reports they can see. This does not apply to read-only users, who always have only read access, no matter what access rights the user group they belong to has. You can define group access rights for each object in the object's settings.

User Groups Overview

The User Groups tab shows a list of all user groups in this PRTG installation and various types of information about each user group.

- Object: The name of the user group. Click it to open its [settings](#) .
- Type: The user group type, for example, a [PRTG user group](#), an [Active Directory group](#), or an [single sign-on \(SSO\) group](#).
- Members: All users that are a member of this user group.
- Primary Group: All users that have this user group as their primary group.
- Active Directory Group: The Active Directory group that the user group is connected to.
- SSO Claim: The access claim for the SSO group that the user group is connected to.

Add User Groups

- To add a new user group to PRTG on premises or to <%P_Pod%>, hover over  and select Add User Group from the menu. The options are almost the same as for editing user groups.
- To change a user group's settings, select it from the list by clicking the group name.
- For each user group you create, PRTG automatically adds a new [group in the device tree](#)  with the name [\[group_name\] home](#).

- For each user group you create, PRTG automatically adds a new [email notification](#) to the [notification templates](#). It has the name `Email to all members of group [group_name]`. The new user group automatically has [read access](#) to the new notification template.
- By default, there are no [access rights](#) defined on objects for a newly created user group. Initially, users in this user group do not see any objects in the device tree except the automatically created `[group_name] home` group for which they have write access. This does not apply if the new user group is an administrator group. Edit the [settings](#) of objects in your device tree, libraries, maps, or reports, and set access rights for the new user group in the Access Rights section.
 - ⓘ The easiest way to set access rights is in the [root group settings](#) and to use the [inheritance of settings](#).
- ⓘ The multi-edit option is not available for the predefined user groups [PRTG Administrators](#) and [PRTG Users Group](#).
- ⓘ You cannot delete predefined objects such as the [PRTG System Administrator](#) user account, the [PRTG Users Group](#), or the [PRTG Administrators](#) group.
- ⓘ If you want to delete an Active Directory group from PRTG, you have to delete all users that are in the user group first. This is because the Active Directory users have this user group as their primary group, and user accounts have to have a primary group.

User Group Settings

Setting	Description
User Group Name	<p>Enter a name for the user group.</p> <p>ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Administrative Rights	<p>Define if user group members have administrative rights:</p> <ul style="list-style-type: none"> ▪ Give user group members administrative rights: Give administrative rights to all user group members. <ul style="list-style-type: none"> ⓘ If you select this option, all user group members have full access to all device tree objects, libraries, maps, reports, and the ticket system. In addition, they can manage user accounts and user groups, and they can change the monitoring configuration of PRTG. ▪ Do not give user group members administrative rights: Access to device tree objects, libraries, maps, and reports for user group members are defined in an object's settings.
Homepage URL	<p>Define the default homepage for users created within this user group. This is the page that the user sees after logging in or when selecting Home from the main menu. Enter a PRTG-internal web page.</p> <p>ⓘ This applies to new users that were either added via Active Directory Integration or using the Add Multiple Users option.</p>

Setting	Description
Active Directory or Single Sign-On Integration	<p>Define whether to connect this user group to external users:</p> <ul style="list-style-type: none"> Do not use Active Directory or single sign-on integration: Do not connect this user group to a user group in your Active Directory or to a single sign-on integration. Use local user accounts instead. Use Active Directory integration: Connect this user group to a user group in your Active Directory. <ul style="list-style-type: none"> For detailed information, see Active Directory Integration⁴³⁸⁵. Use single sign-on integration: Connect this user group to a single sign-on integration. <ul style="list-style-type: none"> For more information, see the Knowledge Base: How to integrate Azure Active Directory into PRTG? <p> You cannot change credentials for users that are members of an Active Directory group.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
Active Directory Group	<p>This setting is only visible if you select Use Active Directory integration above. Select the user group whose members can log in to PRTG using their Active Directory domain credentials from the dropdown menu. The according user accounts have the group access rights¹⁵⁵¹ of the user group you just created.</p> <p> You need to configure a valid Active Directory domain in the Core & Probes⁴²⁰² settings for user groups to appear in the dropdown menu.</p> <p> For detailed information, see Active Directory Integration⁴³⁸⁵.</p> <p>If your Active Directory contains more than 1,000 entries in total, PRTG displays an input field instead of a dropdown menu. This is for performance reasons. In the input field, you can only enter the name of the user group in your Active Directory. PRTG then automatically adds the domain name prefix.</p> <p> PRTG caches the list of the user groups in your Active Directory for one hour. You can update this list earlier by manually clearing the cache via the Administrative Tools⁴²²⁵ by clicking Go! in the Clear Caches section.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
SSO Group Access Claim	<p>This setting is only visible if you select Use single sign-on integration above. Enter the access claim for the SSO group.</p>
User Type	<p>This setting is only visible if you select Use Active Directory integration above. Define the default user access rights for all new users in this user group:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ Read/write user: The user can view monitoring results, libraries, maps, reports, and also edit the according settings. In addition, they can add and delete objects, libraries, maps, and reports. The user can acknowledge alarms, edit notification templates, notification contacts, and schedules. ▪ Read-only user: The user can only view monitoring results, libraries, maps, reports, and the according settings. The user can acknowledge alarms and change their own password if allowed. This is a good choice for public or semi-public logins. <p> ⓘ Read-only users cannot be members of groups with administrative rights.</p> <p> ⓘ If a user logs in to PRTG for the first time using Active Directory credentials, PRTG automatically creates a new, local user account for this user with the user type you define here.</p>
<p>Acknowledge Alarms</p>	<p>This setting is only visible if you enable Read-only user above. Acknowledging an alarm is an action that requires write access. However, you can explicitly allow the read-only user to acknowledge alarms^[229]. Choose between:</p> <ul style="list-style-type: none"> ▪ User can acknowledge alarms: Allow the read-only user to acknowledge alarms. ▪ User cannot acknowledge alarms (default): Do not allow the read-only user to acknowledge alarms.
<p>Allowed Sensors</p>	<p>Define if user group members can create all sensors or only specific sensors:</p> <ul style="list-style-type: none"> ▪ Users can create all sensors: No restrictions for group members apply. ▪ Users can only create certain sensors: Select the allowed sensors from the list of available sensors.
<p>Users Can Create These Sensors</p>	<p>This setting is only visible if you select Users can only create certain sensors above. A list of all available sensors is shown. Select the sensors that user group members can create by adding check marks in front of the respective sensor name.</p> <p> ⓘ You can also select all items or cancel the selection by using the check box in the table header.</p> <p> ⓘ PRTG displays sensors that are in use in bold print.</p> <p> ⓘ This setting does not apply when a user group member runs an auto-discovery^[236]. The auto-discovery adds all sensors that are defined in the used device templates. This setting does also not apply when a user group member adds recommended sensors^[221].</p>
<p>Ticket System Access</p>	<p>Define if user group members can use the ticket system^[240].</p>

Setting	Description
	<ul style="list-style-type: none"> Users can use the ticket system: Users in this user group can read, create, assign, and modify tickets. <ul style="list-style-type: none"> i Group members that are read-only users never have access to the ticket system. Users cannot use the ticket system: The Tickets ²⁸⁸ menu item in the main menu bar is not visible to users in this user group.

Group Members

Setting	Description
Members	This setting is only visible if you select Do not use Active Directory or single sign-on integration above. Define which local user accounts are members of this user group. To add a user account from the list, enable the check mark in front of the user name. The available user accounts depend on your setup.

Primary Group Users

Setting	Description
User List	Shows a list of all user accounts that have this user group as their primary group. This is only shown for your information. You can change the primary group of a user account in the user account's settings ⁴²¹¹ .

i Save your settings. If you leave the page, all changes to the settings are lost.

Comments

On the Comments tab, you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

History

On the History tab, all changes in the settings of an object are logged with a time stamp, the name of the user who made the change, and a message. The history log retains the last 100 entries.

8.12.2.7 Administrative Tools

With the administrative tools, you can start system-specific processes for debugging purposes. Use them if the Paessler support team advises you to do so. You can start the respective processes by clicking Go!.

☁ If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

Administrative Tools For The Core Server

Administrative Tools For The Core Server

<p>Create Configuration Snapshot</p> <p>Saves the current configuration as a .zip file in the Configuration Auto-Backups subfolder in the data directory of your PRTG installation.</p> <p style="text-align: right;">Go!</p>	<p>Write Core Status File</p> <p>Creates a debug file on the core system.</p> <p style="text-align: right;">Go!</p>	<p>Clear Caches</p> <p>Clears the web server's internal caches for Geo Maps, the Active Directory integration, and the Active Directory group list.</p> <p style="text-align: right;">Go!</p>
<p>Load Lookups and File Lists</p> <p>Reloads the lookup files from the lookups\custom folder of the PRTG program directory, and other file lists that are displayed in the web interface, for example, SNMP libraries, device icons, and report templates.</p> <p style="text-align: right;">Go!</p>	<p>Recalculate PRTG Graph Data Cache</p> <p>The recalculation requires a restart of the PRTG core server service.</p> <p style="text-align: right;">Go!</p>	<p>Restart PRTG Core Server Service</p> <p>Restarts the PRTG core server service.</p> <p style="text-align: right;">Go!</p>
<p>Reload Logging Configuration</p> <p>Apply changes to the logging configuration to all PRTG modules.</p> <p style="text-align: right;">Go!</p>		

PRTG Core Server Administrative Tools

Setting	Description
<p>Create Configuration Snapshot</p>	<p>Create a snapshot of your PRTG configuration. This action can take up to 100 seconds. Once finished, you find a .zip file that contains a *.dat file in the \Configuration Auto-Backups subfolder of the PRTG data directory⁴⁵²⁶. The .zip file follows the name pattern PRTG Configuration (Snapshot YYYY-MM-DD HH-MM-SS).zip.</p> <p>i If you run PRTG in a cluster, this action is executed on the cluster node you are logged in to.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>

Setting	Description
Write Core Status File	<p>Create status files of your PRTG core server. You find the two text files in the \Logs\debug subfolder of the PRTG data directory. The files are named Core State (Global Debug Data).txt and Core State (Memory Debug Data).txt. New files are created each time you click Go!.</p> <p> If you run PRTG in a cluster, this action is executed on the cluster node you are logged in to.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
Clear Caches	<p>PRTG caches tiles for Geo Maps, user data for Active Directory Integration, and the Active Directory Group list. Click Go! to delete the cache if you encounter broken Geo Maps tiles, if you changed a user's password in the Active Directory, or if you added groups in the Active Directory.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
Load Lookups and File Lists	<p>(Re)load the lookup files from the \lookups\custom subfolder of the PRTG program directory. In this subfolder, your customized lookup files are stored. If you have created a new lookup file or changed something in a lookup file, it might be necessary to load or to reload these files.</p> <p>With this option, you can also manually reload file lists in the PRTG web interface. If you have added new device icons, device templates, report templates, .oidlib files for the SNMP Library sensor, or language files to the PRTG program directory on the PRTG core server system while the server was running, reloading the file lists might be necessary to display new files in the PRTG web interface.</p> <p> Usually you do not have to reload file lists manually. A list is automatically reloaded when opening the according settings page with a latency of 10 seconds. If you save new device templates via the PRTG web interface, the template list is refreshed immediately.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
Recalculate PRTG Graph Data Cache	<p>PRTG constantly writes monitoring data to disk and keeps the graphs for your graph tabs in memory. If PRTG is ended unexpectedly, the graph cache might become corrupted. In this case, graphs might be empty or show wrong data.</p> <p>If you experience graph display problems, a graph recalculation fixes the problem. Click Go! to delete the data cache file and recalculate it automatically.</p>

Setting	Description
	<p>i If you apply recalculation, PRTG needs to restart the PRTG core server. Because of this, all users of the PRTG web interface, of PRTG Desktop^[4275], or of the PRTG apps for iOS or Android^[4278] are disconnected. After clicking Go!, a dialog window appears that asks you to confirm the required restart. Click OK to trigger the restart.</p> <p>i Directly after this action, your graphs are empty. They are refilled successively while recalculation in the background progresses. Until recalculation is finished, performance of the PRTG web interface might be affected because of high disk input/output (I/O) activity.</p>
Restart PRTG core server service	<p>Restart the PRTG core server service manually. Click Go! for this purpose.</p> <p>i If you restart the PRTG core server service, all users of the PRTG web interface, of PRTG Desktop, or of the PRTG apps for iOS or Android are disconnected. Clicking Go! immediately restarts the PRTG core server service.</p> <p>i If you want to schedule an automatic restart of Windows services for both PRTG core server service and PRTG probe service, you can do this in the corresponding probe settings^[409].</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Reload Logging Configuration	<p>For debugging reasons, it might be necessary to change the log levels of your PRTG core server. The Paessler support team takes you through the necessary steps that are required to change your logging configuration. The log level changes vary according to your PRTG instance, its setup, and the solution of your issue.</p> <p>To apply the changes, load them by clicking Go!.</p>

Administrative Tools For Probes

Administrative Tools For Probes

<p>Write Probe Status Files</p> <p>Creates a set of debug files on all probe systems.</p> <p style="text-align: center;"><input style="border: 1px solid #ccc; padding: 5px 15px; color: #007bff; text-decoration: none; cursor: pointer; margin-top: 10px;" type="button" value="Go!"/></p>	<p>Restart All Probes</p> <p>Restarts all probe services. For disconnected probes, please use the PRTG Administration Tool on the respective probe system to start the probe service.</p> <p style="text-align: center;"><input style="border: 1px solid #ccc; padding: 5px 15px; color: #007bff; text-decoration: none; cursor: pointer; margin-top: 10px;" type="button" value="Go!"/></p>

Probe #1 "Local Probe"

connected from: 127.0.0.1:49899
 Last Data: 12.06.2019 12:51:13 (1 sec ago) (W. Europe Standard Time)
 .NET Framework Support: Installed: 4.7.2 or later

Probe Administrative Tools

Setting	Description
Write Probe State Files	<p>Create status files of your probes. PRTG writes status files for the local probe running on the PRTG core server (in a cluster, on the cluster node you are logged in to) as well as for all configured remote probes (if any).</p> <p>On the respective systems, you find six text files in the \Logs\debug subfolder of the PRTG data directory. The files are named Probe State (Global Debug Data).txt, Probe State (Memory Debug Data).txt, Probe State (Scheduler Debug Data).txt, Probe State (Syslog).txt, Probe State (Trap).txt, and Probe State (xFlow Debug Data).txt. New files are created each time you click Go!.</p>
Restart All Probes	<p>Restart all probes as well as the local probe Windows service. If you have remote probes ⁴⁵⁰¹, the probe Windows services on the remote probe systems are restarted as well. To restart single probes only, see below.</p> <p>i You cannot restart disconnected probes here. Use the PRTG Administration Tool ⁴³⁴⁶ on the probe system to start a disconnected probe.</p> <p>i If you run PRTG in a cluster, this action is executed on the cluster node you are logged in to.</p> <p>In this case, remote probes are only restarted if you are logged in to the primary master node. The cluster probe Windows service of failover nodes is not restarted if you execute this action on the primary master node. If you want to restart the cluster probe Windows service of a failover node, log in to the PRTG web interface of this failover node and click Go! there.</p>
Probe [#Number] "[Name]"	<p>This section shows information about the connection status. If the probe is connected, the field shows the source IP address and port number used by the probe. For the local probe, the IP address is always 127.0.0.1. You also see information about the date when the last data packet was received from the probe.</p> <p>If you want to restart a single probe, click the corresponding Restart Probe button. Entries for every single probe follow.</p> <p>i You cannot restart disconnected probes here. Use the PRTG Administration Tool ⁴³⁴⁶ on the probe system to start a disconnected probe.</p> <p> This option is not available on the hosted probe of a PRTG Hosted Monitor instance.</p>

Others

There are some settings that you must make in the [PRTG Administration Tool](#) . For more details, see the sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#) 
- [PRTG Administration Tool on Remote Probe Systems](#) 

8.12.2.8 Cluster

During the [failover cluster configuration](#) , the cluster settings were predefined. You can change other cluster-related settings here. See the [cluster status](#)  to see if all cluster nodes are properly connected.

 This feature is not available in PRTG Hosted Monitor.

 If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

Cluster Node Setup

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

In the table of the cluster settings, the information for each cluster node is written in one line.

Setting	Description
Node Name	<p>Enter the name of the cluster node (for display purposes).</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Node ID	<p>The ID is unique for every cluster node.</p> <p>i We recommend that you use the default value.</p>
Node State	<p>Set the state for each failover node:</p> <ul style="list-style-type: none"> ▪ Active: Set the failover node to active. ▪ Inactive: Set the failover node to inactive. It is then disabled in the cluster configuration. It is then not an active part of the cluster and does not appear in the cluster status anymore. <p>i This setting is not available for the master node of a cluster. The master node is always set to Active.</p>
IP Addresses/DNS Names Used for Connections Between Nodes	<p>Define the IP addresses or Domain Name System (DNS) names that are used for the connections between the cluster nodes. You can enter different values for every node–node connection.</p> <p>For example, in the field #2 => #1, enter the address under which the master node is reachable from the second cluster node. Usually, this is the IP address or DNS name of the master node. Do this for all available cluster node connections, for example, if you run three cluster nodes, enter the address under which the second cluster node is reachable from the third cluster node into the field #3 => #2.</p> <p>■ See also section Failover Cluster Step by Step, Step 4⁴⁵²¹ and following.</p> <p>i If you use remote probes⁴⁵⁰³ outside your local network or outside your network address translation (NAT), ensure that the IP addresses or DNS names you enter here are valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. These addresses must not be private and have to be reachable from the outside, otherwise your remote probes are not able to connect.</p>

 Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

 For how to set a cluster node into Maintenance Mode, see section [Cluster Status](#) .

 The entire setup process for a cluster requires several different steps. For more information and step-by-step guidance, see section [Failover Cluster Configuration](#) .

8.12.2.9 Single Sign-On

i This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

☁ If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

With the single sign-on (SSO) settings, you can select an SSO provider and configure other related settings.

i You must first configure Azure Active Directory accordingly before you can integrate it into PRTG for SSO. For example, you must register PRTG as an application. For more information, see the Knowledge Base: [How to integrate Azure Active Directory into PRTG?](#)

Single Sign-On Settings

Setting	Description
SSO Login	<p>Define if you want to enable login via SSO:</p> <ul style="list-style-type: none"> ▪ Disable (default) ▪ Enable
Provider	<p>This setting is only visible if you select Enable above. Select an SSO provider from the dropdown list:</p> <ul style="list-style-type: none"> ▪ Azure Active Directory: Use Azure Active Directory as the SSO provider.
Configuration Endpoint	<p>This setting is only visible if you select Enable above. Enter the configuration endpoint URL in the following format:</p> <pre>https://login.microsoftonline.com/<tenant-ID>/v2.0/.well-known/openid-configuration</pre> <p>i Click Load Configuration to automatically fill in the values for Authorization Endpoint, Token Endpoint, JSON Web Key Set (JWKS) URI, and Issuer. If this does not work, then manually enter the values.</p>

Setting	Description
Authorization Endpoint	<p>This setting is only visible if you select Enable above. Enter the entire endpoint URL for authorization purposes, not only the server part. For example:</p> <pre>https://login.microsoftonline.com/<tenant-ID>/oauth2/v2.0/authorize</pre> <p>i Make sure to replace <tenant-ID> with the directory (tenant) ID from Azure Active Directory.</p>
Token Endpoint	<p>This setting is only visible if you select Enable above. Enter the entire token endpoint URL, not only the server part. For example:</p> <pre>https://login.microsoftonline.com/<tenant-ID>/oauth2/v2.0/token</pre> <p>i Make sure to replace <tenant-ID> with the directory (tenant) ID from Azure Active Directory.</p>
JSON Web Key Set (JWKS) URI	<p>This setting is only visible if you select Enable above. Enter the URI of the JSON Web Key Set (JWKS), not only the server part. For example:</p> <pre>https://login.microsoftonline.com/<tenant-ID>/discovery/v2.0/keys</pre> <p>i Make sure to replace <tenant-ID> with the directory (tenant) ID from Azure Active Directory.</p>
Issuer	<p>This setting is only visible if you select Enable above. Enter the SSO issuer. For example:</p> <pre>https://login.microsoftonline.com/<tenant-ID>/v2.0</pre> <p>i Make sure to replace <tenant-ID> with the directory (tenant) ID from Azure Active Directory.</p>
Scope	<p>This setting is only visible if you select Enable above. Enter the scope for SSO. For example:</p> <pre>openid profile offline_access email api://<client-ID>/AnAPIName</pre> <p>i Make sure to replace <client-ID> with the application (client) ID from Azure Active Directory.</p>
Application (Client) ID	<p>This setting is only visible if you select Enable above. Enter the application (client) ID from Azure Active Directory.</p>
Client Secret	<p>This setting is only visible if you select Enable above. Enter the client secret to verify the integrity of the SSO token.</p>
Endpoint Handling	<p>This setting is only visible if you select Enable above. Define whether to select the callback from a list of callbacks or to manually enter a callback:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ Select from a list of endpoints (default): Select an endpoint from a list of available endpoints. ▪ Manually enter a URL: Manually enter an endpoint URL below. <ul style="list-style-type: none"> ❗ You need to enter a manual callback if you access PRTG via a different DNS name. For example, if you access PRTG via myPRTG.example.com but the actual DNS name of the PRTG core server is myPRTG.internal.example.com, you need to enter a manual callback.
Available Callback URLs	<p>This setting is only visible if you select Enable and select Select from a list of endpoints (default) above. This list shows the available callbacks of this PRTG instance. Select the callbacks that your users use to connect to PRTG.</p> <p>❗ If you define an HTTPS endpoint in this field, you need to configure the HTTPS endpoint as a valid redirection URI in your SSO provider's settings.</p>
External Callback URL	<p>This setting is only visible if you select Enable and select Manually enter a URL above. If you access PRTG via a different DNS name, define the HTTPS endpoint.</p> <p>This is necessary if the DNS name that you configured under Setup System Administration User Interface does not appear in the Available Callback URLs list. For example, if you access PRTG via myPRTG.example.com but the actual DNS name of the PRTG core server is myPRTG.internal.example.com, then enter myPRTG.example.com.</p> <p>❗ If you define an HTTPS endpoint in this field, you need to configure the HTTPS endpoint as a valid redirection URI in your SSO provider's settings.</p>
Available Callback URLs (for reference)	<p>This setting is only visible if you select Enable and select Manually enter a URL above. This list shows the available callbacks URLs of this PRTG instance for reference purposes.</p>
Test Single Sign-On Authorization Endpoint	<p>Click Test Single Sign-On Authorization Endpoint to call the authorization endpoint to check if starting the single sign-on process will succeed.</p> <p>❗ In case of errors, check the answer from the endpoint.</p>

❗ Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

Notes and Restrictions

- SSO is not available for the [Freeware Edition](#)²¹.
- SSO users do not have access to the [PRTG API](#)⁴³⁸⁹. Because of this, SSO users can also not create [PDF reports](#)⁴⁰⁸⁸.

- When an SSO user [logs in to the PRTG web interface](#)^[164], PRTG automatically creates a corresponding local account on the PRTG core server.
- Changing the Login Name in PRTG for SSO users is not supported
- By default, no access rights for monitoring objects, libraries, maps, or reports are set for the new user group in PRTG. This is why, initially, users in this user group do not see monitoring objects, libraries, maps, or reports. This does not apply if the new user group has administrative rights. Edit the monitoring [object's settings](#)^[226] and the settings of libraries, maps, and reports, and set access rights for your newly created user group in the respective Access Rights section.
 - ❶ The easiest way is to set these access rights in the [root group settings](#)^[366] and use the [inheritance of settings](#)^[142].
- A local user account for an SSO user is only created if this SSO user has successfully logged in to PRTG. If you want to send [email notifications](#)^[4138] to an SSO group in PRTG, using the option Send to User Group in the notification settings, a member of this SSO group has to log in to PRTG at least once to receive email notifications. To avoid this, enter the email address of the SSO group in the Send to Email Address field in the notification settings and select None for the Send to User Group option.
- If you want to delete an SSO group from PRTG, you have to delete all users that are in this user group first. This is because SSO users always have this user group set as their primary group, and user accounts cannot be without a primary group.
- If a license is not valid, is temporarily unavailable, or is being updated, SSO does not work during this time.
- SSO users cannot log on to a failover node in a cluster.

How to integrate Azure Active Directory into PRTG?

- <https://kb.paessler.com/en/topic/88527>

8.12.3 PRTG Status

To view the status of your PRTG installation, select Setup | PRTG Status from the [main menu bar](#)⁴²⁸⁹. Select the various tabs to change the different settings.

You can view the following aspects of the PRTG status:

- [System Status](#)⁴²³⁶
- [Cluster Status](#)⁴²⁴⁸

8.12.3.1 System Status

System Status

Click the System Status tab to view relevant system information. You might need this data for debugging or when you contact the Paessler support team. They ask you in some cases to provide system status information to analyze your issues with PRTG. Furthermore, this page shows interesting usage statistics. Use the links at the top of the page for quick access to status information.

In this section:

- [Software Version and Server Information](#)⁴²³⁷
- [License Information](#)⁴²³⁸
- [System Startup Log](#)⁴²³⁹
- [System Warnings](#)⁴²³⁹
- [Cluster Status](#)⁴²³⁹
- [Local Status](#)⁴²³⁹
- [Cluster Connections](#)⁴²⁴⁰
- [Core System Memory](#)⁴²⁴⁰
- [Thread Information](#)⁴²⁴⁰
- [Activity History](#)⁴²⁴⁰
- [Auto-Discovery Tasks](#)⁴²⁴¹
- [Background Tasks](#)⁴²⁴¹
- [Database Objects](#)⁴²⁴²

- [System Settings](#)⁴²⁴⁴
- [Web Server Activity](#)⁴²⁴⁵

▪ [Synchronization](#) 

Software Version and Server Information

Category	Description
PRTG Version	Shows the exact version of the build your PRTG installation is running on.
Auto-Update Status	Shows the latest auto-update message available from the auto-update  . For example, the message indicates any updates ready to be installed.  This information is not displayed in PRTG Hosted Monitor.
Operating System	Shows the exact Windows version build and service packs, the number and kind of CPUs, and the computer name of the PRTG core server system.  If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.  When running PRTG on virtual systems, some of the mentioned values might not be available.  This information is not displayed in PRTG Hosted Monitor.
Server Time	Shows the date and time of the PRTG core server system.  If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.
Server CPU Load	Shows the CPU load of the PRTG core server system.  If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.
User Name	Shows the user name  of the user account that you are logged in with.
Active User Sessions	Shows the usernames of all user accounts that are logged in.  When a user account logs out, it takes up to 1 minute until the user name disappears.
Browser	Shows the name and user agent string of the browser you are viewing this page with.

License Information

Setting	Description
License Status	<p>Shows the activation status of this installation of PRTG. Usually, PRTG completes the activation automatically during installation or when you change your license information. Only if PRTG cannot connect directly to the internet, is a manual activation necessary.</p> <p>■ For more information, see section Activate the Product^[110].</p>
License Name	<p>Shows the owner of the license^[107] that you use for this installation of PRTG, for example ExampleOrganization. License Name, license key, and system ID together build your license information.</p> <p>ⓘ You can find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name, for which you might be asked while installing PRTG or when you change your license key^[107].</p>
License Key	<p>Shows the license^[107] key that you use for this installation of PRTG. License Name, license key, and system ID together build your license information.</p>
System ID	<p>The system ID is a fixed value that is automatically assigned to your PRTG installation.</p>
Licensed Edition	<p>Shows the PRTG edition that you use for this installation of PRTG. This determines how many sensors you can use in your monitoring (see below).</p>
Last Update	<p>Shows the date of the last update for this PRTG installation. We recommend that you use the auto-update^[4257].</p>
Maintenance until	<p>Shows the expiration date and the days remaining for your active maintenance contract. You can buy maintenance for each PRTG license. With an active maintenance contract, you can download any available updates and use our premium email support.</p> <p>ⓘ This information is not visible in Paessler PRTG Enterprise Monitor.</p>
Number of Sensors	<p>Shows the number of sensors you can use in your monitoring with your edition of PRTG. If you reach the limit, PRTG automatically sets each new sensor that you add to a Paused status^[197]. To upgrade your license right now, click Need more sensors? Click here to upgrade! to visit our web shop.</p>

Setting	Description
	<p>Editions that allow an unlimited number of sensors do not restrict the number of possible sensors by license, so you can create sensors until the performance limit²⁸ is reached. This means that you can use about 10,000 sensors per PRTG core server (depending on your system's performance, sensors, and scanning intervals).</p> <p>■ For more information, see section System Requirements²³.</p>

System Startup Log

Shows the log information created during the last startup of the PRTG core server.

i If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.

System Warnings

If there are any warnings, PRTG shows them here. Usually, you see [None](#).

Cluster Status

This setting is only visible if you have a [cluster](#)¹³⁵. This section lists all of your cluster nodes.

Category	Description
Node [Number]	<p>Shows the name and type of the cluster node (primary node or secondary node) and its status (current master node or failover node). Additionally, all connections from this cluster node to the other cluster nodes are shown.</p> <p>■ For more information, see section Cluster Status⁴²⁴⁸.</p>

Local Status

This setting is only visible if you have a [cluster](#)¹³⁵. This section lists information about the cluster node that you are logged in to.

Category	Description
Server State	Shows the name of the cluster node and its status (current master node or failover node).

Category	Description
Cluster Messages	Shows internal summary information about the cluster node and the communication between the cluster nodes. You might be asked about this by the Paessler support team.

Cluster Connections

This setting is only visible if you have a [cluster](#)¹³⁵. This section lists information about the connections between the cluster nodes.

Category	Description
State of Local Node	Shows the treversion and size of the server volume, both types of internal system information.
State of Cluster Members	For each cluster node, the name and IP address is shown, as well as a state cyclic redundancy check (CRC) code, the time stamp of the last "keep alive" signal sent, the size of the buffer, and the remote IP address.
Message State of Cluster Members	For each cluster node, the name and unique identifier is shown, as well as the connection state, and statistics about the cluster message system that is used for the communication between the cluster nodes.

Core System Memory

Shows machine-oriented information regarding the memory usage of the PRTG core server system.

i If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.

■ For more information, see the Knowledge Base: [What do the PRTG core memory parameters mean?](#)

Thread Information

Shows machine-oriented information regarding the threads running on the PRTG core server system.

i If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.

Activity History

The Activity History shows how busy PRTG was for you in the past. The graphs indicate the number of activities in the last 365 days. Below the graphs, you see statistics about the past day.

Category	Description
Sensor Scans	Shows how often all sensors refreshed their data in the past.
Sensor Status Changes	Shows how often the sensor states changed in the past.
Notifications Sent	Shows how many notifications PRTG sent out in the past.
Reports Generated	Shows how many reports PRTG created in the past.
Page Views	Shows how often pages in the PRTG web interface were opened in the past.
Sensors	Shows how many sensors existed in the past.
Devices	Shows how many devices existed in the past.
Reports	Shows how many reports existed in the past.
Maps	Shows how many maps existed in the past.

Auto-Discovery Tasks

Category	Description
Running	Shows the number of auto-discovery tasks that are running. A high number of auto-discovery tasks can negatively influence system performance.

Background Tasks

Category	Description
Historic Data	Shows if PRTG is recalculating the historic data cache in the background. If so, you see the tasks to do until done. Usually, this calculation is done after every PRTG core server restart.

Category	Description
Toplist Buffer	When using xFlow (NetFlow, iFlow, sFlow, IPFIX) or Packet Sniffer sensors, PRTG stores Toplist data. The data stream received is buffered and written to the data directory of the PRTG core server system. Depending on the number and size of the data stream as well as the hard disk and system performance of the PRTG core server system, the buffer size can rise. When reaching a buffer size of 500, Toplist data is dropped, which can lead to incorrect Toplist values for the sensors.
Similar Sensors Detection	Shows the status and the selected setting for the analysis depth of the similar sensors analysis.
Recommended Sensors Detection	Shows the status of the detection engine and the tasks of the recommended sensors detection .

Database Objects

Shows statistic information about your monitoring configuration. This information might be necessary when contacting the Paessler support team.

Category	Description
Probes	Shows the total number of probes in your installation.
Groups	Shows the total number of groups in your installation.
Devices	Shows the total number of devices in your installation.
Sensors	Shows the total number of sensors in your installation.
Channels	Shows the total number of channels in your installation.
User Groups	Shows the total number of user groups in your installation.
Users	Shows the total number of users in your installation.
Notifications	Shows the total number of notifications in your installation.
Schedules	Shows the total number of schedules in your installation.
Maps	Shows the total number of created maps in your installation.
Libraries	Shows the total number of created libraries in your installation.

Category	Description
Reports	Shows the total number of reports in your installation.
Bitfield/Boolean/Integer/R ange Lookups	Shows the total number of used lookups by lookup type ⁴⁴⁹³ .
Requests/Second	Shows a value calculated from the total number of sensors and the average scanning interval configured. This number indicates how many monitoring requests per second are sent from the probes to the devices in your network. There are no general guidelines on what a "good" value is here. This depends on the sensors used as well as on your system's performance.

Sensors by Performance Impact

Shows all sensors used in your configuration in order of performance impact (from very low to very high). If the CPU load of the probe system is very high, you can see which sensors might be causing this issue. Consider the recommended number of sensors in the respective [sections](#) ⁴⁷⁶ for sensors with high and very high performance impact.

- ❗ In the list, internal short names are used for sensors instead of the official designations.
- ❗ You can also see the performance impact of a sensor on the sensor's Overview tab or in the [Add Sensor](#) ³⁶² dialog.
- For an overview list of sensors sorted by performance impact, see section [List of Sensors by Performance Impact](#) ⁴⁶⁷².

Sensors by Interval

Shows all sensors used in your configuration in order of scanning interval. Choose reasonable scanning intervals for sensors that can affect the system performance. See the respective [sections](#) ⁴⁷⁶ for sensors for more information.

- ❗ In the list, internal short names are used for sensors instead of the official designations.

Probes

This section lists all probes configured in your monitoring setup. If there are no remote probes configured, only the local probe or the hosted probe appears in the list, which always runs on the PRTG core server.

- ❗ If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.

Remote probes (if any) are only shown when you are logged in to the primary master node. When logged in to a failover node, the cluster probe on this cluster node appears as local probe.

Category	Description
Probe [#Number] "[Name]"	<p>Information about the connection status is shown. If the probe is connected, the field shows the source IP address and port number used by the probe. For the local probe, the IP address is always 127.0.0.1. You also see information about the date when the last data packet was received from the probe.</p> <p>If you want to restart a single probe, open the Administrative Tools Settings .</p>

System Settings

Category	Description
Web Server URL	<p>Shows the URL to access the PRTG web interface .</p> <p> If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.</p>
Web Server IP Addresses	<p>Shows all IP addresses that the PRTG web server runs on.</p> <p> If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.</p>
Web Server Ports	<p>Shows the port that the PRTG web server runs on.</p> <p> If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.</p>
Web Server Port Usage	Shows the number of ports used by the PRTG web server.
SSL/TLS Versions for Web Server	Shows the Secure Sockets Layer (SSL)/Transport Layer Security (TLS) versions used for connections from and to the PRTG web server. This is only shown if you use an SSL/TLS-secured connection.
Web Server Ciphers	Shows the ciphers used by the PRTG web server. This is only shown if you use an SSL/TLS-secured connection.
SSL/TLS Versions for Probe Port	Shows the SSL/TLS versions used for the probe port.
Probe Ciphers	Shows the ciphers used for the remote probe connection.
DH Parameters Size	Shows the length of the Diffie-Hellman (DH) parameters. This is only shown if you use an SSL/TLS-secured connection.

Category	Description
Incoming Probe Connection Binding	Shows a combination of the two values below.
Incoming Probe Connection IP Addresses	Shows a list of all IP addresses on which PRTG listens for incoming remote probe connections. This is the same information as shown in the Core & Probes settings. 0.0.0.0 means that the PRTG core server listens on all local network adapter IPs.
Incoming Probe Connection Port	Shows the port number on which the PRTG listens for incoming remote probe connections. The default port is 23560.
Probe Allow IP Addresses	Shows all source IP addresses that PRTG accepts for incoming remote probe connections. This is the same information as shown in the Core & Probes settings and you can change it there. any means that all remote probe connections are accepted, regardless of the IP address of the remote probe system.
Probe Deny IP Addresses	Shows all source IP addresses that PRTG denies for incoming remote probe connections. This is the same information as shown in the Core & Probes settings and you can changed it there. Denied IPs are superior to allowed IPs. If this field is empty, there are no denied IPs. <i>i</i> PRTG automatically adds the IP address of a remote probe system to this list when you delete a remote probe from your device tree .
Data Path	Shows the path where PRTG stores its configuration, monitoring database, etc. To change this setting, open the PRTG Administration Tool on the PRTG core server system (or of the respective cluster node, if applicable). <i>i</i> If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.

Web Server Activity

Shows statistics about the web server since the last startup. All values are reset when the PRTG core server is restarted.

i If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.

Category	Description
Time Since Startup	Shows the time that has passed since the PRTG web server was started.

Category	Description
Page Views	Shows the total number of page views on this PRTG core server.
Geo Maps	Shows the total number of geographical maps shown on this PRTG core server.
HTTP Requests	Shows the total number of HTTP requests to this PRTG core server.
HTTP Requests > 500/1000/5000 ms	Shows for how many (percent) of the HTTP requests above the page delivery took longer than 500, 1,000, or 5,000 milliseconds (ms).
Slow Request Ratio	Shows a calculated number of the HTTP request values above. The lower this number is, the faster the PRTG web interface is.

Synchronization

The PRTG core server holds the configuration of the entire monitoring setup and deploys it to the probes. This section shows statistics about the synchronization of the PRTG core server with the local probe and all connected remote probes (if any), since the last startup of the PRTG core server. All values shown here are reset when the PRTG core server is restarted.

- i** If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.
- i** You must log in to the primary master node to see synchronization data for remote probe connections.

Category	Description
Last Synchronization with a Probe	Shows the time stamp of the last probe synchronization, and if there is still something to do.
Probe/Core Message Count	Shows the total number of messages sent between the PRTG core server and probes, as well as a calculated message speed value.
Raw Buffer Count	Shows the number of raw buffers and a corresponding status indicator.
Configuration Requests Sent	Shows the total number of configuration requests and the requests that still have to be sent.
Configuration Requests Deleted	Internal debug information. Usually, this value is 0.
Configuration Requests With Response	Internal debug information. Usually, this value is 0.

Cluster Status Tab

Click the Start Maintenance Mode link to put a cluster node in maintenance mode. A cluster node in this mode is still connected to the cluster, but its monitoring results are discarded until you click the Stop Maintenance Mode link. You can use this functionality to explicitly exclude a cluster node from monitoring if you know that the monitoring values are not accurate, for example, because you are reconfiguring the server. During maintenance, a cluster node is displayed with a transparent color in the overview graphic.

 On the Cluster Status tab, you do not see if your [remote probes are connected to failover nodes](#) . Connect to your failover nodes and explicitly check if remote probes are connected (for example, in the device tree of the PRTG web interface on a cluster node).

 For more information about cluster settings, see section [Cluster](#) .

 This feature is not available in PRTG Hosted Monitor.

8.12.4 License Information

To view information about your license and to enter your license key, select Setup | License Information from the [main menu bar](#) ^[289].

☁ This option is not available in PRTG Hosted Monitor.

You can view the following aspects of your PRTG license:

- [Status](#) ^[4251] tab
- [Log](#) ^[4252] tab
- [Update Your License](#) ^[4252]

☁ If 15 minutes (900) seconds have passed since your last credential-based login and you open a system administration page from a different system administration page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

ⓘ This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Status

Click the Status tab to view information about your license.

License Information

Setting	Description
License Status	Shows the activation status of this installation of PRTG. Usually, PRTG completes the activation automatically during installation or when you change your license information. Only if PRTG cannot connect directly to the internet, is a manual activation necessary. ■ For more information, see section Activate the Product ^[110] .
License Name	Shows the owner of the license ^[107] that you use for this installation of PRTG, for example ExampleOrganization . License Name, license key, and system ID together build your license information. ⓘ You can find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name, for which you might be asked while installing PRTG or when you change your license key ^[107] .

Setting	Description
License Key	Shows the license ^[107] key that you use for this installation of PRTG. License Name, license key, and system ID together build your license information.
System ID	The system ID is a fixed value that is automatically assigned to your PRTG installation.
Licensed Edition	Shows the PRTG edition that you use for this installation of PRTG. This determines how many sensors you can use in your monitoring (see below).
Last Update	Shows the date of the last update for this PRTG installation. We recommend that you use the auto-update ^[4257] .
Maintenance until	Shows the expiration date and the days remaining for your active maintenance contract. You can buy maintenance for each PRTG license. With an active maintenance contract, you can download any available updates and use our premium email support.  This information is not visible in Paessler PRTG Enterprise Monitor.
Number of Sensors	Shows the number of sensors you can use in your monitoring with your edition of PRTG. If you reach the limit, PRTG automatically sets each new sensor that you add to a Paused status ^[197] . To upgrade your license right now, click Need more sensors? Click here to upgrade! to visit our web shop. Editions that allow an unlimited number of sensors do not restrict the number of possible sensors by license, so you can create sensors until the performance limit ^[28] is reached. This means that you can use about 10,000 sensors per PRTG core server (depending on your system's performance, sensors, and scanning intervals).  For more information, see section System Requirements ^[23] .

Log

Click the Log tab to show a [table list](#)^[246] of all system log entries with all messages and status changes regarding your license.

Change and Update License Information

Use the following buttons to edit your license or refresh your maintenance information.

- **Get Maintenance:** Click to open the Paessler shop and extend your maintenance for PRTG on premises installations. This button is **only** visible to users of a commercial license.

- Deactivate this License: If you want to use the license of a PRTG installation on a different computer, click this button to deactivate the license. This is necessary, for example, when you move PRTG to a different computer, because a PRTG license can be active on only one computer at the same time. Once you have deactivated the license, the PRTG installation on this computer reverts to the [Freeware Edition](#)^[21] after a grace period of 30 days.

■ See also section [Activate the Product](#)^[110].

Update Your License Information

Click Change License Key or Refresh Information on the Status tab to update your license. Provide the necessary information and click Update License to complete the activation of your license.

- ⓘ If you have any issues with license activation or updates, click Contact Support in the page footer to contact us directly via the [Paessler Service Center](#) in our shop (internet access required).

Step 1: Choose Activation Type

Setting	Description
Activation Type	<p>Define how you want to validate and activate your license:</p> <ul style="list-style-type: none"> ▪ Automatic (online activation with optional HTTP proxy): PRTG connects to the activation server and validates your license. The license is activated automatically. For automatic activation, the PRTG core server system must have internet access. ▪ Manual (offline activation): Choose manual activation if the PRTG core server system has no access to the internet and cannot connect to activation.paessler.com. <ul style="list-style-type: none"> ⓘ This is the default selection if the PRTG core server system is offline.

Step 2: Verify Your PRTG License

Setting	Description
License Name	<p>Enter the License Name that you have received from us, the Paessler AG. It must exactly match. To avoid typing errors, copy and paste the License Name.</p> <ul style="list-style-type: none"> ⓘ You can find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name, for which you might be asked while installing PRTG or when you change your license key^[107].
License Key	<p>Enter the license key you have received from us, the Paessler AG. To avoid typing errors, copy and paste the License Key. It must exactly match your license key.</p>

Setting	Description
System ID	<p>This field shows the system ID, a fixed value assigned to your PRTG installation.</p> <p> This setting is for your information only. You cannot change it.</p>

For offline activation, click Save to File to write your license information into a text file.

Step 3a: Activate Your PRTG

If you select the automatic activation type, you can now update your license. Define if you need an HTTP proxy for the HTTPS connection to the activation server and click Update License.

Proxy Configuration

 This option is not available in PRTG Hosted Monitor.

Setting	Description
Use Proxy Server	<p>We recommend that you use PRTG with a direct internet connection. However, if you need to use a proxy, you can configure the relevant settings here. Choose between:</p> <ul style="list-style-type: none"> No, use direct connection to the internet (default): Do not use a proxy. Use this setting if a direct internet connection to the PRTG core server system is available. Yes, in our network a proxy is mandatory: Define proxy settings below. <p> Proxy settings are valid for auto-update⁴²⁵⁷, activating the product¹¹⁰¹, obtaining Geo Maps⁴⁰²⁶ tiles, and for sending out HTTP, push, and SMS text message notifications⁴¹³⁸.</p>
Proxy Server	<p>This setting is only visible if you enable Yes, in our network a proxy is mandatory above. Enter the address of the proxy server that you use for outbound connections. Enter a valid address.</p>
Port	<p>This setting is only visible if you enable Yes, in our network a proxy is mandatory above. Enter the port number of the proxy server that you use for outbound connections. Enter an integer value.</p>
Use Proxy Credentials	<p>This setting is only visible if you enable Yes, in our network a proxy is mandatory above. Determine whether the proxy server needs credentials or not:</p> <ul style="list-style-type: none"> No, there are no credentials necessary: Do not use credentials for proxy connections.

Setting	Description
	<ul style="list-style-type: none"> Yes, the proxy server requires credentials: Define credentials (username and password) below.
User	This setting is only visible if you enable Yes, the proxy server requires credentials above. Enter a user name for proxy authentication. Enter a string.
Password	This setting is only visible if you enable Yes, the proxy server requires credentials above. Enter a password for proxy authentication. Enter a string.

Step 3b: Request Activation Data

If you select Manual (offline activation), you have to request your activation data at <https://www.paessler.com/activation> using your license information. Open the activation page from a computer with internet access and provide your license information.

Generate the key file for your license and provide this data below.

Step 4: Provide Activation Data

This step is only necessary if you activate your license offline.

- Copy the content of the key file that you have generated on <https://www.paessler.com/activation>.
- Paste it into the Activation Data field. Alternatively, click Load from File if you have saved the key file with your activation data.
- Click Update License to complete the activation of your license.

8.12.5 Auto-Update

Whenever a new version of PRTG is available from the Paessler website, PRTG automatically downloads the setup file if a direct internet connection is available. The [PRTG System Administrator](#) user then receives a [ToDo ticket](#)^[240] with instructions to initiate the update installation.

If you are using a [Freeware or Trial Edition](#)^[21], automatic software updates are available at any time. If you are using a [Commercial Edition](#)^[21], you need to have an active maintenance contract to receive updates.

 This option is not available in PRTG Hosted Monitor.

Status

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

To view the auto-update page, select Setup | Auto-Update from the [main menu bar](#)^[289]. On the Status tab, you can download and install updates.

Using Auto-Update

If there is a new version available, you see detailed information about the available version. Read these notes carefully. You find a summary of current and past release notes below the update section. For detailed release notes, click PRTG Release Notes and Version History, which redirects you to the [version history page on paessler.com](#).

To install the latest available version, click Install Update [version number]. PRTG asks you to confirm installation and license.

 Downloaded software versions are automatically saved in the \download subfolder of the [PRTG program directory](#)^[4526]. The [prtg.zip](#) that contains all necessary files is also cached in this subfolder.

Here you can automatically update your PRTG installation.

- If you are using the freeware or trial edition you can always update to the latest version for free
- If you are using a commercial edition your license key must be covered by a valid maintenance contract in order to download updates.
- You can always prolong your maintenance at <https://shop.paessler.com>

You can deactivate automatic downloading in the [Settings tab](#).

Update Status For PRTG Network Monitor

Latest Version Available from Paessler	17.2.32.2196 NEW! Check For Latest Update and Download
Latest Downloaded Version	

Automatic Software Update Page

Manually Install an Interim Update

Not all available updates from Paessler are pushed to all customers, but they are still available from the website. Sometimes the Paessler support team might ask you to update to the latest version.

In this case, click [Check For Latest Update and Download](#). PRTG connects to the Paessler servers and downloads the setup file, regardless of the status of the update check. Then [Install Update \[version number\]](#).

To use this function, a direct internet connection is necessary on the PRTG core server system.

Select Other Release Channel

PRTG is available in three different release channels. To change the release channel you receive updates from, open the auto-update [Settings](#) ⁴²⁵⁸ tab and choose the desired release channel in the Release Channel section.

Log

Click the Log tab to show log information about the update status of PRTG, newest first. In the [table list](#) ²⁴⁶, you can filter the items by using the [respective options](#) ²⁴⁶.

For more information, see section [Logs](#) ²³⁷.

Settings

Click the Settings tab to configure the Software Auto-Update.

Software Auto-Update

Setting	Description
When a New Version is Available	<p>Define what to do when software updates are available:</p> <ul style="list-style-type: none"> Automatically download and install the latest version: PRTG automatically downloads and installs any new version as soon as PRTG detects that a newer version is available (PRTG checks this once per day). <ul style="list-style-type: none"> i The installation of a new version restarts the PRTG core server service and PRTG probe service and might also include a server restart. Automatically download the latest version and alert the admin: PRTG automatically downloads any new version as soon as PRTG detects that a newer version is available (PRTG checks this once per day). After successful download, PRTG creates a ToDo ticket^[240] for the PRTG System Administrator user. Alert the admin only: When PRTG detects that a newer version is available, it does not automatically download updates, but only creates a ToDo ticket. You can still manually download updates via the auto-update^[4258].
Installation Time	<p>If you select the automatic installation option above, choose the desired time for the installation of updates from the dropdown list. You can also choose As soon as the update is available, which can be at any time of the day.</p>
Release Channel	<p>Updates are delivered in different release channels. You can choose between maximum stability, or most early access to new features. Choose from:</p> <ul style="list-style-type: none"> Stable: Updated about once per month (most conservative option, recommended): These are our best tested versions. Choose this channel for live environments that you depend on. Preview: Updated about once per month (thoroughly tested in our labs, do not use on production systems): Versions in this channel are already thoroughly tested in our labs, but might still contain limitations in certain monitoring configurations. Choose this channel if you are willing to take a little risk for the benefit of getting new features and bug fixes a little earlier. <ul style="list-style-type: none"> i We strongly recommend that you not use those versions in live environments you depend on. Canary: Updated daily (testing only, should not be used on production systems): Updated every night. <ul style="list-style-type: none"> i Use with caution. Software versions in this channel are not tested yet, might contain severe bugs, and are provided for testing purposes only. We strongly recommend that you not use those versions in live environments you have to depend on.

-  Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

Notes

There are a few things we ask you to consider regarding automatic software updates:

- For auto-update to work, the PRTG core server system needs direct internet access. If a proxy connection is needed, configure it in the [Core & Probes](#) settings.
 - For details about the update servers, see the Knowledge Base: [Which servers does PRTG connect to for software auto-update and for activation?](#)
- During installation, the PRTG core server might restart without notice.
- PRTG automatically updates remote probes, causing short downtimes in monitoring of remote locations. In rare cases, a manual update of remote probes is required after you update the PRTG core server. In these cases, you are notified in the device tree, and monitoring of remote locations is interrupted until you perform the [manual update](#) on the remote probe system. If a probe system uses several network connections with different IP addresses, ensure these addresses are included in the [list of allowed IPs](#). Otherwise the remote probe on this machine might be disconnected after an update.
- In a cluster, you only need to install the update on one cluster node. The new version is then automatically deployed to all other cluster nodes (causing a short amount of downtime for the monitoring on the cluster nodes, one after the other).
- If you run several individual PRTG core servers that are not in a cluster, you have to initiate and confirm an update for each single PRTG core server.
- You can disable automatic downloading on the auto-update [Settings](#) tab. Updates are then only downloaded on request, when you click Check For Latest Update and Download.
- PRTG does not start auto-update downloads if less than 500 MB disk space is available on the PRTG core server system. If this is the case, you can check this on the [Log](#) tab.
- Virus scanners can potentially cause issues when downloading or installing software updates. To avoid such issues, we recommend that you make the appropriate exclusions for the PRTG program directory.

8.12.6 Optional Downloads

To see optional downloads, select Setup | Optional Downloads from the [main menu bar](#)^[289]. Click a tab to switch between different options.

The following downloads are available:

- [PRTG Apps](#)^[4262]
- [PRTG Desktop](#)^[4262]
- [Remote Probe Installer](#)

PRTG Apps

To monitor your network while on the go, use our free PRTG apps for smartphones and tablets. They run on iOS and Android.

■ For more information, see section [PRTG Apps for Mobile Network Monitoring](#)^[4278].

■ For more information on PRTG for iOS and PRTG for Android, see our website: [PRTG Apps for iOS or Android](#)

PRTG Desktop

Download PRTG Desktop to your computer. You can run it on Windows and macOS to manage one or several independent [PRTG core servers](#)^[4262] or PRTG Hosted Monitor instances with a native, cross-platform application.

■ For more information, see section [PRTG Desktop](#)^[4275].

■ Directly download PRTG Desktop from our website: [PRTG Desktop Download](#)

☁ PRTG Hosted Monitor supports connections from PRTG Desktop. For more information, see section [Using PRTG Hosted Monitor](#)^[56].

Remote Probe Installer

With remote probes, you can extend your monitoring to distributed networks that are not directly reachable from your PRTG core server system. The version of the remote probe installer must match your version of PRTG, so it is a good idea to download it from here.

■ For more information, see section [Install a Remote Probe](#)^[112].

8.12.8 Contact Support

For technical issues, use the Contact Paessler Support / Send Your Feedback to Paessler form in PRTG. To open the form, select Setup | Contact Support from the [main menu bar](#)²⁸⁹. You can also open the form via Contact Support in the footer on every page in PRTG.

The screenshot displays the PRTG Network Monitor interface. At the top, there are navigation tabs for 'Logs', 'Tickets', and 'Setup'. The 'Setup' menu is open, showing options: Overview, Account Settings, System Administration, PRTG Status, License, Auto-Update, Optional Downloads, PRTG API, and Help and Support Center. The 'Contact Support' option is highlighted with a blue box and a blue arrow pointing to it. Below the menu, there is a 'Notification Triggers' section with fields for Status, Default Interval, and ID. A map of North America is visible. The main area contains three line graphs showing performance metrics over different time periods: 2 days, 30 days, and 365 days. The graphs plot Alarms (#), Response Time (%), CPU Load Index (%), and Traffic Index (%). A legend at the bottom identifies the data series: Alarms (#) in red, Response Time (%) in dark blue, CPU Load Index (%) in green, and Traffic Index (%) in pink. At the bottom of the interface, a 'Contact Support' button with an envelope icon and a 'Help' button with a question mark icon are visible. A blue arrow points to the 'Contact Support' button.

How to Open the Contact Support Form

On the one hand, you can use this form to give us [feedback](#). Help improve PRTG by providing criticism, praise, bug reports, and feature requests. Any comments are welcome. Your feedback is handled directly by the Paessler support team.

On the other hand, you can use this form to ask for support regarding technical issues. To make the support contact more comfortable, PRTG can automatically attach a screenshot in combination with a [Support Bundle](#) that contains several selected PRTG logfiles and status files. This information really helps the Paessler support team to analyze any issue you might have with PRTG. Also consider the suggested links to articles regarding the scope of your issue.

We offer our support directly from our headquarters in Nuremberg, Germany, working closely with our development department to guarantee the fastest and most constructive assistance possible. As we have to analyze a lot of data over the course of a support case, like logfiles and screenshots, we use email as our primary support mechanism. Our office is staffed Monday to Friday from 07:00 to 22:00 (UTC+1), so you receive an answer within 24 hours on business days. Depending on the complexity of the case, we might need to ask for remote access to your system, or to schedule a remote desktop session.

One-to-One Support

Customers with valid maintenance can open support tickets. Use the Contact Support form of your PRTG installation for technical questions to get the best possible help from our experts. If you have trouble using this form, you can fill out the [support ticket form on our web page](#).

Do you use our Freeware? We try to answer your questions in a timely manner but if we are busy, paying customers come first. You might find an answer in our [Knowledge Base](#).

Supported Versions

Note that we only support PRTG versions that were released in the last 12 months. For more information on released versions, see our website: [Release notes for the "stable" release channel](#).

Single Topics

Open a new ticket for each new topic.

Communication Methods

Write us in English or German and communicate via email. This is the best way for us to analyze your logfiles, screenshots, and other data in detail. We always try to answer within 24 hours on business days. If necessary, we ask you for remote access.

Updates and License Key

If you are looking for updates or your license key, log in to the [Paessler Software Shop and Customer Service Portal](#).

Network Planning

If you need help with your network setup or detailed installation planning, our partners are always happy to help. Please [contact a partner near you](#).

How Contact Support Works

PRTG securely transmits your feedback or support question including the support bundle to Paessler via the PRTG Cloud.

- ① Make sure that your PRTG core server system has access to the internet and can reach the URL <https://api.prtgcloud.com:443>

Legal Notice on Data Privacy

Paessler safeguards data that you send to our organization in the same manner in which we protect our own similar confidential information and in accordance with the GDPR. However, Paessler cannot guarantee that your data is handled in compliance with all regulatory standards that are applicable to such data. Accordingly, do not send any data that is subject to regulations that prescribe special handling requirements to Paessler. If your data file contains this type of regulated information, contact us before sending it. We can discuss masking, obfuscation, or other possible methods of converting your data set to a format that Paessler can manage.

Security Reports

If you are a user of PRTG or any of our other services and would like to file a security report, send an email to security@paessler.com. Always include a detailed technical summary in your email. If you wish to send us an encrypted email, use the public key on this page <https://www.paessler.com/support>.

Feature Requests

Do you have requests or suggestions that could improve PRTG? The [Paessler support team](#) is happy to hear your ideas. Read more in our Knowledge Base on [how we handle your feedback](#).

Provide the following information in this section of the contact form.

Field	Description
Your Ticket ID PAE<id>	If you have already opened a ticket (directly via email to support@paessler.com , via the Knowledge Base , or via the support form on paessler.com), enter its ID here. You can find it in your confirmation email regarding the request we received. You can provide the ID with "PAE" in front or only the number. If you leave this field empty, you create a new ticket when you submit this form.
Your Email Address	Enter your email address here. You can provide any of your addresses. However, the recommended and default address is the email address of your user account to be able to associate you with your license.
Scope of Your Question	Select a topic regarding your issue and consider the proposed links.
Emotional State	If you want to, you can express your feelings about PRTG.
Enter a Subject for Your Question/Feedback	Provide short information with max. 60 characters to indicate the topic of your issue.
Enter a Detailed Description	Leave your comments here. They can be feedback or support questions. If you have a support question, describe your issue with as much detail as possible.

Attach a Screenshot and/or Support Bundle

To provide the most helpful information possible, you can attach a screenshot of the selected page and a support bundle with useful analytical data about your PRTG installation.

Setting	Description
Do not attach screenshot	Send the ticket without a screenshot. i If you ask for technical help, we recommend that you attach a screenshot. This helps us a lot to analyze your issue and to provide a solution.
Create and attach screenshot (recommended)	PRTG creates a screenshot of the selected page and sends it with your ticket. You can see a preview below the screenshot section. i We recommend that you open the contact support form directly on the page where you encountered an issue. Taking screenshots is not possible on some generic error pages that are not meaningful enough for the Paessler support team.

In section Support Bundle, you can choose from several packages that differ in coverage of information.

Setting	Description
Support Bundle	<ul style="list-style-type: none">▫ Attach Base Pack with logfiles (recommended): Contains the following data about PRTG:<ul style="list-style-type: none">▫ System status▫ Lists of sensors in the Down status or the Unknown status▫ Core and probe health data▫ Current log entries▫ Attach Base Pack with logfiles and PRTG configuration file: Contains the Base Pack and the PRTG configuration file.<ul style="list-style-type: none">① Send this package only if the Paessler support team told you so. Usernames, encrypted passwords in the config.dat file, and passwords that your browser masks while you enter them on settings pages are removed before PRTG sends this package to the Paessler support team.▫ Do not attach a Support Bundle: The ticket does not contain files. Choose this option only when sending feedback.

Click Submit to send your request directly to the Paessler support team, or click Cancel to return to the page where you opened the contact form. Usually, you receive an answer from the Paessler support team within one or two business days.

① If you have questions or feedback regarding your license purchase, upgrade, or maintenance extension, [contact our customer service](#) ¹⁷⁹.

Part 9

PRTG Desktop

9 PRTG Desktop

PRTG Desktop is an alternative interface that you can use to connect to one or several independent [PRTG core servers](#) or PRTG Hosted Monitor instances to configure your setup, view monitoring results, and keep an eye on your network. It is a cross-platform application for fast access to data and monitoring management.

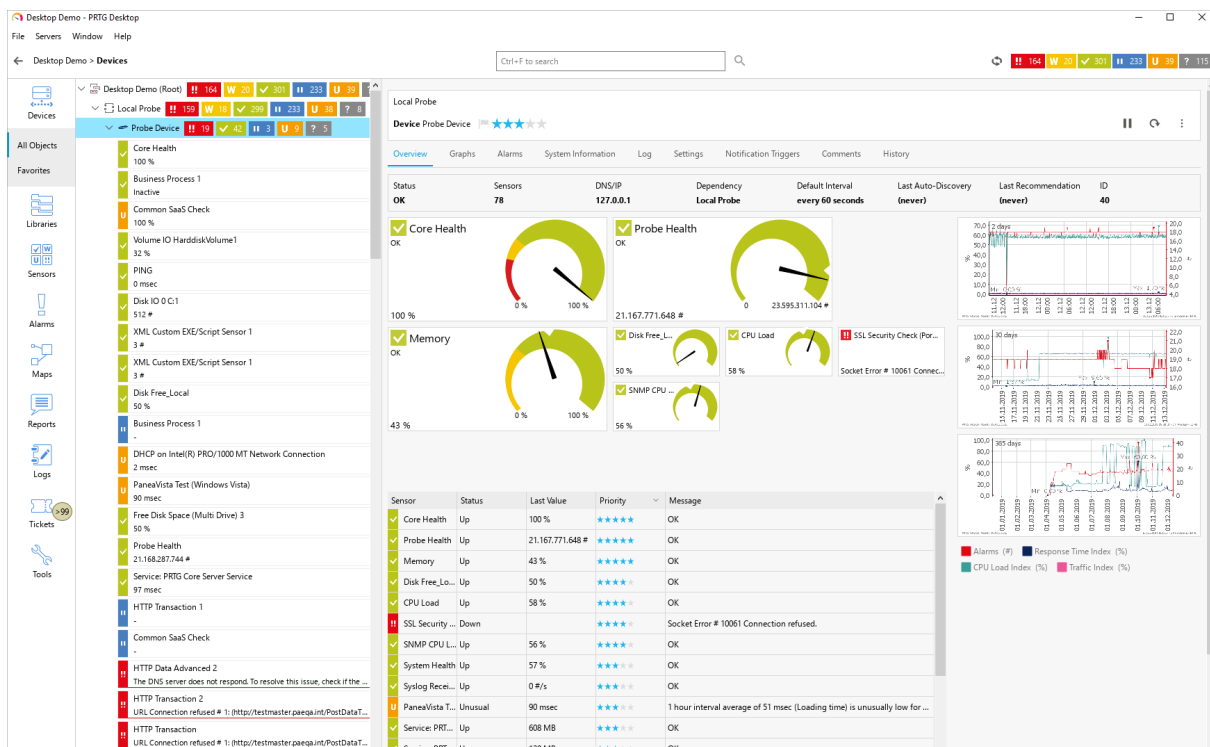

PRTG Desktop natively includes most PRTG functions. For a few options, PRTG Desktop opens an external browser window using your default browser, for example, for system setup.

PRTG Desktop also optionally displays a tray icon, taskbar notifications, or plays notification sounds to keep you up to date in the case of new Alarms, Log Entries, or Tickets.

To use PRTG Desktop, [download](#) and install it on your Windows or macOS computer.

Download the PRTG Desktop user manual here: [PRTG Desktop User Manual \(PDF\)](#)

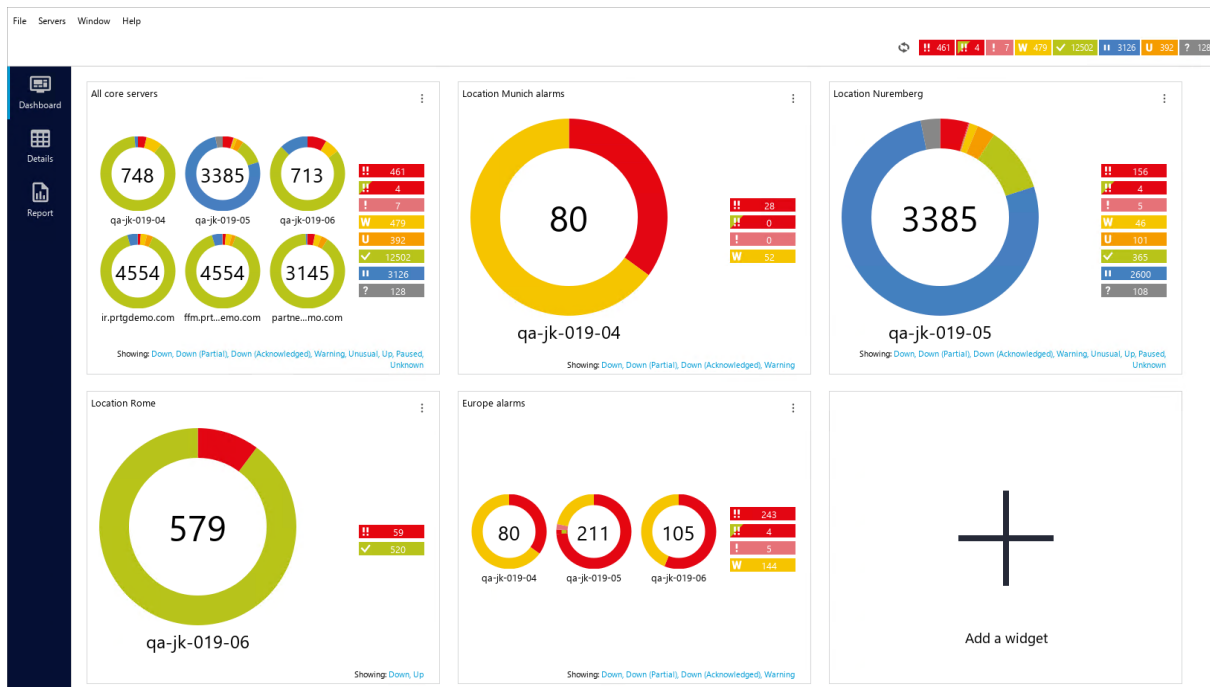

Directly download PRTG Desktop from our website: [PRTG Desktop Download](#)

PRTG Desktop

Access Several Servers in One Console

Using the Multi Server functionality of PRTG Desktop, you can connect to several independent servers to view their data and manage your monitoring centrally.

Multi Server window

- **Dashboard:** Show an overview of all sensors and current alarms of each configured server.
- **Details:** Select a configured server to show its alarms.
- **Report:** Show an overview of the number of sensors on each connected server and in total, and the number of sensors that show a certain status. Export the report in comma-separated values (CSV) format.

i PRTG Desktop is mainly designed to review and manage PRTG installations that you already set up. If you have just started with monitoring, we recommend that you first run through the [smart setup](#)^[48] in the [PRTG web interface](#)^[163] and add your network devices there. Once finished, you can seamlessly switch to PRTG Desktop.

☁ PRTG Hosted Monitor supports connections from PRTG Desktop. For more information, see section [Using PRTG Hosted Monitor](#)^[56].

Part 10

PRTG Apps for Mobile Network Monitoring

10 PRTG Apps for Mobile Network Monitoring

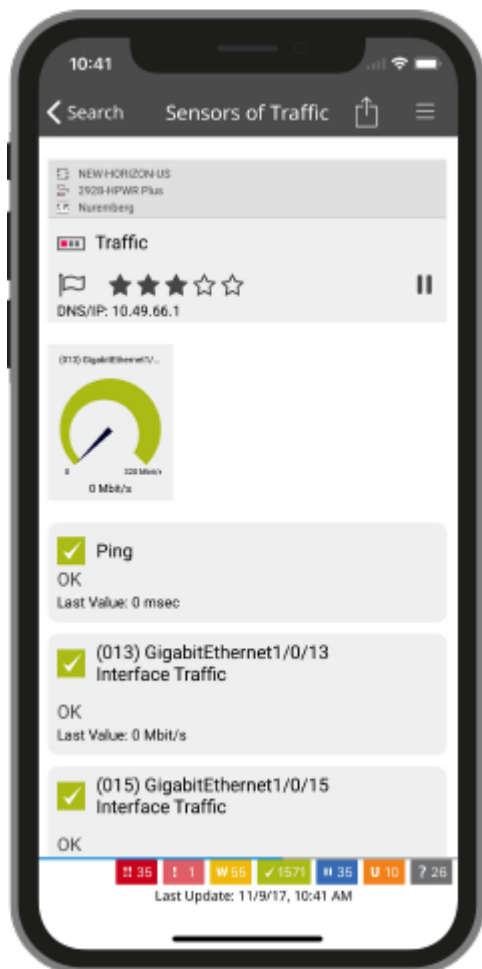

You can access your PRTG installation on your mobile devices with PRTG apps for iOS or Android. You can download and use these PRTG apps for free. [PRTG for iOS](#) ⁴²⁷⁸ and [PRTG for Android](#) ⁴²⁷⁸ let you monitor your network while on the go.

The basic requirements to use these free PRTG apps are a running PRTG core server that is accessible from the network your device is connected to (either directly or via a VPN connection) and a recent operating system version on your mobile device. For details about requirements, see below.

PRTG for iOS

PRTG for iOS is the iOS app that you can use as of PRTG 13. You can use the newest PRTG app version on iPhone, iPad, and iPod touch with iOS version 9 or later. You can also use free [push notifications](#) ⁴¹⁵³ with this PRTG app (required: PRTG for iOS 14.3.6 or later; PRTG 15.4.20 or later).

■ For more information and to download this PRTG app, see our website: [PRTG for iOS](#). For troubleshooting solutions, see the Knowledge Base: [I have an issue with PRTG for iOS. What can I do?](#)

Traffic Sensors on iPhone

PRTG for Android

PRTG for Android is the Android app that you can use as of PRTG 14. Use it on your smartphone or tablet with Android version 4.0 or later, or on a Kindle Fire. For full functionality, we recommend that you use at least Android 4.1. You can also use free [push notifications](#) ⁴¹⁵³ with the PRTG app (required: PRTG for Android 14.3.2 or later; PRTG 15.4.20 or later).

■ For more information and to download this PRTG app, see our website: [PRTG for Android](#). For troubleshooting solutions, see the Knowledge Base: [I have an issue with PRTG for Android. What can I do?](#)

Part 11

Desktop Notifications

11 Desktop Notifications

While you are logged in to the PRTG web interface with your Google Chrome or Firefox browser, PRTG can show notifications on your desktop whenever there are new alarms in your monitoring.

PRTG shows desktop notifications (by default, in the lower-right corner of your desktop) whenever there are new alarms after a page refresh in the PRTG web interface. The notification displays the number of new alarms and the current number of each [sensor status](#).

Example of a Chrome Desktop Notification

i Desktop notifications are not available for Internet Explorer.

Desktop Notifications Settings

When you log in to the PRTG web interface, a message appears, asking you to allow desktop notifications. You have to initially allow the notifications for each installation or profile of Firefox or Google Chrome.

i Desktop notifications in Google Chrome are not available for HTTP connections. See section [User Interface](#) for more information.

- In Google Chrome, click Allow to add the URL of the PRTG web interface to the allowed sites.
- In Firefox, click Allow Notifications to add the URL of the PRTG web interface to the allowed sites.

Click 'Allow' to enable Google Chrome Desktop Notifications

Click 'Allow Notifications' to enable Firefox Desktop Notifications

Disabling or Re-Enabling Desktop Notifications

To disable or re-enable desktop notifications for the PRTG web interface, edit your browser options:

- In Google Chrome: Click the View site information icon in the address bar of the browser. You can block or re-enable notifications for the PRTG web interface in section Notifications.
- In Firefox: Click the Show site information icon in the address bar of the browser. You can block or re-enable notifications for the PRTG web interface in section Permissions.

12.1 Monitoring via SNMP

Monitoring via the Simple Network Management Protocol (SNMP) is the most basic method of gathering bandwidth and network usage data.

How SNMP Monitoring Works

Simple Network Management Protocol (SNMP) is a set of standards for communication with devices in a Transmission Control Protocol (TCP)/IP network. SNMP monitoring is useful if you are responsible for servers and network devices such as hosts, routers, hubs, and switches. It enables you to keep an eye on network and bandwidth usage, and monitor important issues such as uptime and traffic levels.

You can use SNMP to monitor the bandwidth usage of routers and switches on a port-by-port basis, as well as device readings such as memory and CPU load. The target devices must support SNMP. Most devices with enabled SNMP require the same configuration like SNMP version and community string. To find out how to set up SNMP on a specific device, search the internet for your device name or model and SNMP configuration.

Network Monitoring via SNMP

When you use a sensor with this technology, PRTG sends small data packets to devices, for example, querying routers, switches, and servers for the traffic counters of each port. These queries trigger reply packets from the device. Compared to other bandwidth monitoring technologies via World Wide Name (WWN), packet sniffing, or Windows Management Instrumentation (WMI), the SNMP option creates the least CPU and network load.

Reasons to Choose SNMP Monitoring

SNMP is the most commonly used method because it requires minimal bandwidth and CPU cycles. If your network devices support SNMP and/or if you want to monitor large networks with several hundred or thousands of sensors, we recommend that you start with SNMP.

Besides network usage monitoring, another well-known feature of SNMP is the ability to also monitor other network parameters such as CPU load, disk usage, temperature, as well as many other readings, depending on the queried device.

SNMP Network Issues

To use SNMP for monitoring purposes, it is necessary that User Datagram Protocol (UDP) packets can be bidirectionally sent from the PRTG core server to the device that you want to monitor. This is usually the case in LANs and intranets. For connections across the internet, to a perimeter network (also known as DMZ, demilitarized zone, and screened subnet), or for WAN connections, some changes to the traversed firewalls might be necessary.

Keep in mind that SNMP v1 and v2c are no secure protocols, so you should not use them on the internet or with data connections that are not secure. Only SNMP v3 supports encryption.

Understanding SNMP Sensors

To better understand and set up SNMP sensors, you might want to learn more about the principles of object identifiers (OID) and Management Information Base (MIB) files.

- For more information about this topic, see the Knowledge Base: [How do SNMP, MIBs, and OIDs work?](#)
- For an overview and details about all SNMP sensors, see section [List of Available Sensor Types](#) .
- For more information about which SNMP sensor is best for your monitoring setup, see section [Choosing the Right SNMP Sensor](#) .

SNMP Versions

PRTG supports three versions of the Simple Network Management Protocol (SNMP) protocol: version 1, version 2c, and version 3.

SNMP v1

This is the oldest and most basic version of SNMP.

- Pro: Supported by most SNMP-compatible devices.
- Con: Limited security because it only uses a simple password ([community string](#) ) and sends data in clear text (unencrypted). Because of this, you should only use it inside LANs behind firewalls, but not in WANs. Version 1 only supports 32-bit counters, which are not enough for high-load (gigabits/second) bandwidth monitoring.

SNMP v2c

This version adds 64-bit counters.

- Pro: Supports 64-bit counters to monitor bandwidth usage in networks with gigabits/second loads.
- Con: Limited security (same as with SNMP v1).

SNMP v3

This version adds authentication and encryption to SNMP.

- Pro: Offers user accounts and authentication for multiple users and optional data packet encryption to increase the available security, and has all advantages of Version 2c in addition.
- Con: Difficult to configure and higher overhead for the probe, which reduces the number of devices that you can monitor (see [here](#)⁴²⁸⁸ for more information).

SNMP Traps

Various devices can send SNMP trap messages to notify you of system events.

- PRTG supports SNMP v1 and SNMP v2c traps.
- The destination for SNMP traps is the IP address of the trap receiver, which is the IP of the probe system to which you add the [SNMP Trap Receiver sensor](#)³¹⁰⁷.

Which SNMP Version Should I Choose?

The SNMP version you should choose depends on your environment. Here are some guidelines:

- If your network is publicly accessible, you might want to use SNMP v3, which has encryption and secure access. However, security and encryption add overhead, which results in less performance.
- If your network is isolated or well-protected behind firewalls, the lower security level of SNMP v1 or SNMP v2c might be sufficient.
- From the perspective of monitoring with PRTG, SNMP v2c is preferable if you have a lot of devices to monitor. This lets you monitor more devices with a shorter scanning interval, and it supports 64-bit counters.

The most important aspect is to set the same SNMP version in the PRTG settings (for example, in the [root group settings](#)³⁶⁶) as you have configured in your target device. If you select an SNMP version that is not supported by the server or device that you want to monitor, you receive an error message. Unfortunately, these error messages, in most cases, do not explicitly point to the possibility that you are using the incorrect SNMP version. These messages provide minimum information only, such as [cannot connect](#). Similar errors occur when community strings, usernames, or passwords do not match.

■ For more information about basic requirements for SNMP monitoring, see this Knowledge Base article: [My SNMP sensors don't work. What can I do?](#)

SNMP Overload and Limitations of the SNMP System

SNMP v1 and v2 scale directly with the performance of the hardware and the speed of the network. In our labs, we can monitor 30,000 SNMP v1 sensors in a 60-second scanning interval with one PRTG core server (and local probe) plus two remote probes with 10,000 sensors each.

SNMP v3 has performance limitations because of the use of encryption. Furthermore, keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3.

Furthermore, the PRTG core server and probes should run on different computers. If you experience increased values in the [Interval Delay SNMP](#) or [Open Requests](#) channels of the [Probe Health sensor](#)²⁰⁸³ (values above 0 % indicate that the SNMP requests cannot be performed at the desired interval), you need to distribute the load among probes. SNMP v1 and v2 do not have this limitation.

If you run into SNMP overload problems, you have the following options:

- Increase the scanning interval of the SNMP v3 sensors.
- Distribute the SNMP v3 sensors among two or more probes.
- Evenly distribute the SNMP v3 sensors on your devices (about 10 to 100 sensors per device).
- Check if your target devices answer fast enough. Performance issues might also result from slow SNMP v3 devices.
- Switch to SNMP v1 or v2 if you can go without encryption.

What is the SNMP Community String?

The SNMP community string is similar to a user ID or password that allows access to the statistics of a device. PRTG sends the community string along with all SNMP requests. If the correct community string is provided, the device responds with the requested information. If the community string is incorrect, the device discards the request and does not respond.

- ① SNMP community strings are only used by devices that support SNMP v1 and SNMP v2c. SNMP v3 uses safer user name/password authentication, along with an encryption key.

By convention, most SNMP v1/v2c equipment ships with a read-only community string set to the value public. It is standard practice for network managers to change all the community strings to customized values during device setup.

12.1.1 Choosing the Right SNMP Sensor

The Simple Network Management Protocol (SNMP) generally requires little configuration once it is set up. Many network devices support it and you can monitor many parameters with it. PRTG provides you with various SNMP sensors. These sensors range from monitoring general parameters to very specific parameters. Choosing the right sensor for SNMP monitoring that gives you the desired hardware parameters is a decision that depends on several factors: the type of hardware you have, what values you want to monitor, and a few others.

Check SNMP Capability

Make sure that each device that you want to monitor supports SNMP, and that SNMP is enabled. You can find out whether a device supports SNMP by either going to the vendor's website or checking that it is enabled in the configuration of the device.

 If you are uncertain whether SNMP is enabled on the target device and works, we recommend that you try [SNMP Tester](#). You can scan for uptime to perform a basic check for SNMP availability of the target device.

Setup Checklist

1. Enable SNMP on the device.
2. In the security settings of the device, allow SNMP access for the PRTG core server system.
3. Allow User Datagram Protocol (UDP) packages to be sent bidirectionally from the PRTG core server to the device.
4. SNMP requires the use of UDP ports >1023 to the PRTG client side. This is important for your firewall settings.
5. Ensure that the firmware of the device is up to date.
6. Select the appropriate SNMP protocol.

 It is important to know which SNMP version you have to select, because if it is not supported by the server or device you want to monitor, you receive an error message.

 For more information, see the Knowledge Base: [My SNMP sensors don't work. What can I do?](#)

SNMP Monitoring Overview

Vendor-specific SNMP Sensors

PRTG offers many vendor-specific SNMP sensors for some common vendors. These sensors are programmed to match the respective end devices. There are also workarounds for known vendor implementation issues, for example, if SNMP has not been fully implemented on an end device according to the RFCs. Here, our vendor-specific sensors still automatically receive the most important values.

Supported Vendors

- APC
- Buffalo
- Cisco
- Dell
- Fujitsu
- HP

- HPE
- IBM
- Jakarta
- Juniper
- LenovoEMC
- NetApp
- Nutanix
- Poseidon
- QNAP
- SonicWall
- Synology

■ For more information, see the Knowledge Base: [What SNMP sensors does PRTG offer?](#)

Generic SNMP Sensors

PRTG offers several generic sensors that work with almost every device that supports SNMP, the corresponding Management Information Base (MIB) file and OIDs, and it correctly implements the respective RFCs. The standard SNMP libraries of PRTG include predefined, common values for the generic SNMP sensors. You can monitor the following parameters with the generic sensors.

Sensor	Description
SNMP CPU Load sensor <small>2442</small>	The SNMP CPU Load sensor monitors the system load via the Simple Network Management Protocol (SNMP).
SNMP Disk Free sensor <small>3154</small>	The SNMP Disk Free sensor monitors the free disk space on a logical disk via the Simple Network Management Protocol (SNMP).
SNMP Hardware Status sensor <small>2609</small>	The SNMP Hardware Status sensor monitors the status of a server's hardware component via the Simple Network Management Protocol (SNMP).
SNMP Memory sensor <small>2855</small>	The SNMP Memory sensor monitors the memory usage of a system via the Simple Network Management Protocol (SNMP).
SNMP Printer sensor <small>2980</small>	The SNMP Printer sensor monitors various types of printers via the Simple Network Management Protocol (SNMP).

Sensor	Description
SNMP RMON sensor 	<p>The SNMP RMON sensor monitors traffic on a device using the Remote Monitoring (RMON) standard via the Simple Network Management Protocol (SNMP).</p> <p> You can create it on an SNMP-compatible device that provides traffic data via RMON. Depending on the data that the device returns, PRTG displays traffic data for each port in different channels, which allows a detailed analysis. If available, the sensor queries 64-bit counters.</p>
SNMP System Uptime sensor 	<p>The SNMP System Uptime sensor monitors the uptime of a device via the Simple Network Management Protocol (SNMP).</p>
SNMP Traffic sensor 	<p>The SNMP Traffic sensor monitors traffic on a device via the Simple Network Management Protocol (SNMP).</p> <p> You can create the sensor on a device that provides traffic data.</p>
SNMP Trap Receiver sensor 	<p>The SNMP Trap Receiver sensor receives and analyzes Simple Network Management Protocol (SNMP) traps.</p>

Operating System-based SNMP Sensors

PRTG also offers several operating system-based SNMP sensors that extend your SNMP monitoring. You can monitor the following parameters with these sensors.

Sensor	Description
SNMP Linux Disk Free sensor 	<p>The SNMP Linux Disk Free sensor monitors the free space on disks of a Linux/Unix system via the Simple Network Management Protocol (SNMP).</p>
SNMP Linux Load Average sensor 	<p>The SNMP Linux Load Average sensor monitors the system load average of a Linux/Unix system via the Simple Network Management Protocol (SNMP).</p>
SNMP Linux Meminfo sensor 	<p>The SNMP Linux Meminfo sensor monitors the memory usage of a Linux/Unix system via the Simple Network Management Protocol (SNMP).</p>
SNMP Linux Physical Disk sensor 	<p>The SNMP Linux Physical Disk sensor monitors the input/output (I/O) on disks of a Linux/Unix system via the Simple Network Management Protocol (SNMP).</p>

Sensor	Description
SNMP Windows Service sensor <small>3123</small>	The SNMP Windows Service sensor monitors a Windows service via the Simple Network Management Protocol (SNMP).

Custom SNMP Sensors

PRTG also offers custom SNMP sensors. The monitoring capabilities of these sensors extend the scope of the generic sensors. With custom sensors, you can show certain values that are not included in the standard libraries of PRTG. With these sensors, you can monitor most devices that support SNMP and for which PRTG does not have native sensors. Basically, you only need to find out the required OIDs for the desired device readings, for example, in the vendor's documentation for your hardware device.

■ For more information, see the Knowledge Base: [How do I find out which OID I need for an SNMP Custom sensor?](#)

Sensor	Description
SNMP Custom sensor <small>2453</small>	<p>The SNMP Custom sensor monitors a single parameter that is returned by a specific object identifier (OID) via the Simple Network Management Protocol (SNMP).</p> <p>Value types include the expected numeric type of the results at the specified OID: You can choose from</p> <ul style="list-style-type: none"> ▪ Absolute (unsigned integer): for integer values such as 10 or 120 ▪ Absolute (signed integer): for integer values such as -12 or 120 (negative values supported) ▪ Absolute (float): for float values such as -5.80 or 8.23 (with decimal places) ▪ Delta (counter): PRTG calculates the difference between the previous and the current value. <p>▶ For more information, see this video tutorial SNMP Custom sensor and SNMP Custom Library sensor on our website.</p>
SNMP Custom Advanced sensor <small>2464</small>	<p>The SNMP Custom Advanced sensor monitors numeric values returned for object identifiers (OID) via the Simple Network Management Protocol (SNMP).</p> <p>This sensor monitors very similarly to the regular SNMP Custom sensor, with the advantage of being able to poll up to 10 specific OIDs with a single sensor. For each OID, you can define a name, OID, expected type, and the unit to be displayed. The possible value types are the same as with the SNMP Custom sensor.</p>

Sensor	Description
SNMP Custom String sensor ²⁴⁷⁵	<p>The SNMP Custom String sensor monitors a string returned by a specific object identifier (OID) via the Simple Network Management Protocol (SNMP). It can check for keywords. If you want to set limits to the channel value, you can also extract a numeric value contained in the string.</p> <p>Hexadecimal-encoded strings can also be decoded as MAC addresses or IP addresses. The sensor can check for keywords via plain text or regular expression (regex) or you can use a regex to extract a numeric value from the string that can be evaluated later for additional alerts.</p> <ul style="list-style-type: none"> See section Number Extraction with Regular Expression ²⁴⁸⁷ for an example.
SNMP Custom String Lookup sensor ²⁴⁸⁸	<p>The SNMP Custom String Lookup sensor monitors a string that a specific object identifier (OID) returns via the Simple Network Management Protocol (SNMP). It can map the string directly to a sensor status ¹⁹⁷ by using a defined lookup file ⁴⁴⁸⁵.</p> <ul style="list-style-type: none"> Basically, this sensor does a "reverse lookup". You have to define all potential return strings in the lookup file as text values, each in one lookup entry. Graphs and data tables show the value to which the string is mapped, usually an integer (lookup type ⁴⁴⁸³ SingleInt). For more information, see section Example ²⁴⁸⁸.
SNMP Custom Table sensor ²⁵⁰⁰	<p>The SNMP Custom Table sensor monitors entries from a table that is provided via the Simple Network Management Protocol (SNMP). You can create one new sensor per table row. For each sensor, you can define up to ten channels. Each channel shows the value of one defined table column.</p> <p>Vendors use tables when there are multiple instances of the same object (for example, memory, disks). The sensor recognizes a table via a meta-scan and lets you configure the indexes (interfaces) that you want to monitor.</p> <ul style="list-style-type: none"> For more details, see the Knowledge Base: What can I monitor with the SNMP Custom Table sensor?
SNMP Library sensor ²⁷⁹⁷	<p>The SNMP Library sensor uses a Management Information Base (MIB) file to create sensors that monitor a device via the Simple Network Management Protocol (SNMP).</p>

12.2 Monitoring via WMI

You can monitor Windows systems via [Windows Management Instrumentation \(WMI\)](#)^[4298] and [Windows performance counters](#)^[4298]. WMI is the Microsoft base technology for monitoring and managing Windows-based systems. PRTG uses this technology to access data of various Windows configuration parameters and status values. However, sensors using the WMI protocol generally have a high impact on system performance. In addition to strict WMI sensors, there are sensors that can use performance counters to monitor Windows systems.

To monitor via WMI and performance counters, it is usually sufficient to provide Credentials for Windows Systems in PRTG. However, monitoring via WMI is not always trivial and often causes issues.

■ If you run into issues, see the Knowledge Base: [My WMI sensors don't work. What can I do?](#)

It is also possible to use Simple Network Management Protocol (SNMP) for Windows devices. The same information is often available using any of these protocols. From a performance perspective, the preference is SNMP, then WMI or performance counters.

How WMI Works

WMI allows access to the data of many Windows configuration parameters, as well as system status values. Access can be local or remote via a network connection. WMI is based on [COM](#) and [DCOM](#) and is integrated in Windows versions as of Windows Server 2000. PRTG officially supports WMI for Windows 7 or later.

ⓘ WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.

To monitor remote machines, WMI sensors need Active Directory account credentials to have access to the WMI interface. You can enter these credentials in the settings of the parent device or group, or in the [root group](#)^[368]. The sensor then inherits these settings.

ⓘ Sensors using the WMI protocol generally have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)^[130]. Above this number, consider using [remote probes](#)^[4503] for load balancing.

■ For an overview and details about all WMI sensors, see section [List of Available Sensor Types](#)^[4627].

Monitoring Windows Systems: Performance Counters

Besides sensors that can monitor Windows systems only via WMI, PRTG provides sensors that can use a [hybrid](#) approach. If you choose the hybrid approach, these sensors first try to query data via Windows performance counters using [Remote Registry Service](#). These Windows sensors use WMI as a fallback if performance counters are not available or cannot be read out. When running in fallback mode, PRTG tries to connect to performance counters again after 24 hours. You can change the Preferred Data Source in the Windows Compatibility Options in the [device settings](#)^[446].

ⓘ You can identify these hybrid sensors by looking at their categories, for example, in the [Add Sensor](#)^[367] dialog. Search directly for "windows" and select "Performance Counters" as Technology Used. Among them are various sensors with "Windows" in the name, as well as some Hyper-V sensors.

Limitations of WMI on Windows Server 2008 (R1)

You should be aware that the performance of WMI-based monitoring is drastically limited when the monitoring station or the monitored client runs on Windows Server 2008 (R1). When it comes to network monitoring via WMI, Windows Server 2008 R2 is many times faster than Windows Server 2008 (R1).

-  These are not limitations of PRTG. They arise from the WMI functionality built into the Windows operating systems mentioned.
-  These limitations also apply to Windows Vista, which is no longer officially supported. You can still monitor machines that run Windows Vista, but the PRTG core server and probes are no longer supported on this operating system.

The results of our tests are:

- On Windows Server 2008 R2 or Windows 7 (and on later Windows versions), you can run most WMI sensors if you provide optimal conditions, such as running the PRTG core server system and the target systems exclusively under Windows Server 2008 R2 and being located within the same LAN segment. Actual performance can be significantly lower depending on the network topology and the WMI health of the target systems. We have seen configurations that could not go beyond 500 sensors (and even less).
- On Windows 2008 (R1), you can run about 300 WMI sensors with a 1-minute scanning interval.
- The more Windows 2008/Windows 7 client systems you have in your network, the more the WMI monitoring performance is affected.
- System performance (CPU, memory, etc.) of virtualization does not strongly affect WMI monitoring performance.

If you want to use WMI for network monitoring of more than 20 or 30 systems, consider the following rules:

- Do not use Windows 2008 (R1) as monitoring stations for WMI-based network monitoring.
- Use Windows Server 2008 R2 (or later Windows versions) for WMI-based network monitoring instead.
- Consider setting up remote probes for the WMI monitoring. You still get far better WMI monitoring performance with a remote probe on a virtual machine (VM) running Windows Server 2008 R2 than on any physical system running Windows 2008.
- Consider switching to SNMP-based monitoring for large networks. Using SNMP, you can monitor 10 times as many objects than with WMI on the same hardware.

12.3 Monitoring via SSH

Monitoring via Secure Shell (SSH) enables you to gather performance and system data from many Linux and Unix distributions, as well as from certain macOS X systems. If your system is supported, this monitoring technology works without any additional software on the target systems.

How Monitoring via SSH Works

To monitor remote machines via SSH, PRTG needs the credentials (preferably root access) of the devices. If you use SSH sensors, you can enter the necessary credentials in the [settings](#)²²⁶ of the parent device or group, or in the root group, in the Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems section. The sensors then inherit these settings by default.

With each scanning interval, PRTG logs in to your devices and queries data by executing specific commands.

■ For an overview and details about all SSH sensors, see section [List of Available Sensor Types](#)⁴⁶¹².

Limitations When Using SSH Monitoring

Because of the plurality of Linux/Unix derivatives, SSH sensors cannot support all distributions on the market. Also, only certain macOS systems are supported.

■ For a list of successfully tested distributions, see the Knowledge Base: [Which Linux or macOS distributions are supported by the Linux/Unix sensors \(SSH, SNMP\)?](#)

Authentication via SSH Private Key

PRTG supports authentication via password or via private key.

When you use a private key, ensure the following:

- Provide the key in [OpenSSH](#) RSA format.
- The key may not be encrypted. PRTG does not support password-protected keys.
- The key must be provided as an [RSA](#) key, you cannot use [DSA](#) keys.

When you provide an unencrypted RSA private key in OpenSSH RSA format, copy the entire key, including the

```
-----BEGIN RSA PRIVATE KEY-----
```

and

```
-----END RSA PRIVATE KEY-----
```

lines, into the designated text field in PRTG and Save your settings. Once you have pasted in and saved the private key, PRTG shows it as

```
*****
```

Make sure that a corresponding public key exists on the target device.

- For a detailed description on how to convert and use an SSH key, see the Knowledge Base: [How can I use private keys for my SSH sensors with PRTG?](#)

12.4 Monitoring Bandwidth via Packet Sniffing

Packet sniffing comes into consideration if your network devices do not support the Simple Network Management Protocol (SNMP) or xFlow (NetFlow, jFlow, sFlow, IPFIX) to measure bandwidth usage and if you need to differentiate the bandwidth usage by network protocol and/or IP addresses.

❶ Packet Sniffer sensors support [Toplists](#)⁴⁰⁰² (for example, Top Talkers or Top Connections).

How Packet Sniffing Works

If you need to know what applications or IP addresses cause the traffic in your network, you can use a packet sniffer. A packet sniffer looks at every single data package that travels through your network for accounting purposes.

Monitoring with PRTG via Packet Sniffer Sensors

PRTG can analyze the packets that pass the network card of a PC or you can connect it to the monitoring port of a switch. To calculate bandwidth usage, PRTG inspects all network data packets either passing the PC's network card (shown on the left side in the schema above) or the data packages that a monitoring port of a switch (right side) sends with its built-in packet sniffer. Using remote probes, you can set up packet sniffers anywhere in your network.

❶ Packet Sniffer sensors use the [npcap library](#) to monitor traffic.

■ For more information, see section [Add Remote Probe](#)⁴⁵⁰¹.

[Comparing](#)⁴³⁰⁸ the four bandwidth monitoring technologies that PRTG provides (SNMP, Windows Management Instrumentation (WMI), xFlow, and packet sniffing), packet sniffing creates the most CPU and network load, so you should only use it in small to medium-sized networks, on dedicated computers for larger networks, or for individual computers.

Reasons to Choose Packet Sniffing

It is important to understand that the packet sniffer can only access and inspect data packages that actually flow through the network interfaces of the probe system. This is fine if you only want to monitor the traffic of this machine (for example, your web server). In switched networks, only the traffic for a specific machine is sent to each machine's network card, so PRTG usually cannot discern the traffic of the other machines in the network.

If you also want to monitor the traffic of other devices in your network, you must use a switch that offers a monitoring port or port mirroring configuration (Cisco calls it Switched Port Analyzer (SPAN)). In this case, the switch sends a copy to the monitoring port of all data packages traveling through the switch. As soon as you connect one of the probe system's network cards to the switch's monitoring port, PRTG can analyze the entire traffic that passes through the switch.

An alternative is to set up the PRTG core server system as the gateway for all other computers in the network.

Set Up Packet Sniffer Sensors

Find details on how to set up the different xFlow sensors in the following sections:

- [Packet Sniffer sensor](#)  1956
- [Packet Sniffer \(Custom\) sensor](#)  1972

Header-Based Packet Sniffing

For packet sniffing, PRTG looks at the IP addresses and ports of source and destination to assess the protocol. This is a very fast method and saves system resources.

 Sometimes, this method is not fully accurate. For example, it is not possible to identify HTTP traffic on ports other than 80, 8080, and 443 as HTTP. HTTP traffic on non-standard ports would not be accounted as such.

KNOWLEDGE BASE

How can I change the default groups and channels for xFlow and Packet Sniffer sensors?

- <https://kb.paessler.com/en/topic/60203>

12.5 Monitoring Bandwidth via xFlows

Using xFlow (NetFlow, jFlow, sFlow, IPFIX) protocols, you can monitor the bandwidth usage of all packets going through a device. In PRTG, you can view [Toplists](#)^[4002] for all xFlow sensors.

xFlows are monitoring data pushed from network devices to PRTG. You can use them to monitor where and how much data is traveling to and from. This way, they determine which machine, protocol, or user is consuming bandwidth. PRTG supports the following xFlow types:

- NetFlow v5/v9 and IPFIX: Originally introduced by Cisco and supported by several vendors.
- jFlow: Traffic sampling technology introduced by Juniper networks.
- sFlow: Short for [sampled flow](#), introduced by HP. sFlow uses statistical sampling of the traffic at defined intervals to achieve scalability for high volume interfaces.

You can also use [packet sniffing](#)^[4305] for bandwidth monitoring if your hardware does not support any of these xFlow versions.

How xFlow Monitoring works

You can measure bandwidth usage by IP address or by application in a network, using one of the xFlow protocols. They are the best choice especially for networks with high traffic (connections with hundreds of megabits or gigabits).

For xFlow monitoring, the router gathers bandwidth usage data (flows), aggregates it, and sends information about it to PRTG using User Datagram Protocol (UDP) packets. When you use sampling (mandatory for sFlow), only information about every n-th packet is sent to PRTG, which reduces CPU load a lot. Because the switch already performs an aggregation of traffic data beforehand, the flow of data to PRTG is much smaller than the monitored traffic. This makes xFlow the ideal option for high traffic networks that need to differentiate the bandwidth usage by network protocol and/or IP addresses.

NetFlow and IPFIX Monitoring

The NetFlow (and IPFIX) protocol is mainly used by Cisco devices. Once configured, the router sends a NetFlow or IPFIX packet for each data flow to the monitoring system running on a probe. You can filter and evaluate the data in PRTG. Different NetFlow and IPFIX sensors are available: The basic sensors offer predefined channel definitions, the custom variants enable you to define your own channels.

The advantage of using NetFlow or IPFIX:

- Generates little CPU load on the router itself (according to Cisco, 10,000 active flows create about 7% additional CPU load; 45,000 active flows account for about 20% additional CPU load).
- Generates less CPU load on the PRTG core server system compared to Packet Sniffer sensors.

i You must enable NetFlow or IPFIX export on the device that you want to monitor. The device must send a flow data stream to the IP address of the probe system on which you set up the NetFlow or IPFIX sensor.

i You can monitor Juniper jFlow with the corresponding sensors as well. Basically they are adjusted NetFlow v5 sensors.

i NetFlow Lite monitoring is possible using the Sampling Mode of the [NetFlow v9 sensor](#)¹⁸⁵⁶ or of the [NetFlow v9 \(Custom\) sensor](#)¹⁸⁷³. You can turn on the sampling mode and define a suitable Sampling Rate in the sensor settings. Note that NetFlow Lite monitoring might not work in every case even with active sampling mode.

sFlow Monitoring

sFlow works similar to NetFlow monitoring. The router sends data flow packets to the monitoring system running on a probe. The most obvious difference between the two xFlow protocols: With sFlow, not all of the traffic is analyzed, but only every n-th packet.

The advantage is clear: There is less data to analyze, there is less CPU load needed, and less monitoring traffic is generated. Nevertheless, you can get a good insight into your network bandwidth usage.

i PRTG supports sFlow v5.

Set Up xFlow Sensors

Find details on how to set up the different xFlow sensors in the following sections:

- [NetFlow v5 sensor](#)¹⁸²⁴
- [NetFlow v5 \(Custom\) sensor](#)¹⁸⁴¹
- [NetFlow v9 sensor](#)¹⁸⁵⁶
- [NetFlow v9 \(Custom\) sensor](#)¹⁸⁷³
- [IPFIX sensor](#)¹⁴⁵⁸
- [IPFIX \(Custom\) sensor](#)¹⁴⁷⁵
- [sFlow sensor](#)²¹⁹⁶
- [sFlow \(Custom\) sensor](#)²²¹³
- [jFlow v5 sensor](#)¹⁵⁰⁴
- [jFlow v5 \(Custom\) sensor](#)

Limitations

For example, with a dual core, 2.5 Ghz hardware system, you can process about 100,000 flows per second for one xFlow stream. Using sampling, the number of actual flows can be much higher. When using complex filters, the value can be much lower. For example, with a router sending about 2,000 flows/second (which corresponds to mixed traffic at gigabit/second level without sampling) you can expect to configure up to 50 xFlow sensors operating properly.

PRTG internally monitors its own xFlow processing. You can see decreased values in the Health channels of the [Core Health](#)⁷⁶⁰ and [Probe Health](#)²⁰⁶³ sensors as soon as xFlow packets are not processed because of an overload (you find these sensors on the local probe device).

If you experience an overload, consider using sampling or setting up multiple probes and distributing the xFlow streams to them. We recommend that you do not add more than 50 xFlow sensors per probe.

- ① IPv6 flows are supported by NetFlow v9 sensors and IPFIX sensors, other xFlow sensors only support IPv4.

12.7 Monitoring Quality of Service and VoIP

PRTG can monitor the Quality of Service (QoS) in a network with dedicated QoS sensors, as well as Cisco IP service level agreement (SLA) and Cisco Class Based Quality of Service (CBQoS). Slight variations in network parameters like jitter, packet loss, or packet delay variation (PDV) usually have only little effect on Transmission Control Protocol (TCP) based services (for example, HTTP and Simple Mail Transfer Protocol (SMTP)). But for User Datagram Protocol (UDP) based services like Voice over IP (VoIP) and video streaming, a steady stream of data packets is crucial. The sound quality of a VoIP call drops noticeably when UDP packets are not received in time, or if packets are lost or in the wrong order.

As a rule of thumb for good quality of service (from a VoIP perspective), it is important to have low measurements for jitter (less than 20 to 50 ms) and PDV (less than 100 ms), and preferably **zero** measurements for packet loss, duplicated packets, or packets in wrong order.

For QoS measurements, four sensors are available:

Sensor	Description
QoS (Quality of Service) One Way sensor <small>2105</small>	Parameters regarding the quality of a network connection between two probes
QoS (Quality of Service) Round Trip sensor <small>2116</small>	Parameters regarding the quality of a network connection between a probe and a target device at the endpoint of the connection. Traffic is measured bidirectionally.
Cisco IP SLA sensor <small>658</small>	VoIP network parameters using IP SLAs from Cisco via SNMP
SNMP Cisco CBQoS sensor <small>2372</small>	VoIP network parameters using Cisco's CBQoS via SNMP

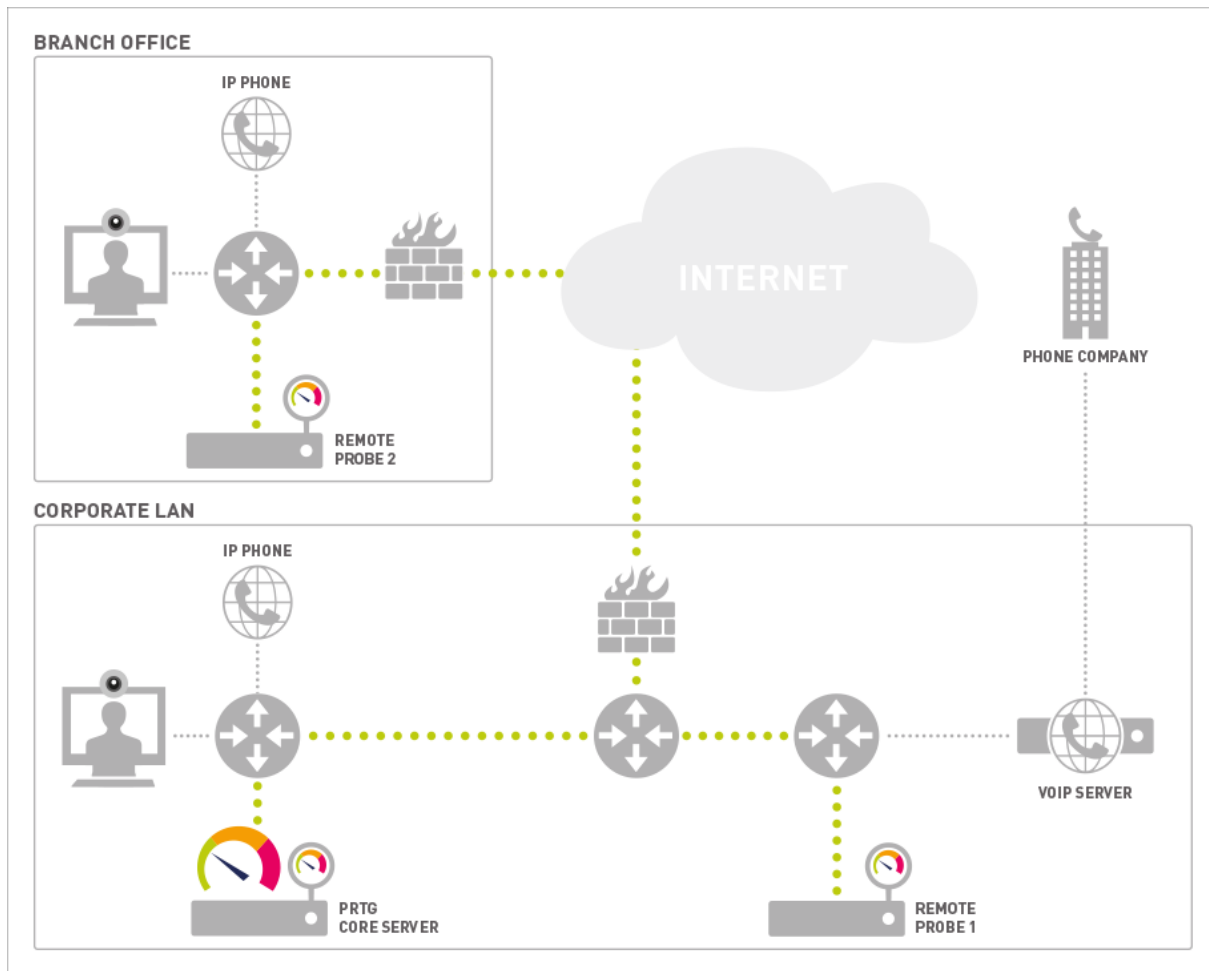

QoS (Quality of Service) Sensors

The QoS sensors monitor the quality of a network connection by measuring the following parameters:

- Jitter in ms according to RFC 3550
- PDV in ms according to RFC 3393
- Lost packets in %
- Out-of-order packets in %
- Duplicated packets in %

The QoS sensors measure the quality of service by sending UDP packets between two probes. This means that you can test any network connection in your network by placing a [remote probe](#) 4501 on (or near) each end of the connection and measuring the connection quality between them. This way, you can find network issues that can affect VoIP sound quality or cause video streaming issues.

You can also use the QoS (Quality of Service) Round Trip sensor without installing a remote probe at the connection endpoint. For details about the PRTG QoS Reflector, see the Knowledge Base: [How can I monitor QoS round trips without using remote probes?](#)

Monitoring Quality of Service with PRTG

The measurements for QoS monitoring are taken between two probes. So the first step is to place two PCs running a remote probe on (or near) both ends of the connection that you want to monitor. As an alternative, the local probe on the PRTG core server system can also be used as one end, or you can use the PRTG QoS Reflector (see the [Knowledge Base](#)) to bounce the packets when monitoring QoS roundtrips. If any firewalls, packet filters, or network address translation (NAT) systems are used, you must configure them as necessary so that the UDP packets can reach the target probe.

Create a new QoS sensor on a probe device, or, if you use the QoS (Quality of Service) Round Trip sensor, on any device. With the settings for the number and for the size of the packets, you can configure the test data stream. 1,000 packets of 172 bytes each is a good start, but if your applications use larger packets, you might want to enter other values here. Try to configure the test streams with parameters similar to that of the UDP services you are using across this connection.

Find details about settings in the sections [QoS \(Quality of Service\) One Way sensor](#)²¹⁰⁵ and [QoS \(Quality of Service\) Round Trip sensor](#)²¹¹⁶.

Cisco IP SLA Sensor

Wikipedia describes IP SLA as [a feature included in the Cisco IOS Software that can allow administrators the ability to Analyze IP Service Levels for IP applications and services. IP SLA uses active traffic-monitoring technology to monitor continuous traffic on the network. This is a reliable method in measuring over head network performance.](#) IP SLA is mostly used to monitor the sound quality of VoIP traffic.

If you have not done so already, add a device that represents the Cisco device that you want to monitor. Then create a new Cisco IP SLA sensor on this device.

■ Find details about settings in section [Cisco IP SLA sensor](#)^[658].

This feature is only available in the more expensive Cisco devices. If you do not have IP SLA-capable routers and switches, you can still get similar information with QoS sensors (see [above](#)^[4310]) that do not require any special hardware.

PRTG monitors the following parameters: Impairment Calculated Planning Impairment Factor (ICPIF), Mean Opinion Score (MOS), Average Jitter, Packets Lost, Packets Out Of Sequence, Packets Late, Average Round Trip Time (RTT), Domain Name System (DNS) RTT, TCP RTT, Transaction RTT.

Two of these parameters are especially interesting for VoIP: MOS and ICPIF.

SNMP Cisco CBQoS Sensor

Cisco CBQoS provides information about QoS of Cisco network devices that support the [Modular QoS Command-Line Interface \(MQC\)](#). With Class Based QoS, you can obtain monitoring data that includes summary counts and rates by traffic class before and after the enforcement of QoS policies, according to Cisco's CBQoS Management Information Base (MIB) definition.

PRTG determines CBQoS data via SNMP. The corresponding sensor is available as of PRTG 13.x.5 or later. CBQoS is available in Cisco IOS by default as of version 12.4(4)T.

To monitor CBQoS, add a device to PRTG for the Cisco device that you want to monitor. Then create a new SNMP Cisco CBQoS sensor on this device.

■ See section [SNMP Cisco CBQoS sensor](#)^[2372] for more details.

This sensor supports the following CBQoS classes:

- Class Map: statistical data about class maps, such as pre-policy and post-policy packets and sizes, drop packets and size, as well as no-buffer drop packets
- Match Statement: statistical data about match statement specific information, such as pre-policy packets and size
- Queueing: statistical data about queueing actions, such as current and maximum queue depth, drop packets, and drop size

You can select the desired CBQoS entries that you want to monitor while creating the sensor. The available entries are specified with their particular connections, their descriptions, and class types.

Voice over IP

For MOS measurements, Cisco conducted a panel test where a wide range of listeners judged the quality of voice samples sent using particular codecs, on a scale of 1 (poor quality) to 5 (excellent quality). The Cisco device calculates the corresponding value for the network connection based on network parameter measurements like jitter and packet loss.

■ The Cisco IP SLA sensor reads out the MOS directly from the Cisco device. For the QoS (Quality of Service) One Way sensor and the QoS (Quality of Service) Round Trip sensor, PRTG calculates the MOS by itself. For details, see the Knowledge Base: [How does PRTG calculate the MOS score for QoS sensors?](#)

The values and their meanings are:

MOS	Quality	Expected Quality Impairment
5	Excellent	Imperceptible
4	Good	Perceptible, but not annoying
3	Fair	Slightly annoying
2	Poor	Annoying
1	Bad	Very annoying

The second interesting parameter ICPIF is the sum of measured impairment factors minus a user-defined access Advantage Factor that is intended to represent the user's expectations, based on how the call was placed (for example, a mobile call versus a land-line call) (quoted from the Cisco website).

Upper Limit for ICPIF	VoIP Call Communication Quality
5	Very good
10	Good
20	Adequate
30	Limiting case
45	Exceptional limiting case
55	Customers likely to react strongly (complaints, change of network operator)

12.8 Monitoring Email Round Trip

Email Round Trip sensors ensure the end-to-end delivery of emails and let you monitor the availability and the performance of a complete email delivery process. There are two sensors for this task:

- [SMTP&POP3 Round Trip sensor](#) 
- [SMTP&IMAP Round Trip sensor](#) 

Both initially deliver an email to a mail server using the Simple Mail Transfer Protocol (SMTP). Afterward, the receiving mailbox is scanned using Post Office Protocol version 3 (POP3) or Internet Message Access Protocol (IMAP) until the email arrives. The test email contains a unique code in the topic that is used to identify the email, such as [PRTG Roundtrip Mail: {6D136420-5A3E-46CF-871A-1DAF0C4F3D5D}](#)

When PRTG successfully receives an email in this email round trip cycle, it marks the respective message for deletion on the mail server. Usually, a mail server then deletes this email. For best performance, we recommend that you use dedicated email accounts for email round trip sensors.

Monitoring an Email Round Trip

In the scenario shown above, there are three steps in the round trip:

- **Step 1**
PRTG delivers an email via SMTP to a mail server (like an email client).
- **Step 2**
The SMTP server delivers the email to a POP3/IMAP server (which can be located at a remote site, in your local LAN, or on the same server as well).
- **Step 3**
Every few seconds, PRTG connects to the POP3/IMAP server until the test email arrives.

Recommended Configuration

Here is a simple concept to check the delivery of email from and to your organization:

1. Create a dedicated email account for this test in your mail system.
2. Set up an external email account (for example, on a hosted mail server or free mail service) and configure it to send all emails back to this dedicated email account in your organization (that you created in [step 1](#)).
3. Set up a Round Trip sensor to send an email to the external email account (that you created in [step 2](#)) using your network's mail server and then check for the email account on your mail system (that you created in [step 1](#)) for the arrival of the email.

With this technique, you are testing multiple aspects of your email server setup. As long as the sensor shows the Up [status](#)¹⁹⁷, this means:

- Your email server accepts emails via SMTP.
- Emails are being sent to the outside world. So the internet connection and MX lookups work.
- Emails from an external mail server can be delivered into your mail system. So the MX records for your domain are correct and the mail server is reachable from the outside world. Also, your email filtering is working.
- Emails can be retrieved using POP3 (or IMAP).

Use dedicated email accounts with this sensor. If you use more sensors of this type, make sure that each sensor uses its own email accounts.

Conclusion

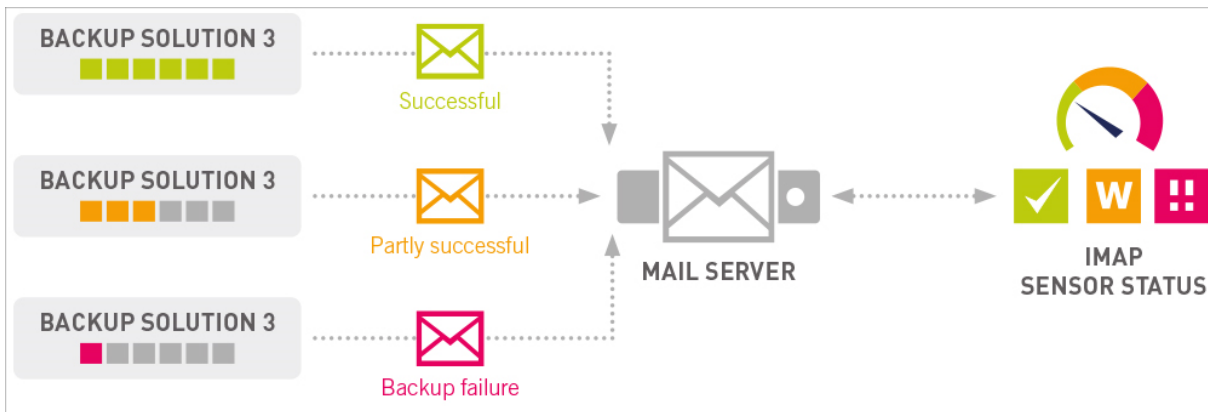

These two sensors ensure the delivery of email from and to your mail servers. Compared to the standard SMTP, POP3, and IMAP sensors that only check the availability of these services, the two round trip sensors actually monitor the complete transaction from accepting the email on the first email server to the delivery of the email to the final POP3/IMAP server.

12.9 Monitoring Backups

Monitoring your backup software enables you to be sure that your recent backups succeeded. With PRTG, you can check the email notifications of various backup jobs. You only need to do two things for backup monitoring:

1. Configure your backup software to send emails to a dedicated email account.
2. Configure the [IMAP sensor](#)¹⁴³⁰ for backup monitoring.

PRTG analyzes the backup emails for you and sets the status of the IMAP sensor accordingly. This way you see the states of all your backup jobs.

Backup Monitoring via Email

Setting up Backup Monitoring

Refer to our Knowledge Base for a step-by-step tutorial on how to monitor your backup jobs: [How can I monitor my backup software to be sure backup succeeded last night?](#)

12.10 Monitoring Virtual Environments

Monitoring your complete IT infrastructure in a comprehensive way usually means monitoring not only your physical infrastructure, but also your virtual environments. With the layer of virtualization added to the layers that represent your physical hardware, it also becomes necessary to plan beforehand how you want to logically set up your monitoring infrastructure.

Monitoring All Layers of Your IT Infrastructure

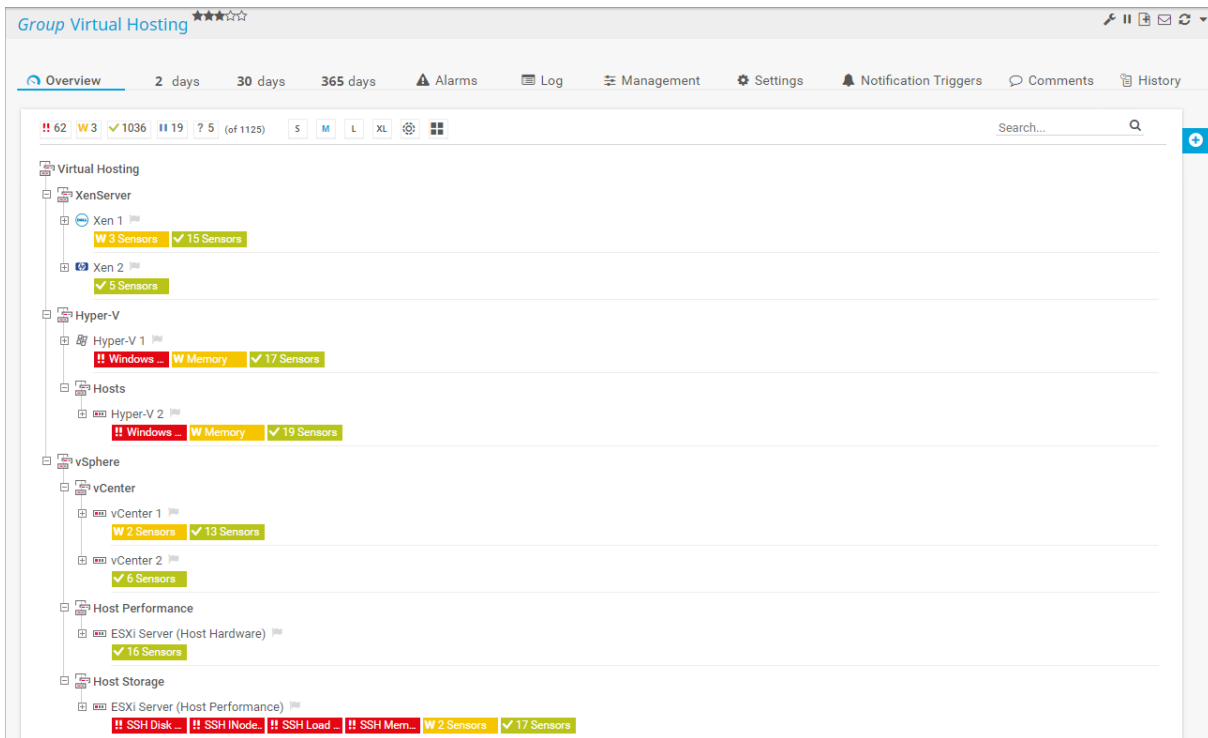

In general, you can assume that with the layer of virtualization, you have to monitor a total of four layers in your IT infrastructure.

Layer	Description
Hardware (Server Racks)	<p>Usually, you monitor most of the hardware components in your network with SNMP sensors⁴⁶¹⁵. With this monitoring technology⁴²⁸⁶, you can gather monitoring data such as CPU load, memory, and disk space. You can also get information about the network traffic and bandwidth usage of your routers and switches.</p> <p>Alerts can tell you if there is an issue with a hardware component or if hardware resources are running out. In addition, you can identify potential bottlenecks that might affect your virtualized infrastructure.</p>
Host Server Hardware	<p>We recommend that you explicitly monitor the host hardware of your virtualization solution. If you have issues with your virtual machines (VM), the origin might be a host hardware failure. You should closely monitor your VM host servers to be alerted if the hardware status changes in any significant way.</p> <p>Besides the standard hardware sensors, PRTG provides specific sensors for various virtualization host servers. The following monitoring data of your host servers can prevent issues in virtualized environments:</p> <ul style="list-style-type: none"> ▪ VMware: current reading and health status (via Web-based Enterprise Management (WBEM)), a general status as shown in vSphere (via Simple Object Access Protocol (SOAP)), and disk space of a VMware data store (via SOAP) ▪ Hyper-V: host health-critical values; deposited pages; network traffic; CPU usage of guests, hypervisor, and in total ▪ Citrix XenServer: CPU, memory, and network usage; the number of running VMs on the host server; and load average
Resource Usage of VMs	<p>VMs run on their particular host servers. PRTG can show you the status of single VMs and several of their performance counters. You might want to know which resources a single VM uses and needs, but we do not recommend that you monitor single VMs in every case because it has a noticeable influence on overall performance. Often, it is sufficient to only monitor VMs that are critical for your network. If a VM reaches its capacity limits, PRTG can alert you so that you can take the respective steps to solve the issue.</p>

Layer	Description
Operating Systems of VMs	<p>Indicators for a healthy VM that you can monitor with PRTG are:</p> <ul style="list-style-type: none"> ▪ VMware: CPU and memory usage, disk read and write speed, read and write latency, and network usage ▪ Hyper-V: CPU usage, disk read and write speed ▪ Citrix XenServer: CPU usage and free memory <p>You can monitor, for example, the Windows operating system of a single VM with the standard WMI sensors. With this technology, you can access data of various Windows parameters. Other operating systems like Linux/macOS can make data available via SSH and SNMP.</p> <p>The status of the operating systems on your VMs can indicate potential issues. You can monitor these but be careful with regard to performance considerations. This is because sensors using the WMI protocol have a high impact on system performance, so you should only monitor operating systems that are critical for your infrastructure. Furthermore, you do not need to monitor every item multiple times. For example, it might be sufficient to monitor free disk space only as a needed resource of the actual VM, not for the VM's operating system itself.</p>

Monitoring the Virtual Infrastructure

To monitor your IT infrastructure, best practice is to first set up the monitoring of your data center's hardware layer in PRTG. This way, you can detect potential bottlenecks that might have an impact on your virtual servers. Then, you can prepare to start monitoring your virtual environment. If you use several solutions for virtual hosting, it is also a good idea to group related host servers, their VMs, and the operating systems. The screenshot below shows a possible structure of monitoring a virtual environment with PRTG.

Grouped Virtual Components

At the top level, you can see the [Virtual Hosting](#) group. This group contains several subgroups for the virtualization solutions Citrix [XenServer](#), Microsoft [Hyper-V](#), and VMware [vSphere](#). The [vSphere](#) group, for example, has three subgroups: we monitor the vCenter VMs and the vCenter Windows operating system ([vCenter](#) group), the performance of the host server ([Host Performance](#) group), and the storage system of the host ([Host Storage](#) group).

Devices for Physical Hosts

In PRTG, set up devices that represent the physical hosts of your VMs. For example, for your VMware hosts, add devices that represent the ESXi servers. For Hyper-V, add devices that represent your Hyper-V host servers. For Citrix, add devices that represent your XenServers.

Then you can add suitable sensors to the host server devices. If you run the [auto-discovery](#)^[296], many sensors are automatically created. Several preconfigured host hardware sensors are available:

- [VMware Host Hardware \(WBEM\) sensor](#)^[333]: monitors an ESXi server via WBEM
- [VMware Host Hardware Status \(SOAP\) sensor](#)^[340]: monitors a VMware host server via SOAP
- [VMware Host Performance \(SOAP\) sensor](#)^[3416]: monitors a VMware host server via SOAP
- [Hyper-V Host Server sensor](#)^[1384]: monitors a Microsoft Hyper-V host server via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#)^[464] of the parent device
- [Citrix XenServer Host sensor](#)^[670]: monitors a Xen host server via HTTP

These sensors monitor hardware-specific counters to ensure that no hardware issues affect your actual VMs. Additional sensors can monitor the host hardware via the Simple Network Management Protocol (SNMP) (for example, traffic and custom requests), and the data storage on ESXi servers via SOAP. There are also sensors for network adapters and storage devices that are connected to a Hyper-V host server.

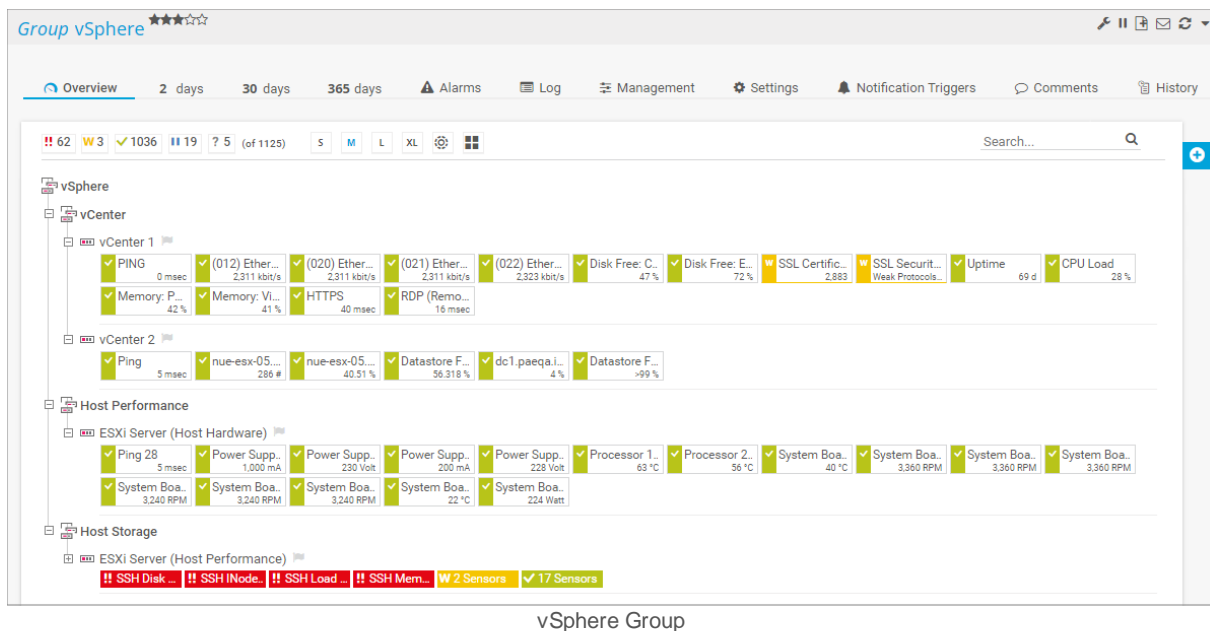

Devices for Virtual Machines

To monitor your actual VMs, add them to your host servers in PRTG. For a better overview, you might want to add a device to PRTG that represents your host server and add sensors for your VM there. The respective sensors for VMs show you the performance of single VMs as well as their resource usage. This identifies VMs with low performance so that you can react before there is an issue with one or more of your VMs. As mentioned before, you can additionally monitor the operating systems of your VMs, if necessary. See the following sections for details about particular virtualization solutions.

VMware Virtual Machine

The [VMware Virtual Machine \(SOAP\) sensor](#) monitors VMs on a VMware host server via SOAP. The general idea is to add a vCenter server as a device to your vCenter group and use it as a parent device to which you add the sensors for your VMs. This way, in the case of vMotion, when your VMs change their host server, PRTG can follow these movements and does not lose the monitored VMs.

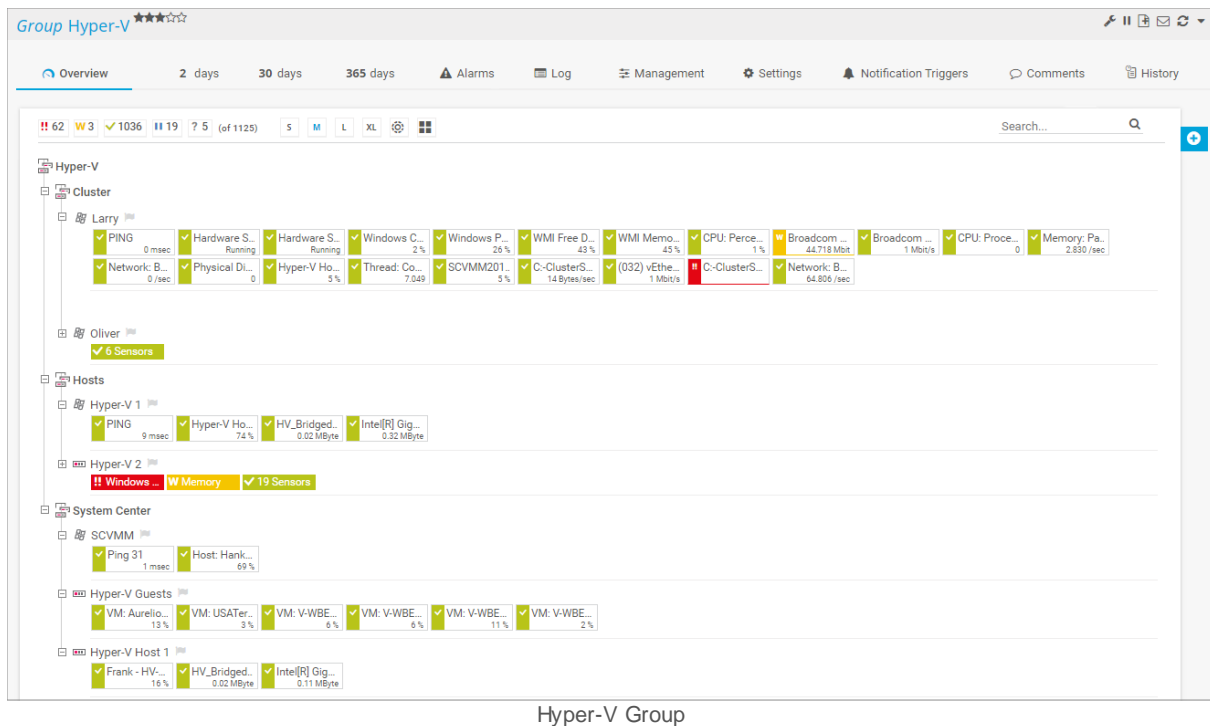

For this sensor, .NET 4.7.2 or later must be installed on the probe system. If you use many VMware sensors, we also recommend that you adjust the settings on your VMware host server to accept more incoming connections.

This screenshot shows an example of a vSphere group. As recommended, the sensors for the VMware virtual machines are added to the vCenter 1 device. There is also a dedicated vCenter 2 device for the vCenter Windows operating system with common WMI sensors for CPU, memory, disk, and network usage. The ESXi host servers are organized in their own groups regarding performance and storage. In this example, PRTG monitors the hosts with the standard SNMP hardware sensors as well as with the specific VMware ESXi host sensors.

Microsoft Hyper-V Virtual Machine

The [Hyper-V Virtual Machine sensor](#)^[1395] monitors VMs via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#)^[464] of the parent device. With this hybrid approach, the sensor first tries to query data via performance counters and uses WMI as a fallback if no performance counters are available. Performance counters generally need less system resources than WMI. The parent device of this sensor must be a Windows server running Hyper-V. You should also disable the User Account Control (UAC) in the Windows operating system of the VM. Otherwise, the sensor might change to the Down status with the error message [The virtual machine is not running or is powered off](#). Also, this sensor does not support [Live Migration](#).

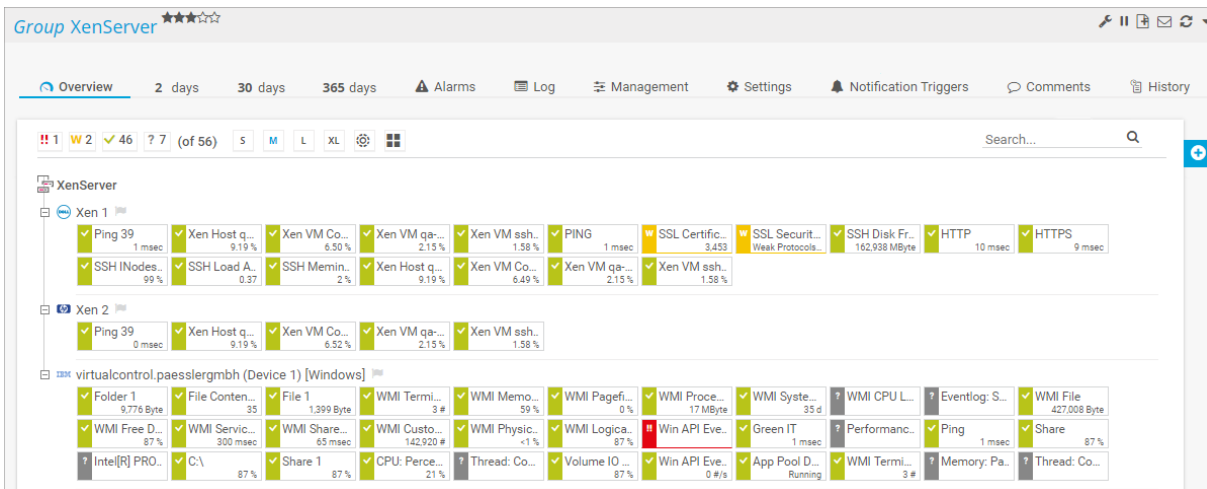

Hyper-V Group

This screenshot shows an example of a [Hyper-V](#) group. There is a dedicated group for failover clusters where two cluster nodes are monitored with several SNMP and WMI sensors, as well as Hyper-V Host Server sensors and sensors for the Hyper-V virtual machines. This ensures that Hyper-V and failover clusters work without any issues. The Hyper-V hosts are monitored the same way, organized in a dedicated group for hosts.

Citrix XenServer Virtual Machine

The [Citrix XenServer Virtual Machine sensor](#)^[681] monitors VMs via HTTP. For this sensor, you have to add a device that represents a Citrix XenServer with version 5.0 or later. Another requirement is the Microsoft .NET Framework. You have to install .NET 4.7.2 or later on the probe system.

In a XenServer pool, each host knows each running VM. Because of this, there is no central instance that provides all available data, so it does not matter on which host you query your VMs. All queries on any host are automatically forwarded to the pool master that manages the XenServer pool. Therefore, it is sufficient to create the desired sensors for your XenServer VMs on a device that represents one host server of your pool. The XenServer sensors find out which host is running and retrieve the respective data.

XenServer Group

This screenshot shows an example of a **XenServer** group. There are two devices for XenServer hosts, **Xen 1** and **Xen 2**, that each have a Citrix XenServer Host sensor and several Citrix XenServer Virtual Machine for the particular VMs on this host. Furthermore, the Windows operating system is represented as a dedicated **virtualcontrol** device that PRTG monitors with several WMI sensors regarding CPU, disk, memory, and network usage.

Performance Considerations

For best performance when monitoring virtual environments, we strongly recommend that you use a computer with Windows Server 2012 R2 or later installed on the probe system. For example, you can run up to 300 VMware sensors with a 60-second scanning interval on Windows Server 2012 R2 or later, while you can only use 30 VMware sensors with the same scanning interval on Windows Server 2008 R2.

12.11 Monitoring Databases

Monitoring your databases lets you ensure that database queries are processed in time, and that the database itself performs within the defined parameters. Furthermore, database monitoring with PRTG can alert you via a corresponding sensor status if database queries return unexpected result values.

PRTG comes with built-in native sensors for the most common databases:

- Microsoft SQL servers
- MySQL servers
- PostgreSQL servers
- Oracle SQL servers

It is also possible to monitor many other database servers. For this case, PRTG uses the ActiveX Data Objects (ADO) interface.

There are two types of database sensors:

- [Sensors that monitor databases directly](#)⁴³²⁴: Monitor databases from the user perspective. These sensors send a request to the database server and receive corresponding values. You can optionally process data tables and show values in individual channels or monitor transactions.
- [Sensors that monitor database performance](#)⁴³²⁷: Monitor databases with a more abstract view on the servers. Usually, these sensors monitor performance counters via Windows Management Instrumentation (WMI).

Sensors Monitoring Databases Directly

PRTG provides several sensors that can monitor the content of databases. Sensors of this type connect to the database server, execute a defined query, and show the execution time of the whole request and the query. You can use these sensors to process the data table and show requested values in individual channels.

The following sensors are available for this kind of monitoring:

- [Microsoft SQL v2 sensor](#)¹⁶⁰⁷: Monitor your Microsoft SQL server 2005 or later.
- [MySQL v2 sensor](#)¹⁶⁷⁴: Monitor your MySQL server version 5.0 or later.
- [Oracle SQL v2 sensor](#)¹⁹²³: Monitor your Oracle database server version 10.2 or later.
- [PostgreSQL sensor](#)²⁰⁶⁴: Monitor your PostgreSQL database version 7.x or later.

For these sensors, you can define valid Structured Query Language (SQL) statements that the sensors send to the database server. Define the queries in an SQL script file and store it in the respective \Custom Sensors\sql\ subfolder of the [PRTG program directory](#)⁴⁵²⁶.

You can select this SQL script when you add the sensor. With every [scanning interval](#)³⁷⁹, the sensor executes this script with the defined query against the database and the database returns corresponding values in individual channels (see the [example](#)⁴³²⁵ below for sample channel value selections). Use the [channel settings](#)³⁹⁷⁸ to define limits for specific values.

 These sensors need .NET 4.7.2 or later installed on the probe system.

Alternatively, you can monitor almost all available database servers with the [ADO SQL v2 sensor](#)⁴⁹⁰ via an ADO connection.

Example: SQL Channel Value Selection

The SQL (v2) sensors determine their channel values by using column numbers, column names, row numbers, or key value pairs. This section shows which option you can choose to get the desired value from an SQL data table.

Consider the following data table that an SQL query might return from a database:

article_id	articles_av ailable	first_listing	orders
00	12	2001	4
01	345	2005	56
02	678	2008	290
03	90	2012	32

This data table has four columns with the following numbering:

- Column 0 has the name "article_id"
- Column 1 has the name "articles_available"
- Column 2 has the name "first_listing"
- Column 3 has the name "orders"

The numbering of columns starts with 0, as well as the numbering for rows starts with 0. The table has four rows, each row contains the properties of one "article". The "articles" have the IDs 00, 01, 02, 03. This also illustrates the proper row numbering (0, 1, 2, 3).

With the options for channel value selection in SQL sensors, you can read out the following values:

- All values that are in row 0 (here: 00, 12, 2001, 4)
- All values that are in column 0 (here: 00, 01, 02, 03)
- All values that are in column 1 (here: 12, 345, 678, 90)

It is not possible to get values from any other cell in a data table. If you need this, you have to reconstruct your data table.

The following samples show possible results for channel value selections regarding this data table:

Sample Channel Value Selection Description

Channel Value Selection by Column Number

This channel shows the value in row 0 of the column you specify. Consider you define "1" as column number. Then the channel value is "12" because it is the cell in column 1 and row 0.

Possible return values for this option are:

- Column number "0" returns "00"
- Column number "1" returns "12"
- Column number "2" returns "2001"
- Column number "3" returns "4"

Channel Value Selection by Column Name

This channel shows the value in row 0 of the column you specify. Consider you define "orders" as column name. Then the channel value is "4" because it is the cell in column "orders" and row 0.

Possible return values for this option are:

- Column name "article_id" returns "00"
- Column name "articles_available" returns "12"
- Column name "first_listing" returns "2001"
- Column name "orders" returns "4"

Channel Value Selection by Row Number

This channel shows the value in column 0 of the row you specify. Consider you define "1" as row number. Then the channel value is "01" because it is the cell in row 1 and column 0.

Possible return values for this option are:

- Row number "0" returns "00"
- Row number "1" returns "01"
- Row number "2" returns "02"
- Row number "3" returns "03"

Channel Value Selection by Key Value Pair

This channel shows the value in column 1 of the same row where the key in column 0 was found. Consider you define "02" as key. Then the channel value is "678" because it is the cell in the same row in column 1 as the key in column 0.

Possible return values for this option are:

- Key "00" returns "12"
- Key "01" returns "345"
- Key "02" returns "678"
- Key "03" returns "90"

This sample channel value selection illustrates how to choose the correct option to get needed values from an SQL data table and shows which cells the SQL sensors can address.

UDF: Counting Returned Rows

If you execute a User-defined Function (UDF) on the SQL server and want to know how many rows this UDF returns, follow these steps:

- A command to execute your UDF on the SQL server might look like this, for example:

```
exec myUDF
```

- To get the information how many rows this UDF returns, extend the query in your SQL script:

```
exec myUDF;  
select @@rowcount as row_count
```

- Create a new SQL v2 sensor and select Data Processing during sensor creation.
- In the settings of your SQL sensor, choose the option Select Channel Value by Column name
- Enter row_count into the Column Name field of the channel to show the value from this column in the channel.
- To count table rows returned by a **SELECT** statement, choose the option Count table rows in the sensor settings section Data Processing.

Sensors Monitoring Database Performance

Performance sensors for database servers have a more abstract view on databases and observe performance externally. They do not read out any values of the database, neither do they send SQL queries to databases. This sensor is only available for Microsoft SQL.

The Microsoft SQL server sensors monitor performance via WMI. You can manually set up different performance counters for your server instances, for example, general statistics, access methods, buffer and memory manager, locks, and SQL statistics.

Microsoft SQL Server performance sensors are available for Microsoft SQL Server 2008, 2012, 2014, 2016, 2017, and 2019:

- [WMI Microsoft SQL Server 2008 sensor](#)  3749
- [WMI Microsoft SQL Server 2012 sensor](#)  3762
- [WMI Microsoft SQL Server 2014 sensor](#)  3775
- [WMI Microsoft SQL Server 2016 sensor](#)  3788
- [WMI Microsoft SQL Server 2017 sensor](#)  3801
- [WMI Microsoft SQL Server 2019 sensor](#)  3814

12.12 Monitoring Syslogs and SNMP Traps

PRTG is utilizable as a full-scale syslog server and Simple Network Management Protocol (SNMP) trap receiver without having to install additional software. This section describes a sample configuration for the syslog and SNMP trap receiver and gives you an idea about how to use these features.

Syslog is a well-established standard for computer message logging. Many network devices support sending syslogs to communicate informational, analysis, and debugging messages that are intended for network management and security auditing. SNMP traps are asynchronous notifications from SNMP-enabled devices and can be used to report important incidents and data, just like syslog messages. Devices trigger these messages for various reasons, such as system events, outages, critical conditions, and many more.

PRTG provides two dedicated sensors that work as full-scale syslog and SNMP trap receivers:

- [SNMP Trap Receiver sensor](#) 
- [Syslog Receiver sensor](#) 

Because both the Syslog Receiver and the SNMP Trap Receiver are implemented as common sensors, you do not need to install additional software (for example, you do not need an extra syslog server but only the PRTG web server). You can create the Syslog Receiver sensors as well as the SNMP Trap Receiver sensors in the usual way via the [Add Sensor](#)  dialog. Then configure your syslog or SNMP trap-enabled devices to send messages to PRTG.

Under lab conditions, PRTG could handle about 10,000 syslog and trap messages per second on a quad core desktop machine when using a single sensor without filters.

 The number of messages PRTG can process actually depends on your configuration and system setup. It might be significantly fewer messages.

You can filter the incoming messages by various parameters so that PRTG only processes specific messages and deletes other data right away. Processed messages are stored in an internal, high-performance database on the probe system and are available for review and analysis via the PRTG web interface. The main limiting factor for storing syslog and trap messages is the hard disk space on the probe system.

Sample Configuration

Follow the steps below for a sample configuration of Syslog Receiver and SNMP Trap Receiver sensors. You can apply these instructions to both the SNMP Trap Receiver as well as the Syslog Receiver because the setup works in a similar way for both.

1. [Adding the Receivers](#) 
2. [Configure the Source Devices](#) 
3. [Collect Messages](#) 
4. [Review and Analyze Messages](#) 
5. [Refine the Filters](#) 
6. [Create Notification Triggers](#)

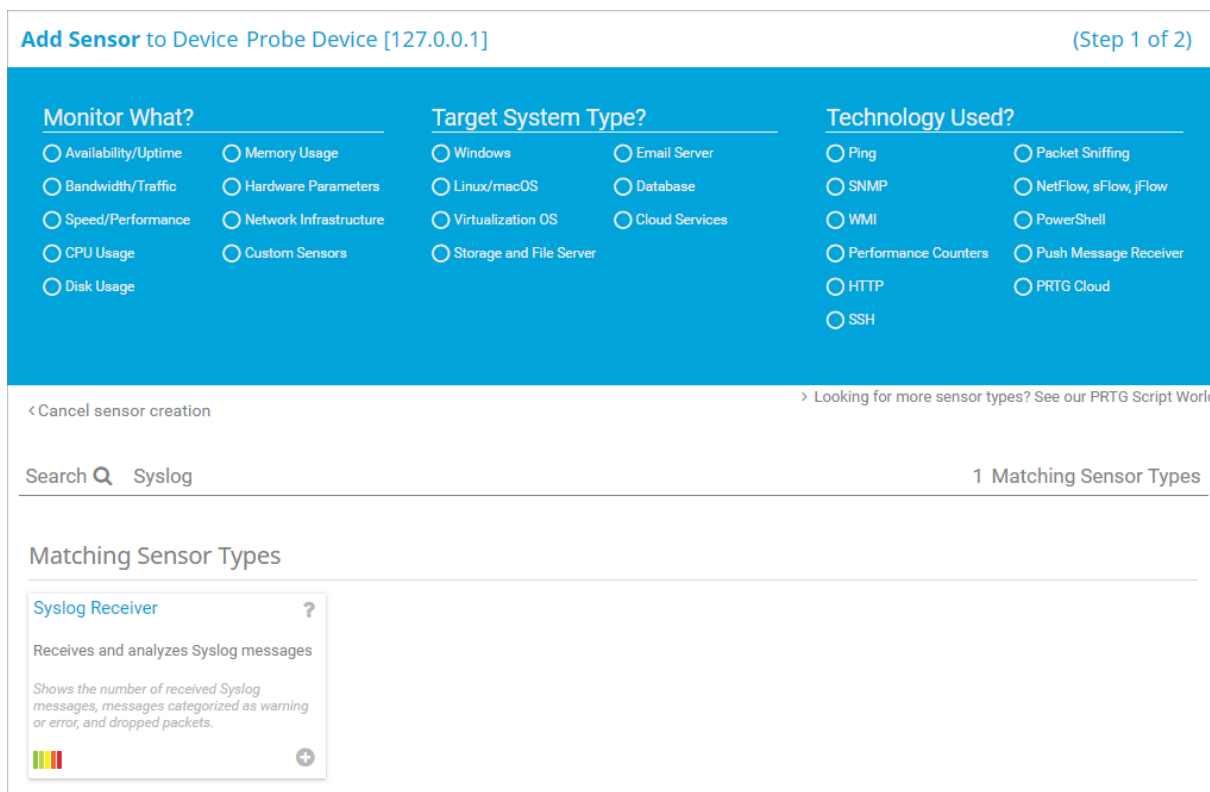

Step 1: Add a Syslog Receiver or SNMP Trap Receiver sensor

Both sensors inherit an implicit filter from the IP address of the parent device. So it is possible to add these sensors to a [probe device](#)^[140]. Then you receive all messages from the probe system and can optionally filter for specific sources later. You can also add these sensors directly to the source device. Then only messages from this device are processed.

Add the receiver sensors to the desired device in the usual way, for example, via the device's [context menu](#)^[266]. We recommend that you leave the sensor's default settings unchanged for the first configuration (port, include and exclude filter, warning and error filter) to see what data actually comes in.

i Adding the sensor directly to a network device increases its speed in comparison to a filter definition in the sensor settings. Distributing Syslog Receiver and SNMP Trap Receiver sensors over different probes makes the overall performance scalable and gives you flexibility with the [data storage](#)^[4526] location.

i If you do not add the sensor to a probe device but to a different device, be careful with the configuration: Ensure that the IP address or Domain Name System (DNS) name of the parent device matches the proper sender. For example, if you want to receive syslog or trap messages from a storage area network (SAN), you might have to add a device using the IP address of a specific array member that sends the messages. Providing a DNS name that points to the IP address of a whole group might not work for SANs.

Syslog Receiver Sensor in the Add Sensor Dialog

Step 2: Appropriately configure your network devices that support sending syslogs or SNMP traps

Configure your syslog or SNMP trap ready devices to send syslogs or traps (see the documentation of the respective device vendors). They have to address the probe system where your Syslog Receiver or SNMP Trap Receiver sensor runs. So specify the IP address of the probe system. If you keep your syslog or trap receiver's default settings, use port 514.

i The protocol is User Datagram Protocol (UDP).

i The SNMP Trap Receiver does not support SNMP v3 traps. Use SNMP v1 or v2c instead.

Filter

Filters are formulas using AND, OR, NOT, brackets and the following fields:

Field	Parameters	Examples
source[ip]	Enter a UDP source IP, IP range, or IP hostmask	source[10.0.23.50], source[10.0.23.10-50], source[10.0.23.10/255]
facility[number]	Enter a number or range of the facility code, between 0 and 23	facility[2], facility[5-7]
severity[number]	Enter a single number or range of the severity code, between 0 (Emergency) and 7 (Debug)	severity[4], severity[1-3]
hostname[text]	Enter the hostname string to match (exact, case sensitive)	hostname[www.paessler.com]
tag[text]	Enter the tag string to match (exact, case sensitive)	tag[su]
appname[text]	Enter the app name string to match (exact, case sensitive)	appname[myproc]
procid[text]	Enter the process ID string to match (exact, case sensitive)	procid[8710]
msgid[text]	Enter the message ID string to match (exact, case sensitive)	msgid[ID47]
message[parttext]	Enter a substring to match the message field (partial, case insensitive)	message[Error]
data[parttext] data[id,param] data[id,param,value]	Enter a substring to match on structured data as displayed in the table (partial, case sensitive); or enter an ID and a parameter (comma separated) to check if the parameter exists in the ID element; or enter an ID, a parameter, and a value (comma separated) to match on a structured data value (RFC 5424)	data[exampleSDID@32473], data[exampleSDID@32473, eventSource], data[exampleSDID@32473, eventSource,Application]

Include Filter **i** severity[0-6]

Exclude Filter **i**

Warning Filter **i** severity[4]

Error Filter **i** severity[0-3]

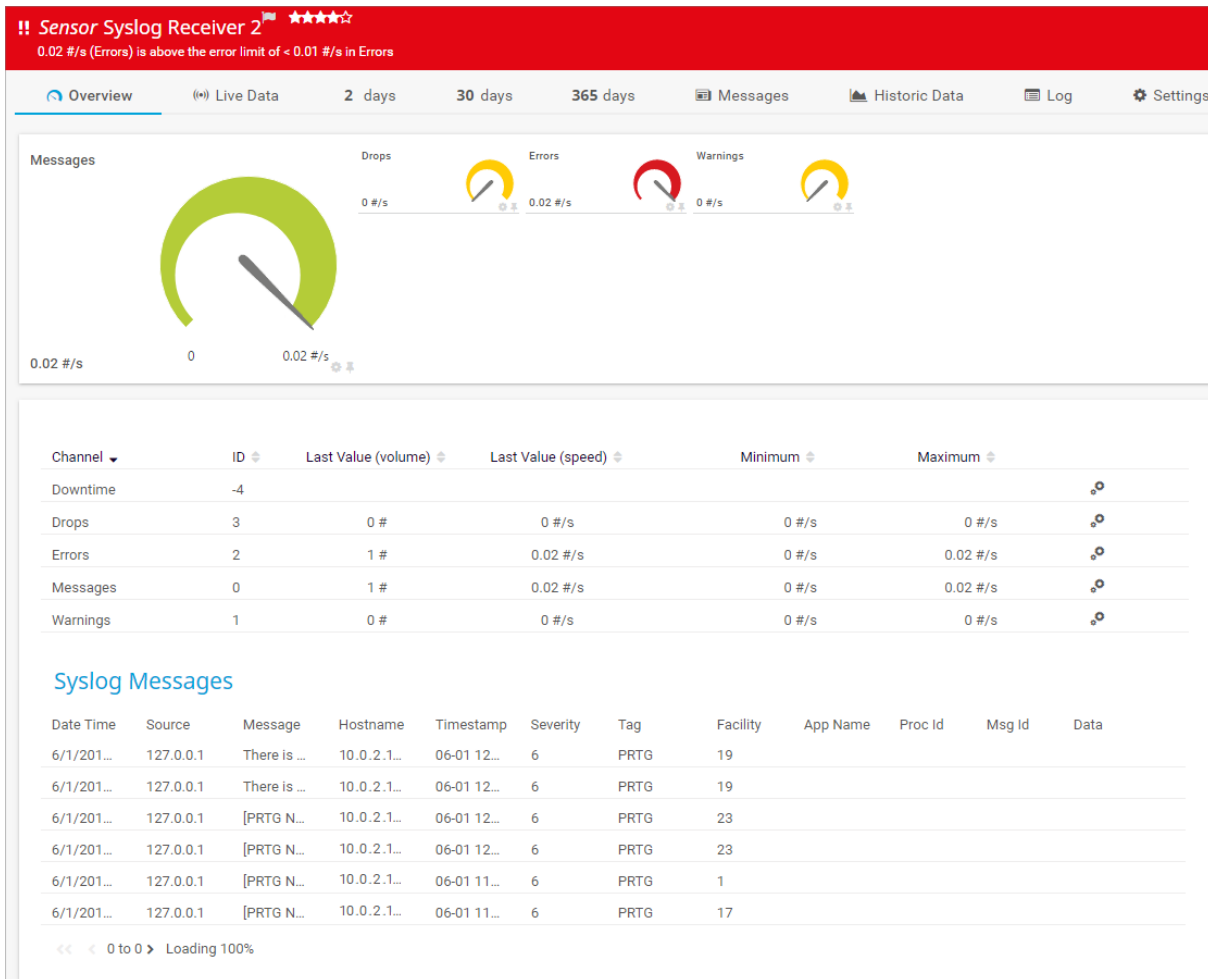

Default Sensor Settings: Sufficient for the First Configuration

Step 3: Start collecting syslog or SNMP trap messages from your devices

You do not have to complete any further configuration steps to use PRTG as a syslog server or SNMP trap receiver. When your devices send syslogs or SNMP traps to the specified probe system, the messages appear automatically in the PRTG web interface. After each sensor scan (by default, the scanning interval is inherited from the parent device), PRTG counts the received syslogs or traps in the according channels (total number of messages during the last interval, error and warning messages, or dropped packets).

Let the syslog receiver or the SNMP trap receiver collect data for a while to see what comes in. By default, the respective sensor shows the Warning status if there was at least one message with **severity 4** and the Down status if there was at least one message with **severity 3 or lower** during the last sensor scan.

❶ Incoming messages are counted per scanning interval, so it might take a few moments to see the received syslogs and traps, depending on the remaining time until the next sensor scan. Of course, you can use Scan Now via the sensor's [context buttons](#)¹⁸⁶ to perform an immediate scan and see corresponding data. The sensor states are also defined per scan. So, for example, a message that is classified as an error counts for the error channel only for one scanning interval. If there is no new error message in the following scanning interval, no message is shown in the error channel and the Down status disappears after the next sensor scan. The syslog or trap itself is still available on the Messages tab.

Syslog Receiver Sensor with Error Messages

Step 4: Review and analyze the collected data

All incoming messages that match the include filter are processed and stored in the internal high-performance database of PRTG. Review and analyze the received syslogs and traps via the PRTG web interface. Then you can decide about further filtering of the incoming messages.

❶ The received data is also available in the [PRTG data directory](#)⁴⁵²⁶ as common files. One data file is created per hour.

In PRTG on premises you can add the Management Information Base (MIB) files of your devices to the \MIB subfolder of the [PRTG program directory](#)⁴⁵²⁶ to use them with the SNMP Trap Receiver sensor. This results in object identifier (OID) resolution and makes trap messages more comprehensible. For example, instead of the OID 1.3.6.1.4.1.32446.1.1.2 you would see [SNMPv2-SMI-v1::enterprises.32446.1.1.2 = 0](#) (example from the PRTG MIB file).

Received Syslogs on the Messages Tab

Step 5: (Optionally) refine the filters

To increase productivity with your PRTG syslog servers and trap receivers, you can adjust the default filter settings. PRTG provides a comprehensible formula system that you can use to describe what kind of messages you want to process and which of them count as error or warning messages. You can configure the following filters for received messages in the settings of the respective receiver:

- Include filter: Process and store specific types of messages only.
- Exclude filter: Do not process specific types of messages and discard them.
- Warning filter: Define rules to categorize received messages as warnings.
- Error filter: Define rules to categorize received messages as errors.

Use the syntax that is provided in the corresponding sections to define your individual filter rules: [SNMP Trap Receiver sensor](#)³¹¹⁹ and [Syslog Receiver sensor](#)³³³⁷.

i You can create filter rules with a few mouse clicks in the Advanced Filter on the Messages tab of a specific sensor and copy these rules into the sensor settings to apply them.

Advanced Filter ✕

Filters are formulas using AND, OR, NOT, brackets and the following fields:

Field	Parameters	Examples
source[ip]	Enter a UDP source IP, IP range, or IP hostmask	source[10.0.23.50], source[10.0.23.10-50], source[10.0.23.10/255]
facility[number]	Enter a number or range of the facility code, between 0 and 23	facility[2], facility[5-7]
severity[number]	Enter a single number or range of the severity code, between 0 (Emergency) and 7 (Debug)	severity[4], severity[1-3]
hostname[text]	Enter the hostname string to match (exact, case sensitive)	hostname[www.paessler.com]
tag[text]	Enter the tag string to match (exact, case sensitive)	tag[su]
appname[text]	Enter the app name string to match (exact, case sensitive)	appname[myproc]
procid[text]	Enter the process ID string to match (exact, case sensitive)	procid[8710]
msgid[text]	Enter the message ID string to match (exact, case sensitive)	msgid[ID47]
message[parttext]	Enter a substring to match the message field (partial, case insensitive)	message[Error]
data[parttext] data[id,param] data[id,param,value]	Enter a substring to match on structured data as displayed in the table (partial, case sensitive); or enter an ID and a parameter (comma separated) to check if the parameter exists in the ID element; or enter an ID, a parameter, and a value (comma separated) to match on a structured data value (RFC 5424)	data[exampleSDID@32473], data[exampleSDID@32473, eventSource], data[exampleSDID@32473, eventSource,Application]

OK
Cancel

Advanced Filters on the Messages Tab

Step 6: (Optionally) create notification triggers

By default, the warning and error channels of the Syslog Receiver and SNMP Trap Receiver sensors have a very low upper warning or error limit (0.00000001). The reason for this is that even when only one syslog or trap has been counted in the respective channel during a scanning interval, the overall status of the sensor shows this with the corresponding status. This way, you always recognize if there is something wrong on the monitored system.

Because of this sensor behavior, best practice is to add a [state trigger](#) on the [Notification Triggers](#) tab of the sensor if you want to get a [notification](#) when a warning or error message type comes in. Define **0 seconds** Down or Warning time condition to not miss any warnings, errors, or any other messages. Alternatively, you could use a [speed trigger](#) for notifications regarding messages per second.

■ For more information, see the Knowledge Base: [How can I configure sensors using speed limits to keep the status for more than one interval?](#)

ⓘ You can use syslog and trap specific placeholders in notification templates to see the messages when you receive a notification. See the [More](#) section for further information.

Notification Triggers

Type ^	Rule	Actions
State Trigger	When sensor state is Down for at least 0 seconds, perform Push Notification	 
	When sensor state is Down for at least 300 seconds, perform Push Notification and repeat every 0 minutes	
	When sensor leaves Down state after a notification was triggered, perform Push Notification	

State Trigger for a Syslog Receiver Sensor

How can I configure sensors using speed limits to keep the status for more than one interval?

- <https://kb.paessler.com/en/topic/73212>

12.13 Monitoring via Push

PRTG provides the option to monitor passively received data. For this purpose, you can set up a device in a way that it automatically sends the data to PRTG. Specific sensors can receive this data and alert you based on your individual settings. For example, all Linux/Unix and most network devices support remote devices generating data, which has to be configured on each device, and sending the messages to a probe system. Usually, only the destination IP and port are required.

Push monitoring enables you to use webhooks to push messages to PRTG using HTTP. Wikipedia describes a webhook as a method of augmenting or altering the behavior of a web page or application with custom callbacks.

PRTG comes with sensors for push monitoring:

- [HTTP Push Count sensor](#)¹³⁰²: counts the number of received messages.
- [HTTP Push Data sensor](#)¹³¹³: displays numeric values from received messages.
- [HTTP Push Data Advanced sensor](#)¹³⁰⁶: shows received values and messages encoded in valid Extensible Markup Language (XML) or JavaScript Object Notation (JSON).
- [HTTP IoT Push Data Advanced sensor](#)¹²⁹⁰: displays data from messages that are received from Internet of Things (IoT) capable devices (for example, Sigfox devices) and that are pushed via an HTTPS request to PRTG.

Use Cases

The push technology can be useful for monitoring in different cases, for example, when target devices do not allow requests via the usual technologies. The following scenarios are good examples of where to use HTTP Push sensors.

- Devices that cannot run a probe
- Appliances that are not accessible via Secure Shell (SSH) or the Simple Network Management Protocol (SNMP)
- Web servers that can periodically run certain scripts or PHP
- Migrating a lot of EXE sensors into one EXE script that manages the HTTP Push sensors and sends data to them. Some coding is required, see the Knowledge Base article: [How can I monitor SCVMM hosts and VMs with PRTG?](#)
- When monitoring Linux services, see the Knowledge Base: [How can I monitor and automatically restart a service on a Linux host?](#)
- If you need to push a lot of data to PRTG in short periods of time: the sensors have been tested with about 10,000 values pushed within one minute.

How to Use

Webhooks basically work like push messages. These are triggered by an event (for example, a new comment to a blog post) and send according information to a specified URL in real time. You can use this technology to push messages to the probe, and monitor count and content with HTTP Push sensors. Because webhooks use HTTP, you can integrate them without having to add new infrastructure to your network.

Recommended Configuration

Follow the steps below for a sample configuration of the HTTP Push sensors.

1. Add the sensors.
2. Define the URLs.

Step 1: Add the HTTP Push Count, HTTP Push Data, HTTP Push Data Advanced, and HTTP IoT Push Data Advanced sensors.

You can use the standard method to add sensors to your configuration.

1. Select the probe device or a device of your own.
 -  A device of your own has no practical advantage with HTTP Push sensors but it might be good for organizational purposes.
2. Click Add Sensor and filter for Push Message Receiver under Technology Used.
3. Select one of the HTTP Push sensors that fits best to your intended usage.

 For more details, see section [Add a Sensor](#)^[36].

Step 2: Define the corresponding URL to send HTTP requests to PRTG.

For the desired configuration to be properly sent to and received by PRTG, use the following URL formats.

HTTP Push Count Sensor

The HTTP Push Count sensor uses the following URL:

`http://<probe_ip>:<port_number>/<token>`

Replace the parameters `<probe_ip>`, `<port_number>`, and `<token>` with the corresponding values.

- The `<probe_ip>` is the IP address of the probe system with the sensor.
- The `<port_number>` is where the sensor listens for incoming HTTP calls.
- The `<token>` is used to define the matching sensor.

Example:

```
http://192.0.2.0:5050/XYZ123
```

-  You can use several sensors with the same port and identification token. In this case, the number of push messages is shown in each of these sensors.

HTTP Push Data Sensor

The HTTP Push Data sensor uses the following URL:

`http://<probe_ip>:<port_number>/<token>?value=<integer_or_float>&text=<text message>`

Replace the parameters `<probe_ip>`, `<port_number>`, `<token>`, and `<integer_or_float>` with the corresponding values. The `&text` parameter is optional: You can omit it.

- You can define the port number and identification token in the sensor settings.
- The probe IP is the IP address of the probe system with this sensor.
- The value can be an integer or a float value depending on the data of your application. You have to set the value type accordingly in the sensor settings. This parameter is the sensor value.
 - ❗ If this parameter is missing, the sensor shows a Down [status](#)^[197].
- You can optionally add a custom text message by replacing the parameter `<text message>` with your custom text. The text is shown as the sensor message. If there is no value but only a text, the text is shown as an error message.
 - ❗ This text message has to be URL encoded (for example, the whitespaces in the sample URL below). Most browsers do URL-encoding automatically.

Example:

```
http://192.0.2.0:5050/XYZ123?value=0&text=this%20is%20a%20message
```

- ❗ You can use several sensors with the same port and identification token. In this case, the data of push messages is shown in each of these sensors.

HTTP Push Data Advanced Sensor

The HTTP Push Data Advanced sensor uses the following URLs depending on the type of HTTP request.

- GET requests: `http://<probe_ip>:<port_number>/<token>?content=<valid XML_or_JSON>`

The XML encoded value of the content parameter has to match the format as defined in section [Custom Sensors](#)^[444].

- POST requests: `http://<probe_ip>:<port_number>/<token>`

This HTTP request method sends the XML or JSON encoded HTTP body as POST data. The body has to match the format as defined in section [Custom Sensors](#)^[444]. For POST requests, use an HTTP content type other than `application/x-www-form-urlencoded`. We strongly recommend the HTTP content type `application/xml` or `application/json`.

Replace the parameters `<probe_ip>`, `<port_number>`, `<token>`, and `<valid XML_or_JSON>` (for GET requests) with the corresponding values:

- You can define port number and identification token in the sensor settings.
- The probe IP is the IP address of the probe system with this sensor.
- The content of GET requests has to be valid XML or JSON in the PRTG API format.
 - ❗ The content has to be URL encoded (for example, the whitespaces in the sample URL below). Most browsers do URL-encoding automatically.

Minimum example for the GET method that returns one static channel value:

```
http://127.0.0.1:5050/XYZ123?
content=<prtg><result><channel>MyChannel</channel><value>10</value></result><text>this
%20is%20a%20message</text></prtg>
```

i By default, values within the `<value>` tags in the returned XML or JSON must be **integers** to be processed. If **float** values are returned, you have to explicitly define this value type as defined in section [Custom Sensors](#)⁴⁴⁴² with `<float>` tags, otherwise the sensor shows 0 values in affected channels. Example:

```
http://127.0.0.1:5050/XYZ123?  
content=<prtg><result><channel>MyChannel</channel><value>10.45</value><float>1</float>  
</result><text>this%20is%20a%20message</text></prtg>
```

i You can use several sensors with the same port and identification token. In this case, the data of push messages is shown in each of these sensors.

HTTP IoT Push Data Advanced Sensor

For examples for the deployment of the HTTP IoT Push Data Advanced sensor, see [More](#)⁴³³⁸ below.

12.14 Monitoring via HTTP

HTTP is a standard application layer protocol and the basis for data communication on the internet. HTTP is a request-response method for client-server architectures, where the client sends a request and the server processes and responds to the request.

Monitoring via HTTP is useful if you want to monitor websites or web servers. It enables you to keep an eye on the availability and download times of a website or the performance statistics of a web server. There are also a lot of other possible use cases for HTTP sensors. For example, you can request any application programming interface (API) that is reachable via HTTP and monitor returned values. This approach lets you include almost any type of device or application into your monitoring.

PRTG comes with sensors for HTTP monitoring:

- [Cloud HTTP sensor](#)  692
- [Cloud HTTP v2 sensor](#)  705
- [Common SaaS sensor](#)  751
- [HTTP sensor](#)  1192
- [HTTP Advanced sensor](#)  1204
- [HTTP Apache ModStatus PerfStats sensor](#)  1223
- [HTTP Apache ModStatus Totals sensor](#)  1235
- [HTTP Content sensor](#)  1247
- [HTTP Data Advanced sensor](#)  1261
- [HTTP Full Web Page sensor](#)  1277
- [HTTP Push Count sensor](#)  1302
- [HTTP Push Data sensor](#)  1313
- [HTTP Push Data Advanced sensor](#)  1325
- [HTTP Transaction sensor](#)  1339
- [HTTP XML/REST Value sensor](#)  1355
- [REST Custom sensor](#)

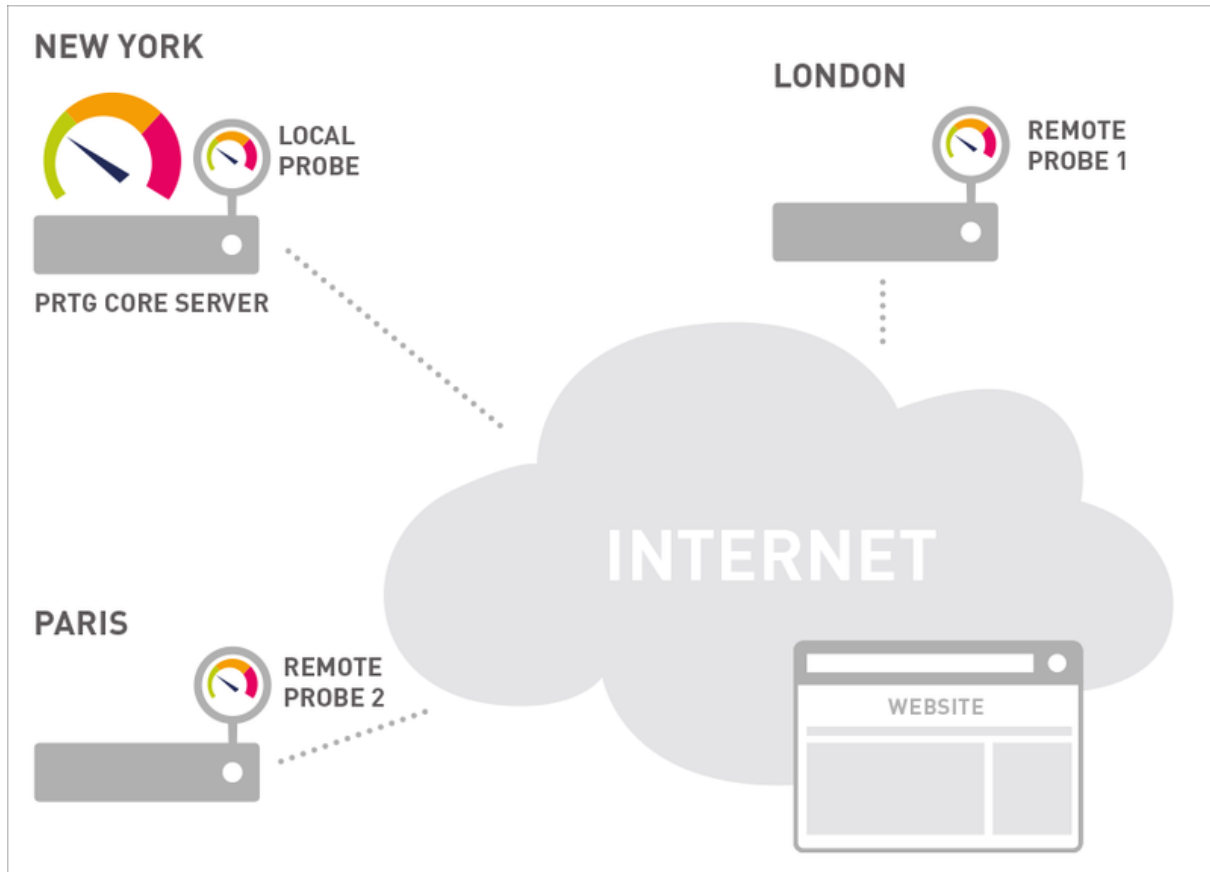

Use Cases

- Monitor the availability and loading times of a website
- Monitor the source code and specific content of a website
- Test the login, purchasing, and shipping processes of a web shop
- Monitor performance statistics and activity of Apache web servers

Types of HTTP Monitoring

Availability Monitoring

This type monitors the availability of a website or a specific website element. For example, the HTTP sensor shows how long the HTML code of a website takes to load. If the sensor shows a loading time that is much longer than expected, the website might not be responding or might be unavailable.

Cloud HTTP Monitoring Provides Better Performance Statistics

The HTTP sensor uses different HTTP requests to request the specified URL.

- GET: requests the website directly
- POST: sends post form data to the URL
- HEAD: requests the HTTP header only, without the actual web page body, saving bandwidth

The HTTP Advanced sensor also monitors the availability of a website, along with other parameters such as bytes received, download bandwidth (speed), and time to first byte, which shows you how fast your web server responds. This sensor lets you use a (custom) user agent when connecting to the target URL and lets you send custom HTTP headers to the target URL.

The Cloud HTTP sensor and the Cloud HTTP v2 sensor monitor a web server from various locations across the globe. For example, the URL of a website to measure the loading time of a page's source code or the URL of a page asset to measure its availability and loading time. The sensors also show the global average response time.

The Common SaaS monitors the availability of your cloud services and is an important pillar for unified monitoring.

Content Monitoring

This type monitors internal values of a web server based application or changes to specific content on a website. The HTTP Full Web Page sensor measures the time it takes to download a web page including all embedded page elements, for example Flash content or images.

 This monitoring option can create a lot of bandwidth traffic, depending on the page size and the scanning interval.

Additionally, the HTTP Content sensor monitors a numeric value returned by an HTTP request. It can also optionally trigger a 'change' notification to notify you of changes to the content.

Example: Content Monitoring

 For example, consider a URL <http://www.example.com/status.html> that returns a PHP script with the current system status in a simple HTML page.

```
<html>
<body>
  Description: Script gives back current status of disk free (%) and CPU usage (%).
  [85.5][12.0]
</body>
</html>
```

You would configure the HTTP Content sensor using

- the script URL from above,
- value type Float,
- and number of channels 2.

The sensor calls the URL with every scanning interval and only regards the two values in brackets [], handling each of them in one channel. The additional description text and HTML tags are not necessary. In this example, they are added in case a human calls the URL.

 If you define the number of channels as 1, the sensor only reads the first value. The second value is ignored. Using 3 as number of channels results in a sensor error message.

To be notified when the website content changes, you first need to configure a Trigger 'change notification' in the sensor's settings and then the notification itself.

 For more information, see section [Notification Triggers Settings](#) .

Performance Monitoring

The HTTP Transaction sensor checks if a web shop is working as expected: with a series of requests, for example, you can simulate the login, purchasing, and shipping processes. Only if all actions can be completed successfully in a row, the check returns an "OK" message. If anything goes wrong, you are immediately alerted and can react instantly to avoid loss of earnings for your company because the web shop is unavailable or very slow.

Apache Web Server Monitoring

The HTTP Apache ModStatus PerfStats and HTTP Apache ModStatus Totals sensors monitor performance statistics and the activity of an Apache web server using mod_status over HTTP. Among other HTTP sensors, these sensors let you enter credentials for web pages that need authentication and let you choose the necessary authentication method.

Security Monitoring

PRTG also provides the option to monitor the security of your website by checking the status of Secure Sockets Layer (SSL) certificates and the security of a connection.

- [SSL Certificate sensor](#)³³⁰²: monitors the certificate of an SSL/TLS-secured connection. For example, it displays whether a certificate has been revoked, or is trusted as root authority, or is self-signed.
- [SSL Security Check sensor](#)³³¹⁵: monitors the SSL connectivity to the port of a device. It tries to connect to the specified TCP/IP port number of a device with different SSL/TLS versions and shows if a specific protocol is supported.

Push Monitoring

PRTG provides the option to monitor passively received data. For this purpose, you can set up a device in a way that it automatically sends the data to PRTG. Specific sensors can receive this data and alert you based on your individual settings. For example, all Linux/Unix and most network devices support remote devices generating data, which has to be configured on each device, and sending the messages to a probe system. Usually, only the destination IP and port are required.

■ For more information, see section [Monitoring via Push](#)⁴³³⁵.

Other Data

You can also monitor other types of data from your website, for example the number of website visitors via the HTTP XML/REST Value sensor. The sensor lets you monitor values within the returned Extensible Markup Language (XML) code, provided your web analytics tool has an XML export option. The HTTP Data Advanced sensor accesses a web server and retrieves XML or JavaScript Object Notation (JSON) encoded data.

The REST Custom sensor queries a Representational State Transfer (REST) application programming interface (API) endpoint and maps the JSON or XML result to sensor values. The mapping rule has to be available as a REST configuration file in JSON template (*.template) format according to the PRTG API definition.

■ For details about the return value format, see section [Custom Sensors](#)⁴⁴⁴⁰.

HTTP Status Codes

The HTTP sensors show their status depending on the HTTP status codes that they receive. By default, the sensor states are the following:

HTTP Status Code	HTTP Sensor Status
2xx Success	Up (Green)

HTTP Status Code	HTTP Sensor Status
3xx Redirection	Warning (Yellow), Down (Red) for too many redirects)
4xx Client Error	Down (Red)
5xx Server Error	Down (Red)

i You need to configure your HTTP sensors manually only if you want to change these default reactions. In this case, you can change the sensor status based on limits and/or keyword checks.

Other HTTP Sensor Settings

- **Server Name Identification (SNI):** You can configure SNI, which has to be a fully qualified domain name (FQDN) and must match the configuration of the target server. For details, see the Knowledge Base: [My HTTP sensors fail to monitor websites which use SNI. What can I do?](#)
- **HTTP Version:** You can choose the HTTP version that the sensor uses when connecting to the target URL.
- **Authentication Method:** You can define if the configured URL needs authentication, enter credentials, and choose an authentication method.
- **Custom User Agent:** You can enter a string to be used as user agent when connecting to the target URL.
- **Custom HTTP Headers:** You can send custom HTTP headers to the target URL.

HTTP Sensor Troubleshooting

For troubleshooting and other tips for monitoring with HTTP sensors, see [More](#)⁴³⁴³ below.

Part 13

PRTG Administration Tool

13 PRTG Administration Tool

The PRTG Administration Tool is part of every PRTG installation. You can use it to edit the administrative settings of local probe and remote probe installations.

You can start the PRTG Administration Tool from the Windows Start menu on the PRTG core server system or on the remote probe system. If you start the PRTG Administration Tool on the PRTG core server system, you can change settings that affect the entire installation and the local probe. If you run the PRTG Administration Tool on a remote probe system, you can only change settings that are related to the remote probe.

Any settings that you change require a restart of the affected PRTG core server service and PRTG probe service to apply any changes to the configuration.

- ① You can also change many administrative settings via the [Setup](#)⁴¹²¹ in the PRTG web interface. For probes, administrative settings are also available on the [Settings tab](#)⁴⁰⁹ in the PRTG web interface.
- ① You can review the history of all changes to the settings of the PRTG Administration Tool in the \Logs\serveradmin subfolder of the [PRTG program directory](#)⁴⁵²⁶. The name of the corresponding logfile is ServerAdmin.log.

PRTG Administration Tool

- [PRTG Administration Tool on PRTG Core Server Systems](#)⁴³⁴⁷
- [PRTG Administration Tool on Remote Probe Systems](#)⁴³⁷¹

13.1 PRTG Administration Tool on PRTG Core Server Systems

With the PRTG Administration Tool, you can define various system settings regarding the PRTG core server installation, restart services, and view log information. You can also change many of these settings via the [system administration](#)  in the PRTG web interface.

The PRTG Administration Tool has the following tabs:

- [PRTG Web Server](#) 
- [PRTG Core Server](#) 
- [Cluster](#) 
- [Administrator](#) 
- [Probe Settings for Core Connection](#) 
- [Probe Settings for Monitoring](#) 
- [Service Start/Stop](#) 
- [Logs and Info](#)

 This section describes the settings that are available in the PRTG Administration Tool when you open it on the PRTG core server system. This means that you can edit settings for the PRTG core server or PRTG web server and the local probe.

 Settings you define are only valid for the PRTG core server system on which you start the PRTG Administration Tool. Make sure that you log in to the system that you want to make changes to and open the PRTG Administration Tool there.

 This feature is not available in PRTG Hosted Monitor.

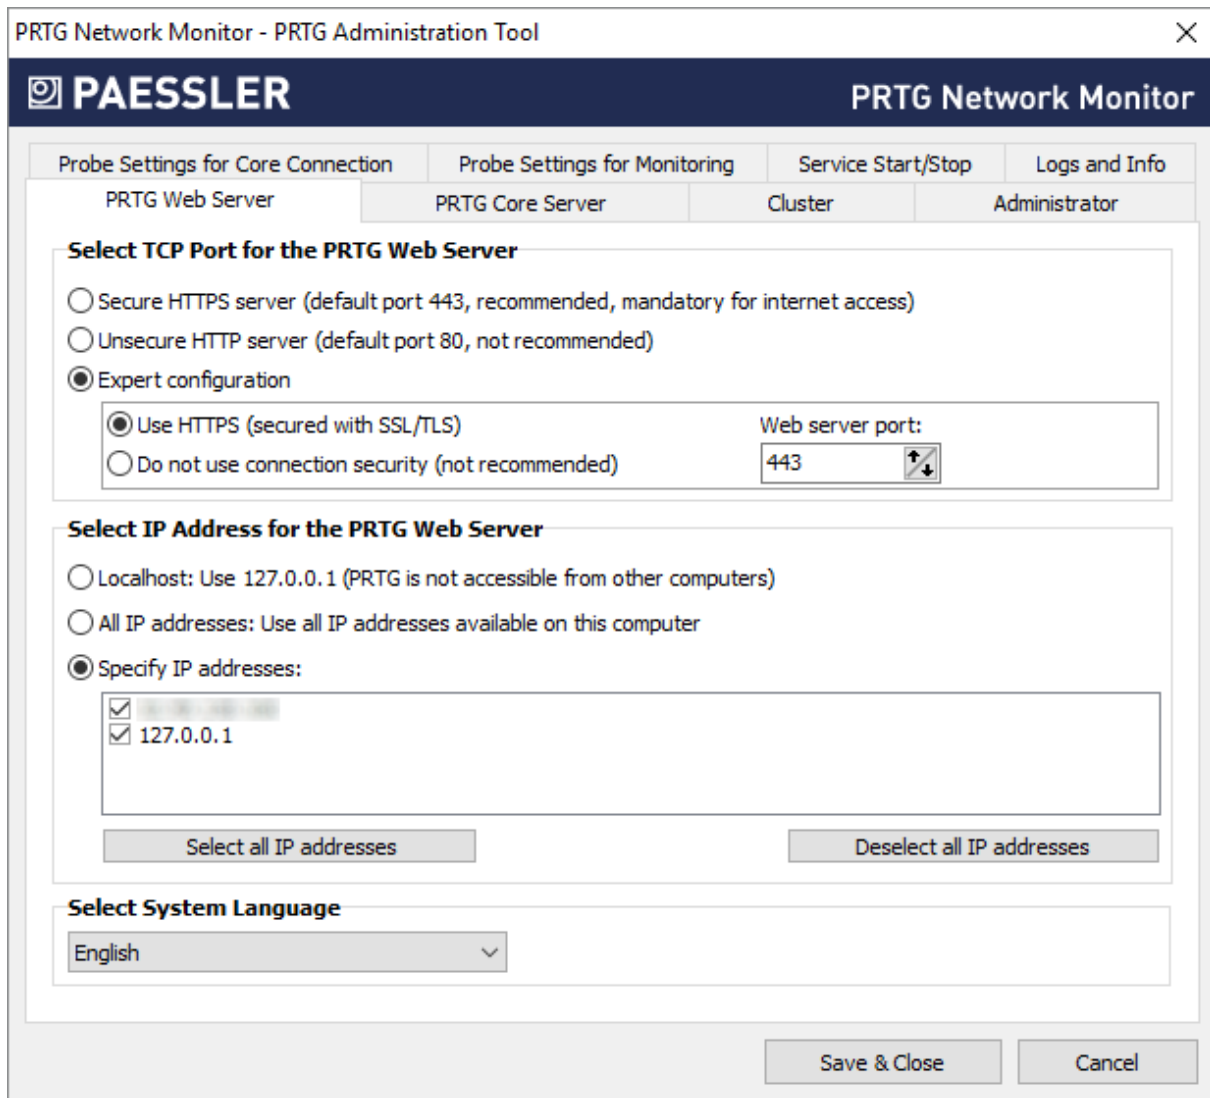

Start the PRTG Administration Tool

- From the Windows Start menu, select the PRTG Network Monitor folder and click PRTG Administration Tool to open the application.
- Confirm the question of the Windows [User Account Control](#) with Yes to allow the PRTG Administration Tool to start.

PRTG Web Server

Edit IP addresses, ports, access methods, and language for the PRTG web interface.

 You can also change these settings under Setup | System Administration | User Interface in the PRTG web interface. For more information, see section [User Interface](#) .

PRTG Web Server Tab

Setting	Description
Select TCP Port for the PRTG Web Server	The PRTG web server provides access via the PRTG web interface and PRTG Desktop ⁴²⁷⁵ . Specify on which port the PRTG web server runs:

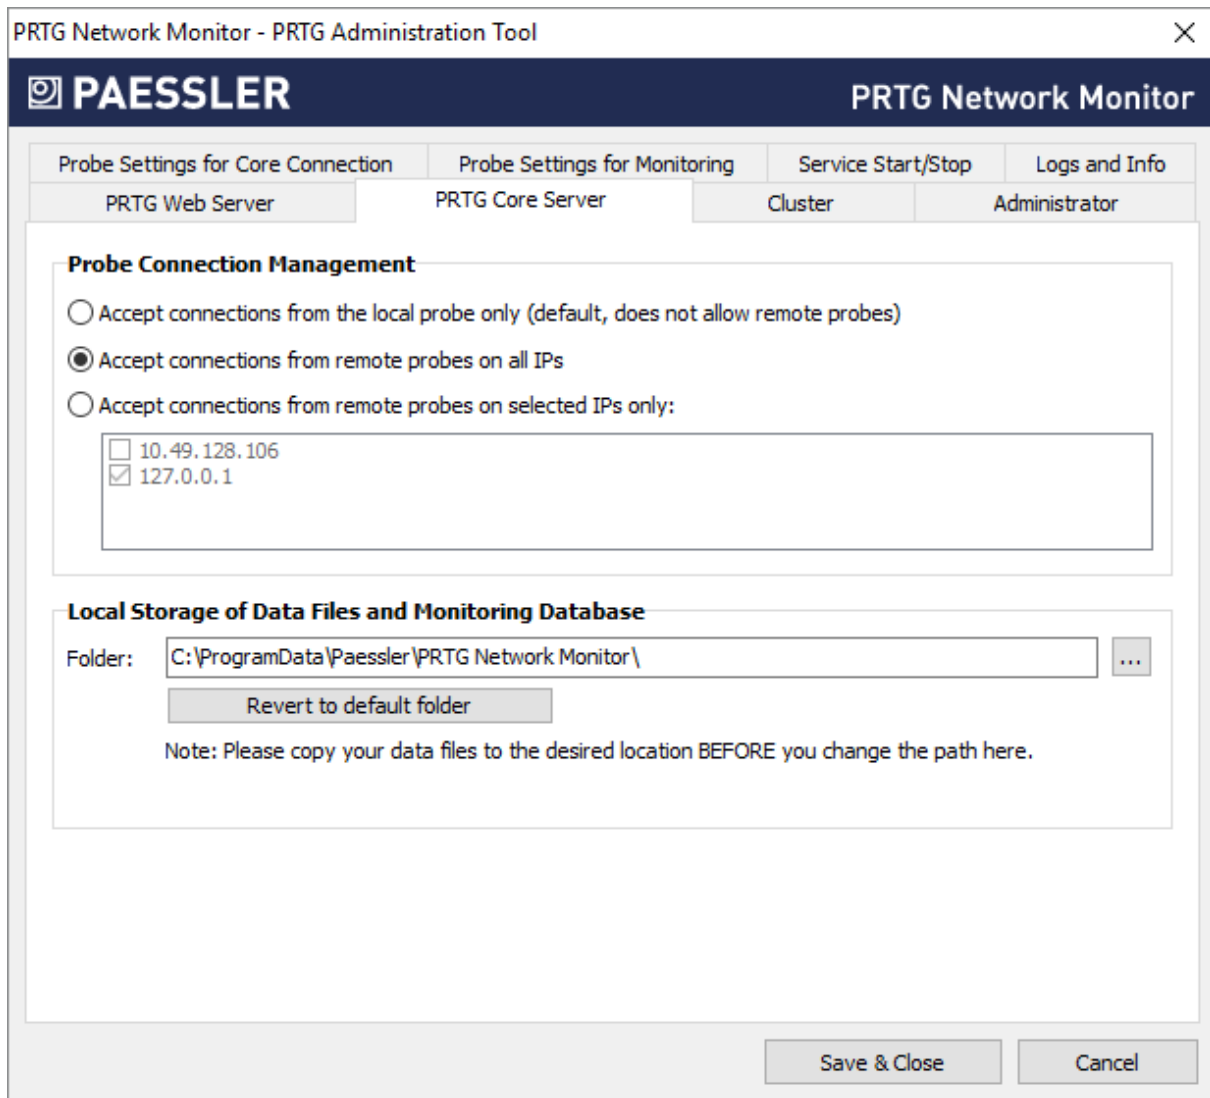

Setting	Description
	<ul style="list-style-type: none"> ▪ Secure HTTPS server (port 443, recommended, mandatory for internet access): This setting is required if you want to access the PRTG core server via the internet. Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured HTTPS connection on port 443. <ul style="list-style-type: none"> ⓘ Although the connection is secure, you see an SSL certificate warning¹⁶⁹⁹ in your browser when you log in to the PRTG web interface because the default certificate is unknown to your browser. You can install a different SSL certificate for PRTG. For more information, see section Using Your Own SSL Certificate with the PRTG Web Server⁴⁵³⁷. ⓘ If port 80 is available, PRTG reserves it as well. If port 80 is not available, PRTG tries port 8080 as fallback. If this port is also not available, PRTG searches from port 8081 upwards for a free port. PRTG sends a ticket²⁴⁰¹ that shows you the currently used port number and switches back to port 80 as soon as it is available again. When users try to connect on port 80 via HTTP, they are redirected to port 443 via HTTPS. You can change this behavior by using a registry setting. If port 443 is not available, PRTG tries port 8443 as fallback. If this port is also not available, PRTG searches from port 8444 upwards for a free port. PRTG sends a ticket that shows you the currently used port number and switches back to port 443 as soon as it is available again. ▪ Unsecure HTTP server (default port 80, not recommended): Use the PRTG web server without SSL/TLS on port 80. This setting is not recommended for WAN connections. <ul style="list-style-type: none"> ⓘ If you use the PRTG web server without connection security on the internet, attackers could potentially spy on credentials that you enter in PRTG. We strongly recommend that you use this option only in a LAN. ▪ Expert configuration: Specify a custom port for the PRTG web server and the security of the connection. This option is intended for systems that already have a web server on the standard port. <ul style="list-style-type: none"> ⓘ If PRTG always uses a fallback port after a server restart, check for other programs that use the same port as PRTG. For example, the Microsoft Microsoft Internet Information Services (IIS) web server also uses port 80 (port 443 for secure connections) by default and blocks it. Please disable such programs and services on startup.
<p>Expert configuration: Connection security</p>	<p>This setting is only visible if you select Expert configuration above. Specify if you want to use connection security:</p> <ul style="list-style-type: none"> ▪ Use HTTPS (secured with SSL/TLS): Use a SSL/TLS secured HTTPS connection on a custom port as defined above. <ul style="list-style-type: none"> ⓘ Although the connection is secure, you see an SSL certificate warning in your browser when you log in to the PRTG web interface, because the default certificate is unknown to your browser. You can install a different SSL certificate for PRTG later. For more information, see Using Your Own SSL Certificate with the PRTG Web Server⁴⁵³⁷.

Setting	Description
Expert configuration: Web server port	<ul style="list-style-type: none"> ▪ Do not use connection security (not recommended): This setting is not recommended for WAN connections. Use the PRTG web server without SSL/TLS on a custom port as defined above. <p>i If you use the PRTG web server without connection security on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend that you use this option in a LAN only.</p> <p>This setting is only visible if you select Expert configuration above. Enter the TCP port number that you want the PRTG web server to run on. Enter an integer value.</p> <p>i If you use a secure connection and port 80 is free, PRTG reserves it as well. When users try to connect on port 80 via HTTP, they are redirected to the custom port via HTTPS. You can change this behavior by using a registry setting.</p> <p>i If the defined port for a secure connection is not available, PRTG tries port 8443 as fallback. If this port is also not available, PRTG searches from port 8444 upwards for a free port. PRTG sends a ticket^[240] that shows you the currently used port number and switches back to the original port as soon as it is available again.</p>
Select IP Address for the PRTG Web Server	<p>The PRTG web server provides access via the PRTG web interface and PRTG Desktop^[4275]. Specify on which IP address the PRTG web server runs. Later, you can log in to PRTG by pointing your browser to the specified IP address.</p> <p>Choose from:</p> <ul style="list-style-type: none"> ▪ Localhost, 127.0.0.1 (PRTG is not accessible from other computers): Use 127.0.0.1 only. The PRTG web interface and PRTG Desktop are only accessible from the PRTG core server system. Either the selected port or at least one port in the range from 8080 to 8089 has to be available on 127.0.0.1. <p>i If you run PRTG on localhost, do not use the DNS name http://localhost to log in to the PRTG web server, as this might considerably slow down the PRTG web interface. Use your local IP address or http://127.0.0.1 instead.</p> <ul style="list-style-type: none"> ▪ All IP addresses: Use all IP addresses available on this computer (recommended): Use all IP addresses that are available on this computer and enable access to the PRTG web server for all of these IP addresses. <p>i The selected Transmission Control Protocol (TCP) port for the PRTG web server must be free on every available IP address.</p>

Setting	Description
	<ul style="list-style-type: none">▪ Specify IP addresses: Select specific IP addresses on which the PRTG web server runs. The list is specific to your system. Add a check mark in front of every IP address you want the PRTG web server to be available at. You can also select all addresses by clicking the Select all IP addresses button or deselect all addresses by clicking the Deselect all IP addresses button. Either the selected port or at least one port in the range from 8080 to 8089 has to be available on the specified IP address. <p>i Regardless of the selected setting above, one port in the range from 8080 to 8180 has to be available on the specified IP address so PRTG can create reports. The report engine tries to connect to the PRTG core server on one of these ports.</p> <p>i If PRTG does not find a network card on startup, it switches the IP setting to Localhost, 127.0.0.1 (PRTG is not accessible from other computers). This setting remains even if a network card is available later on. If you disabled or removed the network card on the PRTG core server system, check this setting again.</p>
Select System Language	Select the system language. The default is English. Depending on your installation, you might be able to choose other languages here. This setting defines the language of the PRTG web interface and the PRTG Administration Tool <small>4346</small> .

PRTG Core Server

Define settings for the PRTG core server.

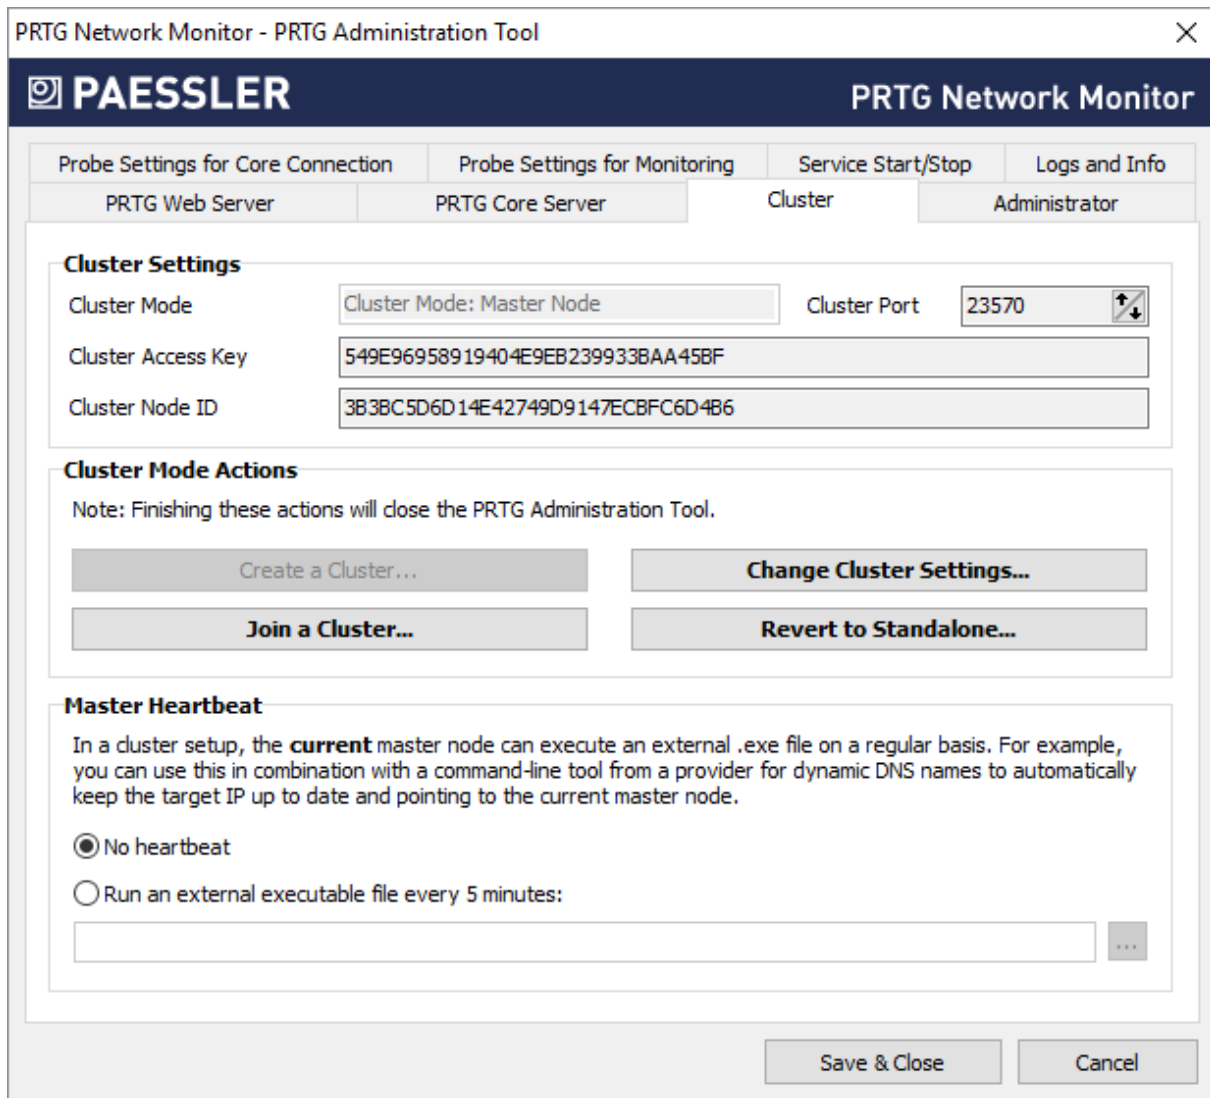

PRTG Core Server Tab

Setting	Description
Probe Connection Management	<p>Define how PRTG handles incoming connections from probes:</p> <ul style="list-style-type: none"> Accept connections from the local probe only (default, does not allow remote probes): Only accept connections from the local probe. If you select this option, you cannot use remote probes ⁴³⁵². Accept connections from remote probes on all IPs: Accept incoming connections from remote probes, no matter on which IP address of the PRTG core server they come in. Accept connections from remote probes on selected IPs only: Accept incoming connections from remote probes on the selected IP address(es) of the PRTG core server. In the list, select the IP addresses by adding a check mark in front of the desired IP addresses.

Setting	Description
	<p> You can also change this setting under Setup System Administration Core & Probes⁴²⁰⁴ in the PRTG web interface.</p>
Local Storage of Data Files and Monitoring Database	<p>Select the directory where PRTG stores configuration and monitoring data. Click  to choose a different folder on the system.</p> <p> Before you change the path, make sure you stop both the PRTG core server service and the PRTG probe service and copy all data to the new location.</p> <p>Click Revert to default folder to reset this setting to default.</p>

Cluster

On the Cluster tab, you can change how the PRTG core server behaves in a cluster. Before you change settings here, see section [Failover Cluster Configuration](#)⁴⁵¹³.

Cluster Tab

Setting	Description
Cluster Settings	<p>Depending on the cluster settings, different options are available.</p> <ul style="list-style-type: none"> Cluster Mode: Shows the cluster mode of the PRTG core server. Possible values are Standalone (no cluster mode), Cluster Mode: Master Node, or Cluster Mode: Failover Node. <p>i This setting is for your information only. You cannot change it.</p> <ul style="list-style-type: none"> Cluster Port: This setting is only visible if PRTG runs in cluster mode. Cluster Access Key: This setting is only visible if PRTG runs in cluster mode. Cluster Node ID: This setting is only visible if PRTG runs in cluster mode.

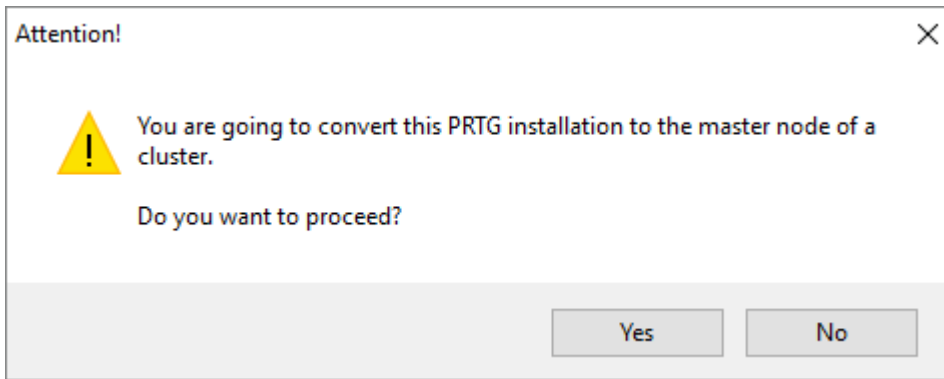

Setting	Description
	<p> This setting is for your information only. You cannot change it.</p>
Cluster Mode Actions	<p>Depending on the cluster settings, you see different active buttons.</p> <ul style="list-style-type: none"> ▪ Create a Cluster ▪ Join a Cluster ▪ Change Cluster Settings ▪ Revert to Standalone <p> For details on these options, see section Cluster Mode Actions .</p>
Master Heartbeat	<p>This section is only visible if PRTG runs in cluster mode. The current master node can execute an external executable file on a regular basis. We call this a heartbeat.</p> <p>You can use this, for example, to report the IP address of the current master node to a dynamic Domain Name System (DNS) provider, so that a DNS name is always redirected to the current master node in case the primary master node fails and a failover node (with a different IP address) becomes the current master node.</p> <p>Choose between:</p> <ul style="list-style-type: none"> ▪ No heartbeat: Do not execute a file on a regular basis. ▪ Run an external executable file every 5 minutes: Click  to browse for the file that you want to execute. This can be, for example, a command-line tool or a batch file. PRTG executes it on the current master node only, in a fixed interval of five minutes. You cannot change the interval. <p> Make sure that the selected file is available under the same (local) path on all failover nodes. In case one of your failover nodes becomes the current master node, PRTG can only execute the heartbeat reliably if the executable file exists on all of your failover nodes.</p>

Cluster Mode Actions

Follow these instructions to create or to join a cluster, to change a cluster's settings, or to revert a cluster node to standalone mode:

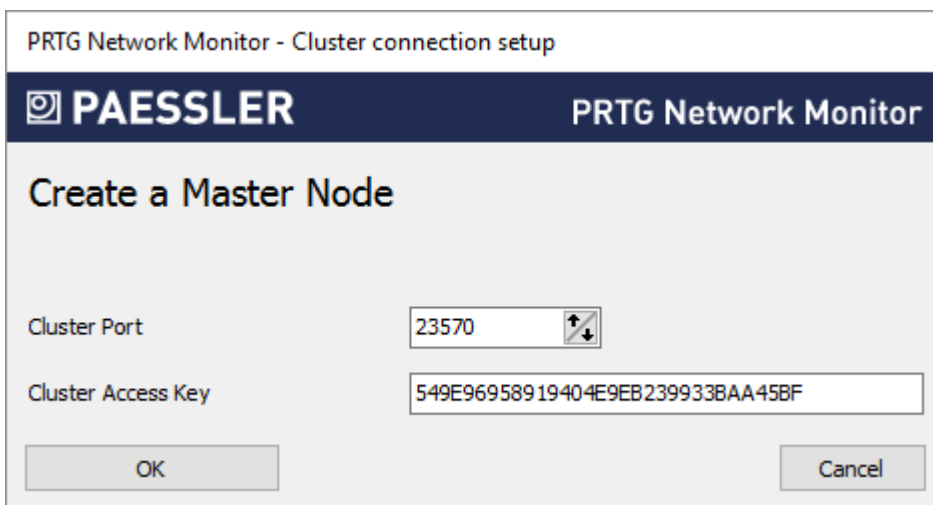

Create a Cluster

- Click Create a Cluster to create a cluster. The current PRTG core server is then the [master node](#) of the cluster.
- Click Yes to convert this installation to a master node.

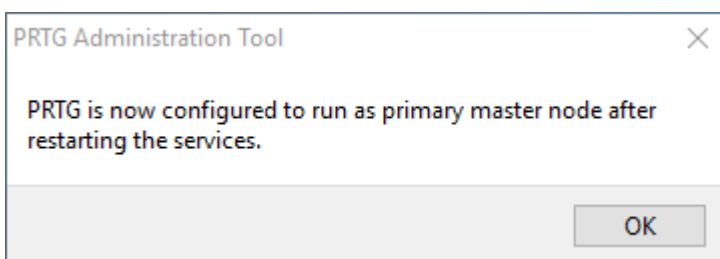

Converting an Installation to a Master Node

- A dialog box appears.

Creating a Master Node

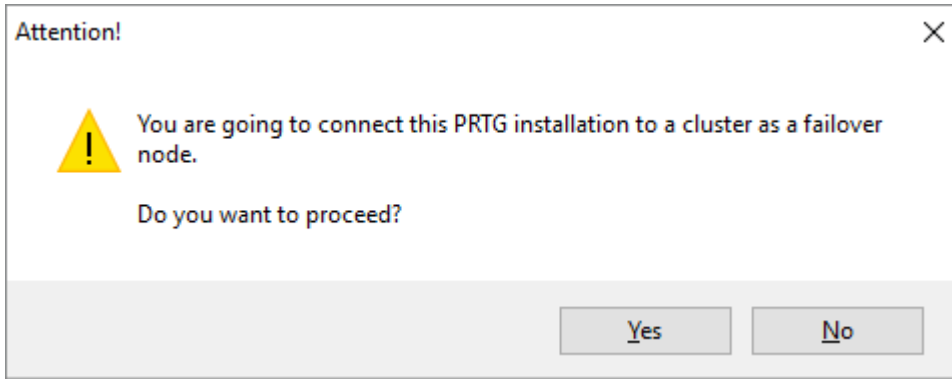

- Enter a Cluster Port. This is the port on which PRTG sends the internal communication between the cluster nodes. Make sure that connections between the cluster nodes are possible on the selected port.
- Enter or paste a Cluster Access Key. This is a unique access key. All cluster nodes must use the same cluster access key to join the cluster. Connection attempts with a different access key are not possible. We recommend that you use the default value.
 - Save the Cluster Access Key so that you have it at hand when you configure the failover nodes.
- After confirming your settings, you are asked to restart Windows services. Click OK to restart the Windows services so that your changes take effect.

Restart Services to Apply Changes

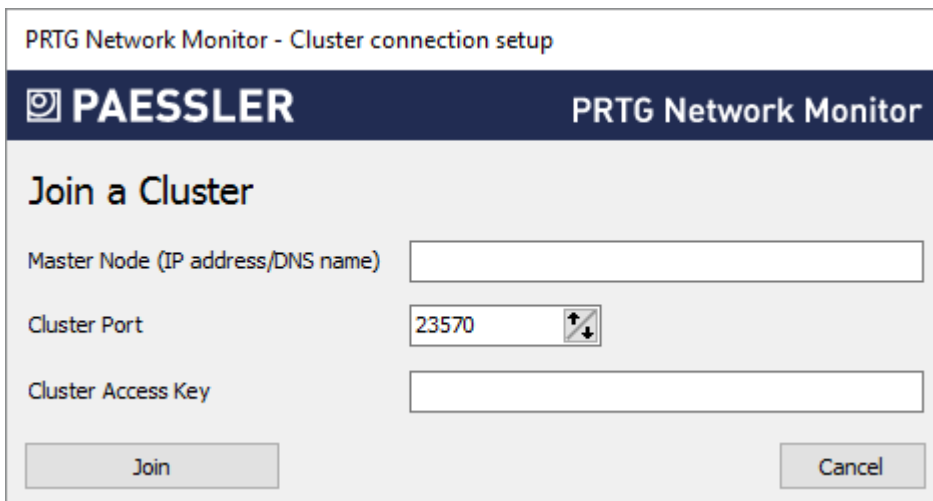

Join a Cluster

- Click Join a Cluster to add this installation to a cluster that already has a [master node](#). The current PRTG core server is then a [failover node](#).
- This button is also available if the PRTG core server is in Cluster Mode: Master Node. This option then changes the master node to a failover node.
- Click Yes to convert this installation into a failover node.

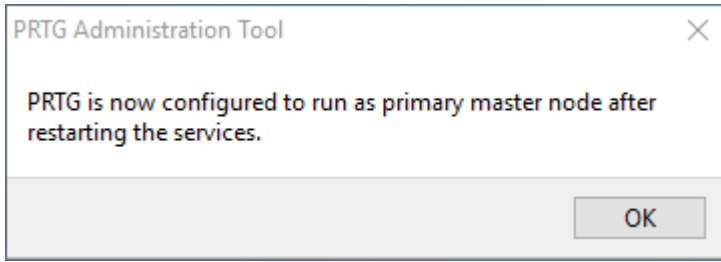

Converting an Installation to a Failover Node

- A dialog box appears.

Cluster Connection Setup

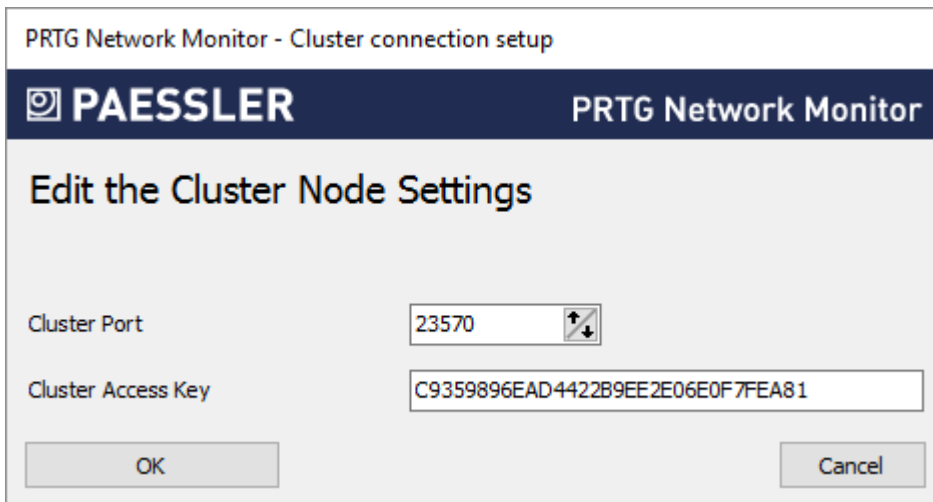

- Enter a Master Node (IP address/DNS name) for the cluster. It must be reachable from the machine that runs the failover node.
- Enter the other settings as defined in the settings of the [master node](#). Make sure that you use the same settings on all cluster nodes.
- Enter a Cluster Port. This is the port on which PRTG sends the internal communication between the cluster nodes. Make sure that connections between the cluster nodes are possible on the selected port.
- Enter or paste a Cluster Access Key. This is a unique access key. All cluster nodes must use the same cluster access key to join the cluster. Connection attempts with a different access key are not possible. We recommend that you use the default value.
 - After confirming your settings, you are asked to restart Windows services. Click OK to restart the Windows services so that your changes take effect.

Restart Services to Apply Changes

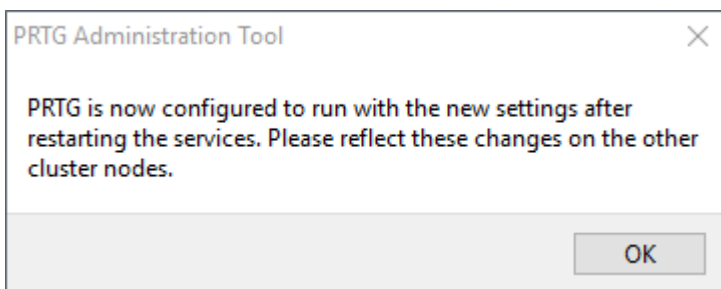

Change Cluster Settings

- If you run PRTG in cluster mode, you can change the settings. Click Change Cluster Settings to do so.
- A dialog box appears.

Edit Cluster Node Settings

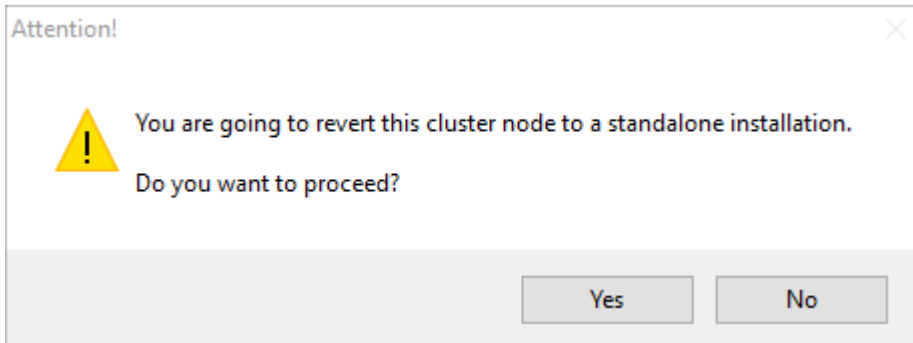

- Enter a Cluster Port. This is the port on which PRTG sends the internal communication between the cluster nodes. Make sure that connections between the cluster nodes are possible on the selected port.
- Enter or paste a Cluster Access Key. This is a unique access key. All cluster nodes must use the same cluster access key to join the cluster. Connection attempts with a different access key are not possible. We recommend that you use the default value.
 - ⓘ ▪ Make sure that you use the same settings on all cluster nodes.
- After confirming your settings, you are asked to restart Windows services. Click OK to restart the Windows services so that your changes take effect.

Restart Services to Apply Changes

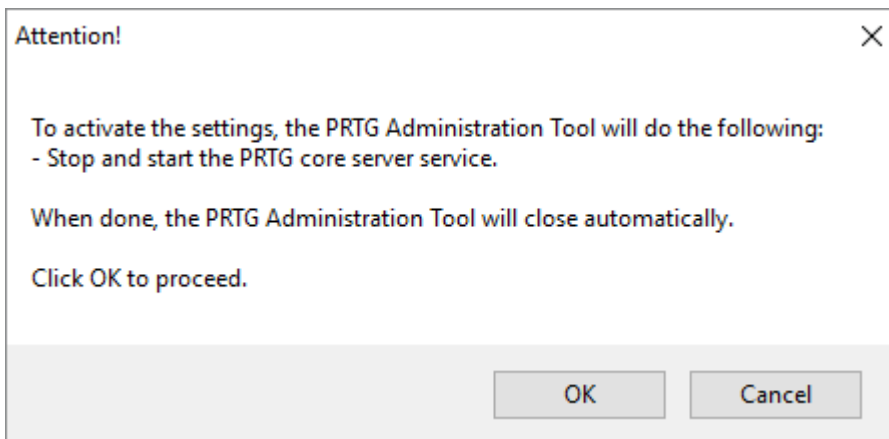

Revert to Standalone

- Click Revert to Standalone to revert this cluster node to a standalone installation.
- A dialog box appears.

Revert Cluster to Standalone Installation

- Click Yes to convert this cluster node to a standalone installation.
- A dialog box appears where PRTG asks you to agree to restart the PRTG core server service. Click OK to proceed.

Restart Services

- ① When you revert a cluster node to Standalone mode, the cluster probe remains in the device tree to keep your device and sensor setup. If you want to completely remove the cluster probe from the device tree, you need to delete it manually.

Administrator

On the Administrator tab, you can change settings for the PRTG System Administrator user.

- ① You can also change the password for the [PRTG System Administrator](#) user account under Setup | Account Settings | [My Account](#)^[4124] in the PRTG web interface.

The screenshot shows a window titled "PRTG Network Monitor - PRTG Administration Tool". The window has a dark blue header with the PAESSLER logo and "PRTG Network Monitor". Below the header are several tabs: "Probe Settings for Core Connection", "Probe Settings for Monitoring", "Service Start/Stop", and "Logs and Info". Underneath these are sub-tabs: "PRTG Web Server", "PRTG Core Server", "Cluster", and "Administrator". The "Administrator" tab is active, showing a section titled "Login Credentials for the PRTG System Administrator User Account". This section contains three input fields: "Email Address" with the value "john.q.public@example.com", "Login Name" with the value "prtgadmin", and "Password" with a masked value "*****". A "Generate new password" button is located to the right of the password field. At the bottom of the window are "Save & Close" and "Cancel" buttons.

Administrator Tab

Setting	Description
Email Address	Enter a valid email address for the PRTG System Administrator user account. By default, PRTG sends notifications and important messages to this address.
Login Name	Enter a login name for the PRTG System Administrator user account. You use it when you log in to the PRTG web interface or PRTG Desktop. ⓘ The default login name is prtgadmin .
Password	Click Generate new password and confirm to generate a new password for the PRTG System Administrator user account. Click Save & Close to set the new password. You use it when you log in to the PRTG web interface or PRTG Desktop.

Setting	Description
	 The default password is prtgadmin .

Probe Settings for Core Connection

Define general settings regarding the local probe and connections.

Probe Settings for Core Connection Tab

Probe Settings

Setting	Description
Name of Probe	<p>Enter a meaningful name to identify the local probe. PRTG shows this name, for example, in the device tree, and in all alarms by default. Enter a string.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Reconnect Time	<p>Define the time that PRTG waits for the local probe to reconnect to the PRTG core server if the connection fails. Enter an integer value.</p>

Connection to PRTG Core Server

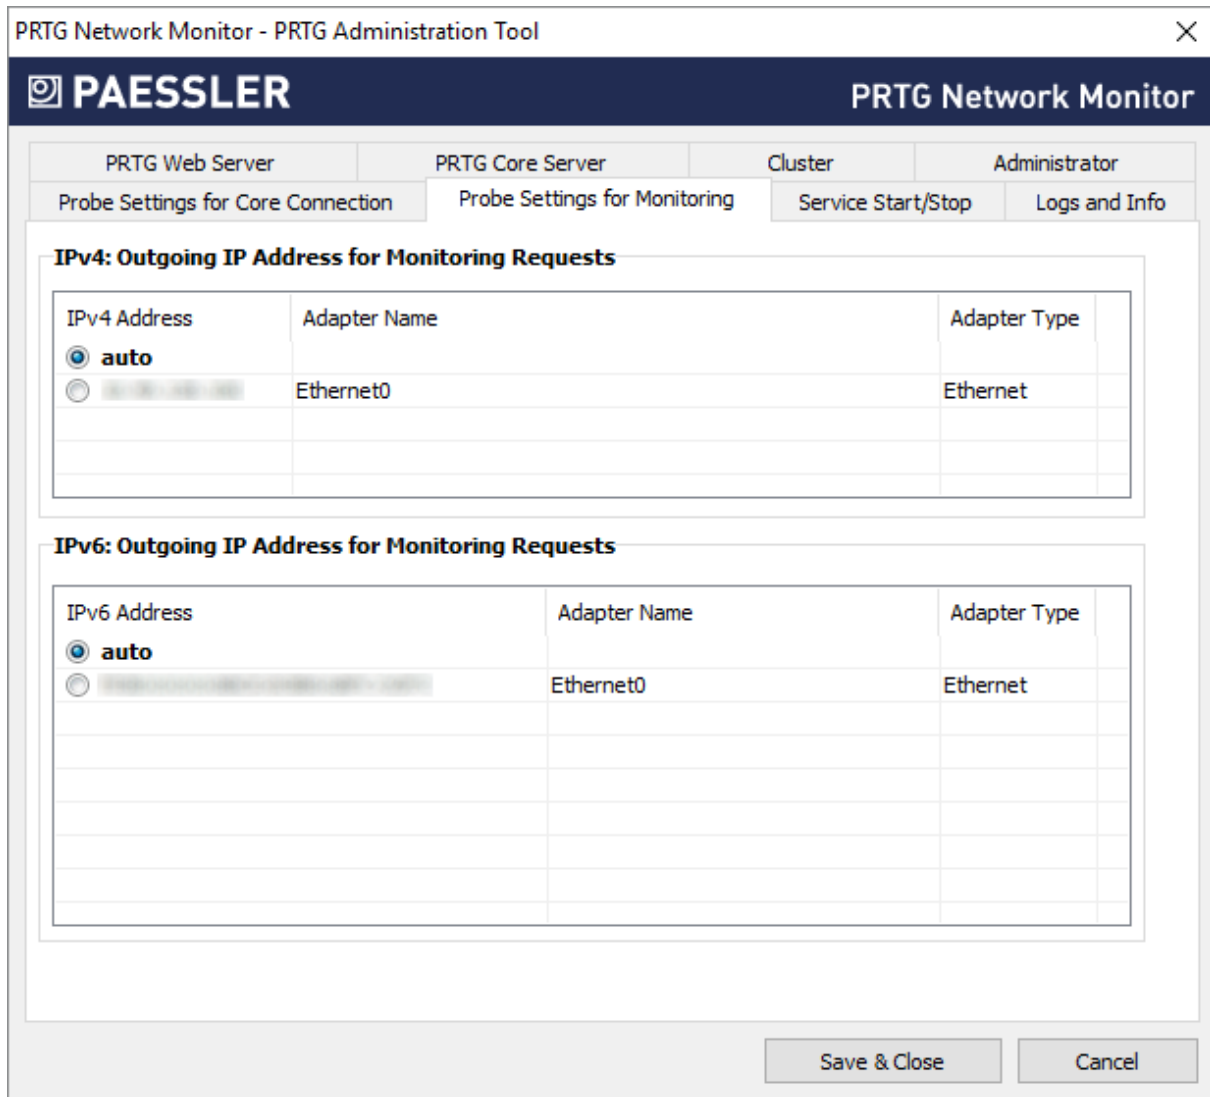

These settings affect the way that the local probe connects to the PRTG core server.

Setting	Description
Server (IPv4 Address or DNS Name)	<p>The local probe connects to the PRTG core server via 127.0.0.1. You cannot change this.</p>
Probe GUID	<p>The probe GUID is a unique identifier for the local probe. You cannot change the GUID on the PRTG core server system.</p> <p>i Edit GUID and Generate new GUID are only available on the remote probe system. For more information, see section PRTG Administration Tool on Remote Probe Systems⁴³⁷¹.</p> <p>i You can deny GUIDs under Setup System Administration Core & Probes⁴²⁰⁴ in the PRTG web interface.</p>
Probe Access Key	<p>Probe Access Key is only available on the remote probe system.</p> <p>i For more information, see section PRTG Administration Tool on Remote Probe Systems⁴³⁷¹.</p>
Confirm Access Key	<p>Confirm Access Key is only available on the remote probe system.</p> <p>i For more information, see section PRTG Administration Tool on Remote Probe Systems⁴³⁷¹.</p>

Path for the PRTG Data Directory on the Probe System

Setting	Description
Path	This setting is not available on the PRTG core server system. Please use Local Storage of Data Files and Monitoring Database on the PRTG Core Server ⁴³⁶³ tab instead.

Probe Settings for Monitoring

Probe Settings for Monitoring Tab

Define the IP address to use for outgoing monitoring requests.

- If more than one IP is available on the system, you can specify the IP address that PRTG uses for the outgoing monitoring requests of certain sensors.
- This setting is for sensors that use the following connection types: HTTP, Domain Name System (DNS), File Transfer Protocol (FTP), Internet Message Access Protocol (IMAP), Post Office Protocol version 3 (POP3), port, remote desktop, Simple Mail Transfer Protocol (SMTP), and Simple Network Management Protocol (SNMP).

- The setting is valid for all monitoring requests that this probe sends.
 - This setting is useful for devices that expect a certain IP address when they are queried.
 - The default setting is auto. PRTG automatically selects an IP address.
- i** This feature does not support all sensors for technical reasons.
- i** If you change this setting, some sensors might stop working. For example, sensors might show the Down status if the selected IP address is blocked on the way to or directly on the monitored device.

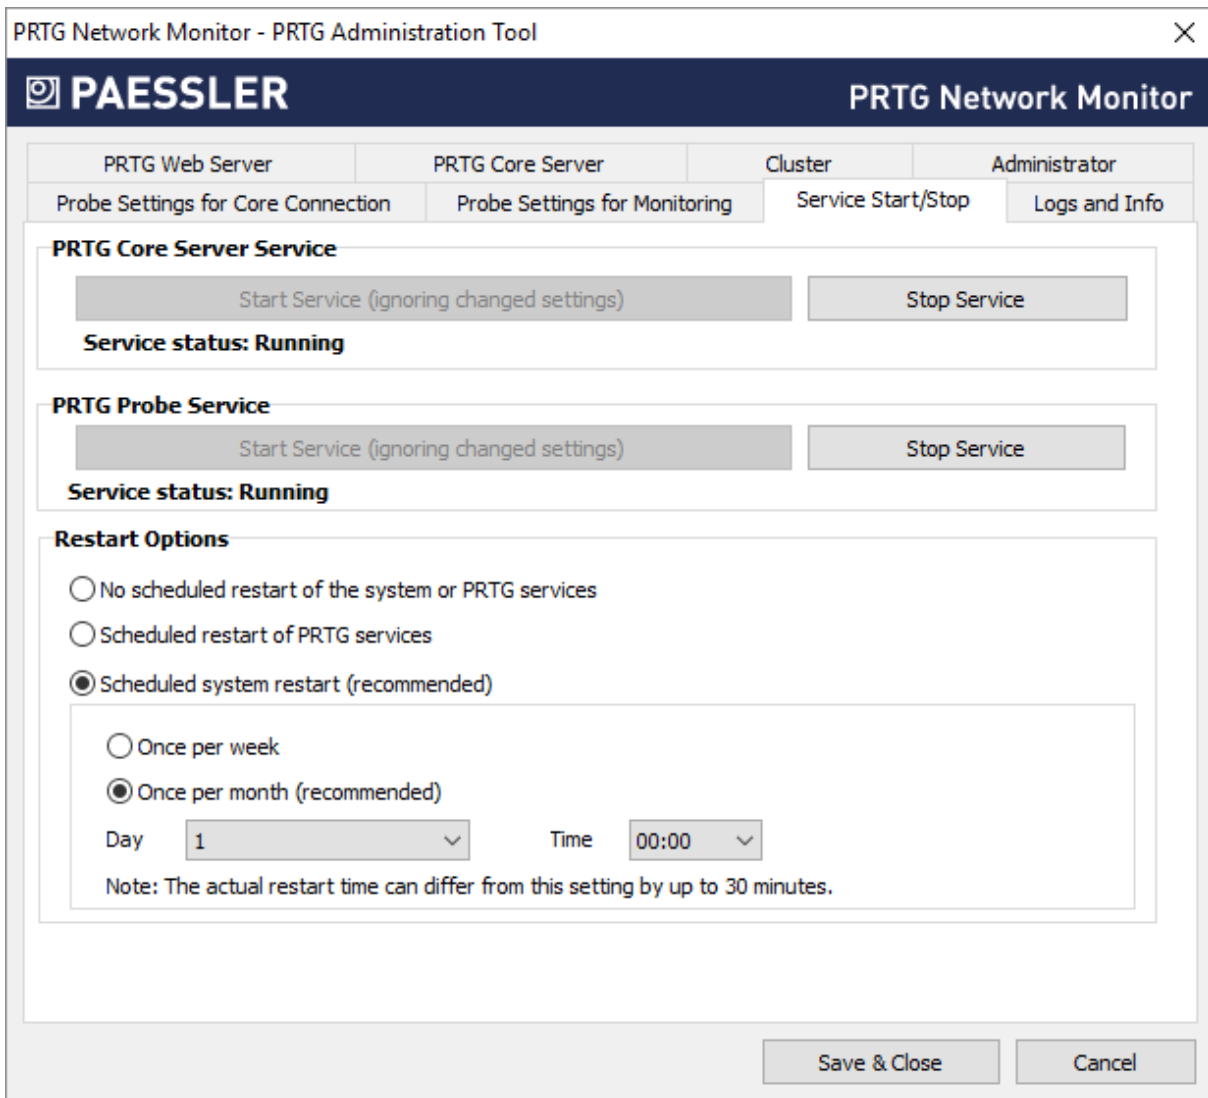

Setting	Description
IPv4: Outgoing IP Address for Monitoring Requests	Define the IP address for outgoing requests that use the IPv4 protocol. The list shows all available IP addresses on the system. Choose a specific IP address or select auto.
IPv6: Outgoing IP Address for Monitoring Requests	Define the IP address for outgoing requests that use the IPv6 protocol. The list shows all available IP addresses on the system. Choose a specific IP address or select auto.

 For more information, see section [IPv6 Support](#) ¹⁶¹.

Service Start/Stop

You can manually start and stop the PRTG core server service and PRTG probe service. Click the respective buttons to start or stop the respective service. Both actions usually take from a few seconds up to several minutes. You can also restart the PRTG core server service and PRTG probe service under Setup | System Administration | [Administrative Tools](#) ⁴²⁵ in the PRTG web interface.

- i** We recommend that you schedule automatic system restarts.

Service Start/Stop Tab

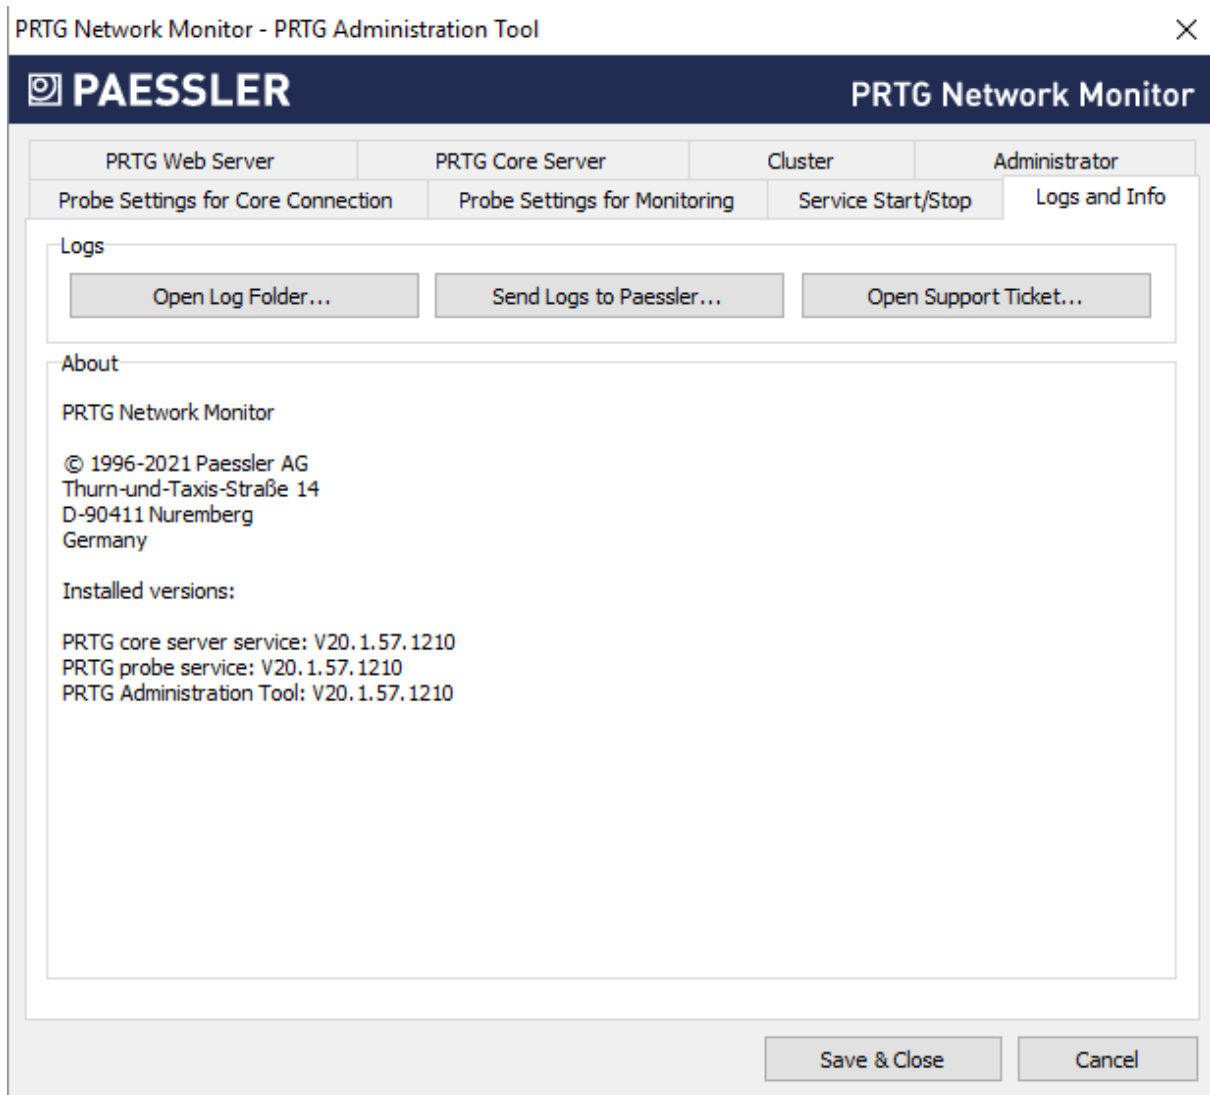

Restart Options

Setting	Description
Restart Options	<p>Define if you want to schedule an automatic restart:</p> <ul style="list-style-type: none"> ▪ No scheduled restart of the system or PRTG services: Do not automatically perform a scheduled restart of services. We recommend that you manually restart the PRTG core server system every few weeks. You can also restart the PRTG core server service and PRTG probe service under Administrative Tools⁴²²⁵ in the PRTG web interface. ▪ Scheduled restart of PRTG services: Restart the PRTG core server service on the PRTG core server system. If you select this option, the PRTG probe service restarts as well. Define a schedule under Restart Schedule.

Setting	Description
	<p>☁ This setting is not available on the hosted probe of a PRTG Hosted Monitor instance.</p> <ul style="list-style-type: none"> ▪ Scheduled system restart (recommended): Define a schedule under Restart Schedule. We recommend that you restart PRTG core server systems once a month for best performance.
Restart Schedule	<p>This setting is only visible if you select a schedule option above. Choose how often you want to restart the PRTG core server service, PRTG probe service, or the PRTG core server system:</p> <ul style="list-style-type: none"> ▪ Once per week: Select a day and a time below. ▪ Once per month (recommended): Select a day of the month and a time below.
Day	<p>This setting is only visible if you select a schedule option above. Select a day of the week (Monday to Sunday) or month (1st to 30th or Last). If you select Last, PRTG restarts the PRTG core server system on the last day of the month, regardless of how many days the month has.</p> <p>ⓘ If you select a date that does not exist in every month (for example, the 30th day in February), PRTG automatically restarts the PRTG core server system on the last day of this month.</p>
Time	<p>This setting is only visible if you select a schedule option above. Select the time of the day when PRTG restarts the PRTG core server system.</p> <p>ⓘ You get a Windows warning message 10 minutes before the restart to inform you about the restart if you are logged in to PRTG. The actual restart time can differ by up to 30 minutes from the time you enter here.</p>

ⓘ You can also define a restart schedule on the [Settings](#) ⁴¹⁰ tab of a remote probe in the PRTG web interface.

Logs and Info

Logs and Info Tab

Logs

Button	Description
Open Log Folder	Open the PRTG data directory ⁴⁵²⁶ to access all logs that PRTG creates.
Send Logs to Paessler	Open an assistant to send logs to the Paessler support team. See Send Logs to Paessler ⁴³⁶⁸ for details. i You can also send logs with the support bundle via Contact Support ⁴²⁷¹ in the PRTG web interface.
Open Support Ticket	Open the support form on the Paessler website in a browser window.

Button	Description
	<p> If you need help, we recommend that you use the Contact Support option in the PRTG web interface instead.</p>

About

The About section shows information about the version of installed PRTG programs and copyright information.

Send Logs to Paessler

 You can also send logs with the support bundle via Contact Support in the PRTG web interface.

Send Logs to Paessler

PAESSLER PRTG Network Monitor

Send Logs to Paessler

Name

Email

Ticket#

Please supply your ticket number (PAEXXXX) if you already have an open support ticket.

Configuration Include configuration file (contains passwords)

Note: All passwords used in PRTG are encrypted in the configuration file, but SNMP communities and hostnames may be written in plain text.

If you click the "Send" button, this program will upload the relevant logfiles and, if selected, the configuration file of your PRTG installation to the Paessler FTP server and support ticket system.

Please ensure that outgoing FTP and HTTP connections are enabled on this machine.

Note: Support communication can only be provided in English or German!

Send Logs to Paessler

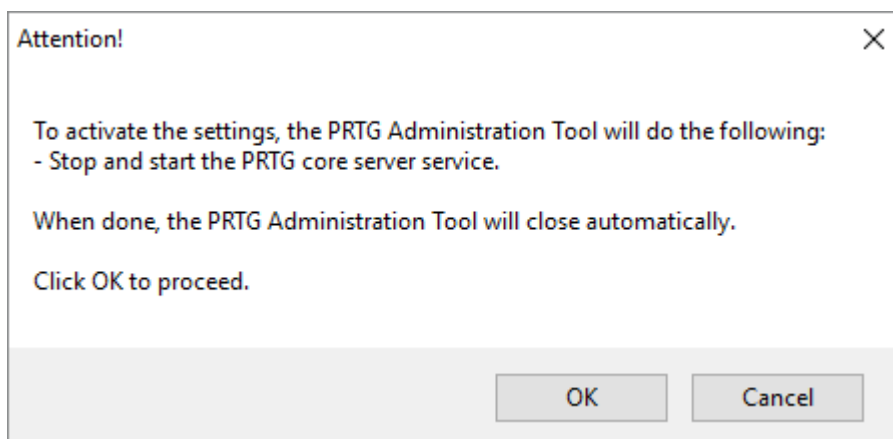

If you open a support ticket, the Paessler support team might ask you to send logs for further analysis.

Field	Description
Name	Enter your name.
Email	Enter a valid email address. You can provide any email address but we recommend that you use the email address of your user account, which PRTG enters by default.
Ticket #	<p>This field is optional. If you have already opened a ticket with the Paessler support team, provide the ticket number you received. Your files are then automatically associated with your ticket.</p> <p>Enter the ticket number starting with PAE followed by four or more digits, for example, PAE12345. If you do not have a ticket number, leave this field empty.</p>
Configuration	Define if you want to include the configuration file. PRTG removes all passwords from the configuration file before sending it to the Paessler support team.

Click Send to start the data upload. PRTG then automatically collects, compresses, and sends your logs to our FTP over SSL (FTPS) server. Ensure that FTPS and HTTP connections are allowed on the remote probe system.

Activate Changed Settings

After you change settings, click Save & Close. A new dialog box appears where PRTG asks you to agree to restart the PRTG core server service. Click OK to proceed.

Restart Services

 KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Which ports does PRTG use on my system?

- <https://kb.paessler.com/en/topic/61462>

13.2 PRTG Administration Tool on Remote Probe Systems

If you start the PRTG Administration Tool on a remote probe system, you can define various probe-related settings, restart services, and view log information. You can also change many of these settings via the [system administration](#)⁴¹⁷⁵ and the [probe settings](#)⁴⁰⁹ in the PRTG web interface.

The PRTG Administration Tool has the following tabs:

- [Probe Settings for Core Connection](#)⁴³⁷¹
- [Probe Settings for Monitoring](#)⁴³⁷⁵
- [Service Start/Stop](#)⁴³⁷⁶
- [Logs and Info](#)

 This section describes the available settings in the PRTG Administration Tool when you open it on a remote probe system. This is not the complete set of available settings. If you need access to all settings regarding the entire PRTG installation, open the PRTG Administration Tool on the PRTG core server system.

 Settings you make here are only valid for the remote probe system on which you open the PRTG Administration Tool. Make sure that you log in to the system that you want to make changes to and open the PRTG Administration Tool there.

Start the PRTG Administration Tool

- From the Windows Start menu, select the PRTG Network Monitor folder and click PRTG Administration Tool to open the application.
- Confirm the question of the Windows [User Account Control](#) with Yes to allow the PRTG Administration Tool to start.

Probe Settings for Core Connection

Define general settings regarding the remote probe and connections.

Probe Settings for Core Connection Tab

Probe Settings

Setting	Description
Name of Probe	<p>Enter a meaningful name to identify the remote probe. PRTG shows this name, for example, in the device tree, and in all alarms by default. Enter a string.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Reconnect Time	Define the time that PRTG waits for the remote probe to reconnect to the PRTG core server if the connection fails. Enter an integer value.

Connection to PRTG Core Server

These settings affect the way the remote probe connects to the PRTG core server.

Setting	Description
Server (IPv4 Address or DNS Name)	Enter the IP address or Domain Name System (DNS) name of the PRTG core server.
Probe GID	<p>The probe GID (global ID (GID)) is a unique identifier for the remote probe. We recommend that you do not change it.</p> <p>Exceptions: If you substitute a remote probe from a different computer, you have to copy the GID from the old probe to the new probe. To do so, click Edit GID and confirm the warning with Yes. You can then change the GID. PRTG checks if the GID is valid. You can also generate a new GID if necessary. To do so, click Generate new GID and confirm the warning with Yes.</p> <p>i You can deny GIDs under Setup System Administration Core & Probes⁴²⁰⁴ in the PRTG web interface. If you remove a remote probe from the device tree or if you deny a remote probe after installation¹¹², PRTG automatically enters its GID in the Deny GIDs list.</p>
Probe Access Key	<p>The probe access key must match one of the access keys in the PRTG core server installation. If it does not match, the remote probe is not able to connect to the PRTG core server.</p> <p>■ For more information, see section Core & Probes⁴²⁰⁴.</p> <p>i Also check the allowed and denied IPs in the Core & Probes⁴²⁰⁴ settings to ensure that the PRTG core server accepts the IP address of the remote probe.</p>
Confirm Access Key	If you enter an access key for a remote probe, enter it in this field again to confirm it.

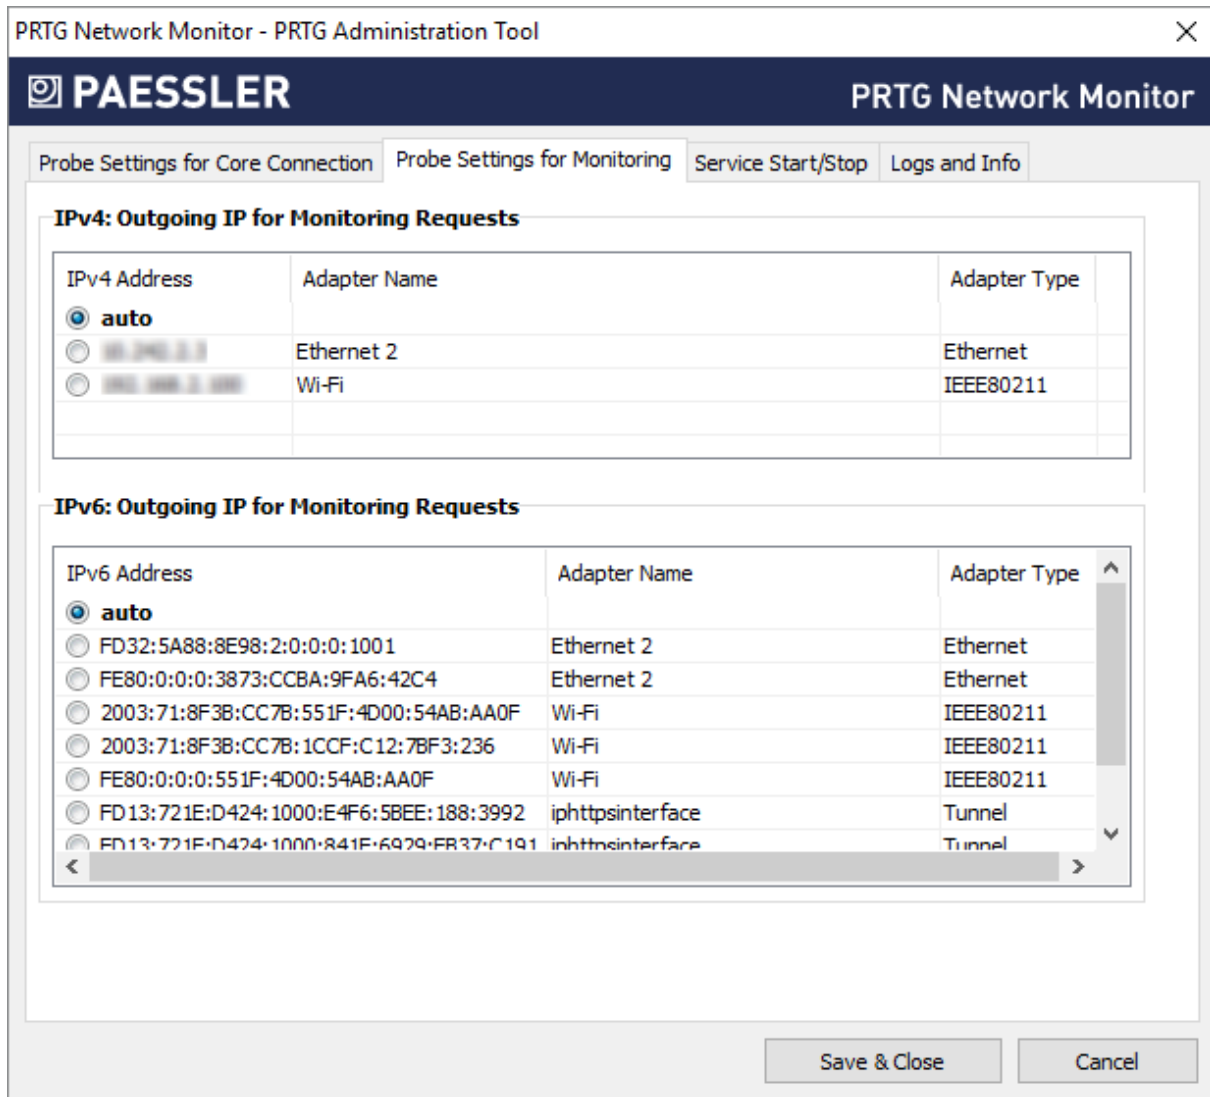

Path for the PRTG Data Directory on the Probe System

Setting	Description
Path	<p>Select the directory where PRTG stores configuration and monitoring data. Click  to choose a different folder on the system.</p> <p> Before you change the path, make sure you stop both the PRTG core server service and the PRTG probe service and copy all data to the new location.</p>

Language for the PRTG Administration Tool for Remote Probes

Setting	Description
[your language]	<p>Choose the language for the PRTG Administration Tool on the remote probe. The default is English.</p>

Probe Settings for Monitoring

Probe Settings for Monitoring Tab

Define the IP address to use for outgoing monitoring requests.

- If more than one IP is available on the system, you can specify the IP address that PRTG uses for the outgoing monitoring requests of certain sensors.
- This setting is for sensors that use the following connection types: HTTP, Domain Name System (DNS), File Transfer Protocol (FTP), Internet Message Access Protocol (IMAP), Post Office Protocol version 3 (POP3), port, remote desktop, Simple Mail Transfer Protocol (SMTP), and Simple Network Management Protocol (SNMP).
- The setting is valid for all monitoring requests that this probe sends.
- This setting is useful for devices that expect a certain IP address when they are queried.
- The default setting is auto. PRTG automatically selects an IP address.

i This feature does not support all sensors for technical reasons.

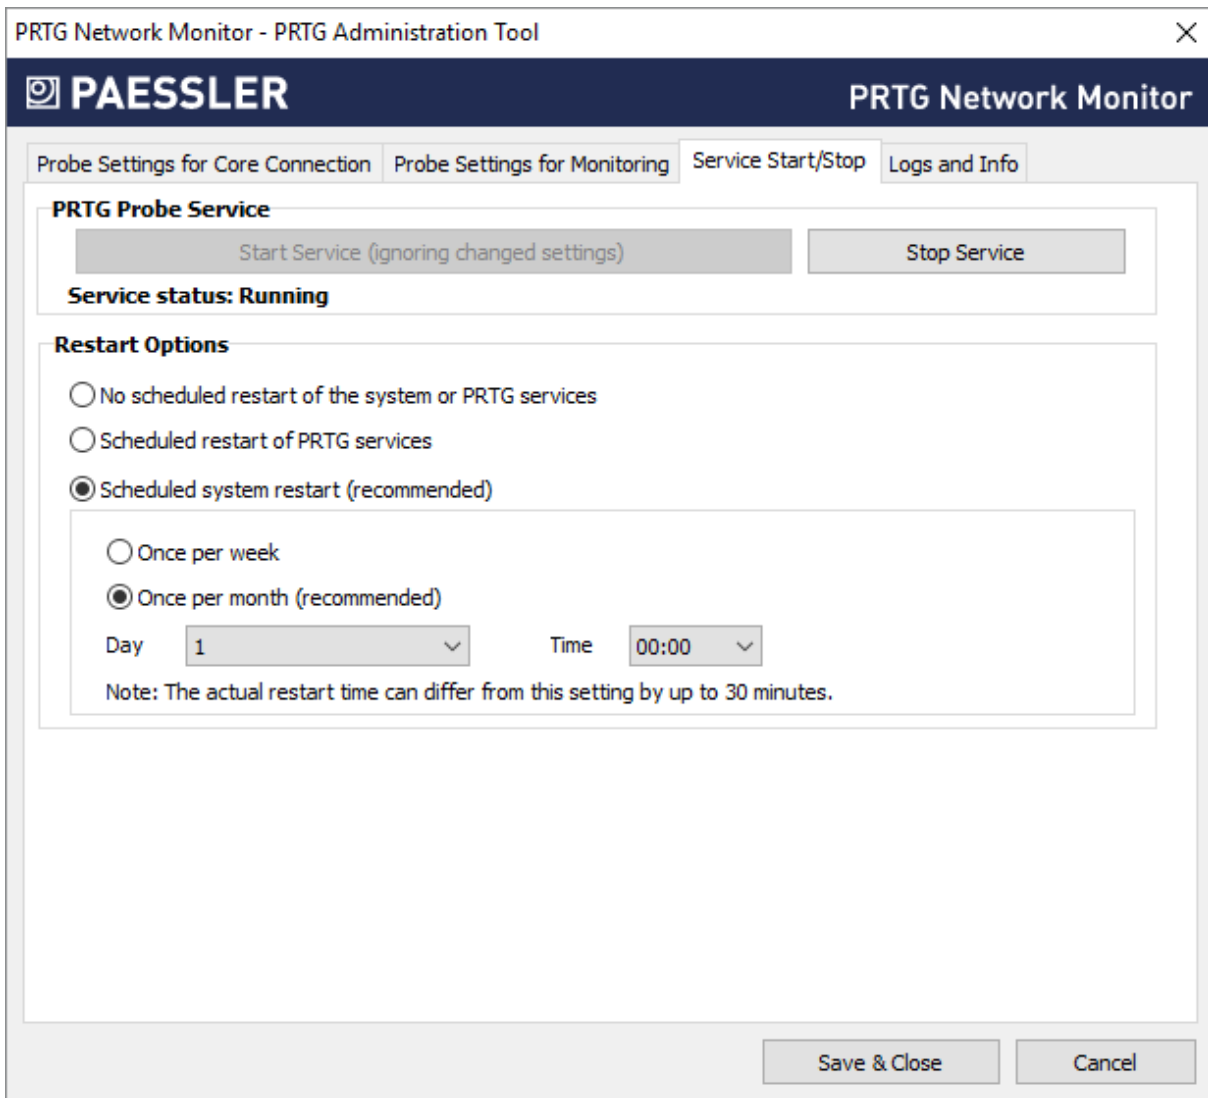

i If you change this setting, some sensors might stop working. For example, sensors might show the Down status if the selected IP address is blocked on the way to or directly on the monitored device.

Setting	Description
IPv4: Outgoing IP for Monitoring Requests	Define the IP address for outgoing requests that use the IPv4 protocol. The list shows all available IP addresses on the system. Choose a specific IP address or select auto.
IPv6: Outgoing IP for Monitoring Requests	Define the IP address for outgoing requests that use the IPv6 protocol. The list shows all available IP addresses on the system. Choose a specific IP address or select auto.  For more information, see section IPv6 Support ¹⁶¹ .

Service Start/Stop

You can manually start and stop the PRTG probe service. Click Start Service to start the service or Stop Service to stop it. Both actions usually take from a few seconds up to several minutes. You can also restart the PRTG probe service under Setup | System Administration | [Administrative Tools](#)⁴²²⁵ in the PRTG web interface.

i We recommend that you schedule automatic service restarts.

Service Start/Stop Tab

Scheduled Restart Settings

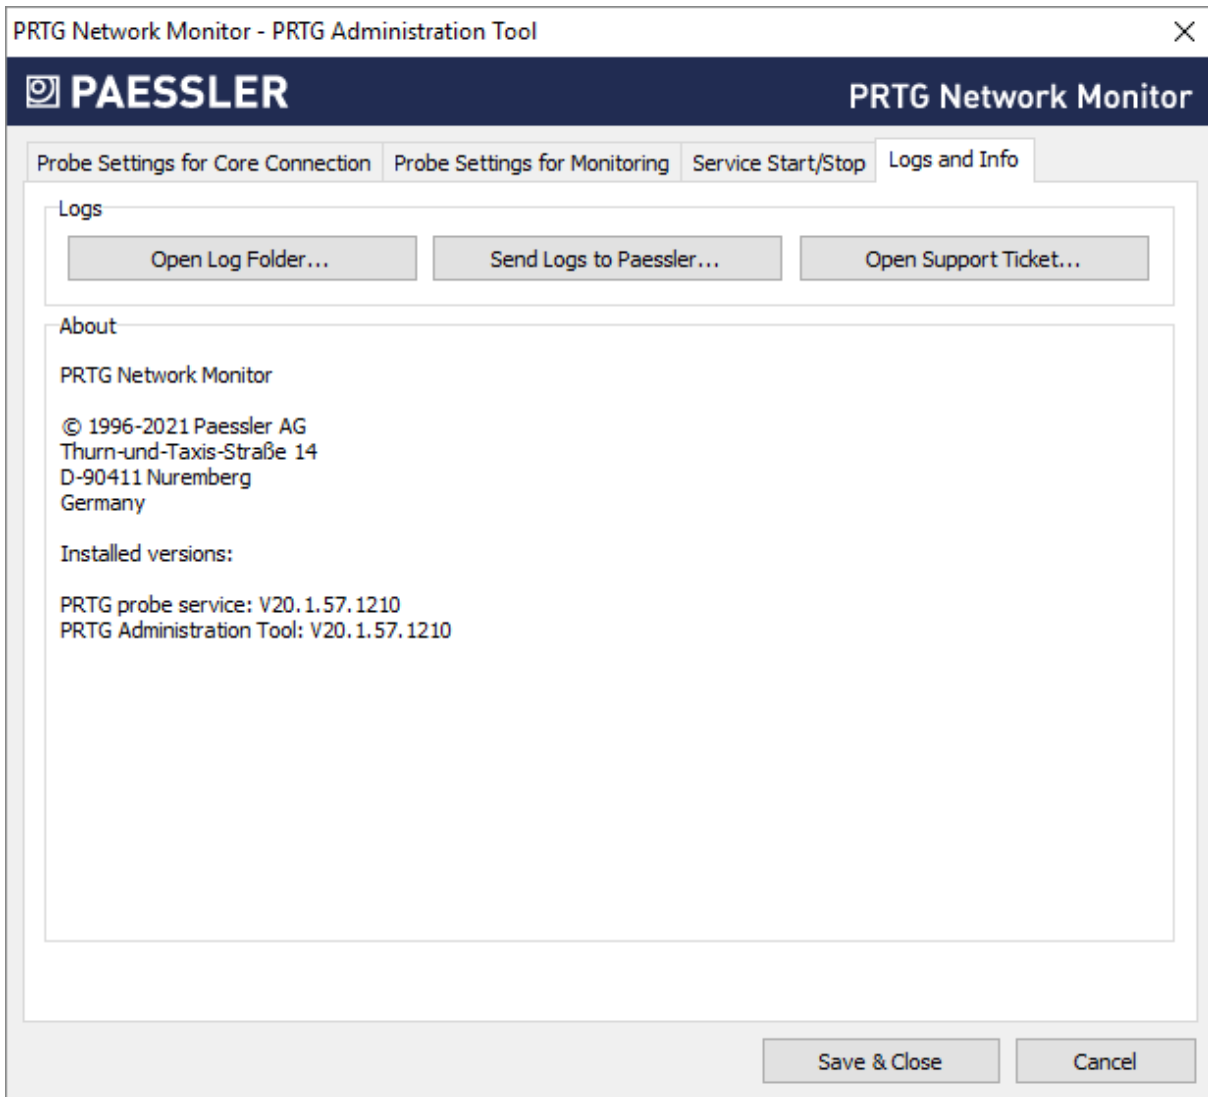

☁ This setting is not available on the hosted probe of a PRTG Hosted Monitor instance.

Setting	Description
Restart Options	<p>Define if you want to schedule an automatic restart:</p> <ul style="list-style-type: none"> No scheduled system or service restart: Do not automatically perform a scheduled restart of services. We recommend that you manually restart the PRTG core server system every few weeks. You can initiate a restart of the PRTG probe service in the Administrative Tools ⁴²²⁵ in the PRTG web interface.

Setting	Description
	<ul style="list-style-type: none"> ▪ Scheduled restart of PRTG services: Restart the PRTG probe service on the probe system. If you select this option on the local probe, the PRTG core server service restarts as well. Define a schedule under Restart Schedule. ▪ Scheduled system restart (recommended): Define a schedule under Restart Schedule. We recommend that you restart probe systems once a month for best performance.
Restart Schedule	<p>This setting is only visible if you select a schedule option above. Choose how often you want to restart the PRTG probe service or the probe system:</p> <ul style="list-style-type: none"> ▪ Once per week: Select a day and a time below. ▪ Once per month (recommended): Select a day of the month and a time below.
Day	<p>This setting is only visible if you select a schedule option above. Select a day of the week (Monday to Sunday) or month (1st to 30th or Last). If you select Last, PRTG restarts the PRTG core server system on the last day of the month, regardless of how many days the month has.</p> <p>i If you select a date that does not exist in every month (for example, the 30th day of February), PRTG automatically initiates the restart on the last day of this month.</p>
Time	<p>This setting is only visible if you select a schedule option above. Select the time of day when PRTG performs the restart.</p> <p>i You get a Windows warning message 10 minutes before the restart to inform you about the restart if you are logged in to PRTG. The actual restart time can differ by up to 30 minutes from the time you enter here.</p>

i You can also define a restart schedule on the [Settings](#) ⁴¹⁰ tab of a remote probe in the PRTG web interface.

Logs and Info

Logs and Info Tab

Logs

Button	Description
Open Log Folder	Open the PRTG data directory ⁴⁵²⁶ to access all logs that PRTG creates.

- [Failover Cluster Configuration](#)  4513
- [Data Storage](#)  4526
- [PRTG Housekeeping](#)  4531
- [Using Your Own SSL Certificate](#)  4537

14.1 Active Directory Integration

PRTG offers a detailed access rights management for user groups in combination with individual user access rights. For detailed information, see section [Access Rights Management](#) ¹⁵⁵.

You can add PRTG user groups to PRTG, or you add user groups from your Active Directory. While integrating an Active Directory into PRTG, you map a user group from your Active Directory to a user group in PRTG.

You can integrate an Active Directory in PRTG in four steps. During this process, you map an Active Directory (AD) group to a user group in PRTG. All members of your Active Directory group can then log in to PRTG using their Active Directory domain credentials.

 You cannot add single Active Directory users to PRTG. You can only allow access for entire Active Directory groups. PRTG automatically creates a user account for each Active Directory user that successfully logs in to PRTG.

 This feature is not available in PRTG Hosted Monitor.

Step 1: Prepare Your Active Directory

- In your Active Directory, make sure that the users that you want to give access to PRTG are members of the same user group in your Active Directory.
- You can also organize users into different user groups, for example, one user group whose members have administrative rights in PRTG, and one user group whose members only have read access in PRTG.

Step 2: Prepare Your PRTG Core Server

- Make sure that the PRTG core server system is a member of the domain that you want to integrate it into. To check this setting, open the Windows Control Panel and click the Change settings link under System, section Computer name, domain, and workgroup settings.

Step 3: Add Active Directory Domain and Credentials (optional) to System Settings

- In the [PRTG web interface](#) ¹⁶³, select Setup | System Administration | Core & Probes from the main menu.
- In section Active Directory Integration, enter the name of your local Active Directory domain in the Domain Name field.
 -  You can only integrate one Active Directory domain into PRTG.
- The following process is optional. PRTG uses the same Windows user account from which a user runs the PRTG core server service. By default, this is the [local system](#) Windows user account. If this user does not have sufficient rights to query a list of all user groups from the Active Directory, provide credentials of a user account with full Active Directory access by using the Use explicit credentials option as Access Type.
 -  If you cannot save changes to the Core & Probes settings because you get an [Error \(Bad Request\)](#) with the message [Active Directory Domain not accessible](#), select Use explicit credentials as Access Type and provide the correct credentials for your Active Directory domain.
- Save your settings.

Step 4: Add a New User Group

- Switch to the User Groups tab (see section [User Groups](#)^[4219]).
- Hover over  and click Add User Group to add a new user group.
- Enter a meaningful User Group Name and select Use Active Directory integration under Active Directory or Single Sign-On Integration.
- From the Active Directory Group dropdown menu that appears, select the group in your Active Directory whose members have access to PRTG. If you have a very large Active Directory with more than 1,000 entries, you see an input field instead of a dropdown menu. In this case, you can only enter the name of the user group in your Active Directory, and PRTG automatically adds the domain name prefix.
- For User Type, define the [access rights](#)^[155] a user from the selected Active Directory group has when logging in to PRTG for the first time. You can choose between Read/write user and Read-only user. Giving users read access only is useful to only show data to a large group of users.
- Click Create.

Done

All users in this newly created Active Directory group can now log in to PRTG using their Active Directory domain credentials. Their user accounts have the [group access rights](#)^[155] of the user group you just created.

Notes and Restrictions

- Active Directory users can [log in to the PRTG web interface](#)^[164] using their Windows user name and password. Do not enter any domain information in the Login Name field. When an Active Directory user logs in, PRTG automatically creates a corresponding local account on the PRTG core server. Credentials are synchronized every hour.
- Do not change the Login Name in PRTG for Active Directory users unless the name changes in the Active Directory. Changing the Login Name in PRTG has no effect on the name in the Active Directory.
- Active Directory queries are made in read-only mode and are compatible with Read-only Domain Controllers (RODC).
- For performance reasons, all requests to Active Directory servers are cached for one hour. If a password is changed, if you add a new user group in the Active Directory, or if you changed group membership of an Active Directory user, you must either wait for an hour or manually clear the cache by selecting Setup | System Administration | Administrative Tools from the main menu and clicking Go! in the Clear Caches section.
- By default, no access rights for monitoring objects, libraries, maps, or reports are set for the new user group in PRTG. This is why, initially, users in this user group do not see monitoring objects, libraries, maps, or reports. This does not apply if the new user group has administrative rights. Edit the monitoring [object's settings](#)^[226] and the settings of libraries, maps, and reports, and set access rights for your newly created user group in the respective Access Rights section.
 - ⓘ The easiest way is to set these access rights in the [root group settings](#)^[366] and use the [inheritance of settings](#)^[142].
- PRTG only supports **explicit** user group rights. If your Active Directory uses groups that are members of other user groups, PRTG does **not** regard the inherited implicit rights of the parent group and therefore refuses login for members of these user groups.

- PRTG ignores Active Directory information about Organizational Units (OU). PRTG cannot read these values. However, if you use the Active Directory in an [auto-discovery group](#)^[296], you can restrict the auto-discovery to machines that are part of an OU.
- You can integrate only one Active Directory domain into PRTG.
- PRTG does not support trusted domains or Active Directory subdomains.
- For very large Active Directories, you see an input field instead of a dropdown menu when you add or modify a user group. In this case, you can only enter the name of the user group in your Active Directory, and PRTG automatically adds the domain name prefix.
- A local user account for an Active Directory user is only created if this Active Directory user has successfully logged in to PRTG. If you want to send [email notifications](#)^[4138] to an Active Directory group in PRTG, using the option Send to User Group in the notification settings, a member of this Active Directory group has to log in to PRTG at least once to receive email notifications. To avoid this, enter the email address of the Active Directory group in the Send to Email Address field in the notification settings and select None for the Send to User Group option.
- If you want to delete an Active Directory group from PRTG because of some changes to the Active Directory, for example, you have to delete all users that are in this user group first. This is because Active Directory users always have this user group set as their primary group, and user accounts cannot be without a primary group.
- If you change the group membership of an Active Directory user, this change is only reflected in the respective user groups in PRTG if this Active Directory user has logged in to PRTG again.
- If you delete an Active Directory user from all user groups in the Active Directory that are related to PRTG access, this user cannot log in to PRTG anymore. However, you still see the user in the user account list in PRTG.

- <https://kb.paessler.com/en/topic/63737>

Where can I find PRTG Mini Probes which are ready to use?

- <https://kb.paessler.com/en/topic/61215>

14.2.1 HTTP API

All calls to the PRTG API are performed by HTTP GET requests. The URLs consist of a path to the API function and some parameters.

- If you are accessing the PRTG API inside your secure LAN, you can use HTTP. In environments that are not secure (for example, when accessing your PRTG core server via the internet), you should use HTTPS requests to make sure that your parameters and passwords are encrypted. This way, all communication between the PRTG core server and your client is Secure Sockets Layer (SSL) encrypted.
- For every API call, the default limit of items is 500. If you want to receive more items per call, add a `count=xxx` parameter with enough room for all sensors.
- You must include authentication with user name and `passhash` (or user name and password) in each request.
■ See section [Authentication](#) for more information.
- All data in the GET parameters must be UTF-8-encoded and URL encoded.

Output Formats

Most data that you can request from the PRTG API is available in data tables in the Extensible Markup Language (XML), the JavaScript Object Notation (JSON) format, and the comma-separated values (CSV) format (using the XML format is recommended). Here are some sample calls with different output formats.

 Examples

XML

```
https://yourserver/api/table.xml?content=sensors&columns=sensor
```

JSON

```
https://yourserver/api/table.json?content=sensors&columns=sensor
```

CSV

```
https://yourserver/api/table.xml?content=sensors&columns=sensor&output=csvtable
```

The example URLs consist of the following elements.

Element	Description
yourserver	The name of your PRTG server.
/api/table.xml or /api/table.json	Addresses an API function. Here, the function renders a table in the XML format or in the JSON format.
content=sensors	Parameter for additional control. In this case, it includes all sensors in the table.

Element	Description
columns=sensor	Parameter for additional control. In this case, only the names of all sensors are shown in the table.
output=csvtable (optional)	Renders a table in the CSV format.

Authentication

All requests to the PRTG API are stateless, which means that there is no multi-step login process of an kind. You must include the authentication with user name and passhash (or user name and password) in each request by using the user name and passhash (or user name and password) parameters.

 Examples

```
https://yourserver/api/table.xml?
content=sensors&columns=sensor&username=myuser&passhash=hash
```

or:

```
https://yourserver/api/table.xml?
content=sensors&columns=sensor&username=myuser&password=mypassword
```

The example URLs now also contain the credentials for authentication purposes:

- username=myuser&passhash=hash (or password=mypassword)

You can request the passhash for an account with the following API call:

```
https://yourserver/api/getpasshash.htm?username=myuser&password=mypassword
```

 Make sure that user name and password are URL-encoded.

Versioning

Most XML replies from the PRTG API contain a <version> field that contains the [program version](#) and [buildnumber](#) of the server's PRTG installation. Your client must look at this version number and compare it to the version number that was used to develop the client. Do not accept version numbers older (smaller) than this one. You should display a warning to the user (or stop processing) if the version number differs by 0.1 or more (for example, version 18.1 vs. 18.2, or version 17.x vs. 18.x). PRTG API conventions or parameters might have changed between versions.

 Newer versions of the same major version of PRTG reply to API calls just like previous versions did.

Error Handling

Depending on whether an API call was successfully processed or not, the PRTG core server replies with the following HTTP status codes:

HTTP Status Code	Meaning	Comments
200	OK	The API call was successfully completed , the XML response contains the result data.
302	Found	The API call was successfully completed and a new object was created (the redirection URL contains the new object ID).
400	Bad Request	The API call could not be successfully completed. The XML response contains the error message.
401	Unauthorized	The username/password credentials cannot be accepted.

For 400 error codes, the error .xml document includes the error message as follows:

```
<?xml version="1.0" encoding="UTF-8" ?>
  <prtg>
  <version>18.1.37.10127+</version>
  <error>Sorry, there is no object with the specified id.</error>
  </prtg>
```

14.2.2 Live Data

You can access live data and live status data of objects using the PRTG API.

Getting Single Object Property

You can get the properties or settings of a single object such as name, hostname, or URL using the PRTG API.

See section [Single Object Property](#)⁴³⁹⁴ for more information.

Getting Single Object Status

You can get the status of a single object such as last value or downtime using the PRTG API.

See section [Single Object Status](#)⁴³⁹⁷ for more information.

Getting Multiple Object Property or Status

You can get the property or status of multiple objects and use sorting and advanced filtering using the PRTG API.

See section [Multiple Object Property or Status](#)⁴⁴⁰⁴ for more information.

Getting System Information

You can get system information from the [system information](#)²³⁷ tables using the PRTG API.

See section [System Information](#)⁴⁴²⁰ for more information.

Getting PRTG System Status

You can also get the PRTG system status such as the number of alarms or messages using the following API calls.

Examples

Live system status in the Extensible Markup Language (XML) format:

```
/api/getstatus.xml?id=0
```

Live system status in the JavaScript Object Notation (JSON) format:

```
/api/getstatus.htm?id=0
```

All sensors in use in the JSON format:

```
/api/sensortypesinuse.json
```

Number of all sensor states:

```
/api/gettreenodestats.xml
```

■ KNOWLEDGE BASE

How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

Application Programming Interface (API) Definition

- [HTTP API](#)  4390
- [Live Data](#)  4393
- [Live Graphs](#)  4424
- [Historic Data](#)  4427
- [Object Manipulation](#)  4430
- [Custom Sensors](#)  4437
- [Custom Notifications](#)  4452
- [Mini Probe API](#)  4455

14.2.2.1 Single Object Property

You can access live data and live status data of single objects using the PRTG API.

- ❗ Authentication with user name and [passhash](#)  4123 (or user name and password) must always be included in each PRTG API request. See section [Authentication](#)  4391 for more information.

In this section:

- [Property/Setting of an Object](#)  4394
- [Supported Object Types](#)  4395
- [Available Channel Parameters](#)  4395
- [Property of a Channel](#)

Property/Setting of an Object

You can get the properties or settings of an object (name, hostname, url) using the following API calls.

- ❗ Because properties might contain HTML content, we recommend that you include [&show=nohtmlencode](#) in all `getobjectproperty` API calls.

Examples

Get an object property/setting:

```
/api/getobjectproperty.htm?id=objectid&name=propertyname&show=nohtmlencode
```

i For `propertyname`, look at the name of the INPUT fields while editing an object. You can discern the `propertyname` parameter by opening the Settings tab of an object and looking at the HTML source of the INPUT fields. For example, the INPUT field for the tags of an object has the name `tags_`. Leave away the underscore `_` and use `tags` as a value for the `propertyname` parameter.

Get a list of all tags for object ID 1003

```
/api/getobjectproperty.htm?id=1003&name=tags&show=nohtmlencode
```

The Extensible Markup Language (XML) result looks like this:

```
<?xml version="1.0" encoding="UTF-8" ?>
<prtg>
  <version>18.3.45.1224+</version>
  <result>probehealthsensor</result>
</prtg>
```

Supported Object Types

`getobjectproperty.htm` supports the following object types:

- probe
- group
- device
- sensor
- channel
- library
- map
- notification
- report
- schedule
- user account

`getobjectproperty.htm` does not support the object types [ticket](#) and [user group](#).

Available Channel Parameters

Name of Input Field	Setting Name (as displayed in the PRTG web interface)
<code>name</code>	Name
<code>limitmode</code>	Limit disabled or enabled (0 or 1)

Name of Input Field	Setting Name (as displayed in the PRTG web interface)
limitmaxerror	Upper Error Limit
limitmaxwarning	Upper Warning Limit
limitminwarning	Lower Warning Limit
limitminerror	Lower Error Limit
limiterrormsg	Error Limit Message
limitwarningmsg	Warning Limit Message

Property of a Channel

With this API call, you can get a sensor's [channels settings](#), for example channel limits. In general, this works like getting properties of any other object. To get channel properties via the PRTG API, you need to provide

- the ID of a sensor (parameter id),
- a subtype ([channel](#) for channels), and
- a subid (ID of the channel that you want to edit)

i Because properties might contain HTML content, we recommend that you include [&show=nohtmlencode](#) in all `getobjectproperty` API calls.

Examples

Get a channel limit

```
/api/getobjectproperty.htm?  
id=sensorid&subtype=channel&subid=channelid&name=limitname&show=nohtmlencode
```

For example, the following API call gets the upper warning limit of a channel with the ID **0** of a sensor with the ID **1003**

```
/api/getobjectproperty.htm?  
id=1003&subtype=channel&subid=0&name=limitmaxwarning&show=nohtmlencode
```

The XML result looks like this:

```
<?xml version="1.0" encoding="UTF-8" ?>  
<prtg>  
  <version>18.3.45.1224+</version>  
  <result>25</result>  
</prtg>
```

Live Data

- [Single Object Property](#) ⁴³⁹⁴
- [Single Object Status](#) ⁴³⁹⁷
- [Multiple Object Property or Status](#) ⁴⁴⁰⁴
- [System Information](#) ⁴⁴²⁰

14.2.2.2 Single Object Status

You can access live data and live status data of single objects using the PRTG API.

- ❗ Authentication with user name and [passhash](#) ⁴¹²³ (or user name and password) must always be included in each PRTG API request. See section [Authentication](#) ⁴³⁹¹ for more information.

In this section:

- [Status of an Object](#) ⁴³⁹³
- [Supported Object Types](#) ⁴³⁹⁸
- [Supported getObjectstatus Output Columns \("Name=" Parameter\)](#) ⁴³⁹⁸
- [Sensor Details](#) ⁴⁴⁰³
- [Ticket Status and Message](#)

Status of an Object

You can get the status information (lastvalue, downtime) of an object using the following API calls:

🗨 Examples

Get object status:

```
/api/getobjectstatus.htm?id=objectid&name=columnname
```

The Extensible Markup Language (XML) result looks like this:

```
<?xml version="1.0" encoding="UTF-8" ?>
<prtg>
  <version>18.4.45.10127+</version>
  <result>True</result>
</prtg>
```

i In some cases, the result can contain HTML formatting elements.

Supported Object Types

getobjectstatus.htm supports the following object types:

- probe
- group
- device
- sensor

Supported getobjectstatus Output Columns ("Name=" Parameter)

With getobjectstatus.htm, you can use the following column names for the name parameter.

i Only one column name is allowed in the API call.

i If you want to use combinations of column names or more than one object in a single API call, use a table API call instead. For more information, see section [Multiple Object Property or Status](#).

Column Name	What It Displays	Can Be Used for
objid	ID of the object	probes, groups, devices, sensors
type	Object type or sensor type	probes, groups, devices, sensors
name	Name of the object	probes, groups, devices, sensors
tags	List of all tags. This includes tags from the object itself plus tags that are inherited from parent objects.	probes, groups, devices, sensors
active	True/false depending on whether an object is set to paused by a user	probes, groups, devices, sensors
downtime	Cumulated downtime of the sensor (displayed as percentage of uptime+downtime)	sensors
downtime	Cumulated downtime of the sensor (in minutes/hours)	sensors
downtimesince	Elapsed time since the last Up status of the sensor	sensors

Column Name	What It Displays	Can Be Used for
uptime	Cumulated uptime of the sensor (displayed as percentage of uptime+downtime)	sensors
uptimetime	Cumulated uptime of the sensor (in minutes/hours)	sensors
uptimesince	Elapsed time since the last Down status of a sensor	sensors
knowntime	Sum of cumulated uptime and downtime of the sensor  The output contains HTML.	sensors
cumsince	Time stamp when accumulation of uptimes/downtimes began	sensors
sensor	Name of the sensor	sensors
interval	Effective interval setting for the sensor	sensors
lastcheck	Time stamp of the last sensor result  The output contains HTML.	sensors
lastup	Time stamp of the most recent Up status of the sensor  The output contains HTML.	sensors
lastdown	Time stamp of the most recent Down status of the sensor  The output contains HTML.	sensors
device	For sensors: ID of the associated device For devices: name of the associated device	devices, sensors
group	For sensors: ID of the associated group For devices: name of the associated group	groups, devices, sensors

Column Name	What It Displays	Can Be Used for
probe	Name of the associated probe	probes, groups, devices, sensors
grpdev	Name of the associated device and associated group, separated by slash	sensors
notifiesx	Returns a string containing the number of each trigger type defined for this object. If trigger inheritance is active, it displays Inherited .	probes, groups, devices, sensors
intervalx	Either Inherited or the current interval setting of the object	probes, groups, devices, sensors
dependency	Name of an associated dependency or Parent i The output contains HTML.	probes, groups, devices, sensors
probegroupdevice	Complete object hierarchy with names of associated device, group, and probe separated by angle brackets (>). If more than one group is in the object hierarchy, these are displayed with dots (..). i The output contains HTML.	probes, groups, devices, sensors
status	Integer value of the status of the object (0=None, 1=Unknown, 2=Scanning, 3=Up, 4=Warning, 5=Down, 6=No Probe, 7=Paused by User, 8=Paused by Dependency, 9=Paused by Schedule, 10=Unusual, 11=Not Licensed, 12=Paused Until, 13=Down Acknowledged, 14=Down Partial)	probes, groups, devices, sensors
message	Detailed message of the object i The output contains HTML.	probes, groups, devices, sensors
priority	Priority setting of the object i The output contains HTML.	probes, groups, devices, sensors
lastvalue	Last sensor result value	sensors
upsens	Number of sensors in the Up status	probes, groups, devices, sensors

Column Name	What It Displays	Can Be Used for
	<ul style="list-style-type: none"> ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy. ⓘ If the count is <1 PRTG returns "". 	
downsens	<p>Number of sensors in the Down status</p> <ul style="list-style-type: none"> ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy. ⓘ If the count is <1 PRTG returns "". 	probes, groups, devices, sensors
downacksens	<p>Number of sensors in the Down (Acknowledged) status</p> <ul style="list-style-type: none"> ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy. ⓘ If the count is <1 PRTG returns "". 	probes, groups, devices, sensors
partialdownsens	<p>Number of sensors in the Down (Partial) status</p> <ul style="list-style-type: none"> ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy. ⓘ If the count is <1 PRTG returns "". 	probes, groups, devices, sensors
warnsens	<p>Number of sensors in the Warning status</p> <ul style="list-style-type: none"> ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy. ⓘ If the count is <1 PRTG returns "". 	probes, groups, devices, sensors
pausedsens	<p>Number of sensors in the Paused status</p> <ul style="list-style-type: none"> ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy. 	probes, groups, devices, sensors

Column Name	What It Displays	Can Be Used for
unusualsens	<p>i If the count is <1 PRTG returns "".</p> <p>Number of sensors in the Unusual status</p> <p>i PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p> <p>i If the count is <1 PRTG returns "".</p>	probes, groups, devices, sensors
undefinedsens	<p>Number of sensors in an undefined status, like None, Unknown, No Probe.</p> <p>i PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p> <p>i If the count is <1 PRTG returns "".</p>	probes, groups, devices, sensors
totalsens	<p>Number of all sensors</p> <p>i PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p> <p>i If the count is <1 PRTG returns "".</p>	probes, groups, devices, sensors
favorite	<p>An exclamation mark (!) if the object is marked as favorite</p> <p>i The output contains HTML.</p>	groups, devices, sensors
schedule	Name of the associated schedule	probes, groups, devices, sensors
minigraph	<p>Numeric data for the minigraphs. Numbers are 5-minute averages for the last 24 hours (must be scaled to the maximum of the series). There are two datasets: " " separates measured value series and error series.</p> <p>i The output contains HTML.</p>	sensors
comments	Object comments	probes, groups, devices, sensors

Column Name	What It Displays	Can Be Used for
host	Hostname or IP address	devices
condition	For probes: If the probe is connected or disconnected (0=Disconnected, 1=Unauthorized, 2=Connected, 3=Banned, 4=Init) For groups: The auto-discovery status	probes, groups
basetype	Object type (string)	probes, groups, devices, sensors
baselink	URL of the object	probes, groups, devices, sensors
icon	URL of the device icon	devices
parentid	ID of the parent object	probes, groups, devices, sensors
location	Location property (used in Geo Maps)  The output contains HTML.	devices
groupnum devicenum	Number of groups or devices in the probe or group	probes, groups

Sensor Details

You can get details about a sensor (sensortype, interval, uptime) using the following API calls:

 You need the sensor ID to get details about a sensor. You can find the ID on the sensor's Overview [tab](#) or by hovering over a sensor in the device tree, for example.

Examples

Get details about a sensor in the XML format:

```
/api/getsensordetails.xml?id=sensorid
```

Get details about a sensor in the JavaScript Object Notation (JSON) format:

```
/api/getsensordetails.json?id=sensorid
```

Ticket Status and Message

The following API calls return status and message of a ticket.

Examples

The status of a ticket:

```
/api/getticketstatus.htm?id=ticketid
```

The subject and assignee of a ticket:

```
/api/getticketmessage.htm?id=ticketid
```

More

KNOWLEDGE BASE

How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

Live Data

- [Single Object Property](#) 4384
- [Single Object Status](#) 4397
- [Multiple Object Property or Status](#) 4404
- [System Information](#) 4420

14.2.2.3 Multiple Object Property or Status

You can access live data and live status data of multiple objects using the PRTG API.

 Authentication with user name and [passhash](#) 4123 (or user name and password) must always be included in each PRTG API request. See section [Authentication](#) 4391 for more information.

In this section:

- [Property or Status of Multiple Objects](#) 4405
- [XML Table Query Builder](#) 4405
- [Output Data Format](#) 4405
- [RAW Date/Time Format](#) 4406
- [Common Data Table Parameters](#) 4406
- [Filtering by Object ID](#) 4407
- [Sorting and Advanced Filtering](#) 4406
- [Supported Output Columns \("columns=" Parameter\)](#)

Property or Status of Multiple Objects

Most data that you can request from the PRTG API is available in data tables in the Extensible Markup Language (XML) format, the JavaScript Object Notation (JSON) format, and the comma-separated values (CSV) format (using the XML format is recommended). The API function `/api/table.xml` is used to access data in tables. Here are some sample calls (URLs are shown without authentication parameters to enhance readability).

- i** The example URLs only show the XML URLs. Use the API function `/api/table.csv` or the `output=constable` parameter to select the CSV format, or `/api/table.json` to return the JSON format.

Examples

A hierarchical list of all groups, devices, and sensors with their status information:

```
/api/table.xml?content=sensortree
```

i `sensortree` does not support JSON output.

All sensors (with status information):

```
/api/table.xml?
content=sensors&columns=objid,group,device,sensor,status,message,lastvalue,priority,
favorite
```

All recent log entries:

```
/api/table.xml?
content=messages&columns=objid,datetime,parent,type,name,status,message
```

You have the easiest start if you use the [XML table query builder](#) ⁴⁴⁰⁵ or click , which most data tables have in the PRTG web interface. Navigate to the information that you want to use, click , and you are taken to a URL that renders the content of the table in the XML format. You can now use the URL as it is or change various parameters to suit your needs.

- For more information on possible raw message status values returned by table-based API calls, see the Knowledge Base: [Is there a list of log status values for the PRTG API?](#)

XML Table Query Builder

You can use the query builder tool to experiment with the PRTG API and to fine-tune your queries. You can find it in the PRTG web interface under Setup | PRTG API, section Live Data.

Output Data Format

XML data from the PRTG API contains the fields that you requested in the `columns` parameter. In most cases, numeric values are included twice: One field contains the value in human-readable format and an additional `_RAW` field contains the value as a number, which is better suited for further processing and calculations.

Example

```
<status>Up</status>
<status_RAW>3</status_RAW>
<lastvalue>98 %</lastvalue>
<lastvalue_RAW>97.7583</lastvalue_RAW>
<message>Created.<br/>18.3.43.1360</message>
<message_RAW>Created. 18.3.43.1360</message_RAW>
```

- The status field shows the value Up (the according RAW value is 3).
 - The lastvalue field shows the value 98% (the according RAW value is 97.7583).
 - The message field shows the text Created.
18.3.43.1360 (the according RAW value is Created. 18.3.43.1360).
- i** Strings returned from _RAW columns are surrounded by double quotes (") in JSON output.

RAW Date/Time Format

For columns with date/time value, the RAW value is defined as follows: The integral part of a value is the number of days that have passed since Dec 30th, 1899. The fractional part of a value is a fraction of a 24-hour day that has elapsed. To find the fractional number of days between two dates, subtract the two values. Similarly, to increment a date and time value by a certain fractional number of days, add the fractional number to the date and time value.

Here are some examples of date/time RAW values and their corresponding dates and times:

RAW Date/Time Value	Description
0	12/30/1899 00h00m (12:00 midnight)
2.75	1/1/1900 18h00m (6:00 pm)
35065	1/1/1996 00h00m (12:00 midnight)

Common Data Table Parameters

The following parameters are common to all data table API calls:

Parameter	Description	Possible Values
content	Select the objects that you want to have in your table.	sensortree (JSON output not supported) devices sensors tickets

Parameter	Description	Possible Values
		ticketdata messages values channels reports storedreports toplists sysinfo (only JSON output supported)
columns	Comma-separated list of columns per record	see Supported Output Columns ("columns=" Parameter)
output	Control the output format	xml: default format (recommended) xmltable: an HTML table in the XML format csvtable: CSV format html: HTML table json: JSON format jsontable: a table in the JSON format
count	Maximum number of items (default 500)	1-50000
start	Start with this entry number (can be used with "count" to request the data page by page)	any

Filtering by Object ID

Add an ID parameter (for example, id=1) to the API URL to select a subset of items for the data table, for example, to reduce the amount of data transferred for each data table API call. The data table only contains information for this object ID and its child objects.

- ⓘ Some table types require an ID. If you omit the ID parameter or if it has the value zero (0), all available objects are used.

Table Type (content=)	ID Required or Optional	Description	Object Types Allowed for the ID
sensortree	optional	You only get a part of the tree (the object with the specified ID and all child objects below it). i JSON output is not supported.	Probe Group
sensors devices	optional	You only get the object with the specified ID and all child objects below it.	Probe Group Device
tickets messages	optional	You only get tickets or logfile entries that are related to the object with the specified ID or any child objects below it.	Any object
values channels	required	You get the data values (or channels) of the sensor with the specified ID.	Sensor
reports	not used	This data table always includes all reports.	n/a
storedreports	required	You get a list of stored .pdf files of the report selected by the ID.	Report
ticketdata	required	You get the history of the ticket selected by the ID.	Ticket
sysinfo	required	You get system information of the object with the specified ID.	Device

Sorting and Advanced Filtering

There are various options to further filter and to sort the data for each data table API call:

Parameter	Description	Possible Values
filter_drel	Only include records younger than this setting	today yesterday 7days

Parameter	Description	Possible Values
	<p> For content=messages and content=tickets only.</p>	<p>30days 12months 6months</p>
filter_status	<p>Only include sensors with a specific status. Using multiple filter_status fields performs a logical OR.</p> <p> For content=sensors only.</p>	<p>Unknown=1 Collecting=2 Up=3 Warning=4 Down=5 NoProbe=6 PausedbyUser=7 PausedbyDependency=8 PausedbySchedule=9 Unusual=10 PausedbyLicense=11 PausedUntil=12 DownAcknowledged=13 DownPartial=14</p>
filter_tags	<p>Only include sensors with a specific tag. Using multiple filter_tag fields performs a logical OR.</p> <p> For content=sensors only.</p>	<p>@tag(tagname)</p>
filter_xyz	<p>Filter the data. (Samples: filter_type=ping, filter_favorite=1). Using multiple filter_xyz fields performs a logical OR.</p>	<p>filter_xyz where xyz is any column name used in the columns parameter Substrings: use filter_xyz=@sub(substring1,substring2) Values not equal/above/below: use filter_xyz=@neq(value), filter_xyz=@above(value), filter_xyz=@below(value)</p>

Parameter	Description	Possible Values
	<p>Filtering using columns is only possible for tree objects. You cannot use columns to filter objects like messages or tickets, for example. For content=tickets, you can use the special filter terms filter_status, filter_user, and filter_type (this corresponds to column tickettype).</p> <p>Like for messages, you can also use filter_drel, filter_dstart, and filter_dend.</p> <p> Multiple filters are not available for tickets.</p>	
sortby	<p>Sort the data. If this parameter is omitted, the table is sorted based on the first column. Add a leading "-" to reverse sort order. (Samples: sortby=name, sortby=lastvalue, sortby=-lastvalue, sortby=uptime)</p>	<p>Any column name used in the columns parameter.</p> <p> Log tables with content=messages are always sorted by descending date.</p>

 Examples

Here are some samples for filtered API calls:

All sensors that are not in the Up [status](#)^[197] (with their status and downtime information):

```
/api/table.xml?
content=sensors&columns=objid,downtimesince,device,sensor,lastvalue,status,message,p
riority
&filter_status=5&filter_status=4&filter_status=10&filter_status=13&filter_status=14&
sortby=priority
```

Fastest Ping sensors:

```
/api/table.xml?
content=sensors&columns=objid,sensor,lastvalue,status,message&sortby=lastvalue
&filter_type=ping
```

Log entries of the last 7 days for object id [2003](#):

```
/api/table.xml?content=messages&id=2003&start=0&filter_dre1=7days&columns=
objid,datetime,type,name,status,message
```

Supported Output Columns ("columns=" Parameter)

You can use the following column names for the columns parameter (separated by comma, for example, columns=objid,name,type).

Column Name	What It Displays	Can Be Used for
objid	ID of the object	all object tables
type	Object type (group, device, report, etc.), or the sensor type (ping, http, etc.), or event type for tickets (relevant for ToDo tickets)	all object tables
name	Name of the object or channel. For log messages/tickets: the name of the related object. For stored reports: the name of the report file.	all object tables channels messages storedreports toplists tickets
tags	List of all tags (for tickets: tags for the related object). This includes tags from the object itself plus tags that are inherited from parent objects.	all object tables (except for user)
active	True/false depending on whether an object is set to paused by a user (for tickets: related object). For notifications that are paused by schedule, it also displays the end of the schedule.	all object tables
downtime	Cumulated downtime of the sensor (displayed as percentage of uptime+downtime)	sensors
downtime	Cumulated downtime of the sensor (in minutes/hours)	sensors

Column Name	What It Displays	Can Be Used for
downtimesince	Elapsed time since last Up status of the sensor	sensors
uptime	Cumulated uptime of the sensor (displayed as percentage of uptime+downtime)	sensors
uptimetype	Cumulated uptime of the sensor (in minutes/hours)	sensors
uptimesince	Elapsed time since the last Down status of the sensor	sensors
knowntime	Sum of cumulated uptime and downtime of the sensor	sensors
cumsince	Time stamp when accumulation of uptimes/downtimes began	sensors
sensor	Name of the sensor	sensors toplists
interval	Effective interval setting for the sensor	sensors
lastcheck	Time stamp of the last sensor result	sensors
lastup	Time stamp of the most recent Up status of the sensor	sensors
lastdown	Time stamp of the most recent Down status of the sensor	sensors
device	Name of the associated device	sensors devices
group	Name of the associated group	sensors devices groups
probe	Name of the associated probe	sensors devices

Column Name	What It Displays	Can Be Used for
		groups
		probes
grpdev	Name of the associated device and the associated group separated by a forward slash (/)	sensors devices
notifiesx	Number of each trigger type defined for the object	probes groups devices sensors
intervalx	Either Inherited or the current interval setting of the object	probes groups devices sensors
accessrights	Access rights of the current user for the sensor tree object	all objects (except for user), for example: probes groups devices sensors
dependency	Name of an associated dependency or Parent	probes groups devices sensors
probegroupdevice	Complete object hierarchy with names of associated device, group, and probe separated by a forward slash (/). If more than one group is in the object hierarchy, these are displayed with '..'	sensor device group probe

Column Name	What It Displays	Can Be Used for
status	<p>For sensor tree objects: status of the object (0=None, 1=Unknown, 2=Scanning, 3=Up, 4=Warning, 5=Down, 6=No Probe, 7=Paused by User, 8=Paused by Dependency, 9=Paused by Schedule, 10=Unusual, 11=Not Licensed, 12=Paused Until, 13=Down Acknowledged, 14=Down Partial)</p> <p>For messages: category of the log message</p> <p>For tickets: status of ticket (open, resolved, closed)</p>	<p>sensors</p> <p>devices</p> <p>groups</p> <p>probes</p> <p>messages</p> <p>tickets</p>
message	<p>Detailed message of the sensor tree object (for example, last error of the sensor) or the history entry, log entry, ticket subject</p>	<p>sensors</p> <p>devices</p> <p>groups</p> <p>probes</p> <p>messages</p> <p>tickets</p> <p>ticketdata</p> <p>history</p>
priority	<p>Priority setting of the sensor tree object or the priority of the log entry/ticket</p>	<p>sensors</p> <p>devices</p> <p>groups</p> <p>probes</p> <p>messages</p> <p>tickets (not supported: schedule, notification, user)</p>
lastvalue	<p>Last sensor result value or channel values</p> <p>When used with channels, you have to use <code>lastvalue_</code> to automatically display volumes and speed.</p>	<p>sensors</p> <p>channels</p>

Column Name	What It Displays	Can Be Used for
upsens	<p>Number of sensors in the Up status</p> <p>i PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p>	<p>all sensors</p> <p>devices</p> <p>groups</p> <p>probes</p>
downsens	<p>Number of sensors in the Down status</p> <p>i PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p>	<p>all sensors</p> <p>devices</p> <p>groups</p> <p>probes</p>
downacksens	<p>Number of sensors in the Down (Acknowledged) status</p> <p>i PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p>	<p>all sensors</p> <p>devices</p> <p>groups</p> <p>probes</p>
partialdownsens	<p>Number of sensors in the Down (Partial) status</p> <p>i PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p>	<p>all sensors</p> <p>devices</p> <p>groups</p> <p>probes</p>
warnsens	<p>Number of sensors in the Warning status</p> <p>i PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p>	<p>all sensors</p> <p>devices</p> <p>groups</p> <p>probes</p>
pausedsens	<p>Number of sensors in the Paused status. This includes all Paused states ('paused by user', 'paused by dependency', 'paused by schedule', etc.).</p>	<p>all sensors</p> <p>devices</p> <p>groups</p> <p>probes</p>
unusualsens	<p>Number of sensors in the Unusual status.</p>	<p>all sensors</p> <p>devices</p> <p>groups</p>

Column Name	What It Displays	Can Be Used for
	<p>i PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p>	probes
undefinedsens	Number of sensors in an undefined status, like None, Unknown, No Probe.	all sensors devices
	<p>i PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p>	groups probes
totalsens	Number of all sensors	all sensors
	<p>i PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p>	devices groups probes
size	Performance impact of the sensor (1=Very Low, 2=Low, 3=Medium, 4=High, 5=Very High)	sensors
value	<p>The channel value or the Toplist value.</p> <p>Should only be used as <code>value_</code>, because then it is expanded for all visible channels/toplist columns.</p>	values topdata
coverage	Sensor coverage of the time span in a value table.	values
favorite	An exclamation mark (!) if the sensor tree object is marked as favorite	sensors devices groups probes
user	User responsible for a history entry or the user (or user group) a ticket is assigned to.	history tickets ticketdata

Column Name	What It Displays	Can Be Used for
parent	Name of the parent object of the associated object of a log message	messages
datetime	Time stamp or time span of the object (for tickets: last modification)	messages tickets ticketdata values history storedreports topidx
dateonly	Like datetime but only the date part	messages tickets history values
timeonly	Like datetime but only the time part	messages tickets history values
schedule	For sensor tree objects: Name of the associated schedule For reports: Report generation schedule	probes groups devices sensors reports
period	Period of the report (day, week, etc.)	reports
email	Email address of the report	reports
template	Template used by the report	reports
lastrun	Time stamp of the last generation of a report	reports

Column Name	What It Displays	Can Be Used for
nextrun	Time stamp of the next generation of a report	reports
size	Size of a stored report	size of a stored report
minigraph	Numeric data for the minigraphs. Numbers are 5-minute averages for the last 24 hours (must be scaled to the maximum of the series). There are two datasets: " " separates measured value series and error series.	sensors
deviceicon	Device icon	devices
comments	Object comments For tickets: related object	all objects
host	Hostname or IP address	devices
devices	For probes: probe status (0=Disconnected, 1=Unauthorized, 2=Connected, 3=Banned, 4=Init) For groups: auto-discovery status	probes groups
basetype	Object type (string)	all tree objects
baselink	URL of the object	all tree objects
icon	URL of the device icon	devices
parentid	ID of the parent object or ID of a ticket	all tree objects tickets
location	Location property (used in Geo Maps)	devices
fold	Subobjects are folded up (true) or down (false) For tickets: user (or user group) to which a ticket is assigned read it since last change	probes groups tickets

Column Name	What It Displays	Can Be Used for
groupnum devicenum	Number of groups or devices in the probe or group	probes groups
tickettype	Type of ticket: user, notification, todo	tickets
modifiedby	User who edited the ticket most recently	tickets ticketdata
actions	Types of all ticket edits	ticketdata
content	Text of the ticket that was added with the last edit	ticketdata
channel	Number of channels with an ID greater than or equal to 0	sensors
_key, _value	Key value pair from the system table	sysinfo (category: system)
_displayname, _class, _caption	Display name, class, and caption from the system table	sysinfo (category: hardware)
_user, _domain	User and domain pair from the system table	sysinfo (category: loggedonusers)
_displayname, _creationdate, _processid	Display name, creation date, and process id from the system table	sysinfo (category: processes)
_displayname, _state, _startmode	Display name, state, and start mode from the system table	sysinfo (category: services)
_displayname, _version	Display name and version pair from the system table	sysinfo (category: software)

More

■ KNOWLEDGE BASE

Is there a list of log status values for the PRTG API?

- <https://kb.paessler.com/en/topic/76501>

How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

Live Data

- [Single Object Property](#) ⁴³⁹⁴
- [Single Object Status](#) ⁴³⁹⁷
- [Multiple Object Property or Status](#) ⁴⁴⁰⁴
- [System Information](#) ⁴⁴²⁰

14.2.2.4 System Information

You can access live data and live status data for system information using the PRTG API.

i Authentication with user name and [passhash](#) ⁴¹²³ (or user name and password) must always be included in each PRTG API request. See section [Authentication](#) ⁴³⁹¹ for more information.

To retrieve system information using API calls, we recommend that you use the following order:

1. Refresh the system information so that it is up to date, if necessary.
For details, see [Scan Now](#) ⁴⁴²⁰.
2. Retrieve generic system information to ensure that the last scan (step 1) was successful and that there are no errors.
For details, see [Generic Data](#) ⁴⁴²¹.
3. Retrieve system information in the form of data tables.
For details, see [Data Tables](#) ⁴⁴²¹.

i System information API calls only support the JavaScript Object Notation (JSON) output.

Scan Now

The following API calls to retrieve new information for a [system information](#) ²³¹ category. To refresh system information via the API, you need to provide

- the ID of a device (parameter id), and
- a kind ([system information category](#) ⁴⁴²¹).

i We recommend that you only refresh system information if absolutely necessary because the refresh triggers a rescan of all system information tables.

Examples

Refresh process information

```
/api/sysinfochecknow.json?id=deviceid&kind=processes
```

Refresh hardware information

```
/api/sysinfochecknow.json?id=deviceid&kind=hardware
```

i sysinfochecknow only supports JSON output.

Supported Output Columns ("kind=" Parameter)

Column Name	Category (as displayed in the PRTG web interface)
system	System
hardware	Hardware
processes	Processes
services	Services
software	Software
loggedonusers	Users

Generic Data

The following API calls retrieve generic data about the system information category since the last scan, for example time stamps and if the last scan was successful. To retrieve this information via the PRTG API, you need to provide

- the ID of a device (parameter id), and
- a kind (system information category).

 Examples

Users

```
/api/sysinfo.json?id=deviceid&kind=loggedonusers
```

Services

```
/api/sysinfo.json?id=deviceid&kind=services
```

 sysinfo only supports JSON output.

Data Tables

The following API calls retrieve all information from a system information category table. To retrieve this information via the PRTG API, you need to provide

- the content type (always sysinfo),
- the category (as displayed in the PRTG web interface),
- columns (see [Supported Output Columns \("columns=" Parameter\)](#)⁴⁴²²), and
- the ID of a device (parameter id).

 Examples

System

```
/api/table.json?
id=deviceid&content=sysinfo&category=system&usecaption=true&headers=key,value&columns=_key,_value
```

Software

```
/api/table.json?
id=deviceid&content=sysinfo&category=software&usecaption=true&headers=key,value&columns=_displayname,_version
```

 Data tables for system information only support JSON output.

Supported Output Columns ("columns=" Parameter)

You can use the following sysinfo-specific column names for the columns parameter (separated by comma, for example, columns=_key,_value).

 For a list of all supported column names, see section [Multiple Object Property or Status](#) .

Column Name	Description	Can Be Used for
_key, _value	Key value pair from the system table	sysinfo (category: system)
_displayname, _class, _caption	Display name, class, and caption from the system table	sysinfo (category: hardware)
_user, _domain	User and domain pair from the system table	sysinfo (category: loggedonusers)
_displayname, _creationdate, _processid	Display name, creation date, and process id from the system table	sysinfo (category: processes)
_displayname, _state, _startmode	Display name, state, and start mode from the system table	sysinfo (category: services)
_displayname, _version	Display name and version pair from the system table	sysinfo (category: software)

- [Single Object Status](#)  4397
- [Multiple Object Property or Status](#)  4404
- [System Information](#)  4420

14.2.3 Live Graphs

You can use live sensor graphs from PRTG in other web pages using the PRTG API. PRTG renders graphs as .png or .svg files. You can include them in other web pages.

i Authentication with user name and [passhash](#)⁴¹²³ (or user name and password) must always be included in each PRTG API request. See section [Authentication](#)⁴³⁹¹ for more information.

Examples

Live graph as a .png file:

```
/chart.png?type=graph&width=300&height=160&graphid=2&id=0
```

Live graph as an .svg file:

```
/chart.svg?type=graph&width=300&height=160&graphid=2&id=0
```

i To switch between PNG and SVG images, change the file extension of /chart to [.png](#) or [.svg](#).

i The URL does not start with /api. When placing these URLs on web pages, keep in mind that the URLs contain the account user name and password/passhash. This can imply security issues. We recommend that you set up a dedicated [read-only](#)¹⁵⁵¹ user account in PRTG that is member of a dedicated user group, for example, that only has read access to the root group and all underlying entries or, even better, only for the object IDs that are used for graph URLs.

Parameters for Live Graph URLs (chart.png or chart.svg)

Parameter	Description
type	Must be graph
graphid	Select time span of the graph: <ul style="list-style-type: none"> ▪ 0=live ▪ 1=last 48 hours ▪ 2=30 days ▪ 3=365 days
width	Width of the image in pixels
height	Height of the image in pixels
id	The object ID of the desired graph object. This is usually the ID of a sensor.
graphstyling	Allow control of some graph styles: <ul style="list-style-type: none"> ▪ Display legend: graphstyling=showLegend%3D%271%27

Parameter	Description
	<ul style="list-style-type: none"> ▪ Hide legend: graphstyling=showLegend%3D%270%27 ▪ Control font size: graphstyling=baseFontSize%3D%27XX%27 (XX is the font size) ▪ Control legend and font size at the same time: graphstyling=showLegend%3D%271%27+baseFontSize%3D%275%27
bgcolor	<p>Background color of the PNG image, for example, #ffff. This affects the area that surrounds the graph.</p> <p>i The value must be URL encoded, for example, %23ffff.</p>
plotcolor	<p>Color of the graph's plot area, for example, #ffff. This affects the whole area within the graph box.</p> <p>i The value must be URL encoded, for example, %23ffff.</p>
plotcolor1	<p>Alternating color of the graph's plot area, for example, #ffff. This affects the tiles within the graph box alternating with plotcolor2. The result is a striped graph box.</p> <p>i The value must be URL encoded, for example, %23ffff.</p> <p>i This parameter is overwritten when using the parameter plotcolor.</p>
plotcolor2	<p>Alternating color of the graph's plot area, for example, #ffff. This affects the tiles within the graph box alternating with plotcolor1. The result is a striped graph box.</p> <p>i The value must be URL encoded, for example, %23ffff.</p> <p>i This parameter is overwritten when using the parameter plotcolor.</p>
gridcolor	<p>Color of grid lines in the graph's plot area, for example, #ffff. This affects the horizontal and vertical lines within the graph box.</p> <p>i The value must be URL encoded, for example, %23ffff.</p>
hide	<p>Do not show defined channels in the graph. Use the ID of a channel to hide it. For example, use hide=-4 to not show the downtime channel in the graph. To hide more than one channel, use commas to separate the IDs.</p>

Retrieving Chart Legends (JSON)

You can show the legend of a sensor graph (channel IDs, colors, units, channel names) in the JavaScript Object Notation (JSON) format.

 Example

Chart legend in the JSON format:

```
/api/chartlegend.json?id=sensorid
```

More

KNOWLEDGE BASE

How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

Application Programming Interface (API) Definition

- [HTTP API](#)  4380
- [Live Data](#)  4393
- [Live Graphs](#)  4424
- [Historic Data](#)  4427
- [Object Manipulation](#)  4430
- [Custom Sensors](#)  4437
- [Custom Notifications](#)  4452
- [Mini Probe API](#)  4455

14.2.4 Historic Data

You can download the historic monitoring data for one sensor in the Extensible Markup Language (XML) format or the comma-separated values (CSV) format using the following API calls. You can either request the results of each single monitoring request (called raw data) or you can let PRTG calculate averages of the data (for example, hourly or daily averages).

To avoid potential server overload, the number of requestable values per API call is limited by means of automatic averaging as follows:

Minimum Level of Detail (Average Interval)	Maximum Timeframe per API Call
Raw data (all single monitoring requests)	For up to 40 days per API request
60 minutes/1 hour averages	40 to 500 days per API request
	<p>i If you try to use a larger time span than 500 days, PRTG automatically reduces it to 365 days.</p>

i API calls for historic data are limited to 5 requests per minute.

API Calls for Historic Data

i Authentication with user name and [passhash](#)⁴¹²³ (or user name and password) must always be included in each PRTG API request. See section [Authentication](#)⁴³⁹¹ for more information.

The API calls for historic data tables look like this:

Examples

XML:

```
/api/historicdata.xml?id=objectid&avg=0&sdate=2018-01-20-00-00-00&edate=2018-01-21-00-00-00
```

CSV:

```
/api/historicdata.csv?id=objectid&avg=0&sdate=2018-01-20-00-00-00&edate=2018-01-21-00-00-00
```

JavaScript Object Notation (JSON):

```
/api/historicdata.json?id=objectid&avg=0&sdate=2018-01-20-00-00-00&edate=2018-01-21-00-00-00&usecaption=1
```

i You must supply the object ID of a sensor as well as a start date/time `sdate` and end date/time `edate`.

i If you use the JSON call, additionally provide the parameter `usecaption=1` to get more information than just the raw data table.

API Call for Historic Graphs

Historic graphs are also available (in the PNG format):

Example

PNG:

```
/chart.png?id=objectId&avg=15&sdate=2018-01-20-00-00-00&edate=2018-01-21-00-00-00&width=850&height=270&graphstyling=baseFontSize='12'%20showLegend='1'&graphid=-1
```

Common Parameters for Historic Data API Calls

You can use the following parameters for the graphs and the data tables:

Parameter	Description	Possible Values
id	ID of the specific sensor	integer value
sdate	Start of the time span (date and time)	yyyy-mm-dd-hh-mm-ss
edate	End of the time span (date and time)	yyyy-mm-dd-hh-mm-ss
avg	Average interval in seconds; use 0 to download raw data (= results of all single monitoring requests)	integer value
width/height	Width and height of the graph in pixels	integer value
graphstyling	baseFontSize='x' sets the size of the font showLegend='x' enables (1) or disables (0) the graph legend	baseFontSize='x'%20showLegend='x'

Historic Data Query Builder

You can also use the [historic data function](#) ^[208] to manually generate and analyze historic sensor data via the PRTG web interface.

14.2.5 Object Manipulation

You can use the following functions to manipulate objects (URLs are shown without user name or passhash to enhance readability).

In this section:

- [Changing Object Settings](#) 
- [Supported Object Types for rename.htm](#) 
- [Switch Inheritance Off/On](#) 
- [Changing Properties of Channels](#) 
- [Pausing/Resuming](#) 
- [Supported Object Types for pause.htm](#) 
- [Error Handling, Rescanning](#) 
- [Rescanning, Triggering Auto-Discovery](#) 
- [Reordering Objects in the Sensor Tree](#) 
- [Report-related](#) 
- [Notification-related](#) 
- [Adding/Deleting Objects](#) 
- [Supported Object Types for duplicateobject.htm](#) 
- [Duplicating Sensors and Changing Clone Settings](#) 
- [Setting Geo Location](#)

Changing Object Settings

 Authentication with user name and [passhash](#)  (or user name and password) must always be included in each PRTG API request. See section [Authentication](#)  for more information.

Examples

Rename an object:

```
/api/rename.htm?id=objectid&value=newname
```

Set priority of an object (valid values for x are 1 to 5):

```
/api/setpriority.htm?id=objectid&prio=x
```

Change properties of objects:

```
/api/setobjectproperty.htm?id=id_of_object&name=property_name&value=new_value
```

 This function can change most string and number properties of objects (names, numeric values, object identifiers (OID), etc.). Use it with caution. You can discern the `property_name` parameter by opening the Settings page of an object and looking at the HTML source of the INPUT fields. For example, the INPUT field for the tags of an object has the name `tags_`. Leave away the underscore `_` and use `tags` as a value for the `property_name` parameter.

Supported Object Types for rename.htm

rename.htm supports the following object types:

- group
- device
- sensor
- map
- report
- library
- notification template
- schedule
- user
- user group

rename.htm does not support other object types.

Switch Inheritance Off/On

This API call sets the inherit setting of objects (location, credentials, compatibility options, proxy settings, scanning interval, access rights, channel unit). In general, this works like changing properties for any other object.

Example

Replace the parameter inheritType with the name of the inheritance type:

```
/api/setobjectproperty.htm?id=id_of_object&name=inheritType_&value=0_or_1
```

 This internal name must be followed by an underscore (_), in contrast to changing properties above. Use the value 0 for switching off inheritance, and 1 for switching on inheritance. For example, the inheritance type for the scanning interval setting has the name intervalgroup_. Thus, this specific part in the URL is &name=intervalgroup_&value=0 (switches off inheritance for scanning interval).

 This call does not work with the Schedule, Dependencies, and Maintenance Window settings.

Changing Properties of Channels

With this API call, you can change a sensor's [channel settings](#)³⁹⁷⁷. In general, this works like changing properties of any other object. To set channel properties via the PRTG API, you need to provide

- the ID of a sensor (parameter id),
- a subtype (channel for channels), and
- a subid (ID of the channel that you want to edit).

 Example: Enabling and Setting Limits for Channels

Set limits for channels:

```
/api/setobjectproperty.htm?  
id=sensorid&subtype=channel&subid=0&name=limitmaxerror&value=limitvalue
```

 You have to set the limits for a channel before you can enable limits.

Enable limits for channels:

```
/api/setobjectproperty.htm?  
id=sensorid&subtype=channel&subid=0&name=limitmode&value=1
```

For example, the following API call sets the upper error limit of a channel with the ID 0 of a sensor with the ID 2970 to the value 25.

```
/api/setobjectproperty.htm?  
id=2970&subtype=channel&subid=0&name=limitmaxerror&value=25
```

 For Toplists, you can use the subtype toplist to change the properties. When using this subtype, subid is the ID of a Toplist.

 For a list of available channel parameters, see section [Single Object Property](#) .

Pausing/Resuming

 Examples

Pause a sensor or object indefinitely:

```
/api/pause.htm?id=objectid&pausemsg=yourmessage&action=0
```

Pause a sensor or object for x minutes:

```
/api/pauseobjectfor.htm?id=objectid&pausemsg=yourmessage&duration=x
```

 The pause message is optional. You can leave out the parameter &pausemsg=yourmessage if you do not want to display a message.

Simulate an error for a sensor:

```
/api/simulate.htm?id=objectid&action=1
```

 simulate.htm only works for sensors in the Up, Warning, Unusual, or Unknown [status](#) .

Resume monitoring of a sensor or object:

```
/api/pause.htm?id=objectid&action=1
```

Supported Object Types for pause.htm

pause.htm supports the following object types:

- probe
- group
- device

- sensor
- notification
- user account

pause.htm does not support other object types.

Error Handling (Acknowledge Alarm)

Example

Acknowledge the Down status:

```
/api/acknowledgealarm.htm?id=objectid&ackmsg=yourmessage
```

Rescanning, Triggering Auto-Discovery

Examples

Scan a sensor now:

```
/api/scannow.htm?id=objectid
```

Run an auto-discovery for a group or device:

```
/api/discovernow.htm?id=objectid&template=filename
```

 Providing a [device template](#)⁴⁰¹⁹ for auto-discovery is optional. You can leave out the parameter `&template=filename` to run the auto-discovery with the options defined in the object's settings. If you use a template, provide the whole file name including file extension surrounded by double quotes and encode whitespaces, if necessary. Example: `&template="Linux%20SNMP.odt"`

 `discovernow.htm` overrides the Auto-Discovery setting of the target group or device. If it is set to No auto-discovery, it automatically changes to Standard auto-discovery (recommended).

Reordering Objects in the Sensor Tree

Example

Move an object in the sensor tree (x can be up, down, top, bottom):

```
/api/setposition.htm?id=objectid&newpos=x
```

Report-related

Example

Add a group, device, or sensor to a report:

```
/api/reportaddsensor.htm?id=reportid&addid=objectid
```

Notification-related

Example

Trigger a notification immediately for testing purposes:

```
/api/notificationtest.htm?id=objectid
```

```
/api/notificationtest.json?id=objectid
```

 objectid is the ID of the notification template.

Adding/Deleting Objects

Adding and deleting objects in your configuration is the most complex and potentially most critical process when using the PRTG API. Keep in mind that adding or deleting objects is much better guided in the normal PRTG web interface with more warnings and alerts.

 We recommend that you use the PRTG web interface for adding and deleting objects, if possible.

Deleting Objects

 API calls to the delete function immediately delete the referenced object including all subobjects, if there are any. For example, deleting a group deletes all its devices and sensors. There is no way to undo a deletion, so use this function with care.

Example

Delete an object:

```
/api/deleteobject.htm?id=objectid&approve=1
```

Adding Objects

Adding completely new objects from scratch is not supported via the PRTG API because of the complexity of object creation and its parameters. To add new objects to PRTG, create a "master" object that is cloned into new objects.

Supported Object Types for duplicateobject.htm

duplicateobject.htm supports the following object types:

- group
- device
- sensor
- report

- library
- map
- notification template

duplicateobject.htm does not support other object types.

Examples

Duplicate a group:

```
/api/duplicateobject.htm?
id=id_of_group_to_clone&name=new_name&targetid=id_of_target_group
```

Duplicate a device:

```
/api/duplicateobject.htm?
id=id_of_device_to_clone&name=new_name&host=new_hostname_or_ip&targetid=id_of_target_group
```

Duplicate a sensor:

```
/api/duplicateobject.htm?
id=id_of_sensor_to_clone&name=new_name&targetid=id_of_target_device
```

Duplicate a library:

```
/api/duplicateobject.htm?id=id_of_library_to_clone&name=new_name
```

Duplicate a notification template:

```
/api/duplicateobject.htm?id=id_of_notification_template_to_clone&name=new_name
```

- i** If duplicateobject succeeds, the PRTG core server replies with a redirect to the URL of the new object (for example, /sensor.htm?id=1234), so your application should parse the new object ID from this URL.
- i** When a group, device, or sensor is cloned, it is initially set to Paused so you have the chance to edit parameters as desired. You must resume it with an API call afterward.
- i** The API calls for duplicating reports, maps, libraries, and notification templates do not require a targetid.

Duplicating Sensors and Changing Clone Settings

The following process duplicates a sensor, changes some settings, and then starts monitoring:

Example

Duplicate the sensor (the server replies with a redirect to the new object's web page, for example /sensor.htm?id=10214, parse id 10214 from the URL):

```
/api/duplicateobject.htm?id=2002&name=mynewsensor&targetid=2001
```

Rename the new sensor:

```
/api/setobjectproperty.htm?id=10214&name=name&value=newname
```

Change the OID (in this example for an [SNMP Custom sensor](#)²⁴⁵³):

```
/api/setobjectproperty.htm?id=10214&name=oid&value=1.2.3.4.5.6.7
```

Resume monitoring for the new sensor:

```
/api/pause.htm?id=10214&action=1
```

Setting Geo Location

You can set the location of any object via an API call. Provide the object ID together with parameters for location and/or longitude and latitude.

If only the location parameter is specified, the PRTG core server executes the geo location lookup (this can take up to three minutes). Provide the name of the location, for example, New York. It is shown in the Location settings, no matter the longitude or latitude.

If the longitude and latitude parameter is specified, the marker in the map is set to this position, no matter of the location parameter. Provide longitude and latitude separated by a comma, for example - 73.998672,40.714728.

Example

Set the geo location of an object:

```
/api/setlonlat.htm?  
id=objectid&location=name_of_object_location&lonlat=longitude,latitude
```

14.2.6 Custom Sensors

Custom sensors can perform a number of monitoring tasks that extend the standard sensor set. Apart from parameterized versions of Simple Network Management Protocol (SNMP), Packet Sniffer, and NetFlow sensors, you can create your own sensors using Windows Management Instrumentation Query Language (WQL) or Python, by compiling an .exe file, using any Windows software development tool, and you can request any Representational State Transfer (REST) application programming interface (API) that returns JavaScript Object Notation (JSON) or Extensible Markup Language (XML) and map the results to channels.

The following documentation describes the custom [EXE/Script](#)^[1063], [Python Script](#)^[2092], and [SSH Script](#)^[3273] sensors. The defined XML and JSON formats for the advanced sensors are also used for advanced HTTP data sensors and the [REST Custom](#)^[2151] sensor.

■ For more information about custom sensors based on SNMP, Windows Management Instrumentation (WMI), Packet Sniffing, and xFlow (NetFlow, jFlow, sFlow, IPFIX), see the respective [custom sensors](#)^[3972].

ⓘ For each sensor interval, PRTG can run an external process. The process can be a Windows .exe file, or a .dll, .bat, .cmd, .vbs, or PowerShell file, as well as a Python or Secure Shell (SSH) script.

In this section:

- [PRTG Sensor Hub](#)

Standard and Advanced EXE/Script Sensor

ⓘ You must create the sensor as a file and store it in a specific subfolder on the probe system. In a cluster, you must store it on each cluster node.

Place executables (.exe, .dll), batch files (.cmd, .bat), VBS scripts (.vbs), or PowerShell scripts (.ps1) into a subfolder of the [PRTG program directory](#)^[4526]. For the standard [EXE/Script sensor](#)^[1063], this is the following subfolder of the PRTG program directory:

```
Custom Sensors\EXE
```

If your executable or script returns XML or JSON, you use it with the [EXE/Script Advanced sensor](#)^[1077]. In this case, store your file in the following subfolder of the PRTG program directory:

```
Custom Sensors\EXEXML
```

You find a sample set of demo sensors in these subfolders, too. As soon as a file is placed into the subfolders mentioned above, you can create your own custom EXE sensor and select the new file from the list of files.

The probe then executes the file on the probe system using the account configured for the PRTG probe service ("system" is the default). The local probe runs the file on the local PRTG core server system. For remote probes, the file actually runs on the remote probe system.

-  We recommend that you not edit the demo files. Create your own new files and make sure to give them unique names that do not start with **Demo**, for example.
-  If your custom sensor code relies on other files (for example, .dll files, .NET framework, Windows PowerShell) you must manually copy or install these files on the probe system.
-  EXE sensors fail if they attempt to open any graphical user interface windows using the Win32 APIs. This is not allowed for processes that are started by a system service.

Standard and Advanced SSH Script Sensor

-  You must create the sensor as an SSH script and place it in a specific directory on the target system running your Linux/Unix installation where the script is executed.

Place your SSH script files for the standard [SSH Script sensor](#)^[3273] in the following directory of the target system:

```
/var/prtg/scripts
```

If your SSH script returns XML or JSON, you use it with the [SSH Script Advanced sensor](#)^[3288]. In this case, store your file in the following directory of the target system:

```
/var/prtg/scriptsxml
```

As soon as a file is placed into the respective directory, you can create your own SSH script sensor and select the new script file from the list of scripts.

-  With each scanning interval, PRTG executes the script on the target system and receives the result as a sensor result.

Interface Definition for EXE/BAT/CMD/VBS/PowerShell/SSH Sensors

Every time the sensor is run, the selected file is executed. The string entered in the Parameters field of the sensor's settings is used as command line (you can use placeholders, see [Command-line Parameters](#)^[4489]). The executable file must send the results to the Standard OUT. For the format of returned data, see below.

-  If the executable file does not return control to the PRTG process, it is killed as soon as the timeout value set for this sensor is reached.

You can test the .exe file that you want to use for the sensor via the command line (cmd.exe). To do so, start the .exe file and pipe the results into a file.

 Example

```
sensorexex parameter > result.txt
```

The results are written into the file result.txt and you can check the results with notepad or any other text editor.

Remarks

- For PowerShell scripts, make sure that they are executed by either signing the files or changing the security policy for Powershell.exe accordingly.
- In SSH scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings in the Parameters field of the sensor's settings.
- The API interface for custom EXE sensors is compatible with the custom EXE sensors provided by PRTG.

Return Values for EXE/BAT/CMD/VBS/PowerShell/SSH Sensors

The expected return values are different, depending on the type of EXE/Script sensor used. The standard sensor needs a simple value:message pair. The EXE/Script Advanced sensor processes an XML or JSON return value. When using the standard SSH Script sensor, it expects returncode:value:message as result. See details below.

Standard EXE/Script Sensor

The returned data for standard EXE/Script sensors must be in the following format:

```
value:message
```

 Value has to be a 64-bit integer or float. It is used as the resulting value for this sensor (for example, bytes, milliseconds) and stored in the database. The message can be any string (maximum length: 2000 characters).

The exit code of the executable file has to be one of the following values:

Value	Description
0	OK
1	WARNING
2	System Error (for example, a network/socket error)
3	Protocol Error (for example, web server returns a 404)

Value	Description
4	Content Error (for example, a web page does not contain a required word)

Standard SSH Script Sensor

The returned data for standard SSH Script sensors must be in the following format:

```
returncode:value:message
```

i Value has to be a 64-bit integer or float. It is used as the resulting value for this sensor (for example, bytes, milliseconds) and stored in the database. The message can be any string (maximum length: 2000 characters).

The SSH script returncode has to be one of the following values:

Value	Description
0	OK
1	WARNING
2	System Error (for example, a network/socket error)
3	Protocol Error (for example, web server returns a 404)
4	Content Error (for example, a web page does not contain a required word)

Advanced Script, HTTP Data, and REST Custom Sensors

The returned data for the [EXE/Script Advanced](#)^[1077], [Python Script Advanced](#)^[2092], [SSH Script Advanced](#)^[3288], [HTTP Push Data Advanced](#)^[1326], [HTTP Data Advanced](#)^[1261], and [HTTP IoT Push Data Advanced](#)^[1290] sensors must be in XML or JSON format, the REST configuration file for the [REST Custom sensor](#)^[2151] must be available as JSON template.

Most parameters have a default value and are not required. The following minimum examples leave most parameters to their default values and return two static channel values.

Examples

XML Return Format: Minimum Example:

```
<prtg>
<result>
<channel>First channel</channel>
<value>10</value>
</result>
<result>
<channel>Second channel</channel>
<value>20</value>
</result>
</prtg>
```

To return an error, the XML format is:

```
<prtg>
<error>1</error>
<text>Your error message</text>
</prtg>
```

JSON Return Format: Minimum Example

```
{
  "prtg": {
    "result": [
      {
        "channel": "First channel",
        "value": 10
      },
      {
        "channel": "Second channel",
        "value": 20
      }
    ]
  }
}
```

To return an error, the JSON format is:

```
{
  "prtg": {
    "error": 1,
    "text": "Your error message"
  }
}
```

i You can find a more detailed demo script for the EXE/Script Advanced sensor in the \Custom Sensors\EXEXML subfolder of the [PRTG program directory](#)⁴⁵²⁶. You find demo files for other sensors in the Custom Sensors folder as well.

Advanced Script, HTTP Data, and REST Custom Sensors: Elements

You can optionally define the encoding of your .xml file at the beginning of the document. For example, to define UTF-8, you would use:

```
<?xml version="1.0" encoding="UTF-8" ?>
```

You can use the following elements in the section between <result> and </result>. In each section, you can return one channel. You can define a maximum of 50 channels.

- i** If you exceed this limit, PRTG tries to display all channels. However, be aware that this is an unsupported procedure and you experience limited usability and performance.
- i** For XML output, the tag names are not case-sensitive. For example, you can use both "VALUE" and "value". For JSON output, the tag names are case-sensitive but you can also use lowercase. For example, you can use both "CustomUnit" and "customunit".

Tag	Mandatory	Description	Possible Content
<Channel>	Yes	Name of the channel as displayed in user interfaces. i This parameter is required and must be unique for the sensor.	Any string
<Value>	Yes	The value as integer or float. i Make sure the <Float> setting matches the kind of value provided. Otherwise PRTG shows 0 values.	Integer or float value
<Unit>	No	The unit of the value. The default is Custom. This is useful for PRTG to convert volumes and times.	BytesBandwidth BytesDisk Temperature Percent TimeResponse TimeSeconds Custom Count CPU: This is a % unit that is accounted to the CPU load in index graphs. BytesFile

Tag	Mandatory	Description	Possible Content
			SpeedDisk SpeedNet TimeHours
<CustomUnit>	No	If Custom is used as unit, this is the text displayed behind the value.	Any string (keep it short)
<SpeedSize> <VolumeSize>	No	Size used for the display value. For example, if you have a value of 50000 and use Kilo as size, the display is 50 kilo #. The default is One (value used as returned). For the Bytes and Speed units, this is overridden by the setting in the user interface.	One Kilo Mega Giga Tera Byte KiloByte MegaByte GigaByte TeraByte Bit KiloBit MegaBit GigaBit TeraBit
<SpeedTime>	No	See above, used when displaying the speed. The default is Second.	Second Minute Hour Day
<Mode>	No	Select if the value is an absolute value or counter. The default is Absolute.	Absolute Difference
<Float>	No	Define if the value is a float. The default is 0 (no). If set to 1 (yes), use a dot as decimal separator in values. i Define decimal places with the <DecimalMode> element.	0 (= no, integer) 1 (= yes, float)

Tag	Mandatory	Description	Possible Content
<DecimalMode>	No	<p>Init value for the Decimal Places option. If 0 is used in the <Float> element (use integer), the default is Auto. Otherwise (for float) the default is All.</p> <p>i You can change this initial setting later in the sensor's channel settings³⁹⁷⁷.</p>	<p>Auto</p> <p>All</p>
<Warning>	No	<p>If enabled for at least one channel, the entire sensor is set to the Warning status. The default is 0 (no).</p>	<p>0 (= no)</p> <p>1 (= yes)</p>
<ShowChart>	No	<p>Init value for the Show in graphs option. The default is 1 (yes).</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	<p>0 (= no)</p> <p>1 (= yes)</p>
<ShowTable>	No	<p>Init value for the Show in tables option. The default is 1 (yes).</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	<p>0 (= no)</p> <p>1 (= yes)</p>
<LimitMaxError >	No	<p>Define an upper error limit for the channel. If enabled, the sensor is set to the Down status if this value is exceeded and the LimitMode is activated.</p> <p>i Provide the value for the limit in the unit of the base data type as it is used in the <Value> element of this section. When a sensor shows the Down status triggered by a limit, it still receives data in its channels.</p>	<p>String with numbers, surrounded by quotation marks ("")</p>

Tag	Mandatory	Description	Possible Content
		<p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	
<LimitMaxWarning>	No	<p>Define an upper warning limit for the channel. If enabled, the sensor is set to the Warning status if this value is exceeded and the LimitMode is activated.</p> <p>i Provide the value for the limit in the unit of the base data type as it is used in the <Value> element of this section. When a sensor shows the Down status triggered by a limit, it still receives data in its channels.</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	String with numbers, surrounded by quotation marks ("")
<LimitMinWarning>	No	<p>Define a lower warning limit for the channel. If enabled, the sensor is set to the Warning status if this value falls below the defined limit and the LimitMode is activated.</p> <p>i Provide the value for the limit in the unit of the base data type as it is used in the <Value> element of this section. When a sensor shows the Down status triggered by a limit, it still receives data in its channels.</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	String with numbers, surrounded by quotation marks ("")

Tag	Mandatory	Description	Possible Content
<LimitMinError>	No	<p>Define a lower error limit for the channel. If enabled, the sensor is set to the Down status if this value falls below the defined limit and the LimitMode is activated.</p> <p>i Provide the value for the limit in the unit of the base data type as it is used in the <Value> element of this section. When a sensor shows the Down status triggered by a limit, it still receives data in its channels.</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	String with numbers, surrounded by quotation marks ("")
<LimitErrorMsg> >	No	<p>Define an additional message. It is added to the sensor's message when entering the Down status that is triggered by a limit.</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Any string
<LimitWarningM sg>	No	<p>Define an additional message. It is added to the sensor's message when entering the Warning status that is triggered by a limit.</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Any string

Tag	Mandatory	Description	Possible Content
<LimitMode>	No	<p>Define if the limit settings defined above are active. The default is 0 (no; limits inactive). If 0 is used, the limits are written to the channel settings as predefined values, but limits are disabled.</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	<p>0 (= no)</p> <p>1 (= yes)</p>
<ValueLookup>	No	<p>Define if you want to use a lookup file (for example, to view integer values as status texts). Enter the ID of the lookup file that you want to use, or omit this element to not use lookups.</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Any string
<NotifyChanged >	No	<p>If a returned channel contains this tag, it triggers a change notification that you can use with the change trigger to send a notification.</p>	No content required

You can use the following elements in the section between <prtg> and </prtg>, outside the <result> section.

i For XML output, the tag names are not case-sensitive. For example, you can use both "TEXT" and "text". For JSON output, the tag names are case-sensitive but you can also use lowercase. For example, you can use both "Text" and "text".

Tag (Case Insensitive)	Mandatory	Description	Possible Content
<Text>	No	Text the sensor returns in the Message field with every scanning interval. There can be one message per sensor, regardless of the number of channels. The default is OK. i This element has to be provided outside of the <result> element.	Any string Maximum length: 2000 characters i The number sign (#) is not supported in sensor messages. If a message contains a number sign, the message is clipped at this point.
<Error>	No	If enabled, the sensor returns an error status. This element can be combined with the <Text> element to show an error message. The default is 0. i This element has to be provided outside of the <result> element. A sensor in this error status cannot return any data in its channels. If used, all channel values in the <result> section are ignored.	0 (= no) 1 (= yes, set sensor to error; ignore <result> section)

- i** Each run (sensor scan) might return either any number of channels (<result>...</result>) or one error response. It is not possible to mix result and error entries.
- i** You can either write the XML output to standard OUT line by line, or give back the entire expression in one line without breaks.

Interface Definition for DLL Sensors

Every time the sensor is to be checked, a function in the selected .dll file is called. The .dll file must export one function:

```
function perform(para,msg:pchar):integer; stdcall;
```

para and msg are zero-terminated strings. The allocated buffer for msg is 255 bytes, the .dll file must make sure that fewer bytes are returned. Msg must be in the following format:

```
value:message
```

Value has to be an 32-bit integer and is used as the resulting value for this sensor (for example, bytes, milliseconds, etc.), message can be any string and is stored in the database.

- i** The integer return value of the perform function has to conform to the same rules as the EXE exit code mentioned above.
- i** If the function call in the .dll file does not return control, it could block the whole PRTG system. Make sure to handle your own timeouts and build in a reliable error management. For this reason, EXE sensors are recommended.

Command-line Parameters

In the parameter field, you can use the following placeholders:

Placeholder	Description
%sensorid	The ID of the EXE/Script sensor.
%deviceid	The ID of the device the sensor is created on.
%groupid	The ID of the group the sensor is created in.
%probeid	The ID of the probe the sensor is created on.
%host	The IP address/DNS name entry of the device the sensor is created on.
%device	The name of the device the sensor is created on.
%group	The name of the group the sensor is created in.
%probe	The name of the probe the sensor is created on.
%name	The name of the EXE/Script sensor.
%windowsdomain	The domain for Windows access (may be inherited from parent).
%windowsuser	The user name for Windows access (may be inherited from parent).
%windowspassword	The password for Windows access (may be inherited from parent).
%linuxuser	The user name for Linux access (may be inherited from parent).
%linuxpassword	The password for Linux access (may be inherited from parent).
%snmpcommunity	The community string for SNMP v1 or v2 (may be inherited from parent).

- i You need to escape placeholders that you use in the parameter field with quotes so that they can be correctly resolved from the command line.
 - i You need to escape special characters and whitespaces in your parameters and surround them with double quotes. See section [Escape Special Characters and Whitespaces in Parameters](#)^[3285] for details.
 - i In SSH scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.
- See section [Inheritance of Settings](#)^[142] for more information on inherited settings.

Escape Special Characters and Whitespaces in Parameters

You need to escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure that the characters are correctly interpreted. PowerShell scripts in particular require adequate escaping so that the parameters are passed in a valid PowerShell syntax. PRTG automatically does most of the escaping for you.

Follow these rules to escape special characters and whitespaces in the parameters fields:

- Use quotes for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotes for parameters that contain single quotes.

```
-name "Mr 'John Q' Public"
```

- Use single quotes for parameters that contain double quotes.

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quote.

```
-name pub\"lic
```

- Use double quotes for parameters that contain double and single quotes and escape double quotes.

```
-name "pu'b\"lic"
```

- i In SSH scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.
- i We recommend that you do not pass passwords in parameters. Use placeholders instead. See section [Custom Sensors](#)^[4450] for details.

Environment Values

If the Set placeholders as environment values option is enabled in the sensor's settings, the values of all placeholders available for [command-line parameters](#)^[4450] are additionally provided as "Environment Variables" during run time, so you can use them in your executable or script file. The variables' names are the same as for placeholders mentioned above, with the prefix prtg_ and without the % character. For example, refer to the sensor's own name by using the variable prtg_name.

Additionally, the following variables are available:

Variable	Description
prtg_version	The version number of your PRTG installation.
prtg_url	The IP address/DNS name of your PRTG installation.
prtg_primarychannel	The ID of the sensor's primary channel (1 if not set).

Application Programming Interface (API) Definition

- [HTTP API](#) 
- [Live Data](#) 
- [Live Graphs](#) 
- [Historic Data](#) 
- [Object Manipulation](#) 
- [Custom Sensors](#) 
- [Custom Notifications](#) 
- [Mini Probe API](#) 

14.2.7 Custom Notifications

In addition to the various standard methods for notifications, you can define your own notifications that can trigger desired actions. The following documentation describes these custom notifications. You can also combine different notification methods in one notification.

■ For more general information about notifications based on email, messaging, and others, see section [Notifications](#)⁴⁰³¹.

Execute HTTP Action

This notification method executes a GET request or sends any POST, PUT, or PATCH data to a custom URL. You can execute specific actions on a web server or control any web service that accepts commands via one-time HTTP requests. Whenever a notification of this kind is triggered, the HTTP action is sent.

With this method, you can also call any application programming interface (API) function of the PRTG web interface. For example, you can automatically pause a sensor or acknowledge an alarm.

ⓘ Authentication with user name and [passhash](#)⁴¹²³ (or user name and password) must always be included in each PRTG API request. See section [Authentication](#)⁴³⁹¹ for more information.

Examples

To automatically pause the sensor that triggers the notification, enter the following HTTP action:

```
http://yourserver/api/pause.htm?id=%  
sensorid&action=0&username=myuser&password=mypassword
```

To use the notification to automatically acknowledge the alarm that triggered it, enter this HTTP action:

```
http://yourserver/api/acknowledgealarm.htm?id=%sensorid&ackmsg=Auto-  
Acknowledged&username=myuser&password=mypassword
```

■ For more information about authentication within the URL and for other possible actions you can configure, see sections [HTTP API](#)⁴³⁹⁰ and [Object Manipulation](#)⁴⁴³⁰.

Execute Program

With this notification method, you can execute a script or a program as an external process. It can be a Windows executable file or a .bat, .cmd, or PowerShell file. You can use .exe, .com, .bat, .cmd, .vbs, or .ps1 files.

ⓘ You must create the notification as a file and place it in a specific subfolder on the PRTG core server system (in a cluster, copy the files to every cluster node).

Place executables (.exe, .com), batch files (.cmd, .bat), VBS scripts (.vbs), or PowerShell scripts (.ps1) into the folder:

```
\Notifications\EXE
```

As soon as a file is placed into the subfolder, you can create or edit your own custom execute program notification and select the new file from the list of files. You can also enter start parameters and use PRTG placeholders for this.

Notes

- PRTG executes the file on the local PRTG core server system using the account configured for the PRTG core server service ([system](#) is default).
- If your custom notification's code relies on other files (for example, .dll, .NET framework, or Windows PowerShell), you must copy/install these files on the PRTG core server system manually.
- Make sure the return code of the executable is 0 (zero). Otherwise PRTG assumes something went wrong with the notification and tries to send it up to 3 times.
- If you run PRTG in a cluster, copy the respective files to every cluster node to make sure the notification also works when the primary master node is not reachable.
- EXE notifications fail if they attempt to open any graphical user interface windows using the Win32 APIs (this is not allowed for processes that are started by a system service).
- To remotely run PowerShell scripts, make sure that you set the according Execution Policy. For more information, see the Knowledge Base: [PowerShell 32 Bit and 64 Bit and Execution Policy](#).

Placeholders

 For more information about the placeholders you can use, see section [List of Placeholders for Notifications](#)

14.2.8 Mini Probe API

Important Notice

We do not further develop the Mini Probe API because we plan major changes to the underlying PRTG API. You can still use the Mini Probe API "as is" but note that it may be deprecated at any time.

■ Knowledge Base: [Where can I find PRTG Mini Probes which are ready to use?](#)

Mini probes allow users to create small probes on any device to meet specific needs. In general, probes are the part of PRTG that run monitoring processes and deliver monitoring results back to the PRTG core server. Mini probes gather monitoring data from platforms where it is not possible or is inapplicable to use the common local and remote probes of PRTG. Mini probes have a less complex implementation than standard probes so that you can create them on any platform. The only requirement is HTTPS connectivity to send monitoring data to your PRTG core server.

i With the current version of PRTG, you can use the mini probe interface with your custom code to implement solutions to special scenarios that you might have in your network. Note that there are major changes planned to the underlying PRTG API. Therefore, any code you write now likely needs to be changed later, so it can be used for future versions of PRTG. For example, if the available HTTP Push sensors are not sufficient for your needs, you can still use the Mini Probe API.

i Because the mini probe requires a Secure Sockets Layer (SSL) secured connection to the PRTG core server, it is not possible by default to connect if SSL is deactivated for PRTG. This is necessary because probably unencrypted passwords are transferred between the probe and the PRTG core server. So it is important to encrypt the connection even on internal routes. If your network setup ensures security in a different way (for example, a VPN), you can use a registry key option for disabling SSL to get a connection to your mini probe.

■ For more details, see the Knowledge Base: [How can I disable SSL for Mini Probes?](#)

☁ The Mini Probe API is not available in PRTG Hosted Monitor.

Differences Between Probe Types

The following table shows technical specifications of the two probe types in PRTG.

Functionality	Local and Remote Probes	Mini Probe
Connection Protocol from Probe to PRTG Core Server	Protocol from PRTG	HTTPS
Security	Data is secured with SSL and an access key. New probe connections must be approved by an administrator. IP address and globally unique identifier (GUID) filtering is possible.	The same security level as for local and remote probes.
Estimated Limit for Sensors per Probe	Several thousand sensors	Fewer than 100 sensors
Estimated Limit for Probes per Installation	Hundreds of probes	Fewer than 100 probes
Estimated Minimum Scanning Interval	Some seconds	At least 60 seconds
Estimated Number of Sensors	More than 200	A few
Updates to New PRTG Versions by the PRTG Core Server	Yes	No
Complexity	High	Very low
Documented API	No	Yes
Supported Platforms	Windows 7 or later (32-bit/64-bit)	Any platform
Scheduling of Sensor Requests Performed by	Probe	Probe
Code Managed by	Paessler AG	Writer of the probe
Probe Scans for Available Measurements Beforehand	Yes	No
Sensors Support Inheritance of Settings ^[142]	Yes	No

Functionality	Local and Remote Probes	Mini Probe
Limitations by Administrator for Allowed Sensors that a User Can Create	Yes	No

The PRTG Mini Probe Protocol

The PRTG Mini Probe Protocol (PMPP) is a simple, lightweight protocol that extends PRTG with custom remote probes. It can be implemented in a variety of programming languages and runs on any kind of platform. These include, for example, Linux, Android, macOS, and iOS.

i Mini probes are not intended for high performance monitoring and support only the sensors that you implement.

Communication and Security

The PMPP uses GET and POST requests via HTTPS to communicate with the PRTG core server. All requests are sent to the defined Transmission Control Protocol (TCP) port for the common PRTG web server (the default is 443 for SSL), or you specify an extra port explicitly for mini probe connections in the [Core & Probes](#) settings. Mini probes use the GET method to receive tasks, and the POST method to send information about the probe and the monitoring results to the PRTG core server.

i The data format of some HTTP fields has to be JavaScript Object Notation (JSON) encoded. See [JSON Definitions](#) for data definitions that require JSON. All exchanged data is secured with SSL.

Authentication

The PMPP uses the same authentication methods as the common remote probes in PRTG. The authentication includes the following steps:

- Allow and deny IPs filter
- Deny global ID (GID) filter
- Access key
- Unique GID that must be approved in the PRTG web interface
- In addition, mini probes must be allowed to connect in the probe connection settings in PRTG. Additionally, you have to provide the mini probe's IP address in the Allow IP Addresses field (or enter any).

There are no sessions on the server: Every request must contain the required authentication information.

■ For more details, see section [Core and Probes](#).

HTTP Requests

The PMPP includes three different HTTP requests that are sent to the PRTG web server:

- **announce:** An announce request is sent once when the probe starts. Afterward, the task and data commands are run in a scheduled manner.
- **tasks:** With a tasks request, the probe requests a list of tasks to perform.
- **data:** The data request sends the monitoring results to the core.

All requests of the mini probe to the PRTG core server must contain the following HTTP fields:

- **gid:** The unique GID of the probe. We recommend a GUID that is generated by the operating system. This identifier must stay the same for as long as the probe installation exists. You can use any string. If you clone a probe, you have to update this field to a new value.
- **key:** An access key as defined in the probe settings of the PRTG core server. The key has to be encoded in SHA1 hash (for example, key=a94a8fe5ccb19ba61c4c0873d391e987982fbbd3).
- **protocol:** The version of the protocol you use. Currently, this value is "1"

All requests return common HTTP response codes.

 For more information, see section [HTTP API](#) .

Announce Request

The announce request uses the POST method and provides all required information about the capabilities of the mini probe for the PRTG core server. The target URL is `https://<yourPRTGserver>/probe/announce`

 This HTTP request must be sent at least once to be able to add sensors. We recommend you send this request every time the probe starts. You should NOT send it with every scanning interval.

The announce request must contain the following HTTP fields:

- **name:** The name of the mini probe. PRTG uses this name to create a corresponding node in the device tree.
- **version:** The version number of the mini probe you have implemented. This is a single integer number, for example, "1".
- **baseinterval:** The number of seconds between two calls of the task/data requests. We recommend 60 or 300 seconds. Depending on the usage, higher or lower values are possible.
- **sensors:** The definition of supported sensors in JSON format.
 See [Sensor Definition](#)  for more information.
- **icon (optional):** You can optionally send the file name of a device icon to show it for the mini probe device in the PRTG web interface.

 If you change the definition of a sensor that has already been announced, these changes are only active after the next start of PRTG. A definition never changes while PRTG is running. However, there is one exception: Setting the "deprecated" flag works without any restart. Because of this, you can replace a sensor with a new one that uses a different definition.

Tasks Request

The tasks request uses the GET method and is sent from your mini probe in the defined scheduler interval to the PRTG core server (for example, every 5 minutes). The target URL is

```
https://<PRTGserver>/probe/tasks
```

This HTTP request returns a list of tasks in JSON format that have to be run by the mini probe.

See [Tasks Definition](#) ⁴⁴⁶⁴ for more information.

Data Request

The data request uses the POST method and contains the HTTP field data. This HTTP field contains any number of sensor results in JSON format. The target URL is

```
https://<PRTGserver>/probe/data
```

You can split the results of one tasks list into several result requests (for example, if some sensors are faster than others). The mini probe should combine as many results as possible into one request but keep the time between measurement and reporting of the value at a low level.

See [Data Definition](#) ⁴⁴⁶⁶ for more information.

JSON Definition

All data definitions of sensors, tasks, and result data of mini probes are JSON encoded. JSON is a language-independent data format that is used to transmit data objects consisting of attribute-value pairs between a server and an application. Refer to the JSON documentation for a general overview of this data format.

Sensor Definition

This section shows how you can define the available sensors for your mini probe. Sensor definitions are specified in the HTTP field "sensors" of the announce request. The sensor types definition is a JSON array where each sensor type is defined in one array element as a JSON object. A JSON object denoting a sensor definition consists of the following JSON name/value pairs:

Name	Mandatory	Description	Possible Value
kind	X	Unique identifier for the sensor type in the mini probe. Used in the tasks definition to identify the sensor type.  Underscore "_" is not allowed here.	Any string
name	X	The display name of the sensor.	Any string
deprecated	—	You can flag the sensor to status deprecated. A flagged sensor can still run but this kind of sensor is not shown when you add new sensors to the probe.	1 (= deprecated) 0 (= not deprecated)

Name	Mandatory	Description	Possible Value
description	—	A short description of the sensor that is shown in the Add Sensor dialog in the PRTG web interface.	Any string
help	—	A help text that is shown in a popup in the Add Sensor dialog in the PRTG web interface.	Any string
tag	—	A default tag for the sensor that is automatically added to the sensor.	Any string
default	—	A sensor of this type is automatically created with the probe if set to "default".	(= set to default) 0 (= not default)
groups	—	In the "groups" array, available settings for this sensor type are defined.	An array of grouped settings JSON objects. ⓘ See Definition of Setting Groups Objects for more information.

Definition of Setting Groups Objects

One settings group definition (one element of the "groups" array) consists of three elements:

Name	Mandatory	Description	Possible Value
name	X	The internal name of the settings group.	Any unique string
caption	X	The label of the settings group as shown in the PRTG web interface.	Any string
fields	X	The available settings of the settings group.	An array of field definition objects. ⓘ See Parameters for Setting Fields for more information.

Parameters for Setting Fields

The following table shows available JSON name/value pairs for setting fields:

Name	Mandatory	Description	Available in Type	Possible Value
type	X	Type of the field. This defines the possible content.	All	Edit Password Integer Radio i See Definition of Setting Fields: Field Types ⁴⁴⁶² for more information.
name	X	The internal name of the field. The name has to be unique per sensor. It is sent with the settings of the probe in the task request.	All	Any unique string
caption	X	The label of the field. It is displayed left of the field.	All	Any string
required	—	If a field is defined as required, this field has to be set when adding or editing the sensor settings. The default is not required.	All	0 (= not required) 1 (= required)
default	—	The default value of the field.	All	Any string or integer (depending on the field type)
help	—	A help text that is displayed right of the field. i You can use limited BBCode: "[b]" and "[/b]" for bold, "[i]" and "[/i]" for italics, and "[br]" for line break.	All	Any string

Name	Mandatory	Description	Available in Type	Possible Value
maximum	—	The maximum value that is allowed for this field.	Integer	Integer
minimum	—	The minimum value that is allowed for this field.	Integer	Integer
options	—	A JSON array that provides several radio buttons to choose a desired option.	Radio	"name":"value" pairs. See Example below.

 Example

"name":"value" pairs that define radio button options:

```
{
  "1":"This is option 1",
  "2":"This is option 2",
  "XYZ":"Another option"
}
```

Definition of Setting Fields: Field Types

A sensor type can have any number of setting fields that are organized in groups of settings. One field is one element in the "fields" array of a settings group. Currently, mini probes support four different field types for settings:

- edit: One line edit field.
- password: An edit field with masked characters.
- integer: A number field with optional minimum/maximum selection.
- radio: A selection of multiple options with radio buttons.

 Example

The following is a detailed example that shows the JSON object definition of a sensor type that is used in the HTTP field sensors of the announce request.

This sensor type is called Sample Sensor and is from the type Sample. It has a description, a help text, and a default tag. There are two setting groups, Group and group2, with several setting fields (six in the first group, one in the second group). The example also shows how you can use the available JSON name/value pairs in the fields array object.

```
[
  {
    "kind": "Sample",
    "name": "Sample Sensor",
    "description": "This is a sample demo sensor",
    "help": "This is the help text of the demo sensors",
    "tag": "demosensor",
    "groups": [
      {
        "name": "Group",
        "caption": "Group",
        "fields": [
          {
            "type": "edit",
            "name": "simpleedit",
            "caption": "Edit Field",
          },
          {
            "type": "edit",
            "name": "extendededit",
            "caption": "Edit Field 2",
            "required": "yes",
            "default": "Default Value",
            "help": "Help text displayed to the right of the field"
          },
          {
            "type": "integer",
            "name": "simplenumber",
            "caption": "Number",
          },
          {
            "type": "integer",
            "name": "number2",
            "caption": "Number 2",
            "required": "1",
            "minimum": 23,
            "maximum": 99,
            "help": "Number field with limit 23-99"
          },
          {
            "type": "password",
            "name": "password",
          }
        ]
      }
    ]
  }
]
```

```

        "caption": "Password",
        "help": "This is a password field"
    },
    {
        "type": "radio",
        "name": "radiotest",
        "caption": "Radio test",
        "help": "This is a radio selection field",
        "options": {
            "1": "This is option 1",
            "2": "This is option 2",
            "3": "This is option 3"
        },
        "default": "2"
    },
    ]
},
{
    "name": "group2",
    "caption": "Group 2",
    "fields": [
        {
            "name": "testfield2",
            "caption": "Test2",
            "type": "edit"
        }
    ]
}
]
}
]

```

Tasks Definition

A tasks definition is a JSON array where each task is one object. Tasks contain all name/value pairs as defined in the sensor settings definition, which are filled with the values you have provided. Additionally, the following information is included:

Name	Mandatory	Description	Possible Value
kind	X	The type of the sensor.	String

Name	Mandatory	Description	Possible Value
sensorid	X	The ID of the sensor.	Integer
host	X	The IP address/DNS name of the parent device as specified for this device. For the probe device, it is 127.0.0.1 by default.	IP address/DNS name
all defined fields	X	All fields that are defined in the sensor setting group objects are included in the tasks definition as name/value pairs.	name/value pairs

i This data comes from PRTG, so the mandatory JSON objects are included automatically.

Example

Definition of two tasks, the first one is the simplest possible one without any values, and the second one uses the sensor settings objects as defined above:

```
[
  {
    "sensorid": "2009",
    "kind": "ping",
    "host": "www.google.com"
  },
  {
    "sensorid": "2010",
    "kind": "sample",
    "host": "www.paessler.com",
    "simpleedit": "Test2",
    "extendededit": "Extended Test",
    "simplenumber": "3",
    "number2": "42",
    "password": "masked text",
    "radiotest": "1",
    "testfield2": "This is test 3"
  }
]
```

Data Definition

A data definition is a JSON array where each result of a task is one object. Every array element contains the following name/value pairs:

Name	Mandatory	Description	Possible Value
sensorid	X	The ID of a specific sensor.	Integer
time	—	<p>The time of measurement in Coordinated Universal Time (UTC)/GMT time zone as a JSON number in the Unix time format (in milliseconds since Unix epoch, which is 00:00:00 UTC on January 1, 1970). Time values must be strictly chronological, so the Unix time of each measurement must be greater than the one before. The time values should be close to the current time (which is now) to prevent sensors in the Unknown status¹⁹⁷.</p> <p>i If no time value is provided, the current time (now) is used.</p>	JSON number defining Unix time
message	—	An optional text message.	Any string
channel	X	The channel result values.	<p>An array of name/value pairs.</p> <p>i See Parameters for Data Definitions: Channel Result Values⁴⁴⁶⁷ for more information.</p>

Examples

Data definition object with sensor status OK:

```
[
  {
    "sensorid":"2003",
    "message":"Optional Message",
    "channel":[
      {
        "name":"Time",
        "mode":"integer",
        "unit":"TimeResponse",
        "value":6
        "showchart":1
        "showtable":1
      }
      {
        "name":"Pages",

    "sensorid":"2003",
    "error":"Response",
    "code":10,
    "message":"Error Message"
  }
]
```

Parameters for Data Definitions: Channel Result Values

The following table shows name/value pairs that can be used in the "channel" array objects of data definition objects:

Name	Mandatory	Description	Possible Value
Name	X	The name of the channel as displayed in user interfaces.	Any string
Value	X	Any number without quotation marks.	An integer, float, or counter value
Mode	—	The type of the value. i Make sure that it matches the provided value, otherwise PRTG shows 0 values.	Integer, float, or counter
Unit	—	The unit of the value. i If you set the correct unit type instead of using custom units, PRTG can display received values better.	BytesBandwidth BytesMemory BytesDisk BytesFile TimeResponse TimeSeconds TimeHours Temperature Percent Count CPU: This is a % unit that is accounted to the CPU load in index graphs. Custom (define the name of the unit using the additional field customunit)
ShowChart	—	Init value for the Show in graphs option. i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.	0 (= do not show graph) 1 (= show graph)

Name	Mandatory	Description	Possible Value
ShowTable	—	<p>Init value for the Show in tables option.</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	<p>0 (= do not show table)</p> <p>1 (= show table)</p>
SpeedSize VolumeSize	—	<p>Size used for the display value. For example, if you have a value of 50000 and use Kilo as size, the display is 50 kilo #. The default is One (value used as returned).</p> <p>i For the Bytes and Speed units, this is overridden by the setting in the user interface.</p>	<p>One</p> <p>Kilo</p> <p>Mega</p> <p>Giga</p> <p>Tera</p> <p>Byte</p> <p>KiloByte</p> <p>MegaByte</p> <p>GigaByte</p> <p>TeraByte</p> <p>Bit</p> <p>KiloBit</p> <p>MegaBit</p> <p>GigaBit</p> <p>TeraBit</p>
SpeedTime	—	<p>See above, used when displaying the speed. The default is Second.</p>	<p>Second</p> <p>Minute</p> <p>Hour</p> <p>Day</p>
decimalMode	—	<p>Init value for the Decimal Places option. If 0 is used in the float mode (use integer), the default is Automatic. Otherwise (for float), the default is All.</p>	<p>Automatic</p> <p>All</p> <p>Custom</p>

Name	Mandatory	Description	Possible Value
		<p>i You can change this initial setting later in the sensor's channel settings ³⁹⁷⁷.</p>	
decimalDigits	—	<p>If you define Custom as decimalMode, specify the number of digits after the delimiter.</p>	Integer
ValueLookup	—	<p>Define if you want to use a lookup file (for example, to view integer values as status texts). Enter the ID of the lookup file that you want to use, or omit this element to not use lookups.</p> <p>■ See section Define Lookups ⁴⁴⁸⁵ for more information.</p> <p>i This setting is only considered on the first sensor scan, when the channel is newly created. It is ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Any string
LimitMaxError	—	<p>Define an upper error limit for the channel. If enabled, the sensor is set to the Down status if this value is exceeded and the LimitMode is activated.</p> <p>i Provide the value for the limit in the unit of the base data type as it is used in the <Value> element of this section. When a sensor shows the Down status triggered by a limit, it still receives data in its channels.</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Integer

Name	Mandatory	Description	Possible Value
LimitMaxWarning	—	<p>Define an upper warning limit for the channel. If enabled, the sensor is set to the Warning status if this value is exceeded and the LimitMode is activated.</p> <p>i Provide the value for the limit in the unit of the base data type as it is used in the <Value> element of this section.</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Integer
LimitMinWarning	—	<p>Define a lower warning limit for the channel. If enabled, the sensor is set to the Warning status if this value falls below the defined limit and the LimitMode is activated.</p> <p>i Provide the value for the limit in the unit of the base data type as it is used in the <Value> element of this section.</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Integer
LimitMinError	—	<p>Define a lower error limit for the channel. If enabled, the sensor is set to the Down status if this value falls below the defined limit and the LimitMode is activated.</p>	Integer

Name	Mandatory	Description	Possible Value
LimitErrorMsg	—	<p>① Provide the value for the limit in the unit of the base data type as it is used in the <Value> element of this section.</p> <p>① The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Any string
LimitWarningM sg	—	<p>① The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p> <p>Define an additional message. It is added to the sensor's message when entering the Down status that is triggered by a limit.</p> <p>① The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Any string

Name	Mandatory	Description	Possible Value
LimitMode	—	<p>Define if the limit settings defined above are active. The default is 0 (no; limits inactive). If 0 is used, the limits are written to the channel settings as predefined values, but limits are disabled.</p> <p>i The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	<p>0 (= no)</p> <p>1 (= yes)</p>
Warning	—	<p>If enabled for at least one channel, the entire sensor is set to the Warning status. The default is 0 (no).</p>	<p>0 (= no)</p> <p>1 (= yes)</p>
Message	—	<p>Text the sensor returns in the Message field with every scanning interval. There can be one message per sensor, regardless of the number of channels. The default is OK.</p>	<p>Any string</p>
Error	—	<p>The type of error.</p> <p>i The type is not necessarily shown in PRTG.</p>	<p>Data: The monitored device returned a value but the sensor could not process it.</p> <p>Response: The monitored device reported an error. This includes timeouts, HTTP response codes, etc.</p> <p>Exception: Error in sensor handling.</p> <p>Socket: Socket error.</p>
Code	—	<p>The error code that is stored in the database.</p>	<p>Integer</p>

14.3 Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors

You can use filter rules for the Include Filter, Exclude Filter, and Channel Definition fields of [Packet Sniffer](#)⁴³⁰³, [xFlow](#), and [IPFIX](#)⁴³⁰⁵ sensors. The filter rules are based on the following format:

```
field[filter]
```

In this section:

- [All Sensors](#)⁴⁴⁷⁵
- [Packet Sniffer Sensors](#)⁴⁴⁷⁶
- [NetFlow v5 and jFlow v5 Sensors](#)⁴⁴⁷⁶
- [NetFlow v9 and IPFIX Sensors](#)⁴⁴⁷⁷
- [sFlow Sensors](#)⁴⁴⁷⁶
- [Valid Data Formats](#)⁴⁴⁷⁸
- [Examples](#)

Valid Fields for All Sensors

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name ■ For more information, see section Valid Data Formats ⁴⁴⁷⁸ .
Port	Any number
SourceIP	IP address or Domain Name System (DNS) name
SourcePort	Any number
DestinationIP	IP address or Domain Name System (DNS) name
DestinationPort	Any number
Protocol	Transmission Control Protocol (TCP) , User Datagram Protocol (UDP) , Internet Control Message Protocol (ICMP) , Open Shortest Path First (OSPF) , any number
ToS	Type of Service (ToS) : any number
DSCP	Differentiated Services Code Point (DSCP) : any number

Additional Fields for Packet Sniffer Sensors Only

Field	Possible Filter Values
MAC	Physical address ■ For more information, see section Examples ⁴⁴⁷⁶ .
SourceMAC	Physical address
DestinationMAC	Physical address
EtherType	IPV4 , ARP , RARP , APPLE , AARP , IPV6 , IPXold , IPX , any number
VlanPCP	IEEE 802.1Q VLAN Priority Code Point
VlanID	IEEE 802.1Q VLAN Identifier
TrafficClass	IPv6 Traffic Class: corresponds to TOS used with IPv4
FlowLabel	IPv6 Flow Label

Additional Fields for NetFlow v5 and jFlow v5 Sensors Only

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel. Possible values: IP address or DNS name ■ For more information, see section Valid Data Formats ⁴⁴⁷⁶ .
SourceASI	Any number

Field	Possible Filter Values
DestinationASI	Any number

Additional Fields for NetFlow v9 and IPFIX Sensors Only

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	<p>IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel.</p> <p>Possible values: IP address or DNS name</p> <p>■ For more information, see section Valid Data Formats <small>4478</small>.</p>
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in the form of a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in the form of a single number (number of contiguous bits).
NextHop	IP address or Domain Name System (DNS) name
VLAN	VLAN values represent a VLAN identifier (any number)
SourceVLAN	VLAN values represent a VLAN identifier (any number)

Field	Possible Filter Values
DestinationVLAN	VLAN values represent a VLAN identifier (any number)

Additional Fields for sFlow Sensors Only

Field	Possible Filter Values
Interface	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	<p>IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel.</p> <p>Possible values: IP address or DNS name</p> <p> For more information, see section Valid Data Formats .</p>
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address

Valid Data Formats

- IP fields support wildcards (*), range (10-20) and hostmask (/10, /255.255.0.0) syntax, as well as DNS names.
 -  IPv6 wildcards, IPv6 ranges, and IPv6 hostmasks are not supported.
- Number fields support range (80-88) syntax.
- Protocol and EtherType fields support numbers and a list of predefined constants.

 For detailed information on IP address ranges, see section [Define IP Address Ranges](#) .

Examples

All of the following filter rules are valid examples:

```
SourceIP[10.0.0.1]
SourceIP[10.*.*.*]
SourceIP[10.0.0.0/10]
DestinationIP[10.0.0.120-130]
DestinationPort[80-88]
Protocol[UDP]
MAC[00-60-50-X0-00-01]
DSCP[46]
```

You can create more complex expressions using parentheses () and the words and, or, or and not. For example, these are valid filter rules:

```
Protocol[TCP] and DestinationIP[10.0.0.1]
```

This rule filters for all TCP traffic with the destination IP 10.0.0.1.

```
Protocol[TCP] or DestinationIP[10.0.0.1]
```

This rule filters for all TCP traffic and all traffic with the destination IP 10.0.0.1.

```
Protocol[TCP] and (DestinationIP[10.0.0.1] or SourceIP[10.0.0.120-130])
```

This rule filters for all TCP traffic with either the destination IP 10.0.0.1 or the source IP range 10.0.0.120-130.

```
Protocol[TCP] and not (DestinationIP[10.0.0.1] or SourceIP[10.0.0.120-130])
```

This rule filters for all TCP traffic that does not have the destination IP 10.0.0.1 and the source IP range 10.0.0.120-130.

14.4 Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors

When adding [custom xFlow sensors](#), [custom IPFIX](#)⁴³⁰⁵, or [custom Packet Sniffer sensors](#)⁴³⁰³, you have the option to provide a Channel Definition using the following syntax (one entry per channel):

```
#<id> : <Name>
<Rule>
```

Syntax

- The <id> must be 1 or a higher number, and it must be unique for the sensor. This means that each channel definition must have a unique ID.
 - ❗ The maximum channel ID you can use is 2147483648 (2³¹). Higher IDs are not supported. We recommend that you use channel IDs like 1, 2, or 3.
- The <id> is linked to the historic data.
 - ❗ As soon as you change the ID, you lose the history for this particular channel that the ID was linked to.
- One rule can span multiple lines.
- The next rule starts with a # as the first character in a line.
- The <name> is the channel's display name.
- The rules are processed top to bottom (the number does not matter) and the data is accounted to the first match.
- PRTG automatically adds one channel named Other. This channel counts all traffic for which you have not defined a specific channel.
- After the name, you can use an optional [<unit>] to override the automatic unit, which is based on the source sensors.

The <Rule> syntax is identical to the one described in the [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#)⁴⁴⁷⁵ section. Because data is accounted to the first match, make sure that you start with the most specific rule at the top and get less specific to the bottom.

- ❗ We recommend that you write the rules list in an external editor first and then paste it into the Channel Definition field of the sensor in PRTG. If the rules contain an error, the entries are removed after adding them.
- ❗ You cannot delete channels of a sensor, even if you remove a channel from the channel definition. You also cannot change the display name of channels using the channel definition of custom xFlow sensors. Renaming is only possible via [channel settings](#)³⁹⁷⁷.

Example

General example:

```
#5:HTTP
Protocol[TCP] and
(SourcePort[80] or DestinationPort[80] or SourcePort[8080] or
DestinationPort[8080])
```

Channel definition example for differentiating by protocol:

```
#1:TCP
Protocol[TCP]

#2:UDP
Protocol[UDP]

#3:ICMP
Protocol[ICMP]
```

14.5 Define IP Address Ranges

In some setting fields, you can either enter a host name or single IP address, or you can define IP address ranges. These are available, for example, for [xFlow and Packet Sniffer sensors](#)^[4600] and for [probe connection settings](#)^[4204]. PRTG follows a common syntax for IP address ranges.

■ For the supported syntax of the automatic network discovery functionality in PRTG, see section [Auto-Discovery](#)^[296] (IP Address Selection Method).

Available Options

Option	Description	Syntax	Examples
Simple	Enter a fixed IP address.	a.b.c.d	10.0.10.9
Hostname	Enter a hostname. PRTG resolves it to an IP address in your network.	hostname	device-xyz
Hostmask	Enter a hostmask. A hostmask defines the relevant bits of the IP address. ❗ Valid hostmasks are /0 - /32 for IPv4 and /0 - /128 for IPv6.	a.b.c.d/h or a.b.c.d/e.f.g.h	10.0.0.0/24
Range	Enter an IP address range. Replace each of a, b, c, d with either <ul style="list-style-type: none"> ▪ * (asterisk) for any value; corresponds to 0-255 or ▪ x-y for any range between 0 and 255. 	a.b.c.d	10.0.0.1-20 or 10.*.0.* or 10.0.0-50.*

14.6 Define Lookups

PRTG uses lookups for some sensors and for some sensors with custom channels. In general, lookups map status values as returned by a device (usually integers) to more informative expressions in words. Additionally, lookups can define a shown [sensor status](#)^[197] based on the status value returned by a device, just like [channel limits](#)^[397b] can define a sensor status, too. For a printer that returns the status value "1", for example, PRTG can show a sensor in the yellow Warning status with the text message "Toner Low" instead of only displaying the status value "1".

You can customize lookups by defining your own text messages that a channel shows and mapping them to a certain sensor status. See section [Customizing Lookups](#)^[4491].

If a sensor's channels use lookups, you can individually define how to control the sensor's status, either using the lookup definition or using limits for numeric values returned by the device. For details, see section [Channel Settings](#)^[397b], section Alerting and Limits. It is not possible to use both definitions at the same time.

- i Lookups do not change data in the PRTG database, they merely change the way channels are shown. Any change to lookup definition files applies to historic data as well as to live data.
- i Some exceptions apply to the [SNMP Custom String Lookup sensor](#)^[2485] that basically does an inverse lookup. It does not map an integer to a text message but only looks for matching strings in the lookup definition and shows a status based on this text value.

☁ To upload customized lookups to PRTG Hosted Monitor, [contact the Paessler support team](#)^[4266].

In this section:

- [Requirement: Channel Unit "Custom"](#)^[4485]
- [Visualization of Lookup Channels](#)^[4486]
- [Lookups Directory and Format](#)^[4488]
- [The XML Schema](#)^[4489]
- [Customizing Lookups](#)^[4491]
- [desiredValue Attribute](#)^[4493]
- [Lookup Types: SingleInt, Boolean, BitField, Range](#)^[4493]
- [Define Lookup Files in Channel Settings](#)^[4494]
- [Loading Lookups](#)^[4494]
- [Debugging](#)

Requirement: Channel Unit "Custom"

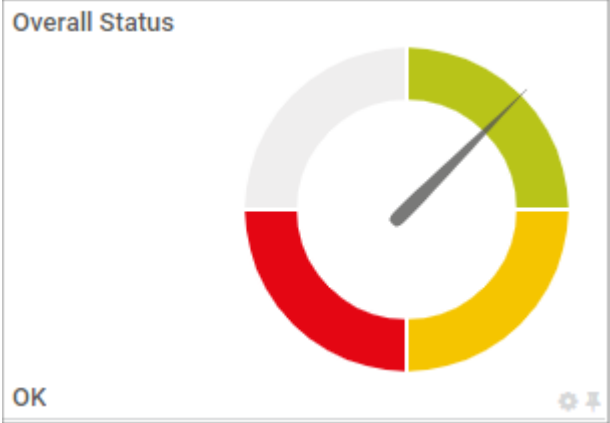

All channels with an enabled Lookup need to use the Channel Unit "Custom". For details, see section [Channel Settings](#)^[397b].

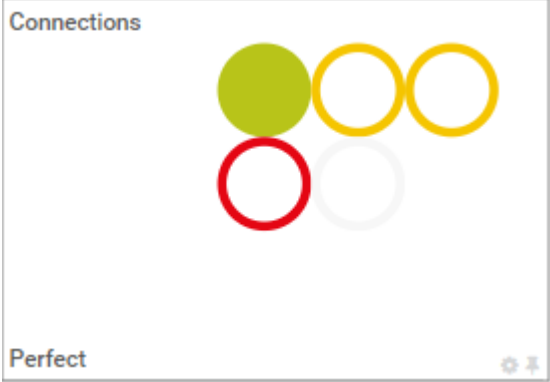

- i There are sensors that provide the Channel Unit "Lookup" in their settings. Do **not** use the Channel Unit "Custom" for channels of these sensors if you want to use lookups. This would result in malfunctioning lookup definitions. For the following sensors, select the Channel Unit "Lookup" in the settings and select your lookup file directly under Channel Lookup during sensor creation:

- [Google Analytics sensor](#)  1153
- [Microsoft SQL v2 sensor](#)  1607
- [MySQL v2 sensor](#)  1674
- [Oracle SQL v2 sensor](#)  1923
- [PostgreSQL sensor](#)  2064
- [SNMP Custom Advanced sensor](#)  2464
- [SNMP Custom Table sensor](#)

Visualization of Lookup Channels

PRTG can display channels that use lookups as follows.

Lookup Type	Visualization	Example
SingleInt, Range	Gauge	 <p>A Gauge Showing the Status of a Lookup Channel</p>
Boolean	Switch	 <p>A Switch Showing the Status of a Boolean Lookup Channel</p>

Lookup Type	Visualization	Example
BitField	Toggles	 <p>Connections</p> <p>Perfect</p> <p>Toggles Show ing the Status of a BitField Lookup Channel</p>

You can view the text messages for the different lookup values by hovering over the respective color section.

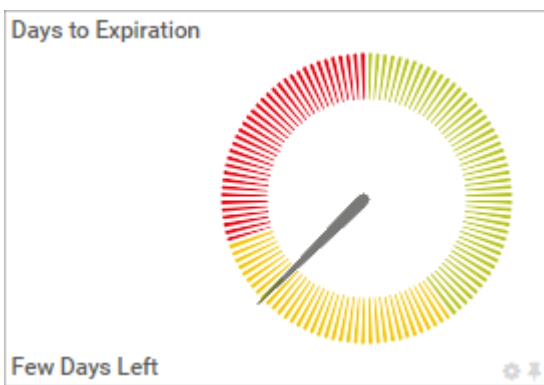

Gauge Show ing the Respective Lookup Message w hen Hovering over a Color Section

To see which lookup value in which channel shows the Warning or Down status, check the sensor message on a sensor's Overview tab:

Sensor Message in the Overview Tab

i We recommend that you stay below 120 lookup values to display visually informative gauges for primary channels. Non-primary channels have an upper limit of around 40 lookup values for gauges.

Gauge Show ing 120 Lookup Values

i The various sensor states that are displayed in gauges always follow the clockwise order Up (green) < Warning (yellow) < Down (red) < Unknown (gray). This clockwise order by colors stays the same, no matter which numeric value is mapped to which sensor status in the lookup definition. See the following example:

```
<?xml version="1.0" encoding="UTF-8"?>
  <ValueLookup id="example.lookups" desiredValue="1" undefinedState="olsWarning"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="PaeValueLookup.xsd">
    <Lookups>
      <SingleInt state="Ok" value="1">
        Works
      </SingleInt>
      <SingleInt state="Ok" value="2">
        Works a bit
      </SingleInt>
      <SingleInt state="Warning" value="4">
        Is slow
      </SingleInt>
      <SingleInt state="Error" value="8">
        Does not work
      </SingleInt>
      <SingleInt state="Ok" value="16">
        Works sometimes
      </SingleInt>
    </Lookups>
  </ValueLookup>
```

Even though the value "8" comes before the value "16", the state "OK" (shown as the Up status) is displayed before the state "Error" (shown as the Down status).

See [Lookups Directory and Format](#)⁴⁴⁸⁸ and [The XML Schema](#)⁴⁴⁸⁹ for more information about the lookup code and format.

Lookups Directory and Format

Lookups are defined in Extensible Markup Language (XML) format in files ending with .ovl. PRTG standard lookup files are located in the lookups subfolder of the [PRTG program directory](#)⁴⁵²⁶. These files are maintained by PRTG itself. In each of the files, lookups for one or more sensors are defined. Furthermore, the lookups subfolder contains the \custom subfolder to store your customized lookups.

For a list of all standard lookup files, see section [List of Standard Lookup Files](#)⁴⁷²⁴.

The files follow a basic principle. For each numeric value, you can define:

- A message that the sensor looks up and shows instead of the numeric value itself.
- The status that the sensor shows.

Use the [SNMP Custom String Lookup sensor](#)²⁴⁸⁹ to map a string to a corresponding status. For this purpose, use the [lookup type](#)⁴⁴⁹³ SingleInt.

You cannot access this directory on PRTG Hosted Monitor instances.

The XML Schema

An exemplary schema of the .xml files containing the lookup definitions can look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="..." desiredValue="..." undefinedState="..." xmlns="..." xsi="...">
  <Lookups>
    <SingleInt state="..." value="...">status text</SingleInt>
    <SingleInt state="..." value="...">status text</SingleInt>
    <SingleInt state="..." value="...">status text</SingleInt>
  </Lookups>
</ValueLookup>
```

Element	Description	Attributes, Value Assignment, and Content
<code><?xml></code> content	This is the XML declaration that every .xml file begins with.	<ul style="list-style-type: none"> version and encoding are "1.0" and "UTF-8" respectively content: <code><ValueLookup>contentValueLookup</ValueLookup></code>
<code><ValueLookup></code> <code>contentValueLookup</code> <code></ValueLookup></code>	Defines the ID of the channel, which desiredValue is used, the status for undefined values (undefinedState), and links to the predefined schema definitions in PRTG that allow editing of lookup files with supported editors.	<ul style="list-style-type: none"> id: Specifies how the name of the lookup file is shown in the channel settings³⁹⁷⁷. <ul style="list-style-type: none"> i The id is parsed as a lowercase string. desiredValue⁴⁴⁹³: Contains the value used for the calculation of the "Coverage". undefinedState: Optionally define a status for values that are not defined in the lookup file. If the target device returns a value that is not included in the lookup definition, the sensor shows this status (Ok, Warning, Error, or None) with an according message. Without a definition of "undefinedState", the sensor only shows the returned value.

Element	Description	Attributes, Value Assignment, and Content
<code><Lookups> contentLookups </Lookups></code>	Defines the particular lookups for the sensor data.	<ul style="list-style-type: none"> ▪ xmlns:xsi/xsi: Refers to predefined XML schema definitions in PRTG (which allow editing of lookup files with supported editors). ▪ <code>contentValueLookup</code>: Lookup definitions <code><Lookups>contentLookups</Lookups></code> • <code>contentLookups</code>: One or more lookup entries, see below.
<code><SingleInt> status text </SingleInt></code>	Each element defines one lookup entry. There can be one or more lookup entries from the same lookup type ⁴⁴⁹³ .	<ul style="list-style-type: none"> ▪ <code>state</code>: Defines the status the sensor shows. Allowed values are Ok, Warning, Error, and None ("None" does not trigger a status change).
<code><Boolean> status text </Boolean></code>	<p>i You can use only one kind of lookup type in one lookup file. This means, only <code>SingleInt</code>, only <code>Boolean</code>, only <code>BitField</code>, or only <code>Range</code>. Different lookup types in one file are not allowed.</p>	<p>i State values must be capitalized for the sensor to work properly.</p>
<code><BitField> status text </BitField></code>	The notation for the different lookup types can vary:	<ul style="list-style-type: none"> ▪ <code>value</code>: Defines the value that triggers the lookup. Enter an integer value. i Range always needs both values "from" and "to".
<code><Range> status text </Range></code>	<ul style="list-style-type: none"> ▪ <code><SingleInt state="..." value="...">status text</SingleInt></code> ▪ <code><Boolean state="..." value="...">status text</Boolean></code> ▪ <code><BitField state="..." value="...">status text</BitField></code> ▪ <code><Range state="..." from="..." to="...">status text</Range></code> 	<ul style="list-style-type: none"> ▪ <code>status text</code>: Defines a status text that is used as substitution text and shown instead of the integer value, for example, a status message. i The SNMP Custom String Lookup sensor maps the status text to one of the specified states. For this sensor, use <code>SingleInt</code>.

Because all .xml files containing lookup definitions are delivered in a previously specified schema as indicated above, you can [customize lookups](#)⁴⁴⁹¹ accordingly.

Example

The following code illustrates the lookup definition for the toner status of the [SNMP HP LaserJet Hardware](#) sensor:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hp.laserjet.tonerstatus" desiredValue="1"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="PaeValueLookup.xsd">
  <Lookups>
    <SingleInt state="Ok" value="0">Toner Okay</SingleInt>
    <SingleInt state="Warning" value="1">Toner Low</SingleInt>
    <SingleInt state="Error" value="2">No Toner Cartridge Loaded</SingleInt>
  </Lookups>
</ValueLookup>
```

In our example, the lookup file has the following effect:

Value as Reported from HP Printer	Text Shown in PRTG (Channel)	Sensor Status Shown in PRTG	
0	Toner Okay		Up
1	Toner Low		Warning
2	No Toner Cartridge Loaded		Down

Customizing Lookups

To upload customized lookups to PRTG Hosted Monitor, [contact the Paessler support team](#).

If you want to change the status definitions of a specific channel, you basically have to do the following:

1. Find out the (file) name of the default lookup file in the settings of the channel that you want to change the behavior for.
 2. From the \lookups subfolder of the [PRTG program directory](#), copy this file into the \lookups\custom subfolder. Make sure that you do not change the file name.
OR
create a new .xml file there.
- i** When using the same ID in the [ValueLookup](#) tag, the files in the \lookups\custom subfolder have a higher priority than the original files in the \lookups folder. This way, PRTG prefers your customizations to the original lookup settings. If you want to use custom lookup definitions [in addition](#) to the standard lookups, define a new ID in the lookup file that is not used by any other lookup file. PRTG identifies lookup definitions via this ID, it does **not** use the file name.

3. Open the file with an XML or text editor and customize the lookups as you like. You can define your own text messages or customize sensor states for particular return values. For example, if you do not want a sensor to show the Down status for the return value 2 but only the Warning status, replace the state "Error" with "Warning".

i All possible states are specified in the LookupState.xsd file in the custom directory. Following the schema of the .xml files that are delivered with PRTG ensures that you edit lookups in a safe way.

i If you [imported an .oidlib file](#)²⁸⁰⁷ that contains lookups (you can see this in section Lookup in MIB Importer), you can define your own sensor states for returning values. If you add an [SNMP Library sensor](#)²⁷⁹⁷ using this .oidlib file, PRTG creates a lookup definition file using the lookupname of the chosen library as id parameter. Override this lookup definition with your own custom lookup as described in this section. This is important because lookups that are added via an .oidlib file do not contain any status definitions and result in the Warning status of the sensor by default because of the entry `undefinedState="Warning"`.

i If you use an SNMP Custom String Lookup sensor, you can create a new custom lookup definition in the \lookups\custom subfolder with the expected return values. In this case, use the lookupname of the chosen library as id parameter to override the lookups from the .oidlib file.

i When you save an edited lookup, make sure that it is saved as an .ovl file. Otherwise, the lookup might accidentally be saved as a .txt file and might not be loaded.

Example for Lookups Customization

For example (for illustration purposes only), imagine you want

- the sensor to show the Warning status for all undefined values that the target device might return,
- to change the shown status for the return value "2" from the Down to the Warning status, and
- to add the state "None" (shown as the grey Unknown status) to the [example](#)⁴⁴⁸¹ above.

Then take the following steps:

1. Copy the file oid.paessler.hp Laserjet.tonerstatus to the \lookups\custom subfolder of the PRTG program directory.
2. Open this file with an editor.
3. Leave the ID value unchanged to prioritize the customized lookup file.
4. Insert the status definition for undefined values into the ValueLookup element:
`undefinedState="Warning"`
5. Replace the state "Error" with "Warning" for value "2".
6. Add a SingleInt element with the state "None" for the (hypothetical) return value "3".
7. Save the file and [reload](#)⁴⁴⁹⁴ the custom lookup folder in PRTG.

The customized lookup file looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hp.laserjet.tonerstatus" desiredValue="1"
undefinedState="Warning" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="PaeValueLookup.xsd">
  <Lookups>
    <SingleInt state="Ok" value="0">Toner Okay</SingleInt>
    <SingleInt state="Warning" value="1">Toner Low</SingleInt>
    <SingleInt state="Warning" value="2">No Toner Cartridge
Loaded</SingleInt>
    <SingleInt state="None" value="3">Unknown Status of Toner</SingleInt>
  </Lookups>
</ValueLookup>
```

■ See also the [SNMP Custom String Lookup sensor](#)²⁴⁹⁸ for a lookup definition that maps a string value to a sensor status.

desiredValue Attribute

It is necessary to define a desiredValue in the lookup files. The desiredValue corresponds to a [status value](#) that triggers a lookup. PRTG calculates the percentage of time this specific status was monitored. The result is displayed for all data tables and graphs that show averaged values.

Considering the example above where the desiredValue is "1", PRTG calculates the percentage of time the toner status showed the Warning status. If during a time span of five minutes, four of five sensor scans returned "Warning", PRTG would show an average of 80% for this time span because 80% of the time, the sensor showed the Warning status.

i The desiredValue attribute always has to be an integer value. For the lookup type range, use an integer that you defined for one of your "from" or "to" parameters in the lookup file.

■ For more information, see also the Knowledge Base: [Can I graph text values?](#)

Lookup Types: SingleInt, Boolean, BitField, Range

Besides the lookup type SingleInt as seen above, there are three other lookup types: Boolean, BitField, and Range. Using these types, you can define lookup values beyond simple integers.

Lookup Type	Description	Syntax
SingleInt	Use an integer to define a lookup for one status value.	value="int" i The full 32-bit integer range is supported.
Boolean	Use 0 or 1 to define a lookup for two different status values.	value="0" value="1"

Lookup Type	Description	Syntax
BitField	Use a bitfield for multiple status values.	<p>Only use this lookup type if you have some basic knowledge about bitmasks. See section More ⁴⁴⁹⁵ for a general introduction.</p> <ul style="list-style-type: none"> i Every value has to equal a power of two (for example, 1, 2, 4, 8, 16, 32, 64, etc.). i The SNMP Custom String Lookup sensor does not support BitFields.
Range	Uses an inter range from-to to define a lookup for several status values.	<p>from="int" to="int"</p> <ul style="list-style-type: none"> i Using ranges, the parameters "from" and "to" always have to be defined. If you want to query only one single value in a range file, this value must be set as a parameter for "from" and "to" (for example, from="2" to="2"). See also the Knowledge Base: Custom lookup range. i The SNMP Custom String Lookup sensor does not support ranges. i The full 32-bit integer range is supported.

i You can use only one kind of lookup type in one lookup file. This means, only [SingleInt](#), only [Boolean](#), only [BitField](#), or only [Range](#). Different lookup types in one file are not allowed.

Define Lookup Files in Channel Settings

For each sensor with a custom channel, you can define a lookup file to use with the option Lookup in the channel settings. This option is visible for many SNMP sensors, some application sensors, and always for the following sensors:

- [EXE/Script sensor](#) ¹⁰⁶³
- [EXE/Script Advanced sensor](#) ¹⁰⁷⁷ (if a Custom unit is defined)
- [SNMP Custom sensor](#)

■ For details, see section [Channel Settings](#) ³⁹⁷⁷.

Loading Lookups

You can (re)load the lookups in the custom folder by going to Setup | System Administration | [Administrative Tools](#) ⁴²²⁵ in the PRTG web interface and clicking Go! under Load Lookups and File Lists.

 A sensor whose lookup file you have modified and reloaded does not re-evaluate this lookup before the next sensor scan. For sensors with large scanning intervals, use the Scan Now option from the [context menu](#)²⁷⁰ to immediately apply the new lookup definition and to avoid an incorrect sensor status.

Debugging

What happens if...?

- a return value is defined in the lookups that is never returned by a device because the value is not assigned: The value is never triggered, so PRTG ignores this entry.
- PRTG receives a return value that is not defined for lookups: No substitution message can be found. PRTG only shows the return value. You can optionally define a status for unknown values with a definition of undefinedState in the ValueLookup element (see section [The XML Schema](#)⁴⁴⁸⁹).
- different lookup types are in one lookup file: This is not allowed and PRTG discards this lookup definition. If you use miscellaneous lookup types in one file, for example, ranges and singleInts together, PRTG creates a ticket when loading lookups or restarting the PRTG core server with the following error message: `Lookup file "[...]" could not be loaded (" is not a valid integer value)".`
- XML code is incorrect: PRTG creates a new ticket when loading lookups or restarting the PRTG core server with a corresponding error message and discards this lookup definition.
- a lookup file has a file ending other than `.ovl`: The file is not loaded.
- alerting is disabled or based on limits: "Error" and "Warning" states defined in the lookup do not apply. Make sure that you select the option Enable alerting based on lookups in the channel settings if you want to use lookup definitions to control the sensor status.
- you define a scaling factor in channel settings: This does not modify the values that are defined by lookups. Any applied lookup always uses the raw value as retrieved from the target device. If you use a scaling factor for such a channel, you notice the scaling in data graphs, but the channel value appears unmodified in data tables.

14.7 Regular Expressions

For some sensors, you can use regular expressions to match a search pattern. PRTG supports Perl Compatible Regular Expression (PCRE).

The following sensors support using regular expressions:

- [DHCP sensor](#) ⁸⁷³
- [File Content sensor](#) ¹¹⁰⁴
- [HTTP Advanced sensor](#) ¹²⁰⁴
- [IMAP sensor](#) ¹⁴³⁰
- [Port sensor](#) ²⁰⁴¹
- [SNMP Custom String sensor](#) ²⁴⁷⁵
- [WMI Custom String sensor](#)

i You can only use regular expressions for the respective sensors if you explicitly enable using regular expressions in the sensors' settings.

i PRTG supports regular expression (regex) options in the form (?ismxUU) and their negations like, for example, (?-i). PRTG does not support regex flags like, for example, /g (global), /s (single line), or /gs, and does not correctly search for the target string if you try to set flags.

See below for examples with the most [common patterns](#) ⁴⁴⁹⁷ and an [example](#) ⁴⁴⁹⁷ for possible matches.

Common Search Patterns

Find matches containing the word error **or** alarm:

```
\b(error|alarm)\b
```

Find matches containing the word ERROR, **not** error, using case sensitivity:

```
(?-i)\bERROR\b
```

Find matches containing the words error **and** alarm, in any order:

```
(?=.*\berror\b)(?=.*\balarm\b).*
```

Find matches containing all of the words tree, flower, leaf, **and** bug, in any order:

```
(?=.*\btree\b)(?=.*\bflower\b)(?=.*\bleaf\b)(?=.*\bbug\b).*
```

i It is not possible to match an empty string using the PRTG regex search with sensors.

Example

The search pattern

```
(?i)(?=.*\berror\b)(?=.*\balarm\b).*
```

matches the following expressions:

- Alarm error
- Error alarm
- I am an error and I trigger an alarm.
- I am an alarm and I indicate an error.
- An alarm combined with an error indeed!
- An error combined with an alarm, too!

14.8 Calculating Percentiles

PRTG not only monitors your network and informs you in case of issues that are worth a closer look, it also stores a lot of historic data gathered from your sensors. This means that you have a base for statistical analysis and evaluation of what is and was happening in your network.

When creating a report, you get raw data, sums, averages, and percentages of your monitoring data.

Additionally, PRTG also offers percentile calculation. This statistical method arranges your data, for example, from the lowest value to the highest value, and calculates the percentile that you want, optimally informing you about the distribution of your network-relevant data.

i For example, if you request the 95th percentile, you know that 95 percent of the measured data is below a certain value, and thanks to PRTG, you know what this certain value is.

If applied to bandwidth, for example, you know which values you have when talking about the 5 percent of unusually high bandwidth consumption, and which value your users do not exceed 95 percent of the time. Service providers often use percentiles to offer fairer billing that excludes infrequent usage peaks.

■ If you want to know more about the formula that PRTG uses for percentile calculation, see the Knowledge Base: [What are percentiles and what differences do they make in PRTG reports?](#)

Create a report for several sensors and device groups using the [reports](#)⁴⁰⁶⁹ feature, or create reports for single sensors using the [historic data reports](#)²⁰⁸¹.

14.9 Add Remote Probe

Remote probes can extend your monitoring with PRTG.

- With remote probes, you can monitor different subnetworks that are separated from your PRTG on premises core server by a firewall, and you can keep an eye on remote locations. You can install [one or more remote probes](#)^[4503].
- Remote probes are useful if you want to distribute monitoring load by taking it from the PRTG core server system and putting it on one or more remote probe systems.
- You need a remote probe if you want to monitor your local network using a PRTG Hosted Monitor instance.

Monitoring Remote Locations via Remote Probes

For instructions on how to add a remote probe, see the following sections:

- Background information: [Remote Probes and Multiple Probes](#)^[4503]
- Step-by-step installation: [Install a Remote Probe](#)^[112]
- Partially automatic installation: [Remote Probe Setup via Device Tools](#)^[4507]

14.9.1 Remote Probes and Multiple Probes

Upon installation, PRTG automatically creates the first probe, the local probe in PRTG on premises, and the hosted probe in PRTG Hosted Monitor. They run on the PRTG core server system and monitor all reachable devices, servers, and services from this system, using the sensors you configured.

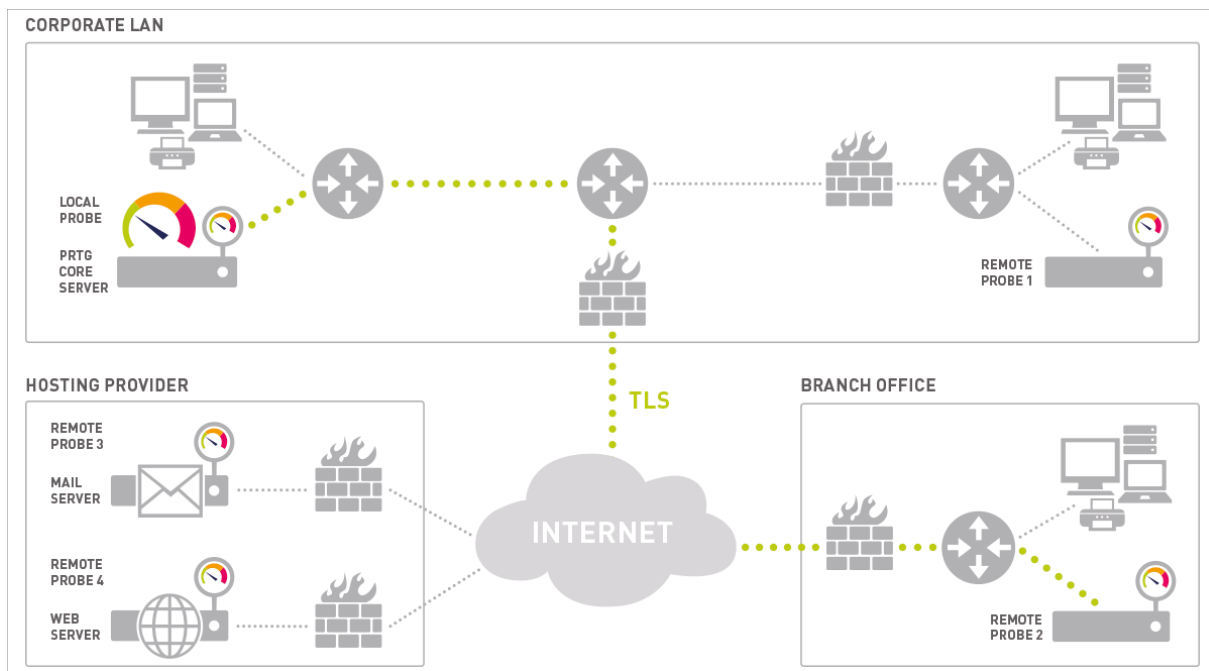

Working only with a local probe should suffice for LAN monitoring with PRTG on premises and if you want to monitor one location only. For LAN monitoring with PRTG Hosted Monitor, at least one remote probe is required because the hosted probe can only reach targets that are publicly available via the internet.

Scenarios Requiring Remote Probes

There are several situations that make it necessary to work with remote probes in the same LAN or in remote locations. Among these situations are the following:

- You run a PRTG Hosted Monitor instance and want to monitor your local network.
- You have more than one location and you need to make sure that services are available from all locations.
- Your network is divided into several LANs by firewalls, and the local probe cannot monitor specific services across these firewalls.
- You want to monitor systems in a secure network and you need a secure connection between the PRTG core server and this network.
- You want to sniff packets on a different computer.
- You want to monitor NetFlow data on a different computer.
- You experience performance issues with CPU-intensive sensors like Packet Sniffer or NetFlow sensors and need to distribute the load among more than one PC.

The following chart shows an example for a remote probe scenario.

Monitoring a Distributed Network with PRTG

The PRTG core server inside the **corporate LAN** (top left) can monitor:

- Services inside the **corporate LAN** using the local probe.
- Services behind a firewall in the **corporate LAN** using remote probe 1.
- Secured services inside the **branch office** (bottom right) using remote probe 2.
- Secured services on **mail server** and **web server** using remote probe 3 and remote probe 4 installed directly on these servers.
- Public services on the internet using any of the probes.

How Probes Work

As soon as a probe starts, it automatically connects to the **PRTG core server**^[131], downloads the sensor configuration, and begins its monitoring tasks. The PRTG core server sends new configuration data to a probe as soon as the user changes the monitoring configuration. Probes monitor autonomously and send the monitoring results back to the PRTG core server for each check they have performed.

If the connections between the PRTG core server and a probe fail for any reason (for example, restarting the PRTG core server system), the probe continues to monitor and stores the results. During a connection loss, a buffer stores a maximum of 500,000 sensor results in the RAM of the remote probe system (up to 50 - 200 MB). This means that for 100 sensors with a 1-minute scanning interval, the monitoring results of up to 3 days can be buffered (or 52 minutes for 10,000 sensors with a 1-minute scanning interval). The probe automatically reconnects to the PRTG core server as soon as it is available again and transmits all monitoring results gathered during the connection loss.

The connection between a probe and the PRTG core server is initiated by the probe and is Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured. This means that the data sent back and forth between the PRTG core server and the probe is not visible to someone capturing data packets. The PRTG core server provides an open TCP/IP port and waits for connection attempts from probes. If a new probe connects for the first time, you receive a **ToDo ticket**^[240] and then see the new probe in the device tree.

As a security precaution, you must manually approve the probe in the device tree before you can create any sensors. You can also deny a probe. It is then disconnected. PRTG accepts no further connection attempts and it adds the probe IP address to the Deny IP Addresses list in the probe's system settings (see section [Core & Probes](#)^[4202]). This ensures that unauthorized probes cannot connect to a PRTG core server.

Because the probe initiates the connection, you must ensure that a connection to your PRTG core server from the outside can be established. For example, you might need to open any necessary ports in your firewall and you might need to specify a network address translation (NAT) rule for your network. The process is the same as if you wanted to allow access to the web server provided by the PRTG core server via port 443, for example. Make sure that you have the Transmission Control Protocol (TCP) port [23560](#) open or forwarded on both your PRTG core server side and probe side.

If you run PRTG in a cluster, remote probes also connect to all cluster nodes and send monitoring data. This works as described above for a single PRTG core server. If the master node fails, you can still see monitoring data on the failover nodes. You can define the Cluster Connectivity of each probe in the probe's [settings](#)^[409], section Administrative Probe Settings.

Automatic Probe Update

Whenever you install a new version of PRTG on the PRTG core server, all remote probes automatically download and install the updated version as soon as they reconnect to the updated PRTG core server.

The local probe is updated when you update the PRTG core server. All remote probes automatically download the new binaries using the SSL/TLS-secured probe connection or PRTG core server connection. Downloading the 4-MB file takes anywhere from a few seconds (in LANs) up to a few minutes (via internet connections), depending on the available bandwidth. As soon as the update has been downloaded, the remote probe disconnects, installs the update, and reconnects to the PRTG core server. This takes between 20 and 100 seconds. Note that during the update phase, monitoring by the local probe can be affected because of the bandwidth required for the downloads.

 If a remote probe keeps being disconnected after an update, check if the server with the remote probe has two network connections with different IP addresses. Make sure these addresses are in the list of allowed IPs in the [Core & Probes](#)^[4204] settings.

Delete Remote Probe

Deleting a connected remote probe via the device tree stops the [PRTG probe service](#) on the remote probe system and sets the startup type to manual. We recommend that you additionally uninstall the remote probe on the remote probe system.

Deleting a disconnected remote probe does not stop the [PRTG probe service](#) on the remote probe system and does not affect the startup type. The remote probe will continue to try to reconnect to the PRTG core server until you manually stop the PRTG probe service or uninstall the remote probe on the remote probe system.

Add Remote Probe

- [Remote Probes and Multiple Probes](#)  4503
- [Remote Probe Setup via Device Tools](#)  4507

14.9.2 Remote Probe Setup via Device Tools

Directly install a remote probe by right-clicking a device in the device tree. This partially automatic installation mechanism is an alternative to [installing a remote probe using the Remote Probe Installer](#)^[112]. For a quick installation guide, see the Paessler Website: [How to install a PRTG remote probe in 4 steps](#).

i This is an experimental feature. It might not work in all situations. In this case, see section [Debugging](#)^[4511].

☁ This feature is not available in PRTG Hosted Monitor.

i You cannot install a remote probe on the local probe device or hosted probe device. The Remote Probe Setup via Device Tools is also not available for devices on remote probes. In this case, use the [Remote Probe Installer](#)^[112].

i If you run PRTG in a cluster, see [Cluster and Remote Probes Outside the LAN](#)^[4509].

Steps to Take

To install a remote probe directly from the device tree in the PRTG web interface, follow these steps:

- [Step 1: Meet the Requirements](#)^[4507]
- [Step 2: Prepare the PRTG Core Server](#)^[4508]
- [Step 3: Provide Credentials \(Optional\)](#)^[4509]
- [Step 4: Install the Remote Probe](#)^[4510]
- [Step 5: Approve the New Remote Probe](#)

Step 1: Meet the Requirements

To install a remote probe on a computer, make sure that you meet the following requirements.

- The target computer runs the operating system Windows 7 or later.
- The target computer is accessible through remote procedure call (RPC). This is usually the case when your PRTG core server and the target computer are located in the same LAN segment. Otherwise, open Windows [services.msc](#) on the target computer and start the RPC service.
- Programs are allowed to communicate through your Windows Firewall. Open the settings of your firewall and select Allow an app through firewall. Mark the check box for Remote Service Management, and the check box Public in the corresponding line.
- Connections between remote probes and the PRTG core server require port [23560](#). Make sure that on your PRTG core server side, this port is not blocked by firewall rules, and, on the remote probe side, the Transmission Control Protocol (TCP) port [23560](#) is open for outgoing connections as well.
 - If you need to set a different port (not recommended), see the Knowledge Base: [How can I customize ports for core-probe connections used by PRTG?](#)

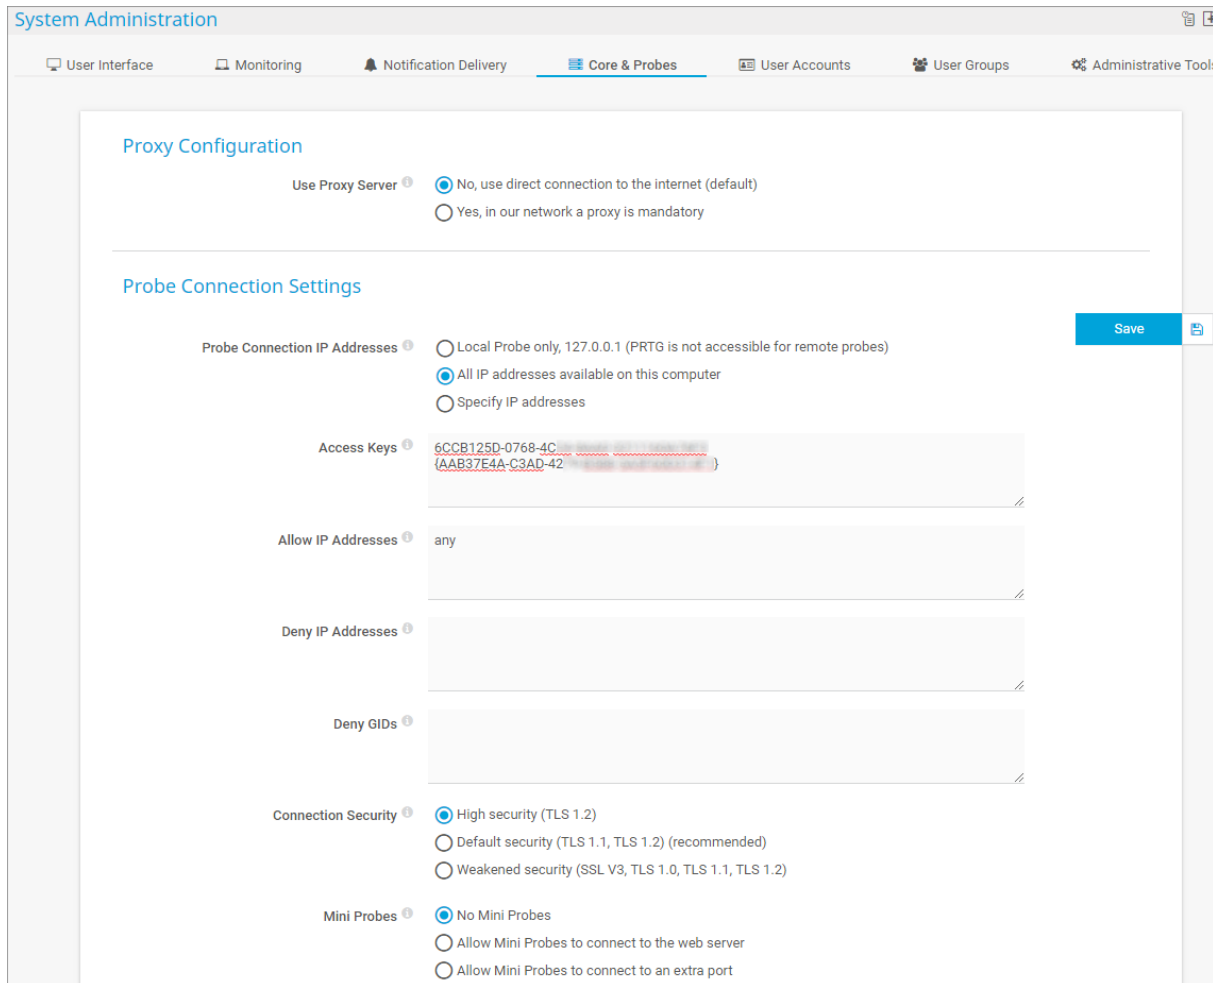

i Your PRTG on premises or PRTG Hosted Monitor installations already include a local probe or hosted probe on the PRTG core server. This is why you cannot additionally install a remote probe on your PRTG core server system.

■ For more information on the requirements for remote probes, see section [System Requirements](#)^[24].

Step 2: Prepare the PRTG Core Server

i Because your remote probe needs to connect to your PRTG core server, PRTG needs to accept incoming remote probe connections. So, with PRTG on premises, first prepare your PRTG core server before you install the remote probe.

Edit the relevant settings in section [Core & Probes](#). From the main menu in the [PRTG web interface](#), select Setup | System Administration | Core & Probes to access the probe settings and go to the Probe Connection Settings.

Probe Connection Settings in System Administration

Step 2.1: Probe Connection IPs

By default, a PRTG core server accepts connections from the Local Probe only (IP address [127.0.0.1](#)). This setting is the most secure setting, but it does not allow any remote probes to connect to your PRTG core server.

To accept remote probes, select one of the following settings:

- All IP addresses available on this computer: Any IP on your PRTG core server system accepts incoming probe connections.
- Specify IP addresses: Specify selected IP addresses that accept incoming connections.

Step 2.2: Allow IP Addresses

In the Allow IP Addresses field, you can enter the IP address of the computer on which you want to install a remote probe. You can also enter the word [any](#). This sets the PRTG core server to accept remote probe connections from any IP address.

 If you use [any](#), make sure that you only write the word in lower case. Any other variations are not valid.

Changing other settings is not required. For details about the fields for Access Keys, Deny IP addresses, and Deny GIDs, see section [Core & Probes](#) .

When you are done, click Save to save your settings.

 If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After clicking Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, of [PRTG Desktop](#) , or of [PRTG Apps for Mobile Network Monitoring](#)  are disconnected and reconnected.

 To edit the core-probe connection settings, you can also use the [PRTG Administration Tool](#)  on your PRTG core server.

Cluster and Remote Probes Outside the LAN

 If you run PRTG as a cluster and you want to run remote probes outside your local network, you have to make sure that your cluster nodes and the addresses they use are reachable from the outside. Check your cluster node settings under [Cluster](#)  before you install a remote probe outside your local network. Enter valid addresses (Domain Name System (DNS) names or IPs) for both cluster nodes to reach each other and for remote probes to individually reach all cluster nodes. Remote probes outside your LAN cannot connect to your cluster nodes if they use local addresses.

If you already have a remote probe installed outside your LAN and the remote probe is disconnected because of this, follow these steps:

1. Uninstall the remote probe.
2. Update the [cluster node settings](#)  with addresses that are reachable from outside your LAN.
3. Restart your PRTG core servers.
4. Install the remote probe again. It then obtains the IP address or DNS name entries that it can reach.

 See also section [Failover Cluster Configuration](#) , section Remote Probes in a Cluster.

Step 3: Provide Credentials (Optional)

If you have not yet done so, [add a device](#)  that represents the target computer on which you want to install the remote probe. Set the correct Windows credentials for this device.

1. Open the [device settings](#) .
2. In the Credentials for Windows Systems section, provide Domain or Computer Name, User Name, and Password for the target computer. You can also [inherit](#)  the credentials from the settings of a parent object in the device tree.

i Make sure that this user account has administration rights on the target computer.

Step 4: Install the Remote Probe

1. In the device tree, open the [context menu](#) ²⁶⁶ of the target device.
2. Select Device Tools | Install Remote Probe to open the install dialog in a new window.

i This option is only available for devices on the PRTG on premises local probe.

Install Remote Probe on Device Workstation

Please note: This is an experimental feature, it may not work in all situations. Please send your feedback to support@paessler.com.

You are about to install a remote probe on the computer "Workstation". This will allow PRTG to monitor this computer locally instead of using remote monitoring features. This can sometimes be a good workaround for performance or authentication problems (for example, for WMI sensors). Additionally, this will allow you to use some probe-only sensors like Packet Sniffer, NetFlow, and others.

Details

Device Name	Workstation
Status	OK
Priority	★★★★☆
Parent Probe	Probe (Local Probe)
Parent Group	Servers
Sensors by State	<input checked="" type="checkbox"/> 2 (Total: 2)

Prerequisites

Please make sure you fulfill the following conditions.

- The target device must be a computer with a supported Windows version.
- The target computer must be accessible through RPC (this is usually the case when your PRTG server and the target computer are located in the same LAN segment).
- Open or forward port 23560 in your firewall to allow connections between the probe and your PRTG core server.
- Windows credentials must be set in the device settings or its parents' settings (current user name: paesslergmbh\Testadmin) and the user account must have administration rights on the target machine.
- You have to allow remote probe connections to your PRTG core server. Open the Core & Probes tab in the System Administration of your PRTG web interface. In section Probe Connection Settings, select the option All IPs available on this computer or specify IPs for the setting Probe Connection IPs. Do not use the "Local Probe only" (127.0.0.1) setting! (Current setting: 10.0.0.1)

Start Probe Installation

The installation will take between 10 and 100 seconds.

[Install Remote Probe on "Workstation"](#)

Remote Probe Installation Dialog

The install dialog includes four sections:

- Experimental feature notice and short introduction
- Details: Overview of the device like Device Name, Status, Priority, Parent Probe, Parent Group, and Sensors by State.
- Prerequisites: Make sure that you meet the requirements listed here. If not, PRTG cannot start the installation process. Open requirements are highlighted in red.

Prerequisites

Please make sure you fulfill the following conditions.

- The target device must be a computer with a supported Windows version.
- The target computer must be accessible through RPC (this is usually the case when your PRTG server and the target computer are located in the same LAN segment).
- Open or forward port 23560 in your firewall to allow connections between the probe and your PRTG core server.
- You cannot install a remote probe on a probe device.
- Windows credentials must be set in the device settings or its parents' settings (current user name: test\test) and the user account must have administration rights on the target machine.
- Please correct before proceeding:** You have to allow remote probe connections to your PRTG core server. Open the Core & Probes tab in the System Administration of your PRTG web interface. In section Probe Connection Settings, select the option All IPs available on this computer or specify IPs for the setting Probe Connection IPs. Do not use the "Local Probe only" (127.0.0.1) setting! (Current setting: 127.0.0.1)

Installation Unable to Start Because Prerequisites Are Not Met

- Start Probe Installation: Time estimation for the installation and installation start button

If all prerequisites are met, you can install the remote probe on the target computer by clicking Install Remote Probe on "[device name]". Wait until the process has ended. If the installation is successful, the following message appears in the Start Probe Installation section: **Done. Result is: OK.**

- ❗ Every time you start an installation, PRTG automatically adds a new key to the field Access Keys in the [Core & Probes](#) settings, no matter if the installation has been successful or not.

Step 5: Approve the New Remote Probe

If the installation is successful, you receive further instructions after the result message. You also receive a new [ToDo ticket](#).

Click Approve and auto-discover new probe to acknowledge the new remote probe and to instantly start an [auto-discovery](#) in this network. Click Approve new probe to acknowledge the new remote probe without running an auto-discovery. You can also discard the remote probe by clicking Deny.

- ❗ When you deny or remove a remote probe, this device's global ID (GID) is listed in the Deny GIDs field in the [Core & Probes](#) settings. Future probe connections from this device are automatically denied.

- ❗ Denying the remote probe in the device tree does **not** uninstall the remote probe, but only denies access to the PRTG core server. The remote probe continues to run on the target system until you uninstall it manually.

Wait while the remote probe connects. Once the remote probe has connected, you can create groups, devices, and sensors to customize your monitoring via the new remote probe.

Debugging

- Note that installing a remote probe directly from the device tree in the PRTG web interface is an experimental feature. This approach might not be possible in all situations.
- Make sure you met all the requirements as described in [step 1](#) such as the Windows Firewall settings.
- If the quick installation procedure as described in this section does not work with your setup, manually install your remote probes via the Remote Probe Installer as described in section [Install a Remote Probe](#).

14.10 Failover Cluster Configuration

A failover cluster consists of two or more PRTG core servers that work together to form a high availability monitoring system. PRTG offers the single failover cluster (one master node and one failover node) in all licenses, including the freeware edition.

☁ This feature is not available in PRTG Hosted Monitor.

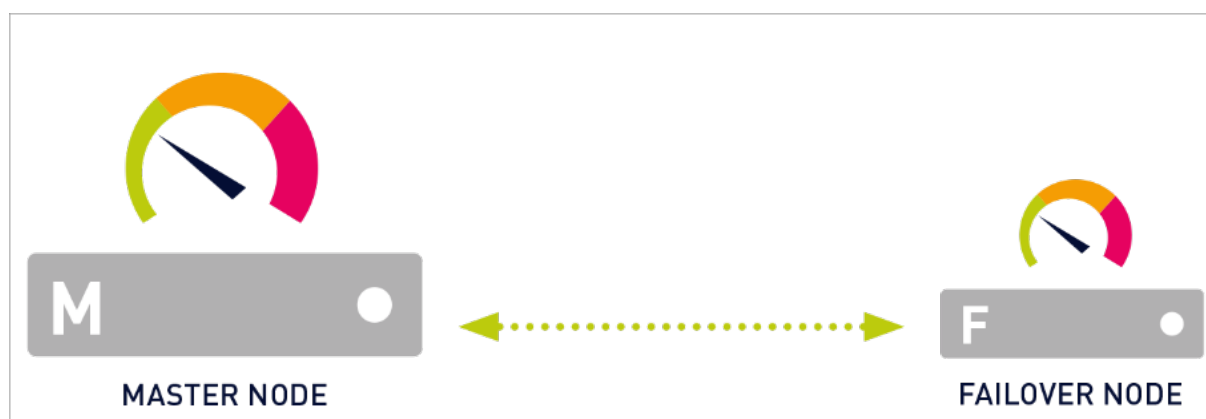

Illustration of a Single Failover Cluster

■ For more information about clusters in general, see section [Cluster](#)^[135].

Before You Start

Consider the following notes about clusters.

- You need two servers that run any Windows version (Windows 7 or later). The servers can be physical machines or virtual machines (VM). For more information, see section [System Requirements](#)^[23].
- Your servers must be up and running.
- Your servers must be similar in regard to the system performance and speed (like CPU, RAM, etc.).
- In a cluster, each of the cluster nodes individually monitors the devices that you add to the cluster probe. This means that monitoring load increases with every cluster node. Make sure your devices and your network can handle these additional requests. Often, a longer scanning interval for your entire monitoring setup is a good idea. For example, set a scanning interval of five minutes in the root group's [settings](#)^[366].
- We recommend that you install PRTG on dedicated, physical machines for best performance.
- Keep in mind that a server that runs a cluster node might automatically restart without prior notice (for example, because of special software updates).
- Both servers must be visible for each other through the network.
- Communication between the two servers must be possible in **both directions**. Make sure that no software or hardware firewall blocks communication. All communication between cluster nodes is directed through one specific Transmission Control Protocol (TCP) port. You define the port during the cluster setup (by default, it is TCP port 23570).

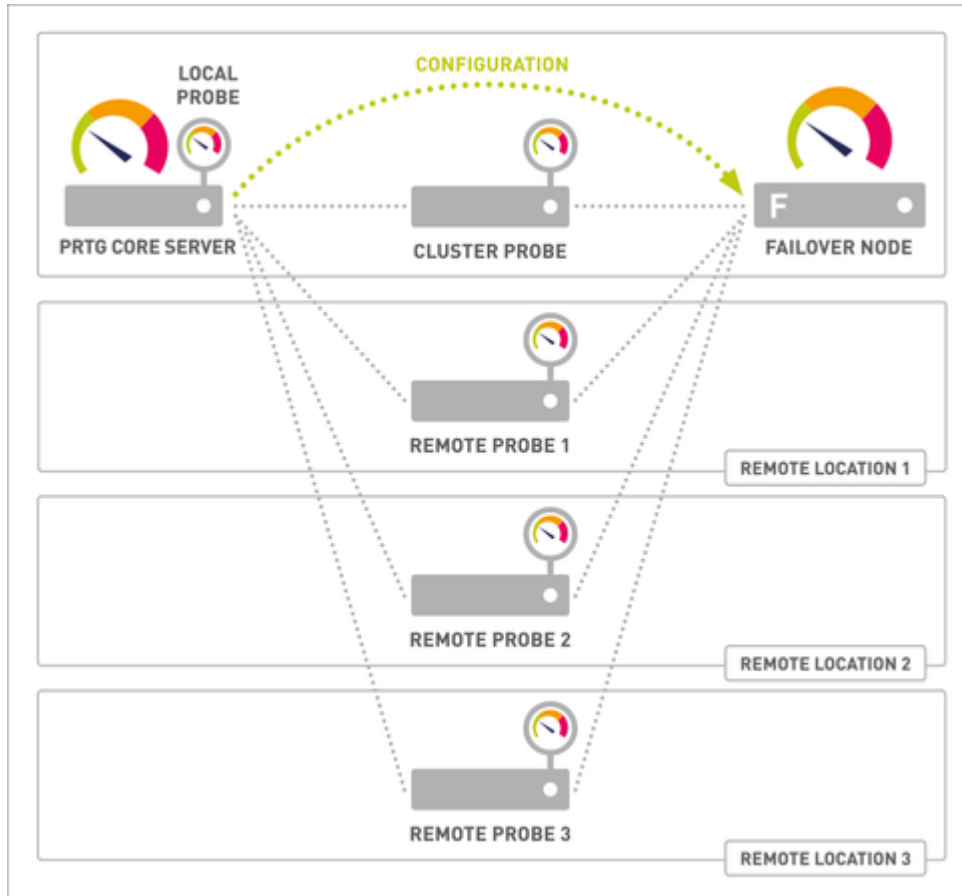

- In a cluster, a Domain Name System (DNS) name that you enter under Setup | System Administration | User Interface in the PRTG web interface is only used in links that point to the master node. You cannot enter a DNS name for a failover node. This means that any HTTP or HTTPS links that point to a failover node (for example, in notifications or in maps) always point to the failover node's IP address in your local network and might therefore not be reachable from external networks or from the internet, particularly if you use network address translation (NAT) rules.
- Email notifications for failover: The failover master node sends notifications if the primary master node is not connected to the cluster. To ensure that PRTG can deliver emails in this case, configure the [notification delivery](#) settings so that PRTG can use them to deliver emails from your failover node as well. For example, use the option to set up a secondary Simple Mail Transfer Protocol (SMTP) email server. This fallback server must be available for the failover master node so that it can send emails over it independently from the first email server.
- Make your machines secure. Every cluster node has full access to all stored credentials, other configuration data, and the monitoring results of the cluster. Also, PRTG software updates can be deployed from every cluster node. So, make sure you take security precautions to avoid security attacks like hackers and Trojans. Secure every cluster node as carefully as the master node.
- Run cluster nodes either on 32-bit or 64-bit Windows versions only. Avoid using both 32-bit and 64-bit versions in the same cluster. This configuration is not supported and might result in an unstable system. Also, ZIP compression for the cluster communication is disabled and you might encounter higher network traffic between your cluster nodes.
- If you run cluster nodes on Windows systems with different time zone settings and you use [schedules](#) to pause monitoring of sensors, the schedules apply at the local time of each cluster node. Because of this, the overall status of a particular sensor is shown as Paused every time the schedule matches a cluster node's local system time. Use the same time zone setting on each Windows system with a cluster node to avoid this behavior.
- The password for the [PRTG System Administrator](#) user account is not automatically synchronized on cluster nodes.
- Stay below 2,500 sensors per cluster for best performance in a single failover. Clusters with more than 5,000 sensors are not officially supported. For each additional failover node, divide the number of sensors by two.

In cluster mode, you cannot use sensors that wait for data to be received. Because of this, you can use the following sensors only on a [local probe or remote probe](#):

- [DHCP](#)
- [HTTP Push Count](#)
- [HTTP Push Data](#)
- [HTTP Push Data Advanced](#)
- [IPFIX](#) and [IPFIX \(Custom\)](#)
- [jFlow v5](#) and [jFlow v5 \(Custom\)](#)
- [NetFlow v5](#) and [NetFlow v5 \(Custom\)](#)
- [NetFlow v9](#) and [NetFlow v9 \(Custom\)](#)
- [Packet Sniffer](#) and [Packet Sniffer \(Custom\)](#)
- [sFlow](#) and [sFlow \(Custom\)](#)
- [SNMP Trap Receiver](#)
- [Syslog Receiver](#)

Remote Probes in a Cluster

PRTG provides cluster support for remote probes. This means that all your remote probes can connect to all of your cluster nodes. Because of this, you can still see monitoring data of remote probes and sensor warnings and errors even when your master node fails.

Remote Probes with Cluster Connectivity

Consider the following notes about clusters with remote probes.

- You have to allow remote probe connections to your failover nodes. To do so, log in to each machine in your cluster and open the [PRTG Administration Tool](#)⁴³⁵¹. On the PRTG Core Server tab, accept connections from remote probes on each cluster node.
- If you use remote probes **outside your local network**: You have to use IP addresses or Domain Name System (DNS) names for your cluster nodes that are valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Open the [Cluster](#)⁴²²⁹ settings and adjust the entries for cluster nodes accordingly so that these addresses are reachable from the outside. New remote probes try to connect to these addresses but cannot reach cluster nodes that use private addresses.
- If you use network address translation (NAT) with remote probes **outside the NAT**: You have to use IP addresses or DNS names for your cluster nodes that are reachable from the outside. If your cluster nodes are inside the NAT and the cluster configuration only contains internal addresses, your remote probes from outside the NAT are not able to connect. The PRTG core server must be reachable under the same address for both other cluster nodes and remote probes.

- A remote probe only connects to the PRTG core server with the defined IP address when starting. This PRTG core server must be the primary master node.
 - Initially, remote probes are not visible on failover nodes. You need to set their Cluster Connectivity first in the [Administrative Probe Settings](#)^[409] for them to be visible and to work with all cluster nodes. Select Remote probe sends data to all cluster nodes for each remote probe that you want to connect to all cluster nodes.
 - Newly connected remote probes are visible and work with all cluster nodes immediately after you acknowledge the probe connection. The connectivity setting Remote probe sends data to all cluster nodes is default for new remote probes.
 - As soon as you activate a remote probe for all cluster nodes, it automatically connects to the correct IP addresses and ports of all cluster nodes.
 - Once a remote probe has connection data from the primary master node, it can connect to all other cluster nodes also when the primary master node fails.
 - Changes that you make in the connection settings of cluster nodes are automatically sent to the remote probes.
 - If a PRTG core server (cluster node) in your cluster is not running, the remote probes [deliver monitoring data](#)^[450] after the server restarts. This happens individually for each PRTG core server in your cluster.
 - If you enable cluster connectivity for a remote probe, it does not deliver monitoring data from the past when cluster connectivity was disabled. For sensors that use difference values, the difference between the current value and the last value is shown with the first new measurement (if the respective sensor previously sent values to the PRTG core server).
 - Except for this special case, all PRTG core servers show the same values for sensors on devices that you add to the cluster probe.
 - The PRTG core server that is responsible for the configuration and management of a remote probe is always the current master node. This means that only the current master node performs all tasks of the PRTG core server. If you use a split cluster with several master nodes, only the master node that appears first in the cluster configuration is responsible.
- i** You can use remote probes in a cluster as described above, which is showing monitoring data of all remote probes on all cluster nodes. However, you cannot cluster a remote probe itself. To ensure gapless monitoring for a specific remote probe, install a second remote probe on a machine in your network next to the remote probe. Then create all devices and sensors of the original remote probe on the second remote probe by [cloning](#)^[4010] the devices from the original remote probe, for example. The second remote probe is then a copy of the first remote probe and you can still monitor the desired devices if the original remote probe fails.
- i** Remote probes that send data to all cluster nodes result in increased bandwidth usage. Select Remote probe sends data only to primary master node in the [probe settings](#)^[409] for one or more remote probes to lower bandwidth usage if necessary.
- i** Explicitly check on each cluster node if a remote probe is connected. PRTG does not notify you if a remote probe is disconnected from a cluster node. For example, log in to the PRTG web interface on a cluster node and check in the device tree if your remote probes are connected.

14.10.1 Failover Cluster Step by Step

This section guides you through the step-by-step process to set up a failover cluster. Follow these instructions carefully to successfully integrate two or more PRTG core servers into one failover cluster.

 Before you start, make sure that you consider the information in section [Failover Cluster Configuration](#) .

 This feature is not available in PRTG Hosted Monitor.

In this section:

- [Step 1: Install the PRTG Core Servers](#) 
- [Step 2: Configure the Master Node](#) 
- [Step 3: Configure the Failover Node](#) 
- [Step 4: Confirm the Failover Node](#) 
- [Step 5: Check the Cluster Connection](#) 
- [Step 6: Troubleshooting](#) 
- [Step 7: Move Sensors to the Cluster Probe Now](#) 
- [Step 8: Move Custom Content to the Failover Nodes](#) 
- [Step 9: Add More Failover Nodes \(optional\)](#)

Step 1: Install the PRTG Core Servers

First, you need two separate PRTG core server installations. Use the same license key for both PRTG core server installations.

If you already have a PRTG core server, this is your future master node. In this case, set up an additional PRTG core server installation.

Before you set up a cluster, make sure that all (future) cluster nodes run the **exact same** PRTG version (build number). Install updates if necessary.

 Once you establish the cluster, any updates that you install on a cluster node are automatically deployed to all other cluster nodes.

 For details about the installation process, see section [Install a PRTG Core Server](#) .

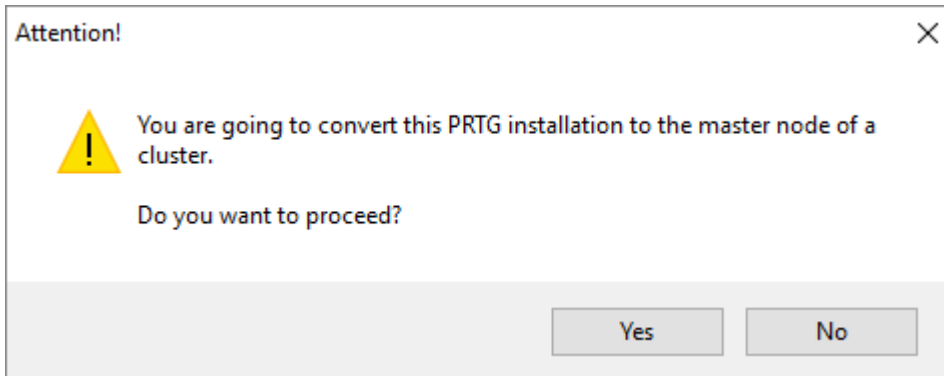

Step 2: Configure the Master Node

Decide which of your PRTG core server installations is your future master node. If you have an installation of PRTG in your network that has been running for some time, this should be your master node so that your monitoring configuration is kept.

On the master node, from the Windows Start menu, open the [PRTG Administration Tool](#) . On the Cluster tab, click the following button:

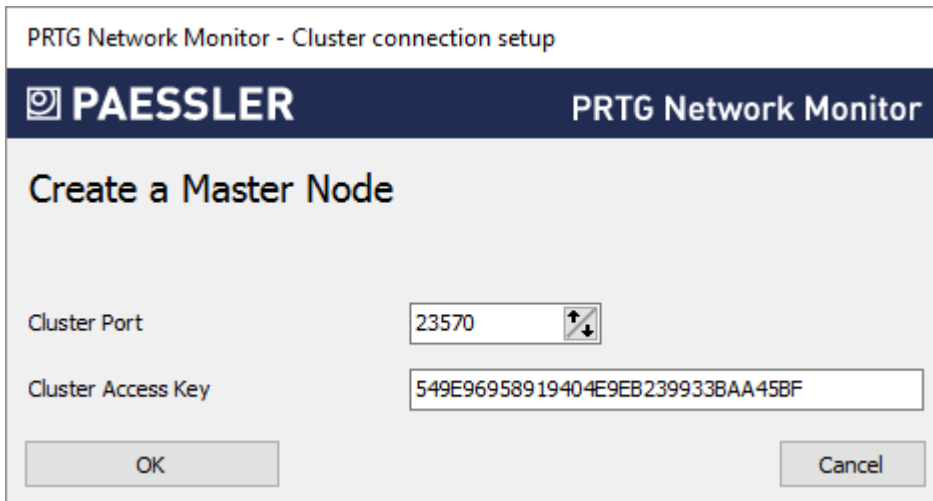

Create a Cluster

- Click Create a Cluster to create a cluster. The current PRTG core server is then the **master node** of the cluster.
- Click Yes to convert this installation to a master node.

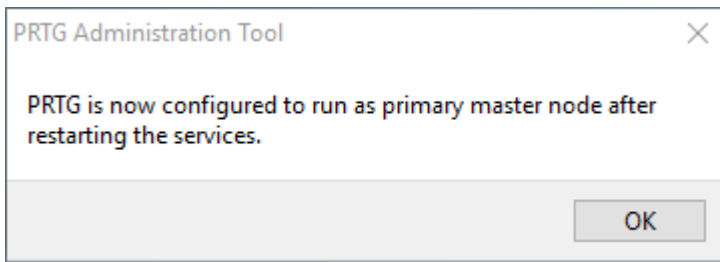

Converting an Installation to a Master Node

- A dialog box appears.

Creating a Master Node

- Enter a Cluster Port. This is the port on which PRTG sends the internal communication between the cluster nodes. Make sure that connections between the cluster nodes are possible on the selected port.
- Enter or paste a Cluster Access Key. This is a unique access key. All cluster nodes must use the same cluster access key to join the cluster. Connection attempts with a different access key are not possible. We recommend that you use the default value.
 - ① ▪ Save the Cluster Access Key so that you have it at hand when you configure the failover nodes.
- After confirming your settings, you are asked to restart Windows services. Click OK to restart the Windows services so that your changes take effect.

Restart Services to Apply Changes

Step 3: Configure the Failover Node

On the machine that is your failover node, open the [PRTG Administration Tool](#)⁴³⁶³. On the Cluster tab, click the following button:

Join a Cluster

- Click Join a Cluster to add this installation to a cluster that already has a **master node**. The current PRTG core server is then a **failover node**.
- This button is also available if the PRTG core server is in Cluster Mode: Master Node. This option then changes the master node to a failover node.
- Click Yes to convert this installation into a failover node.

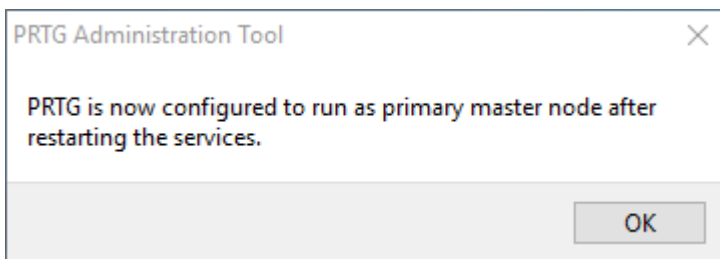

Converting an Installation to a Failover Node

- A dialog box appears.

Cluster Connection Setup

- Enter a Master Node (IP address/DNS name) for the cluster. It must be reachable from the machine that runs the failover node.
- Enter the other settings as defined in the settings of the [master node](#). Make sure that you use the same settings on all cluster nodes.
- Enter a Cluster Port. This is the port on which PRTG sends the internal communication between the cluster nodes. Make sure that connections between the cluster nodes are possible on the selected port.
- Enter or paste a Cluster Access Key. This is a unique access key. All cluster nodes must use the same cluster access key to join the cluster. Connection attempts with a different access key are not possible. We recommend that you use the default value.
 -  After confirming your settings, you are asked to restart Windows services. Click OK to restart the Windows services so that your changes take effect.

Restart Services to Apply Changes

Step 4: Confirm the Failover Node

Now you need to confirm the new failover node by setting it to Active in the master node's settings.

In a browser window, log in to the [PRTG web interface](#) ¹⁶⁴ of the master node.

In the [Cluster](#) ⁴²⁸ settings, you see your master node in the first line of the cluster list and your failover node in the second line.

i If you use [remote probes](#) ⁴⁵⁰³ outside of your local network, for each PRTG core server in the cluster, use a Domain Name System (DNS) name or IP address that the remote probes can reach from the outside. Enter the entries in the [Cluster Node Setup](#) ⁴²³⁰ table accordingly. The addresses must be valid for both cluster nodes to reach each other and for remote probes to individually reach all cluster nodes. Remote probes outside your LAN cannot reach private IP addresses or DNS names.

Cluster Node Setup

Node Name	Node ID	Node State	IPs/DNS Names used for Connections Between Nodes				
1 PRTG Network Monitor (10.0.1)	85F	Active	#2 ⇒ #1	#3 ⇒ #1	#4 ⇒ #1	#5 ⇒ #1	
2 Node 10.0.10.35	CF0	<input checked="" type="radio"/> Active	#1 ⇒ #2	#3 ⇒ #2	#4 ⇒ #2	#5 ⇒ #2	
3		<input type="radio"/> Active	#1 ⇒ #3	#2 ⇒ #3	#4 ⇒ #3	#5 ⇒ #3	
4		<input type="radio"/> Active	#1 ⇒ #4	#2 ⇒ #4	#3 ⇒ #4	#5 ⇒ #4	
5		<input type="radio"/> Active	#1 ⇒ #5	#2 ⇒ #5	#3 ⇒ #5	#4 ⇒ #5	

IPs/DNS Names used for Connections

#2 ⇒ #1

10.0.10.34

#1 ⇒ #2

10.0.10.35

System Administration: Cluster Node Setup

For the failover node, set the Node State to Active and Save the changes. The cluster nodes now connect and exchange configuration data. This might take a few minutes.

Step 5: Check the Cluster Connection

In two browser windows, log in to the PRTG web interfaces of **both** of your PRTG core servers. Open the Cluster Status tab in both windows. You should see the cluster status with the two cluster nodes in a Connected state after a few minutes.

Node 1: PRTG Network Monitor (10.0.10.34)		
Primary Node (Current Master)		Start Maintenance Mode
Connection To	IP	State
⇒ Node 10.0.10.35	10.0.10.35	Connected
Node 2: Node 10.0.10.35		
Secondary Node (Failover Node, Version: 50186)		Start Maintenance Mode
Connection To	IP	State
⇒ PRTG Network Monitor (10.0.10.34)	10.0.10.34	Connected

Cluster Status

Step 6: Troubleshooting

If the cluster nodes cannot connect, see

- the cluster log entries on the [Cluster Status](#) ⁴²⁴⁸ tab in the PRTG web interface
- the PRTG core server logfile, a text file in the \Logs subfolder of the [PRTG data directory](#) ⁴⁵²⁶, ⁴⁵²⁶

In the latest entries of these logs, you can see messages about any errors that might have occurred. These give you hints on where to find a solution.

If you have connection issues with the two cluster nodes, make sure that no software or hardware firewall is blocking communication on the cluster port defined during cluster setup. Communication between the cluster nodes must be possible in **both directions** for the cluster to work properly.

Step 7: Move Sensors to the Cluster Probe Now

You have successfully set up your failover cluster. All devices that you create or move under the cluster probe are monitored by both cluster nodes.

i To monitor your configuration via all cluster nodes, on your master node, move your groups, devices, and sensors from the local probe to the cluster probe. Objects, including their settings, are then automatically transferred to all cluster nodes.

Step 8: Move Custom Content to the Failover Nodes

On startup of the master node, [maps](#) ⁴⁰⁹⁵ and [custom lookups](#) ⁴⁴⁸⁵ are automatically transmitted to the failover nodes. While changes to maps are automatically synchronized, you have to manually [\(re\)load lookups](#) ⁴⁴⁹⁴ on all cluster nodes. Other custom content has to be manually copied from the according subfolders of the [PRTG program directory](#) ⁴⁵²⁶ on the master node to the same folders on the failover nodes.

Custom Content	Subfolder of the PRTG Program Directory
Device templates 	\devicetemplates
Custom sensors 	\devicetemplates
MIB files 	\MIB
SNMP libraries 	\snmplibs
Notifications 	\Notifications

Step 9: Add More Failover Nodes (optional)

If you want to add an additional failover node to your cluster, you need an additional license key to run two and three failover nodes, and two additional license keys to run four failover nodes.

i In a cluster, only PRTG core servers that have with the same [license](#)  type can be combined. To add an additional failover node to the cluster, set up a new PRTG core server on a new machine and use an additional license key. Then proceed with [step 3](#)  and following. Use a second license key to set up both the second failover node and third failover node. Use a third license key to set up the fourth failover node. Each failover cluster is technically limited to five cluster nodes: as a maximum, you can have one master node and four failover nodes in one cluster.

i Stay below 2,500 sensors for best performance in a cluster. Clusters with more than 5,000 sensors are not supported. For each additional failover node, divide the number of sensors by two.

14.11 Data Storage

PRTG stores the monitoring configuration, monitoring data, logs, tickets, and reports, as well as support and debug data into different subfolders in the PRTG data directory on the probe system. Additionally, there is data in the PRTG program directory (for example, scripts for your custom sensors^[4526]) and in the Windows registry.

☁ You cannot access these directories on the PRTG Hosted Monitor core server system.

Find the following topics below:

- [PRTG Program Directory](#)^[4526]
- [PRTG Data Directory](#)^[4526]
- [Files and Subfolders in the PRTG Data Directory](#)^[4526]
- [Structure of the Logs Folder](#)^[4528]
- [Windows Registry](#)^[4529]
- [HTTP Full Web Page Sensor: Cached Files](#)^[4529]
- [Auto-Update Files](#)

PRTG Program Directory

32-bit systems:

```
%programfiles%\PRTG Network Monitor
```

64-bit systems:

```
%programfiles(x86)%\PRTG Network Monitor
```

i These are the default paths. If you specified a different installation directory, you find your data there.

PRTG Data Directory

On Windows Vista (not officially supported), Windows 7, Windows Server 2008 R2, Windows 8, Windows 8.1, Windows Server 2012, Windows 10, Windows Server 2016, or Windows Server 2019:

```
%programdata%\Paessler\PRTG Network Monitor
```

i These are the default paths, depending on your Windows version. If you specified a custom path for data storage, you need to look it up in the [PRTG Administration Tool](#)^[4351] on the PRTG Core Server tab. You find the path there.

i The Windows ProgramData folder is hidden by default. To display it, you have to enable hidden items in the View options of your Windows system.

Files and Subfolders in the PRTG Data Directory

The following files are stored in the PRTG data directory:

File	Description	File Format
PRTG Configuration.dat	Monitoring configuration (for example probes, groups, devices, sensors, users, maps, reports, and more)	Extensible Markup Language (XML)
PRTG Configuration.old	Backup of previous version of monitoring configuration	XML
PRTG Graph Data Cache.dat	Precalculated data for the graphs throughout the PRTG web interface (if missing, this file is automatically recalculated from the files in the "monitoring database")	Proprietary

The following folders are stored in the PRTG data directory:

Folder	Description	File Format
\Configuration Auto-Backups	Backup versions of the file PRTG Configuration.dat	ZIP / XML
\Log Database	Database with the recent event history for the whole system: menu option Logs in the PRTG web interface	Raw data format (DB)
\debug	Text file based logs of the core server system and the probe system	TXT
\sensors	Text file based debug logs of the sensors (files named after the ID of a sensor; logs are written only if activated in a sensor's settings)	TXT
\core	Text file based logs of the core server system, the probe system, the cluster system, and result files for certain sensors	TXT
\webservice	HTTP server logfiles of the PRTG web server	Standard web server log format
\Monitoring Database	Results of all monitoring requests for all sensors (required for historic reports)	Proprietary
\Report PDFs	Older PDF reports stored in the file system	PDF
\reporter	Screenshots created for reporting issues to the Paessler Support team	PNG
\Screenshots (Fullpage Sensor)	Screenshots stored by the PhantomJS browser engine of the HTTP Full Web Page sensor	JPG (in subfolders)

Folder	Description	File Format
\StreamLog	Data logfiles for Packet Sniffer and xFlow (NetFlow, jFlow, sFlow, IPFIX) sensors (only available if activated in the sensor settings)	
\Support Data	Collected and compressed logfile data when sending a support bundle to the Paessler support team ■ For more information, see the Knowledge Base: What is the best way to contact Paessler Support?	LOG / TXT / ZIP
\Syslog Database	Received Syslog messages	Proprietary
\System Information Database	Retrieved system information ^[23] for the categories hardware, users (loggedonusers), processes, services, software, system (in according subfolders)	Proprietary (in JavaScript Object Notation (JSON) format)
\ToDo Database	Database with all ToDo entries	Raw data format (DB) Deprecated as of PRTG 14.1.8
\Ticket Database	Database with all tickets ^[24] (ticketdata.dat)	Raw data format (DAT)
\Toplist Database	Database for historic Toplists for Packet Sniffer and xFlow sensors	Raw data format (TOP)
\Trap Database	Received SNMP Trap messages	Proprietary

Structure of the Logs Folder

Folder	Description	File Format
\appserver	Currently not in use	N/A
\core	Text file based logs of the core system and cluster system	TXT
\debug	Text file based debug logs of the core system and probe system, and core cache recalculation	TXT
\desktopclient	Currently not in use	N/A

Folder	Description	File Format
\enterpriseconsole	Text file based logs of the deprecated Enterprise Console	TXT
\probe	Text file based logs of the probe system	TXT
\reporter	Text file based logs of creating PDF reports and screenshots for the Paessler Support team	TXT
\sensordeprecation	Text file based log of deprecated sensors	TXT
\sensors	Text file based logs of sensors	TXT
\serveradmin	Text file based logs of the administration system	TXT
\webserver	HTTP server logfiles of the PRTG web server	TXT

Windows Registry

System settings on 32-bit systems:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Paessler\PRTG Network Monitor
```

System settings on 64-bit systems:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Paessler\PRTG Network Monitor
```

HTTP Full Web Page Sensor: Cached Files

If you use the HTTP Full Web Page, files might be cached in this directory:

```
C:\Windows\System32\config\systemprofile\AppData\Local\Microsoft\Windows\Temporary Internet Files\Content.IE5
```

Auto-Update Files

PRTG automatically saves downloaded software versions in the \download subfolder of the PRTG program directory. The compressed prtg.zip file that contains all necessary files is also cached there.

14.12 PRTG Housekeeping

Once you have prepared your IT infrastructure and set up the devices and sensors you need for monitoring your network with PRTG, you can let PRTG do its work. However, you should regularly review your setup to keep your installation of PRTG up to date and ensure the best possible monitoring for your network. In this section, you find some tips on what to check in your PRTG installation and, if necessary, how to clean it up.

In this section:

- [General Issues](#) 
- [License and Version Check](#) 
 - [License Information](#) 
 - [Software Version and Server Information](#) 
- [System and Performance Check](#) 
 - [Overall System Status](#) 
 - [Background Tasks](#) 
 - [Libraries and Sensors Check](#) 
 - [User Accounts Check](#) 
 - [Maps Check](#) 
 - [Notifications](#) 
 - [Data Storage and Backup](#)

General Issues

- Check if you still have your license document. If not, [request your license](#) from Paessler anew.
- Check if the customer contact details (including VAT identification number) that Paessler has from you are still valid. If you need to update your data, do not hesitate to [contact](#) us.
- If you [use your own SSL certificate](#)  and not the default Secure Sockets Layer (SSL) certificate delivered with PRTG, check if your certificate is still valid.
- Regularly check our [Paessler Blog](#) and/or subscribe to our weekly newsletter to stay up to date regarding PRTG and other IT-related content.

License and Version Check

License Information

- Check if your license  is still up to date. You can view the activation status of PRTG under Setup | License Information.

 This option is not available in PRTG Hosted Monitor. For PRTG Hosted Monitor, log in to your PRTG Hosted Monitor instance and [manage your subscription](#)  there.

- For a quick overview of your license status, go to the [Welcome](#) ¹⁷⁴ page. There you can see how many maintenance days you have left and the number of sensors available to you.
 - ❗ The number of available sensors that is displayed here does not consider sensors in the Paused [status](#) ¹⁹⁷ for technical reasons. However, sensors in the Paused status are not included in the maximum number of sensors that your license allows. Add the number of your sensors that are in the Paused status to the displayed number to know exactly how many sensors are still available on your installation.

Software Version and Server Information

- Check if you run the most recent version of PRTG. You can view your PRTG version under Setup | PRTG Status, section Software Version And Server Information. The version number consists of the following parts: **year**, **quarter**, **version**, **build**. For example, if your PRTG version is **19.2.52.1161**, this means that you have installed version **52**, build **1161**, which was released in the second quarter of the year **2019**.
 - Check if the selected [release channel](#) ²⁰ is still the one that fits your monitoring requirements. You can view the release channel you use under Setup | Auto-Update | Status. Available channels are Stable (most conservative option), Preview (thoroughly tested), and Canary (for testing only). To select a different release channel, click the Select Other Release Channel link.
- ❗ You can also view your installed PRTG version and release channel in the footer of the PRTG web interface.

System and Performance Check

Overall System Status

Check your overall [system status](#) ⁴²³⁶ under Setup | PRTG Status.

Section	What to do
Software Version And Server Information	<p>Check your Server CPU Load. This value should be lower than 50%.</p> <ul style="list-style-type: none"> ■ For information on how to improve your system performance, see the Knowledge Base: How can I speed up PRTG—especially for large installations?
System Startup Log	<ul style="list-style-type: none"> ▪ Check if the log of your last system startup is OK all in all. ▪ Check when the last system restart took place. If it has been more than one month, we recommend that you restart your server. Optionally, you can combine the restart with the installation of the latest Windows updates. <ul style="list-style-type: none"> ❗ To schedule an automatic probe restart (for example, for the local probe or a remote probe), go to the respective probe's Settings tab, section Scheduled Restart Settings, and select your favorite Restart Option. ■ For further logfiles and where to find them, see section Data Storage ⁴⁵²⁶.
System Warnings	<p>Check if your system warnings say None.</p>

Section	What to do
	<p>System warnings that might be shown are, for example:</p> <ul style="list-style-type: none"> ▪ The available diskspace is too low! ▪ The available memory is too low! ▪ Connection to database lost! ▪ No configuration file found, but monitoring data for an unknown configuration exists! ▪ This beta version has expired ▪ The path to PRTG's configuration file (%s) could not be found. Please check network paths if applicable. ▪ Internal error. Restart of PRTG required. ▪ The license of this cluster member is not valid for operating in the configured cluster.
Sensors by Interval	<ul style="list-style-type: none"> ▪ Check how many sensors have a scanning interval of 300 seconds or even shorter. ▪ Ask yourself if the chosen scanning intervals really make sense regarding the performance impact^[4243] of the respective sensors on your system. Shorter scanning intervals usually do not give you more accuracy but cause unnecessary load on your machine and the network. For example, does a WMI Free Disk Space (Multi Disk) sensor really need to scan your disks every 60 seconds, or is it really necessary to search for Windows updates more often than once every 24 hours? <p>ⓘ Tip: Change the scanning interval in the Root Group Settings^[366] and use the inheritance mechanism to use this interval for all objects that are below in the object hierarchy.</p>
System Settings	<ul style="list-style-type: none"> ▪ Check if your web server ports are still correct. ▪ If your PRTG core server system is reachable via the internet, we recommend that you prevent communication via port 80 (HTTP) and that you only use port 443 (HTTPS). To change the web server settings, go to Setup System Administration User Interface, section Web Server, and select a TCP Port for Web Server.
Web Server Activity	<p>Check the Slow Request Ratio. This value should be lower than 10%.</p>

Background Tasks

- Check if there are any scheduled [auto-discoveries](#)^[296] that you do not need anymore. You can view a list of all auto-discovery processes or running auto-discovery processes under Logs | System Events | Auto-Discovery.

- Check if [similar sensors detection](#)  is enabled. If you do not need this analysis (which runs with low priority in the background), go to Setup | System Administration | Monitoring and select Turn analysis off.
- Check if [recommended sensors detection](#)  is enabled. If you do not need this analysis (which runs with low priority in the background when you add a new device, when the last analysis was executed more than 30 days ago, or when you manually start it), go to Setup | System Administration | Monitoring and select Turn sensor recommendations off.

Libraries and Sensors

- Check if all your [libraries](#)  are up to date. Remove all (default) libraries that you do not need.
- Check if there are any sensors that are still monitoring your network although you do not need them for your infrastructure, particularly if they have a high impact on system performance. For example, this includes the following sensor types: Sensor Factory, Packet Sniffer, VMware, Email Round Trip, SQL Server, CloudWatch, QoS, File, Folder, HTTP Full Web Page, and custom EXE sensors. Set the sensors to the Paused status if you do not want to completely delete them from your system.
- Check the number of channels per sensor. Sensors with more than 50 channels can have a high impact on system performance.
- Check the [List of Available Sensor Types](#) . Are there any new sensors that you do not know yet?

User Accounts

- Check if your [user accounts](#)  and [user groups](#)  are still up to date. Update user contact details (email address, phone number) if necessary, or disable users that do not work with the respective installation of PRTG anymore. Always keep in mind that multiple user accounts and groups can slow down web server performance.
- Check your [user access rights](#)  settings.

Maps

- Check if the [maps](#)  you created are still in use or if you could delete them.
- Check if there are any broken links in the maps that might need correction.
- Check if you can still retrieve embedded HTML objects and frames.

Notifications

- Check if the contact details (email address, phone number for SMS) in your [notification contacts](#)  are still up to date.
- Check if custom [notification templates](#)  are still in use by clicking  under Setup | Account Settings | Notification Templates.
- Check if there are any new default notification templates that might be of use for your specific setup.
- Check if your notification templates still work by clicking  under Setup | Account Settings | Notification Templates.
- Check if there are any error messages regarding notifications under Logs | System Events | Notifications.

Data Storage and Backup

- Check for how many days [different kinds of data are kept](#)⁴²⁰⁶ and if you might be able to optimize your settings so that the file containing this data does not get too large. To change the settings, go to Setup | System Administration | Core & Probes, section Historic Data Purging.
- Manually check the \Configuration Auto-Backups subfolder of the [PRTG data directory](#)⁴⁵²⁶: Are backups still being written? Are these backups perhaps filling up available disk space?
 - For more information, see also the Knowledge Base: [How do I back up all data and configuration of my PRTG installation?](#)

14.13 Using Your Own SSL Certificate with the PRTG Web Server

This section gives you a brief overview of how to use your own trusted Secure Sockets Layer (SSL) certificate files with the PRTG web server.

☁ This only applies to PRTG on premises installations, not to PRTG Hosted Monitor instances.

What is SSL/TLS?

PRTG supports SSL/TLS to secure all data entered and shown in the [PRTG web interface](#)^[163], in [PRTG Desktop](#)^[4276], or in the [PRTG apps for iOS or Android](#)^[4276]. This ensures that no sensitive information can be intercepted when sending data between the PRTG core server and your client software.

By default, PRTG is delivered with an SSL certificate so you can use secure connections to your PRTG core server. However, this is a self-signed certificate, which is why browsers show an [SSL certificate warning](#)^[169] when you try to access the PRTG web interface. Despite this warning, your connection is still completely secure.

To remove the browser warning, you can obtain a certificate that is valid for your own domain name and signed by a valid authority. You can request your own trusted certificate from an issuer like GoDaddy, DigiCert, or InstantSSL, for example. You must provide the certificate in a suitable format and you have to import it correctly into your PRTG core server.

Importing Trusted SSL Certificates for PRTG

There are many different issuers for certificates, and there are different formats in which certificates can be provided. PRTG needs three different correctly named files containing data in the expected encoding and format. This can make manually importing an issued certificate slightly complicated because there are various certificate files that you must retrieve from a certificate authority (CA). So, to ease the installation of a trusted certificate, we provide the freeware tool PRTG Certificate Importer.

The PRTG Certificate Importer automatically combines and converts all files that a CA bundle contains for use with PRTG and stores the certificate files under the correct path on your PRTG core server. At best, you only provide the path to your received CA bundle and let the tool do the rest. We strongly recommend that you use the PRTG Certificate Importer if you want to install a trusted certificate for PRTG.

✂ For more information about this tool and a download link, see the Paessler website: [PRTG Certificate Importer](#)

Manual Certificate Import

Although we recommend that you use PRTG Certificate Importer because it is much more comfortable, you can still import your trusted certificate manually. If you do so, note that PRTG requires three different certificate files in a Privacy-Enhanced Mail (PEM) encoded format, and an unencrypted private key:

- `prtg.crt`: This is the certificate for your PRTG core server. It has to be stored in PEM-encoded format.
- `prtg.key`: This is the private key matching your server certificate. It has to be stored in PEM-encoded format and must not be encrypted. Make sure that you provide this file in [decrypted](#) format. The best way to check this is to open the file in a text editor. If you find a line containing the word "ENCRYPTED", the file still needs to be decrypted before you can use it with PRTG. Decrypt it using an SSL tool (for example, OpenSSL) and your key password.

- root.pem: This is the public root certificate of your certificate's issuer. It has to be stored in PEM-encoded format and must contain all necessary root certificates of your issuer in one file. If there is more than one PEM-encoded root certificate, use a text editor to copy all of them into a single file (the order does not matter).

 PEM-encoded files must not contain Unix line breaks. Only Windows line breaks are supported.

Copy these three files to the \cert subfolder of the [PRTG program directory](#)⁴⁵²⁶ (back up files before) on the PRTG core server and restart the PRTG core server service (see section [PRTG Administration Tool on PRTG Core Server Systems](#)⁴³⁶⁴).

 The PRTG core server service is not able to start if the files are not provided in exactly the expected format.

 If you use remote probes, make sure that you copy the same certificates to the \cert subfolder of the [PRTG program directory](#)⁴⁵²⁶ on the remote probe and restart the PRTG probe service (see section [PRTG Administration Tool on Remote Probe Systems](#)⁴³⁷⁶).

 For detailed instructions and examples, installation descriptions for various certificates (including [Wildcard](#) certificates), as well as links to certificate tools and converters, see section [More](#)⁴⁵³⁸.

15.1 Differences between PRTG on premises and PRTG Hosted Monitor

See below for the differences between the settings and features that PRTG on premises and PRTG Hosted Monitor have to offer.

Licensing, Payment, Infrastructure

Topic	PRTG on premises	PRTG Hosted Monitor
Trial period	30 days	10 days
Freeware	freeware (100 sensors) available	no freeware, smallest edition is PRTG 500
Payment	one-time license fee plus yearly maintenance	monthly fee
PRTG edition size flexibility	upgrade only	upgrade or downgrade
Maximum installation size	unrestricted	10,000 sensors
PRTG update management	done by user	done by Paessler

Features

Feature	PRTG on premises	PRTG Hosted Monitor
Local probe	Yes	No
Hosted probe	No	Yes
Cluster	Yes	No
Freeware (100 sensors)	Yes	No
Remote Desktop Protocol (RDP) access to core server	Yes	No
Historic data purging (manually defined)	Yes	No

Feature	PRTG on premises	PRTG Hosted Monitor
Active Directory integration	Yes	No
License settings via PRTG web interface	Yes	No
Recommended Sensors on local probe/hosted probe	Yes	No
Auto-discovery for groups on local probe/hosted probe	Yes	No
Mini probes	Yes	No
Device tools on local probe/hosted probe	Yes	No
Proxy server settings	Yes	No
System information on local probe/hosted probe	Yes	No
PRTG Administration Tool on PRTG core server	Yes	No
Notification methods:	Yes	No
<ul style="list-style-type: none"> ▪ Add Entry to Event Log ▪ Syslog Message ▪ SNMP Trap Message ▪ Execute Program 		
Re-login request on setup pages after 15 minutes	Yes	No
IPv6 on local probe/hosted probe	Yes	No

Sensors on the Hosted Probe of PRTG Hosted Monitor

You can use the following sensors on the hosted probe of PRTG Hosted Monitor:

Supported Sensors

Amazon CloudWatch Alarm sensor

TFTP sensor

Traceroute Hop Count sensor

Veeam Backup Job Status sensor

VMware Datastore (SOAP) sensor

VMware Host Hardware (WBEM) sensor

VMware Host Hardware Status (SOAP) sensor

Supported Sensors

VMware Host Performance (SOAP) sensor

VMware Virtual Machine (SOAP) sensor

Zoom Service Status sensor

Sensors on a Remote Probe Device

You can use the following sensors only on a [remote probe](#) ⁴⁵⁰³ device.

i For performance reasons, you cannot add these sensors to the hosted probe of a PRTG Hosted Monitor instance.

Supported Sensors

Active Directory Replication Errors sensor

ADO SQL v2 sensor

Dell PowerVault MDi Logical Disk sensor

Dell PowerVault MDi Physical Disk sensor

DHCP sensor

Enterprise Virtual Array sensor

Event Log (Windows API) sensor

Exchange Backup (PowerShell) sensor

Exchange Database DAG (PowerShell) sensor

Exchange Database (PowerShell) sensor

Exchange Mailbox (PowerShell) sensor

Exchange Mail Queue (PowerShell) sensor

Exchange Public Folder (PowerShell) sensor

EXE/Script sensor

Supported Sensors

EXE/Script Advanced sensor

File sensor

File Content sensor

Folder sensor

HTTP Full Web Page sensor

HTTP Push Count sensor

HTTP Push Data sensor

HTTP Push Data Advanced sensor

Hyper-V Cluster Shared Volume Disk Free sensor

Hyper-V Host Server sensor

Hyper-V Virtual Machine sensor

Hyper-V Virtual Network Adapter sensor

Hyper-V Virtual Storage Device sensor

IPFIX sensor

IPFIX (Custom) sensor

IPMI System Health sensor

jFlow v5 sensor

jFlow v5 (Custom) sensor

Microsoft SQL v2 sensor

MySQL v2 sensor

NetFlow v5 sensor

NetFlow v5 (Custom) sensor

Supported Sensors

NetFlow v9 sensor

NetFlow v9 (Custom) sensor

Oracle SQL v2 sensor

Oracle Tablespace sensor

Packet Sniffer sensor

Packet Sniffer (Custom) sensor

PerfCounter Custom sensor

PerfCounter IIS Application Pool sensor

Port sensor

Port Range sensor

PostgreSQL sensor

Python Script Advanced sensor

QoS (Quality of Service) One Way sensor

QoS (Quality of Service) Round Trip sensor

sFlow sensor

sFlow (Custom) sensor

Share Disk Free sensor

SMTP sensor

SNMP Trap Receiver sensor

Syslog Receiver sensor

Windows CPU Load sensor

Windows IIS 6.0 SMTP Received sensor

Supported Sensors

Windows IIS 6.0 SMTP Sent sensor

Windows IIS Application sensor

Windows MSMQ Queue Length sensor

Windows Network Card sensor

Windows Pagefile sensor

Windows Physical Disk I/O sensor

Windows Print Queue sensor

Windows Process sensor

Windows System Uptime sensor

Windows Updates Status (PowerShell) sensor

WMI Battery sensor

WMI Custom sensor

WMI Custom String sensor

WMI Disk Health sensor

WMI Event Log sensor

WMI Exchange Server sensor

WMI Exchange Transport Queue sensor

WMI File sensor

WMI Free Disk Space (Multi Disk) sensor

WMI HDD Health sensor

WMI Logical Disk I/O sensor

WMI Memory sensor

Supported Sensors

WMI Microsoft SQL Server 2005 sensor (Deprecated)

WMI Microsoft SQL Server 2008 sensor

WMI Microsoft SQL Server 2012 sensor

WMI Microsoft SQL Server 2014 sensor

WMI Microsoft SQL Server 2016 sensor

WMI Microsoft SQL Server 2017 sensor

WMI Microsoft SQL Server 2019 sensor

WMI Remote Ping sensor

WMI Security Center sensor

WMI Service sensor

WMI Share sensor

WMI SharePoint Process sensor

WMI Storage Pool sensor

WMI Terminal Services (Windows 2008+) sensor

WMI Terminal Services (Windows XP/Vista/2003) sensor

WMI UTC Time sensor

WMI Vital System Data v2 sensor

WMI Volume sensor

WSUS Statistics sensor

Settings

 These settings are only available in PRTG on premises.

Setting Title	Setting Name
Auto-Update	When a New Version is Available
	Installation Time
	Release Channel
Notification Templates	Add Entry To Event Log
	Send Syslog Message
	Send SNMP Trap
	Execute Program
Core & Probes	Proxy Configuration
	Probe Connection IPs
	Mini Probes
	Mini Probe Port
Administrative Tools for Probes	Restart Local Probe
Scanning Intervals	Available Intervals (definition of individual intervals)
Notification Delivery	SMTP Delivery (everything but sender email and name)
	SMS Delivery
Recommended Sensors Detection	Detection Engine
User Interface (Website)	DNS Name
	Google Analytics Tracking ID
User Interface (Web Server)	IP Address for Web Server
	TCP Port for Web Server
	Web Server Port
	Web Server Security

Setting Title	Setting Name
	Connection Security
	Active IP Address/Port Combination(s)
User Accounts	Login Name
	Password
	Passhash
Administrative Tools for the Core Server	Create Configuration Snapshot
	Write Core Status File
	Clear Caches
	Load Lookups and File Lists
	Recalculate PRTG Graph Data Cache
	Restart PRTG core server service
	Reload Logging Configuration
Advanced Network Analysis	System Information
Scheduled Restart Settings (Local Probe)	Restart Options
	Restart Schedule
	Specify Day
	Specify Hour

15.2 Glossary

This section explains PRTG-specific terminology.

Alarms

The [alarms](#) list shows all [sensors](#) that are in the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual [status](#). The alarms list shows you all irregularities in your network.

Auto-discovery

The [auto-discovery](#) process uses Ping to scan your network for [devices](#) (for [groups](#) only). It assesses the device type for all discovered devices, and it creates [sensor](#) sets that match the discovered device types based on built-in templates or your custom [device templates](#).

Channel

The monitoring data of a [sensor](#) is shown in [channels](#). For example, sensors that measure network traffic have one channel each for traffic [in](#), traffic [out](#), and traffic [total](#). You can set various [triggers](#) for each channel to define [sensor status](#) changes or [notifications](#) based on the monitoring data received.

Cluster

A [cluster](#) consists of two or more [PRTG core servers](#) that work together to form a high availability monitoring system. A cluster consists of a [master node](#) and one or more [failover nodes](#). Every [cluster node](#) can monitor every [device](#) in a network for fail-safe monitoring.

Cluster node

[Cluster nodes](#) make up a cluster. Cluster nodes can be [master nodes](#) or [failover nodes](#).

Cluster probe

When you create or join a [cluster](#), PRTG automatically creates a [cluster probe](#). All [objects](#) that you create on the cluster probe (or below in the [device tree](#)) are monitored by all [cluster nodes](#). Create or move [objects](#) there for fail-safe monitoring. If one cluster node fails, the other cluster nodes continue to monitor all objects. You can add [groups](#) and [devices](#) to the cluster probe. The cluster probe runs as part of the [local probe](#).

Cluster probe device

The [cluster probe device](#) is an internal system device that PRTG automatically adds to the [cluster probe](#). It has access to the [cluster node](#) system and monitors its health parameters using several [sensors](#).

Dashboard

A preconfigured sample [dashboard](#) is available in the Home menu of the PRTG web interface. Dashboards provide an overview of the overall status of your monitoring configuration. You can create custom dashboards using the [Maps](#) feature.

Device

A [device](#) represents a physical or virtual component in your network that is reachable via an IP address. For a clear [device tree](#) structure, you usually create one device for each physical or virtual component that you want to monitor. You can add one or more [sensors](#) to a device.

Device template

If you want to add a specific [device](#) several times, you can create a [device template](#) from a device in the [device tree](#). When you create a device template, PRTG saves information for nearly all [sensors](#) on the device to a template file. You can later use the template file in combination with the [auto-discovery](#) (restrictions apply for a few sensor types).

Device tree

The configuration of PRTG is represented in a hierarchical tree structure called the [device tree](#), which contains all monitoring [objects](#). While building the device tree, you can relate to your network's topology to make your monitoring setup more understandable.

Failover master node

If the [primary master node](#) of a [cluster](#) fails, a [failover node](#) becomes a [failover master node](#). The failover master node takes over the role of the primary master node until it reconnects to the cluster.

Failover node

In a [cluster](#), a [failover node](#) monitors all [sensors](#) on the [cluster probe](#) and it provides monitoring data for the [PRTG core server](#). Additionally, it serves as a backup in case the [master node](#) fails.

Gauge

A [gauge](#) is a type of visual representation of the values of a [channel](#). The gauge needle points to the current value of the channel. Other types of visual representations are [toggles](#) and [switches](#).

Geo Maps

The [Geo Maps](#) feature shows the different locations of your [devices](#) on a geographical map using the location data that you provide in the settings of [probes](#), [groups](#), or devices. The status icons on the geographical maps that represent your devices also show the overall status of a location. This is useful for monitoring distributed networks.

Group

A [group](#) is an organizational unit in the [device tree](#). You can add [devices](#) or subgroups to groups. This way, you can model your physical network's topology within the PRTG configuration. You can use groups to arrange similar objects so that they inherit the same settings.

Hosted probe

The [hosted probe](#) in PRTG Hosted Monitor is like the [local probe](#) in PRTG on premises. When you create a PRTG Hosted Monitor instance, the system automatically adds the hosted probe. The hosted probe runs on the [PRTG core server](#) system that we host for you and it shows the monitoring values of your PRTG Hosted Monitor instance. You can use the hosted probe to monitor [devices](#), servers, and services that are publicly available on the internet like, for example, websites. To monitor your LAN, you need at least one [remote probe](#) installation in your network. The local probe is not available in PRTG Hosted Monitor.

Library

A [library](#) enables you to create additional views of your [device tree](#). These views are updated in the same scanning interval as your device tree and show the same monitoring data, but arranged the way you want. This is useful if you want to display data in different ways, like depending on target groups or a specific use case.

Library node

[Libraries](#) use [library nodes](#) to reference [objects](#) in your monitoring setup. Library nodes can show a subtree of the [device tree](#) or they can show a collection of filtered [sensors](#).

Limit

[Limits](#) let you define thresholds for [channel](#) values. When the value of a channel is above or below the defined limit, the sensor can show the Warning or Down status.

Local probe

When installing PRTG on premises, the [local probe](#) is installed together with the [PRTG core server](#). All [objects](#) created on the local probe, or underneath it in the [device tree](#), are monitored by the local PRTG core server system. You can add [groups](#) and [devices](#) to the local probe. If you use PRTG Hosted Monitor, the [hosted probe](#) replaces the local probe.

Lookup

PRTG uses [lookups](#) for some [sensor](#) types and for some sensors with custom [channels](#). In general, lookups map status values as returned by a [device](#) (usually integers) to more informative expressions in words.

Maps

The [Maps](#) feature lets you present monitoring data the way you want it. An editor is available that lets you create maps (sometimes referred to as [dashboards](#)) directly in your browser. Using maps, you can also make overviews of live data publicly available.

Master node

In a [cluster](#), the [master node](#) controls the settings and cluster management. It also takes over notifications. All changes to the monitoring configuration are made on the master node, which distributes the changes among all other cluster nodes in real time. There are two types of master nodes: [primary master node](#) and [failover master node](#).

Meta-scan

Sensors that use the [meta-scan](#) function, for example SNMP sensors, first look at the according [device](#) to find what they can monitor. This can be tables, object identifiers (OID), or disks, for example. When the meta-scan is finished, the second step of the [Add Sensor](#) dialog shows you the parameters that you can monitor. Some sensors require basic information before they can perform a meta-scan. Provide the requested information, such as credentials, in the appearing dialog box. PRTG then scans and recognizes all parameters that are available for monitoring based on your input.

Mini probe

With a [mini probe](#), you can create small [probes](#) on any [device](#) (not only on Windows systems).

Notification

PRTG uses [notifications](#) to send you alerts whenever it discovers a defined status, such as slow [sensors](#), or when [channels](#) breach threshold values. You can define an unlimited number of notifications. You can use one or more of several notification methods like email, text messaging, push notifications to Android and iOS devices, and more.

Notification trigger

PRTG sends a [notification](#) when a defined event triggers it. These events are known as [notification triggers](#). The following events can trigger notifications: [sensor status](#) changes, [sensor](#) value threshold breaches, speed threshold breaches, volume threshold breaches, and sensor value changes.

Object

All types of items in the [device tree](#) are generally referred to as [objects](#), or [monitoring objects](#). An object can be a [probe](#), a [group](#), a [device](#), or a [sensor](#).

Object hierarchy

All [objects](#) are arranged in a hierarchical order called the [object hierarchy](#). The object hierarchy is used to define common settings for groups of objects.

Object selector

The [object selector](#) lets you browse all [objects](#) in your configuration and lets you select an object. The left-hand side shows the [device tree](#). If you have selected a [device](#), the right-hand side shows the [sensors](#) on the device.

Primary group

Every user has to be a member of a [primary group](#) to make sure there is no user without group membership. Membership in other user groups is optional.

Primary master node

In a [cluster](#), the [primary master node](#) is the [cluster node](#) that is the [master node](#) by configuration.

Probe

A [probe](#) is where the actual monitoring takes place. There are [local probes](#), [cluster probes](#), [remote probes](#), and [hosted probes](#).

Probe device

The [probe device](#) is an internal system device that PRTG automatically adds to the [local probe](#). It has access to the [probe system](#) and monitors its health parameters using several [sensors](#).

Probe system

A [probe system](#) is the system, or Windows computer, that runs a [probe](#). A [remote probe](#), a [cluster probe](#), and the [local probe](#) run on a probe system.

PRTG Administration Tool

The [PRTG Administration Tool](#) is part of your PRTG installation. You can use it to edit the administrative settings of the [local probe](#) and [remote probe](#) installations. You can start the PRTG Administration Tool from the Windows Start menu on the [PRTG core server system](#) or on the [remote probe system](#).

PRTG Application Programming Interface (PRTG API)

The [PRTG API](#) enables you to access monitoring data and to manipulate [objects](#) using HTTP requests, to run your own written [sensors](#) and [notifications](#), and to implement [mini probes](#).

PRTG Cloud

The [PRTG Cloud](#) is used by the [Cloud HTTP sensor](#)^[692], the [Cloud HTTP v2 sensor](#)^[705], the [Cloud Ping sensor](#)^[720], and the [Cloud Ping v2 sensor](#)^[731] to monitor the loading times of a web server via HTTP or the Transmission Control Protocol (TCP) ping times to a parent device from different locations worldwide. PRTG also sends push notifications and securely transmits support bundles to Paessler via the PRTG Cloud.

PRTG core server

The [PRTG core server](#) is the central unit of PRTG. It receives monitoring data from the [probe](#)^[494] and handles reporting and notifications, provides the web server for the user interfaces, and much more. In a [cluster](#)^[450], one PRTG core server is installed on every [cluster node](#)^[450]. The PRTG core server is configured as a Windows service that is permanently run by the Windows system without requiring a user that is logged in.

PRTG core server service

The [PRTG core server service](#) is responsible for running the [PRTG core server](#)^[455]. It is a Windows service that permanently runs on the [PRTG core server system](#)^[455].

PRTG core server system

The [PRTG core server system](#) is the system, or Windows computer, that runs the [PRTG core server](#)^[455].

PRTG data directory

The [PRTG data directory](#) is the directory on the [PRTG core server system](#)^[455] or [remote probe system](#)^[456] where PRTG stores monitoring data, configuration data, and logs.

PRTG Desktop

[PRTG Desktop](#) is an alternative interface that you can use to connect to the [PRTG core server](#)^[455] or a PRTG Hosted Monitor instance to configure your setup, view monitoring results, and keep an eye on your network. It is a cross-platform application for fast access to data and monitoring management.

PRTG Hosted Monitor

[PRTG Hosted Monitor](#) is the PRTG cloud solution where we at Paessler run the [PRTG core server](#)^[455] and [hosted probe](#)^[452] for you. PRTG Hosted Monitor does not require a PRTG core server installation inside your network.

PRTG on premises

[PRTG on premises](#) is a network monitoring application for Windows-based systems with which you can monitor your entire network. PRTG on premises requires a [PRTG core server](#)^[455] installation inside your network.

PRTG probe service

The [PRTG probe service](#) is responsible for running a [probe](#). It is a Windows service that permanently runs on the [probe system](#).

PRTG program directory

The [PRTG program directory](#) is the directory on the [PRTG core server system](#) where PRTG stores all files that are required for it to run.

PRTG web interface

The [PRTG web interface](#) is the Asynchronous JavaScript and XML (AJAX) based web interface of PRTG. It is the default interface for setting up your monitoring.

Recommended Sensors Detection

The [Recommended Sensors Detection](#) feature enables PRTG to analyze [devices](#) in your network and to suggest sensors that are still missing for a comprehensive monitoring setup. If enabled, the analysis runs in the background with low priority if you add a new device, if the last analysis was executed more than 30 days ago, or if you manually start it.

Release channel

PRTG updates are delivered in different [release channels](#). With PRTG on premises, you can choose between maximum stability ([Stable](#)), or most early access to new features ([Canary](#) or [Preview](#)). PRTG Hosted Monitor does not have release channels. Instead, we roll out the latest stable version to PRTG Hosted Monitor instances in stages, so your instance automatically updates to the latest stable version.

Remote probe

A [remote probe](#) is a small piece of software that is installed on a computer, or [remote probe system](#), in the local or remote network. It scans the network and sends monitoring results to the [PRTG core server](#). Once the connection has been established, the remote probe is shown in the [device tree](#). All [objects](#) that you create on the remote probe, or below it in the device tree, are monitored by the remote probe system. You can add [groups](#) and [devices](#) to the remote probe. In a [cluster](#), remote probes can connect to all cluster nodes so you can view monitoring data of a remote probe on all [cluster nodes](#).

Remote probe device

The [remote probe device](#) is an internal system device that PRTG automatically adds to the [remote probe](#). It has access to the [remote probe system](#) and monitors its health parameters using several [sensors](#).

Remote probe system

The [remote probe system](#) is the system, or Windows computer, that runs a [remote probe](#).

Root group

The **root group** is the topmost instance in the [object hierarchy](#) in the device tree. It contains all [objects](#) in your monitoring setup. All objects inherit the settings of the root group by default.

Schedule

You can use [schedules](#) to pause monitoring or notifications for certain periods of time or at certain times. You can also use schedules to define the periods of time that are covered when creating reports.

Sensor

A **sensor** monitors one aspect of a [device](#). For example, one sensor monitors if a device responds to a ping request. A different sensor monitors the traffic of one Ethernet port of a router, and so on. The data of sensors is shown in their respective [channels](#). Each sensor has at least one channel.

Sensor status

The color of a [sensor](#) represents the **sensor status**. There are 8 different sensor states: Down, Down (Partial), Down (Acknowledged), Warning, Unusual, Up, Paused, and Unknown.

Similar Sensors Detection

The **Similar Sensors Detection** feature enables PRTG to analyze [sensor](#) data for similarities. If enabled, the detection runs in the background with low priority. The recommended setting for the analysis depth is to let PRTG automatically decide how many [channels](#) it analyzes.

Switch

A **switch** is a type of visual representation of the values of a [channel](#). Switches represent boolean values when using [lookups](#).

Tickets

Tickets are created by the system or by a user and contain important messages or action steps for the administrator or other users to take. You should view every [ticket](#) to take appropriate action. You can access the list of tickets from the main menu.

Toggle

A **toggle** is a type of visual representation of the values of a [channel](#). Toggles represent bitfields when using [lookups](#).

Toplist

Packet Sniffer and xFlow (NetFlow, jFlow, sFlow, IPFIX) [sensor](#) types can break down traffic by IP address, port, protocol, and other parameters. The results are shown in graphs that are called **Toplists**.

Unusual Detection

The **Unusual Detection** feature can set [sensors](#)⁴⁵⁶⁷ to the Unusual [status](#)⁴⁵⁶⁷ when it detects values that are not typical for the time span in which they are measured. If the detection is enabled, PRTG compares the current average values to the historic monitoring results for this purpose. If the current values show a big difference to the values that are normally retrieved by a sensor, this sensor indicates this with the Unusual status.

xFlow

Paessler designates all kinds of flow protocols as **xFlow**. PRTG supports NetFlow v5, NetFlow v9, IPFIX, sFlow v5, and jFlow v5.

15.4 List of Abbreviations

See below for a list of abbreviations used in this documentation.

A

ACL	access control list
ADO	ActiveX Data Objects
ADSL	asymmetric digital subscriber line
AES	Advanced Encryption Standard
AET	Application Entity Title
AIM	AOL Instant Messenger
AJAX	Asynchronous JavaScript and XML
API	application programming interface
ARP	Address Resolution Protocol
AWS	Amazon Web Services

B

BA	basic authentication
BMC	Baseboard Management Controller

C

CA	certificate authority
CBQoS	Class Based Quality of Service
CDOT	clustered Data ONTAP
CGI	Common Gateway Interface
CIFS	Common Internet File System
CIM	Common Information Model

CLI	command-line interface
CLR	common language runtime
CoS	Class of Service
CRC	cyclic redundancy check
CSS	cascading style sheets
CSV	comma-separated values

D

DAG	Database Availability Group
DBMS	database management system
DC	domain controller
DCS	domain components
DES	Data Encryption Standard
DHCP	Dynamic Host Configuration Protocol
DICOM	Digital Imaging and Communications
DN	distinguished name
DNS	Domain Name System
DoS	denial of service
DSCP	Differentiated Services Code Point
DTU	Database Transaction Unit

E

EBS	Elastic Block Store
EC2	Elastic Compute Cloud
ECC	Elliptic Curve Cryptography

eDTU	elastic Database Transaction Unit
ELB	Elastic Load Balancing
EVA	Enterprise Virtual Array

F

FAT	file allocation table
FCP	Fibre Channel Protocol
FCS	Frame Check Sequence
FIPS	Federal Information Processing Standards
FQDN	fully qualified domain name
FTP	File Transfer Protocol
FTPS	FTP over SSL

G

GID	global ID
GSA	Google Search Appliance
GUID	globally unique identifier

H

HDD	hard disk drive
HL7	Health Level 7

I

IAM	Identity and Access Management
ICMP	Internet Control Message Protocol
ICPIF	Impairment Calculated Planning Impairment Factor

IDE	integrated development environment
iDRAC	Integrated Dell Remote Access Controller
IIS	Microsoft Internet Information Services
IKE	Internet Key Exchange
iLO	HPE Integrated Lights Out
IMAP	Internet Message Access Protocol
IMM	Integrated Management Module
I/O	input/output
IOPS	input/output operations per second
IPC	Industrial PC
IPFIX	Internet Protocol Flow Information Export
IPMI	Intelligent Platform Management Interface
IPsec	Internet Protocol Security
IRC	Internet Relay Chat
iRMC	integrated Remote Management Controller
iSCSI	Internet Small Computer System Interface

J

JSON	JavaScript Object Notation
JWKS	JSON Web Key Set

L

L2L	LAN-to-LAN
LDAP	Lightweight Directory Access Protocol
LIF	logical interface

LUN	logical unit number
-----	---------------------

M

MAPI	Messaging Application Programming Interface
MD5	message-digest algorithm 5
MIB	Management Information Base
MOS	mean opinion score
MQTT	Message Queue Telemetry Transport
MSH	message header
MSMQ	Microsoft Message Queuing
MSP	managed service provider
mutex	mutual exclusion
MWL	Modality Worklist

N

NAS	network-attached storage
NAT	network address translation
NFS	network file system
NIC	network interface card
NMAP	Network Mapper
NSA	Network Security Appliance
NTFS	New Technology File System
NTLM	NT LAN Manager

O

OAuth2	Open Authorization 2
ODBC	Open Database Connectivity
OID	object identifier
OLEDB	Object Linking and Embedding, Database
OMSA	OpenManage Server Administrator
ONTAPI	DATA ONTAP API
OSPF	Open Shortest Path First
OU	organizational unit

P

P2P	Peer-to-Peer
PACS	picture archiving and communication system
PAP	Password Authentication Protocol
PCRE	Perl Compatible Regular Expression
PDV	packet delay variation
PEM	Privacy-Enhanced Mail
PMPP	PRTG Mini Probe Protocol
POP3	Post Office Protocol version 3
PRTG	PRTG Network Monitor; Paessler PRTG Enterprise Monitor

Q

QNAP	Quality Network Appliance Provider
QoS	Quality of Service

R

RADIUS	Remote Authentication Dial-In User Service
RAID	redundant array of independent disks
RDP	Remote Desktop Protocol
RDS	Relational Database Service
regex	regular expression
REST	Representational State Transfer
RMON	Remote Monitoring
RPC	remote procedure call
RPM	revolutions per minute
RTT	round-trip time

S

SaaS	software as a service
SAN	storage area network
SASL	Simple Authentication and Security Layer
SCSI	Small Computer System Interface
SCVMM	System Center Virtual Machine Manager
SHA	Secure Hash Algorithm
SID	Oracle System ID
SIP	Session Initiation Protocol
SLA	service level agreement
S.M.A.R.T.	Self-Monitoring, Analysis and Reporting Technology
SMB	server message block

SMTP	Simple Mail Transfer Protocol
SNI	Server Name Identification
SNMP	Simple Network Management Protocol
SNR	signal-to-noise ratio
SNS	Simple Notification Service
SNTP	Simple Network Time Protocol
SOAP	Simple Object Access Protocol
SPA	Single Page Application
SPAN	Switched Port Analyzer
SQL	Structured Query Language
SQS	Simple Queue Service
SRP	Secure Remote Password
SSD	solid-state drive
SSH	Secure Shell
SSL	Secure Sockets Layer
SSO	single sign-on
SVC	switched virtual circuit

T

TCP	Transmission Control Protocol
TFTP	Trivial File Transfer Protocol
TLS	Transport Layer Security
ToS	Type of Service

U

UAC	User Account Control
UCS	Unified Computing System
UDF	User-defined Function
UDP	User Datagram Protocol
UID	Unique Identifier
UNC	Universal Naming Convention
UPnP	Universal Plug and Play
UPS	uninterruptible power supplies
URI	uniform resource identifier
UTC	Coordinated Universal Time
UUID	universally unique identifier

V

vCore	virtual core
VM	virtual machine
VNC	Virtual Network Computing
VoIP	Voice over IP

W

WBEM	Web-based Enterprise Management
WMI	Windows Management Instrumentation
WQL	Windows Management Instrumentation Query Language
WSUS	Windows Server Update Services

WWN	World Wide Name
-----	-----------------

X

xFlow	xFlow (NetFlow, jFlow, sFlow, IPFIX)
XML	Extensible Markup Language
XSS	cross-site scripting

15.5 List of Available Sensor Types

This chapter lists all available sensors, arranged both into different categories and in alphabetical order.

i In the [Add a Sensor](#) ³⁶¹ assistant, you have various options to filter for suitable sensors.

Category	Description
All Sensors in Alphabetical Order ⁴⁵⁸²	A list of all sensors, the PRTG version in which they were introduced, and their default tags.
General Sensors ⁴⁵⁹⁹	Sensors that let you monitor the basic parameters of your network
Backup and Replication Monitoring Sensors ⁴⁶⁰⁰	Sensors that let you monitor backup and replication jobs
Bandwidth Monitoring Sensors ⁴⁶⁰⁰	Sensors that let you analyze your network bandwidth
Cloud Service Sensors ⁴⁶⁰²	Sensors that let you get a quick overview of all cloud services
Custom Sensors ⁴⁶⁰³	Sensors that let you enhance the monitoring task far beyond the standard sensor set
Database Server Sensors ⁴⁶⁰⁴	Sensors that let you monitor the most common databases
eHealth Sensors ⁴⁶⁰⁵	Sensors that let you monitor medical equipment
EXE Sensors ⁴⁶⁰⁵	Sensors that let you carry out a wide range of different operations. See the EXE sensors ⁴⁶⁰⁵ in the table for more information.
Hardware Parameter Sensors ⁴⁶⁰⁶	Sensors that let you monitor the status of hardware components
IoT and IIoT Sensors ⁴⁶¹¹	Sensors that let you monitor IoT-capable and IIoT-capable devices
Linux/Unix/macOS Sensors ⁴⁶¹²	Sensors that let you monitor Linux-based networks
Mail Server Sensors ⁴⁶¹³	Sensors that let you monitor different parameters of mail servers

Category	Description
PRTG Internal Sensors 	Sensors that let you monitor internal parameters of PRTG
PRTG Sensor Hub Sensors 	Sensors that let you use scripts, plugins, and add-ons from the PRTG Sensor Hub
SNMP Sensors 	Sensors that let you monitor a wide range of devices via SNMP
Storage and File Server Sensors 	Sensors that let you monitor different parameters of storage and file servers
Various Server Sensors 	Sensors that let you monitor a wide range of server parameters
Virtual Server Sensors 	Sensors that let you monitor your visualized IT infrastructure
VoIP and QoS Sensors 	Sensors that let you monitor the QoS in a network and all VoIP-relevant network parameters
Web Server (HTTP) Sensors 	Sensors that let you monitor server parameters with HTTP
Windows WMI/Performance Counter Sensors 	Sensors that let you monitor Windows systems via WMI and Windows performance counters
More 	Links to further information about sensors and monitoring in the PRTG Manual and the Knowledge Base

All Sensors in Alphabetical Order

The version numbers show when the respective sensor was originally introduced to PRTG. The default tags are automatically predefined in a sensor's settings when you add a sensor.

 For more information, see section [Tags](#) .

Sensor	Introduced in Version	Default Tags
Active Directory Replication Errors sensor 	8.3.0	ptfsensor
ADO SQL v2 sensor 	16.x.24	sqlsensor

Sensor	Introduced in Version	Default Tags
Amazon CloudWatch Alarm sensor ⁵⁰⁹	16.x.22	cloudwatchsensor alarm
Amazon CloudWatch EBS sensor ⁵²³	15.x.19	cloudwatchsensor ebs
Amazon CloudWatch EC2 sensor ⁵³⁸	15.x.19	cloudwatchsensor ec2
Amazon CloudWatch ElastiCache sensor ⁵⁵⁴	15.x.19	cloudwatchsensor elasticache
Amazon CloudWatch ELB sensor ⁵⁷⁰	15.x.19	cloudwatchsensor elb
Amazon CloudWatch RDS sensor ⁵⁸⁵	15.x.19	cloudwatchsensor rds
Amazon CloudWatch SNS sensor ⁶⁰¹	15.x.19	cloudwatchsensor sns
Amazon CloudWatch SQS sensor ⁶¹⁵	15.x.19	cloudwatchsensor sqs
AWS Cost sensor ⁶³⁰	20.1.56	aws cost awscost
Business Process sensor ⁶⁴⁴	15.x.20	factorysensor businessprocesssensor
Cisco IP SLA sensor ⁶⁵⁸	7	ipslasensor
Citrix XenServer Host sensor ⁶⁷⁰	12.x.1	xenhostsensor
Citrix XenServer Virtual Machine sensor ⁶⁸¹	8.1.0	xenhostsensor
Cloud HTTP sensor ⁶⁹²	14.x.14	httpsensor
Cloud HTTP v2 sensor ⁷⁰⁵	20.3.62	cloud cloudhttpsensor http
Cloud Ping sensor ⁷²⁰	14.x.14	pingsensor
Cloud Ping v2 sensor ⁷³¹	20.3.62	cloud cloudpingsensor ping
Cluster Health sensor ⁷⁴⁴	9.1.0	clusterhealthsensor

Sensor	Introduced in Version	Default Tags
Common SaaS sensor ^[751]	15.x.19	commonsaas saas

General Sensors

Sensor	What It Monitors
Cloud HTTP sensor 	Response time and response code of the target server
Cloud HTTP v2 sensor 	Response time and response code of the target server
Cloud Ping sensor 	Response times of the target server
Cloud Ping v2 sensor 	Response time of the target server using TCP ping
HTTP sensor 	Loading time of a web page or element
Ping sensor 	Ping time and packet loss

Sensor	What It Monitors
Port sensor  2041	Time until a request to a port is accepted
Port Range sensor  2054	A network service by connecting to various TCP/IP ports
SNMP Traffic sensor  3094	Traffic on a device via SNMP
SSL Certificate sensor  3302	Certificate of an SSL/TLS connection
SSL Security Check sensor  3315	SSL/TLS connectivity to the port of a device
Windows Network Card sensor  3499	Bandwidth usage and traffic of a network interface via WMI or Windows performance counters

Backup and Replication Monitoring Sensors

Sensor	What It Monitors
Active Directory Replication Errors sensor  4777	A Windows DC for replication errors
File sensor  1092	Changes to file content and file time stamp
Folder sensor  1116	A folder using SMB
IMAP sensor  1430	An email server using IMAP
Veeam Backup Job Status sensor  3369	Status of all backup job runs on the Veeam Backup Enterprise Manager in the last 24 hours

Bandwidth Monitoring Sensors

Sensor	What It Monitors
IPFIX sensor  1458	Traffic data from an IPFIX-compatible device
IPFIX (Custom) sensor  1475	Traffic data from an IPFIX-compatible device
jFlow v5 sensor  1504	Traffic data from a jFlow v5 compatible device
jFlow v5 (Custom) sensor  1521	Traffic data from a jFlow v5 compatible device

Sensor	What It Monitors
NetFlow v5 sensor 	Traffic data from a NetFlow v5 compatible device
NetFlow v5 (Custom) sensor 	Traffic data from a NetFlow v5 compatible device
NetFlow v9 sensor 	Traffic data from a NetFlow v9 compatible device
NetFlow v9 (Custom) sensor 	Traffic data from a NetFlow v9 compatible device
Packet Sniffer sensor 	Headers of data packets that pass a local network card
Packet Sniffer (Custom) sensor 	Headers of data packets that pass a local network card
sFlow sensor 	Traffic data from an sFlow v5 compatible device
sFlow (Custom) sensor 	Traffic data from an sFlow v5 compatible device
SNMP Cisco ADSL sensor 	ADSL statistics of a Cisco router
SNMP Cisco ASA VPN Traffic sensor 	Traffic of an IPsec VPN connection on a Cisco Adaptive Security Appliance
SNMP HPE ProLiant Network Interface sensor 	A network interface in an HPE server via SNMP
SNMP Library sensor 	A device via SNMP
SNMP NetApp Network Interface sensor 	A network card of a NetApp storage system
SNMP RMON sensor 	Traffic on a device using the RMON standard
SNMP SonicWall VPN Traffic sensor 	Traffic of an IPsec VPN on a SonicWall NSA via SNMP
SNMP Traffic sensor 	Traffic on a device
Windows Network Card sensor 	Bandwidth usage and traffic of a network interface

Cloud Services Sensors

Sensor	What It Monitors
Amazon CloudWatch Alarm sensor  509	Status of an Amazon CloudWatch alarm
Amazon CloudWatch EBS sensor  523	Performance of the Amazon Cloud service EBS
Amazon CloudWatch EC2 sensor  538	Performance of the Amazon Cloud service EC2
Amazon CloudWatch ElastiCache sensor  554	Performance of the Amazon Cloud service ElastiCache
Amazon CloudWatch ELB sensor  570	Performance of the Amazon Cloud service ELB
Amazon CloudWatch RDS sensor  585	Performance of the Amazon Cloud service RDS
Amazon CloudWatch SNS sensor  601	Performance of the Amazon Cloud service SNS
Amazon CloudWatch SQS sensor  615	Performance of the Amazon Cloud service SQS
AWS Cost sensor  630	Cost of an AWS account by reading its data from the AWS Cost Explorer API
Common SaaS sensor  751	Availability of several SaaS providers
Dropbox sensor  956	A Dropbox account using the Dropbox API and OAuth2
Google Analytics sensor  1153	Several metrics from a Google Analytics account using the Google API and OAuth2
Google Drive sensor  1168	A Google Drive account using the Google API and OAuth2
Microsoft 365 Service Status sensor  1546	Overall status of all services of a Microsoft 365 subscription
Microsoft 365 Service Status Advanced sensor  1557	Detailed status of all services of a Microsoft 365 subscription
Microsoft Azure Subscription Cost sensor  1569	Cost in a Microsoft Azure subscription
Microsoft OneDrive sensor  1595	A Microsoft OneDrive Personal account using the OneDrive API and OAuth2
Zoom Service Status sensor  3959	Availability of global Zoom services

Custom Sensors

Sensor	What It Monitors
Business Process sensor  644	A summarized status of entire business processes while monitoring several process components
EXE/Script sensor  1063	One value returned by the executable file or script (in one channel only) and the execution time
EXE/Script Advanced sensor  1077	Values returned by the executable file or script in multiple channels
IPFIX (Custom) sensor  1475	Traffic by type according to your needs
jFlow v5 (Custom) sensor  1521	Traffic by type according to your needs
NetFlow v5 (Custom) sensor  1841	Traffic by type according to your needs
NetFlow v9 (Custom) sensor  1873	Traffic by type according to your needs
Packet Sniffer (Custom) sensor  1972	Traffic by type according to your needs
Python Script Advanced sensor  2092	Values returned by the Python script in multiple channels
REST Custom sensor  2151	Values returned by a REST API in multiple channels
Sensor Factory sensor  2178	Entire business processes that involve several components
sFlow (Custom) sensor  2213	Traffic by type according to your needs
SNMP Custom sensor  2453	A single parameter that is returned by a specific OID via SNMP
SNMP Custom Advanced sensor  2464	Numeric values returned for OIDs via SNMP
SNMP Custom String sensor  2475	A string returned by a specific OID via SNMP
SNMP Custom String Lookup sensor  2489	A string returned by a specific OID via SNMP directly mapped to a sensor status
SNMP Custom Table sensor  2500	Entries from a table that is provided via SNMP

Sensor	What It Monitors
SSH Script sensor 	One value returned by the executable file or script (in one channel only) and the execution time
SSH Script Advanced sensor 	Values returned by the script in multiple channels and the execution time
WMI Custom sensor 	Retrieved value of a custom query via WMI
WMI Custom String sensor 	Retrieved string value in the sensor message and the response time

Database Server Sensors

Sensor	What It Monitors
ADO SQL v2 sensor 	A database using an ADO connection
Microsoft SQL v2 sensor 	A database on a Microsoft SQL server
MySQL v2 sensor 	A database on a MySQL server
Oracle SQL v2 sensor 	A database on an Oracle server
Oracle Tablespace sensor 	A tablespace on an Oracle server
PostgreSQL sensor 	A database on a PostgreSQL server
WMI Microsoft SQL Server 2005 sensor 	Performance of a Microsoft SQL Server via WMI
WMI Microsoft SQL Server 2008 sensor 	Performance of a Microsoft SQL Server via WMI
WMI Microsoft SQL Server 2012 sensor 	Performance of a Microsoft SQL Server via WMI
WMI Microsoft SQL Server 2014 sensor 	Performance of a Microsoft SQL Server via WMI
WMI Microsoft SQL Server 2016 sensor 	Performance of a Microsoft SQL Server via WMI
WMI Microsoft SQL Server 2017 sensor 	Performance of a Microsoft SQL Server via WMI
WMI Microsoft SQL Server 2019 sensor 	Performance of a Microsoft SQL Server via WMI

eHealth Sensors

Sensor	What It Monitors
DICOM Bandwidth sensor 	Bandwidth usage of a C-STORE request to a DICOM-capable device
DICOM C-ECHO sensor 	Availability of DICOM-capable systems and devices by sending C-ECHO requests to the target system
DICOM Query/Retrieve sensor 	C-FIND capability of DICOM-capable systems and devices
HL7 sensor 	Availability of HL7 interfaces
Soffico Orchestra Channel Health sensor 	State and overall number of successful or failed channel calls

EXE Sensors

Sensor	What It Monitors
Active Directory Replication Errors sensor 	A Windows DC for replication errors
ADO SQL v2 sensor 	A database using an ADO connection
Citrix XenServer Host sensor 	A Xen host server via HTTP
Citrix XenServer Virtual Machine sensor 	A VM on a Citrix XenServer via HTTP
Dell PowerVault MDi Logical Disk sensor 	A virtual disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i
Dell PowerVault MDi Physical Disk sensor 	A physical disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, or MD3620f
DICOM Bandwidth sensor 	Bandwidth usage of a C-STORE request to a DICOM-capable device
DICOM C-ECHO sensor 	Availability of DICOM-capable systems and devices by sending C-ECHO requests to the target system

Sensor	What It Monitors
DICOM Query/Retrieve sensor  907	C-FIND capability of DICOM-capable systems and devices
Enterprise Virtual Array sensor  968	An HPE Storage EVA using the sssu.exe from HPE P6000 Command View Software
Exchange Backup (PowerShell) sensor  993	Backups of an Exchange server using Remote PowerShell
Exchange Database (PowerShell) sensor  1004	Database information of an Exchange server using Remote PowerShell
Exchange Database DAG (PowerShell) sensor  1017	DAG status of a database on an Exchange server using Remote PowerShell
Exchange Mail Queue (PowerShell) sensor  1030	Number of items in the outgoing mail queue of an Exchange server using Remote PowerShell
Exchange Mailbox (PowerShell) sensor  1041	Mailboxes of an Exchange server using Remote PowerShell
Exchange Public Folder (PowerShell) sensor  1052	Public folders and subfolders of an Exchange server using Remote PowerShell
EXE/Script sensor  1063	One value returned by the executable file or script (in one channel only) and the execution time
EXE/Script Advanced sensor  1077	Values returned by the executable file or script in multiple channels
FTP Server File Count sensor  1140	Number of files available in the directory listing
HL7 sensor  1180	Availability of HL7 interfaces
HTTP Full Web Page sensor  1277	Full download time of a web page including assets such as images
HTTP XML/REST Value sensor  1355	An .xml file from a specified URL
Hyper-V Cluster Shared Volume Disk Free sensor  1372	A Microsoft Hyper-V cluster shared volume via PowerShell
IP on DNS Blacklist sensor  1448	Listing of an IP address on specific blacklist servers

Sensor	What It Monitors
IPMI System Health sensor 	Status of a system via IPMI
Microsoft SQL v2 sensor 	A database on a Microsoft SQL server
NetApp Physical Disk sensor 	Disks of a NetApp cDOT or ONTAP storage system accessing the API via SOAP
Oracle SQL v2 sensor 	A database on an Oracle server
Oracle Tablespace sensor 	A tablespace on an Oracle server
Ping Jitter sensor 	A statistical jitter value and execution time
RADIUS v2 sensor 	A RADIUS server according to RFC 2865
REST Custom sensor 	A REST API endpoint
SIP Options Ping sensor 	Connectivity for a SIP server using SIP options "Ping"
Traceroute Hop Count sensor 	Number of hops needed from the probe system that the sensor runs on to the IP address/DNS name defined in the sensor's parent device
VMware Host Hardware Status (SOAP) sensor 	Hardware status of a VMware host server using SOAP
VMware Host Performance (SOAP) sensor 	A VMware host server using SOAP
VMware Virtual Machine (SOAP) sensor 	A VM on a VMware host server using SOAP
Windows MSMQ Queue Length sensor 	Number of messages in a message queue of the parent device
Windows Print Queue sensor 	Print queue on the sensor's parent device
Windows Updates Status (PowerShell) sensor 	Status of Windows updates on a computer, either from Microsoft or from the local WSUS server
WSUS Statistics sensor 	Various statistics on a WSUS server via WMI

Hardware Parameter Sensors

Sensor	What It Monitors
Dell PowerVault MDi Logical Disk sensor 	A virtual disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i
Dell PowerVault MDi Physical Disk sensor 	A physical disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, or MD3620f
Enterprise Virtual Array sensor 	An HPE Storage EVA using the sssu.exe from HPE P6000 Command View Software
NetApp Aggregate sensor 	Status of a NetApp cDOT or ONTAP storage aggregate accessing the API via SOAP
NetApp I/O sensor 	Input and output operations of a NetApp cDOT or ONTAP storage system accessing the API via SOAP
NetApp LIF sensor 	Logical interfaces of a NetApp cDOT or ONTAP cluster accessing the API via SOAP
NetApp LUN sensor 	Logical unit number (LUN) of a NetApp cDOT or ONTAP storage system accessing the API via SOAP
NetApp NIC sensor 	Network interface card (NIC) of a NetApp cDOT or ONTAP cluster accessing the API via SOAP
NetApp Physical Disk sensor 	Disks of a NetApp cDOT or ONTAP storage system accessing the API via SOAP
NetApp SnapMirror sensor 	SnapMirror relationships of a NetApp cDOT or ONTAP storage system accessing the API via SOAP
NetApp System Health sensor 	Health of a NetApp cDOT or ONTAP storage system accessing the API via SOAP
NetApp Volume sensor 	Volumes on a NetApp cDOT or ONTAP storage system accessing the API via SOAP
SNMP APC Hardware sensor 	Performance counters on an APC UPS device via SNMP

Sensor	What It Monitors
SNMP Buffalo TS System Health sensor  2316	System health of a Buffalo TeraStation NAS via SNMP
SNMP Cisco System Health sensor  2383	System health of a Cisco device via SNMP
SNMP Cisco UCS Blade sensor  2395	Health status of a Cisco UCS blade server via SNMP
SNMP Cisco UCS Chassis sensor  2407	Health status of the chassis of a Cisco UCS device via SNMP
SNMP Cisco UCS Physical Disk sensor  2419	A physical disk of a Cisco UCS device via SNMP
SNMP Cisco UCS System Health sensor  2430	System health of a Cisco UCS device via SNMP
SNMP CPU Load sensor  2442	System load via SNMP
SNMP Dell EqualLogic Logical Disk sensor  2513	A volume of a Dell EqualLogic storage system via SNMP
SNMP Dell EqualLogic Member Health sensor  2525	Health of an array member of an EqualLogic storage system via SNMP
SNMP Dell EqualLogic Physical Disk sensor  2537	A disk in a Dell EqualLogic storage system via SNMP
SNMP Dell Hardware sensor  2549	Performance counters on a Dell hardware device via SNMP
SNMP Dell PowerEdge Physical Disk sensor  2559	A physical disk in a Dell PowerEdge server via SNMP
SNMP Dell PowerEdge System Health sensor  2571	System health of a Dell PowerEdge server via SNMP
SNMP Disk Free sensor  2585	A logical disk via SNMP
SNMP Fujitsu System Health v2 sensor  2596	Status of a Fujitsu PRIMERGY server via the iRMC and SNMP
SNMP Hardware Status sensor  2609	Status of a hardware component of a server via SNMP
SNMP HP LaserJet Hardware sensor  2619	Performance counters on an HP LaserJet hardware device via SNMP

Sensor	What It Monitors
SNMP HPE BladeSystem Blade sensor 	Status of an HPE BladeSystem via SNMP
SNMP HPE BladeSystem Enclosure System Health sensor 	System health of an HPE BladeSystem device via SNMP
SNMP HPE ProLiant Memory Controller sensor 	A memory controller in an HPE server via SNMP
SNMP HPE ProLiant Network Interface sensor 	A network interface in an HPE server via SNMP
SNMP HPE ProLiant Physical Disk sensor 	A physical disk in an HPE server via SNMP
SNMP HPE ProLiant System Health sensor 	System health of an HPE ProLiant server via SNMP
SNMP IBM System X Physical Disk sensor 	A physical disk in an IBM server via SNMP
SNMP IBM System X Physical Memory sensor 	Memory modules in an IBM server via SNMP
SNMP IBM System X System Health sensor 	System health of an IBM device via SNMP
SNMP Juniper NS System Health sensor 	System health of a Juniper NetScreen device via SNMP
SNMP LenovoEMC Physical Disk sensor 	A physical disk in a LenovoEMC NAS via SNMP
SNMP LenovoEMC System Health sensor 	The system health of a LenovoEMC NAS via SNMP
SNMP Library sensor 	A device via SNMP
SNMP Memory sensor 	Memory usage of a system via SNMP
SNMP NetApp Enclosure sensor 	Power supply and cooling of an enclosure that is part of a NetApp storage system via SNMP
SNMP NetApp I/O sensor 	Input/output operations per second (IOPS) on a NetApp storage system via SNMP
SNMP NetApp Logical Unit sensor 	IOPS on a logical unit of a NetApp storage system via SNMP
SNMP NetApp Network Interface sensor 	A network card of a NetApp storage system via SNMP

Sensor	What It Monitors
SNMP NetApp System Health sensor 	Status of a NetApp storage system via SNMP
SNMP QNAP Physical Disk sensor 	A physical disk in a QNAP NAS via SNMP
SNMP QNAP System Health sensor 	System health of a QNAP NAS via SNMP
SNMP SonicWall System Health sensor 	Health values of a SonicWall NSA via SNMP
SNMP SonicWall VPN Traffic sensor 	Traffic of an IPsec VPN on a SonicWall NSA via SNMP
SNMP Synology Physical Disk sensor 	A physical disk in a Synology NAS via SNMP
SNMP Synology System Health sensor 	System health of a Synology NAS via SNMP
SSH SAN Enclosure sensor 	A SAN enclosure via SSH
SSH SAN Logical Disk sensor 	A logical disk on a SAN via SSH
SSH SAN Physical Disk sensor 	A physical disk on a SAN via SSH
SSH SAN System Health sensor 	System health of a SAN via SSH
Windows Physical Disk I/O sensor 	I/O parameters of a hard disk on a Windows system via WMI
WMI Battery sensor 	Available capacity and the state of connected batteries of a Windows-based device via WMI
WMI Disk Health sensor 	Health of a physical disk on a Windows system via WMI
WMI HDD Health sensor 	Health of IDE disk drives on the target system using S.M.A.R.T.
WMI Vital System Data v2 sensor 	Vital system parameters (CPU, thread, memory, network, pagefile) via WMI

IoT and IIoT Sensors

Sensor	What It Monitors
HTTP IoT Push Data Advanced sensor 	Messages received from IoT-capable devices

Sensor	What It Monitors
Modbus TCP Custom sensor 	that are pushed via an HTTPS request to PRTG Up to five values returned by a Modbus TCP server
MQTT Round Trip sensor 	Availability of an MQTT broker (server)
MQTT Statistics sensor 	Received messages and payload from an MQTT topic
MQTT Subscribe Custom sensor 	Up to five numeric values from the received JSON data
OPC UA Certificate sensor 	Certificate of an OPC UA server
OPC UA Custom sensor 	Up to five numeric values returned by specific OPC UA node IDs
OPC UA Server Status sensor 	Server status, uptime, and diagnostic information of an OPC UA server

Linux/Unix/macOS Sensors

Sensor	What It Monitors
Python Script Advanced sensor 	A Python script on the probe system
SFTP Secure File Transfer Protocol sensor 	FTP servers of a Linux/Unix system using the SSH File Transfer Protocol (FTP over SSH)
SNMP Linux Disk Free sensor 	Free space on disks of a Linux/Unix system via SNMP
SNMP Linux Load Average sensor 	System load average of a Linux/Unix system via SNMP
SNMP Linux Meminfo sensor 	Memory usage of a Linux/Unix system via SNMP
SNMP Linux Physical Disk sensor 	I/O on disks of a Linux/Unix system via SNMP
SSH Disk Free sensor 	Free space on disks of a Linux/Unix system via SSH

Sensor	What It Monitors
SSH INodes Free sensor 	Free index nodes on disks of Linux/Unix and macOS systems via SSH
SSH Load Average sensor 	Load average of a Linux/Unix system via SSH
SSH Meminfo sensor 	Memory usage of a Linux/Unix system via SSH
SSH Remote Ping sensor 	Connectivity between a system running Linux/macOS X and another device using ICMP echo requests and SSH
SSH SAN Enclosure sensor 	A SAN enclosure via SSH
SSH SAN Logical Disk sensor 	A logical disk on a SAN via SSH
SSH SAN Physical Disk sensor 	A physical disk on a SAN via SSH
SSH SAN System Health sensor 	System health of a SAN via SSH
SSH Script sensor 	One value returned by the executable file or script (in one channel only) and the execution time
SSH Script Advanced sensor 	Values returned by the script in multiple channels and execution time

Mail Server Sensors

Sensor	What It Monitors
Exchange Backup (PowerShell) sensor 	Backups of an Exchange server using Remote PowerShell
Exchange Database (PowerShell) sensor 	Database information of an Exchange server using Remote PowerShell
Exchange Database DAG (PowerShell) sensor 	DAG status of a database on an Exchange server using Remote PowerShell
Exchange Mail Queue (PowerShell) sensor 	Number of items in the outgoing mail queue of an Exchange server using Remote PowerShell
Exchange Mailbox (PowerShell) sensor 	Mailboxes of an Exchange server using Remote PowerShell

Sensor	What It Monitors
Exchange Public Folder (PowerShell) sensor 	Public folders and subfolders of an Exchange server using Remote PowerShell
IMAP sensor 	An email server using IMAP
IP on DNS Blacklist sensor 	Listing of the IP address of the sensor's parent device on specific blacklist servers
POP3 sensor 	An email server using POP3
SMTP sensor 	A mail server using SMTP
SMTP&IMAP Round Trip sensor 	Time it takes for an email to reach an IMAP mailbox after being sent using SMTP
SMTP&POP3 Round Trip sensor 	Time it takes for an email to reach a POP3 mailbox after being sent using SMTP
SSL Security Check sensor 	SSL/TLS connectivity to the port of a device
Windows IIS 6.0 SMTP Received sensor 	Number of received emails for a Microsoft IIS 6.0 SMTP service (Exchange 2003) via WMI or Windows performance counters
Windows IIS 6.0 SMTP Sent sensor 	Number of sent emails for a Microsoft IIS 6.0 SMTP service (Exchange 2003) via WMI or Windows performance counters
WMI Exchange Server sensor 	A Microsoft Exchange Server 2003 or later via WMI
WMI Exchange Transport Queue sensor 	Length of transport queues of a Microsoft Exchange Server 2003 or later via WMI

PRTG Internal Sensors

Sensor	What It Monitors
Cluster Health sensor 	Health of the cluster
Core Health sensor 	Status of the PRTG core server
Core Health (Autonomous) sensor 	Status of the PRTG core server

Sensor	What It Monitors
Probe Health sensor 	Status of the probe
System Health sensor 	Status of the probe system

PRTG Sensor Hub Sensors

In addition to the built-in sensors, you can create your own sensors. You can write a script or a program and use it with a [custom sensor](#) . There are already many free, useful scripts, plugins, and add-ons for PRTG in the [PRTG Sensor Hub](#). You can also directly open the PRTG Sensor Hub from the [Add Sensor](#)  dialog in the PRTG web interface.

- To use the sensors in the PRTG Sensor Hub, go to <https://www.paessler.com/sensor-hub> and follow the instructions there.

SNMP Sensors

Sensor	What It Monitors
Cisco IP SLA sensor 	VoIP network parameters using IP SLAs from Cisco via SNMP
SNMP APC Hardware sensor 	Performance counters on an APC UPS device via SNMP
SNMP Buffalo TS System Health sensor 	System health of a Buffalo TeraStation NAS via SNMP
SNMP Cisco ADSL sensor 	Asymmetric digital subscriber line (ADSL) statistics of a Cisco router via SNMP
SNMP Cisco ASA VPN Connections sensor 	VPN connections on a Cisco Adaptive Security Appliance via SNMP
SNMP Cisco ASA VPN Traffic sensor 	Traffic of an IPsec VPN connection on a Cisco Adaptive Security Appliance via SNMP
SNMP Cisco ASA VPN Users sensor 	Account connections to a VPN on a Cisco Adaptive Security Appliance via SNMP
SNMP Cisco CBQoS sensor 	Network parameters using Cisco's CBQoS via SNMP
SNMP Cisco System Health sensor 	System health of a Cisco device via SNMP

Sensor	What It Monitors
SNMP Cisco UCS Blade sensor  2395	Health status of a Cisco UCS blade server via SNMP
SNMP Cisco UCS Chassis sensor  2407	Health status of the chassis of a Cisco UCS device via SNMP
SNMP Cisco UCS Physical Disk sensor  2419	A physical disk of a Cisco UCS device via SNMP
SNMP Cisco UCS System Health sensor  2430	System health of a Cisco UCS device via SNMP
SNMP CPU Load sensor  2442	System load via SNMP
SNMP Custom sensor  2453	A single parameter returned by a specific OID via SNMP
SNMP Custom Advanced sensor  2464	Numeric values returned for OIDs via SNMP
SNMP Custom String sensor  2475	A string returned by a specific OID via SNMP
SNMP Custom String Lookup sensor  2489	A string returned by a specific OID via SNMP directly mapped to a sensor status
SNMP Custom Table sensor  2500	Entries from a table that is provided via SNMP
SNMP Dell EqualLogic Logical Disk sensor  2513	A volume of a Dell EqualLogic storage system via SNMP
SNMP Dell EqualLogic Member Health sensor  2525	Health of an array member of an Dell EqualLogic storage system via SNMP
SNMP Dell EqualLogic Physical Disk sensor  2537	A disk in a Dell EqualLogic storage system via SNMP
SNMP Dell Hardware sensor  2549	Performance counters on a Dell hardware device via SNMP
SNMP Dell PowerEdge Physical Disk sensor  2559	A physical disk in a Dell PowerEdge server via SNMP
SNMP Dell PowerEdge System Health sensor  2571	System health of a Dell PowerEdge server via SNMP
SNMP Disk Free sensor  2585	Free disk space on a logical disk via SNMP

Sensor	What It Monitors
SNMP Fujitsu System Health v2 sensor 	Status of a Fujitsu PRIMERGY server via the iRMC and SNMP
SNMP Hardware Status sensor 	Status of a hardware component of a server via SNMP
SNMP HP LaserJet Hardware sensor 	Performance counters on an HP LaserJet hardware device via SNMP
SNMP HPE BladeSystem Blade sensor 	Status of an HPE BladeSystem via SNMP
SNMP HPE BladeSystem Enclosure System Health sensor 	System health of an HPE BladeSystem device via SNMP
SNMP HPE ProLiant Logical Disk sensor 	A logical disk in an HPE server via SNMP
SNMP HPE ProLiant Memory Controller sensor 	A memory controller in an HPE server via SNMP
SNMP HPE ProLiant Network Interface sensor 	A network interface in an HPE server via SNMP
SNMP HPE ProLiant Physical Disk sensor 	A physical disk in an HPE server via SNMP
SNMP HPE ProLiant System Health sensor 	System health of an HPE ProLiant server via SNMP
SNMP IBM System X Logical Disk sensor 	A logical disk in an IBM server via SNMP
SNMP IBM System X Physical Disk sensor 	A physical disk in an IBM server via SNMP
SNMP IBM System X Physical Memory sensor 	Memory modules in an IBM server via SNMP
SNMP IBM System X System Health sensor 	System health of an IBM device via SNMP
SNMP interSeptor Pro Environment sensor 	Data from a Jakarta interSeptor Pro environmental monitoring system via SNMP
SNMP Juniper NS System Health sensor 	System health of a Juniper NetScreen device via SNMP
SNMP LenovoEMC Physical Disk sensor 	A physical disk in a LenovoEMC NAS via SNMP
SNMP LenovoEMC System Health sensor 	System health of a LenovoEMC NAS via SNMP

Sensor	What It Monitors
SNMP Library sensor 	A device via SNMP
SNMP Linux Disk Free sensor 	Free space on disks of a Linux/Unix system via SNMP
SNMP Linux Load Average sensor 	System load average of a Linux/Unix system via SNMP
SNMP Linux Meminfo sensor 	Memory usage of a Linux/Unix system via SNMP
SNMP Linux Physical Disk sensor 	Input/output (I/O) on disks of a Linux/Unix system via SNMP
SNMP Memory sensor 	Memory usage of a system via SNMP
SNMP NetApp Disk Free sensor 	Free space on disks of a NetApp storage system via SNMP
SNMP NetApp Enclosure sensor 	Power supply and cooling of an enclosure that is part of a NetApp storage system via SNMP
SNMP NetApp I/O sensor 	Input/output operations per second (IOPS) on a NetApp storage system via SNMP
SNMP NetApp License sensor 	Licenses for the services of a NetApp storage system via SNMP
SNMP NetApp Logical Unit sensor 	IOPS on a logical unit of a NetApp storage system via SNMP
SNMP NetApp Network Interface sensor 	A network card of a NetApp storage system via SNMP
SNMP NetApp System Health sensor 	Status of a NetApp storage system via SNMP
SNMP Nutanix Cluster Health sensor 	Status and performance of a Nutanix cluster via SNMP
SNMP Nutanix Hypervisor sensor 	A Nutanix hypervisor via SNMP
SNMP Poseidon Environment sensor 	Performance counters for environmental measurements on Poseidon hardware via SNMP
SNMP Printer sensor 	Various types of printers via SNMP

Sensor	What It Monitors
SNMP QNAP Logical Disk sensor 	A logical disk in a QNAP NAS via SNMP
SNMP QNAP Physical Disk sensor 	A physical disk in a QNAP NAS via SNMP
SNMP QNAP System Health sensor 	System health of a QNAP NAS via SNMP
SNMP RMON sensor 	Traffic on a device using the RMON standard via SNMP
SNMP SonicWall System Health sensor 	Health values of a SonicWall NSA via SNMP
SNMP SonicWall VPN Traffic sensor 	Traffic of an IPsec VPN on a SonicWall NSA via SNMP
SNMP Synology Logical Disk sensor 	A logical disk in a Synology NAS via SNMP
SNMP Synology Physical Disk sensor 	A logical disk in a Synology NAS via SNMP
SNMP Synology System Health sensor 	System health of a Synology NAS via SNMP
SNMP System Uptime sensor 	Time a device runs via SNMP
SNMP Traffic sensor 	Traffic on a device via SNMP
SNMP Trap Receiver sensor 	SNMP traps
SNMP Windows Service sensor 	A Windows service via SNMP

Storage and File Server Sensors

Sensor	What It Monitors
Dell EMC Unity Enclosure Health v2 sensor 	Health of an enclosure on a Dell EMC storage system via the REST API
Dell EMC Unity File System v2 sensor 	A file system on a Dell EMC storage system via the REST API
Dell EMC Unity Storage Capacity v2 sensor 	Storage capacity of a Dell EMC storage system via the REST API
Dell EMC Unity Storage LUN v2 sensor 	A LUN on a Dell EMC storage system via the REST API

Sensor	What It Monitors
Dell EMC Unity Storage Pool v2 sensor 	A storage pool on a Dell EMC storage system via the REST API
Dell EMC Unity VMware Datastore v2 sensor 	A VMware datastore on a Dell EMC storage system via the REST API
Dell PowerVault MDi Logical Disk sensor 	A virtual disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i
Dell PowerVault MDi Physical Disk sensor 	A physical disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, or MD3620f
Enterprise Virtual Array sensor 	An HPE Storage EVA using the sssu.exe from HPE P6000 Command View Software
File sensor 	Changes to file content and file time stamp
File Content sensor 	Text files (for example, logfiles) for certain strings
Folder sensor 	A folder using SMB
FTP sensor 	File servers using FTP and FTPS
FTP Server File Count sensor 	Changes to files
Hyper-V Cluster Shared Volume Disk Free sensor 	A Microsoft Hyper-V cluster shared volume via PowerShell
Hyper-V Virtual Storage Device sensor 	A virtual storage device running on a Microsoft Hyper-V host server via WMI or Windows Performance Counters
NetApp Aggregate sensor 	Status of a NetApp cDOT or ONTAP storage aggregate accessing the API via SOAP
NetApp I/O sensor 	Input and output operations of a NetApp cDOT or ONTAP storage system accessing the API via SOAP
NetApp LIF sensor 	Logical interfaces of a NetApp cDOT or ONTAP cluster accessing the API via SOAP
NetApp LUN sensor 	A LUN of a NetApp cDOT or ONTAP storage system accessing the API via SOAP

Sensor	What It Monitors
NetApp NIC sensor  1751	Network interface card (NIC) of a NetApp cDOT or ONTAP cluster accessing the API via SOAP
NetApp Physical Disk sensor  1765	Disks of a NetApp cDOT or ONTAP storage system accessing the API via SOAP
NetApp SnapMirror sensor  1779	SnapMirror relationships of a NetApp cDOT or ONTAP storage system accessing the API via SOAP
NetApp System Health sensor  1794	Health of a NetApp cDOT or ONTAP storage system accessing the API via SOAP
NetApp Volume sensor  1809	Volumes on a NetApp cDOT or ONTAP storage system accessing the API via SOAP
SFTP Secure File Transfer Protocol sensor  2228	FTP servers of a Linux/Unix system using the SSH File Transfer Protocol (FTP over SSH)
Share Disk Free sensor  2240	Free disk space of a share (Windows/Samba) using SMB
SNMP Buffalo TS System Health sensor  2316	System health of a Buffalo TeraStation NAS via SNMP
SNMP Cisco UCS Physical Disk sensor  2419	A physical disk of a Cisco UCS device via SNMP
SNMP Dell EqualLogic Logical Disk sensor  2513	Volume of a Dell EqualLogic storage system via SNMP
SNMP Dell EqualLogic Member Health sensor  2525	Health of an array member of an EqualLogic storage system via SNMP
SNMP Dell EqualLogic Physical Disk sensor  2537	A disk in a Dell EqualLogic storage system via SNMP
SNMP Dell PowerEdge Physical Disk sensor  2559	A physical disk in a Dell PowerEdge server via SNMP
SNMP HPE ProLiant Logical Disk sensor  2650	A logical disk in an HPE server via SNMP
SNMP HPE ProLiant Physical Disk sensor  2685	A physical disk in an HPE server via SNMP
SNMP IBM System X Logical Disk sensor  2711	A logical disk in an IBM server via SNMP

Sensor	What It Monitors
SNMP IBM System X Physical Disk sensor 	A physical disk in an IBM server via SNMP
SNMP LenovoEMC Physical Disk sensor 	Physical disk in a LenovoEMC NAS via SNMP
SNMP LenovoEMC System Health sensor 	System health of a LenovoEMC NAS via SNMP
SNMP Linux Disk Free sensor 	Free space on disks of a Linux/Unix system via SNMP
SNMP Linux Physical Disk sensor 	Input/output (I/O) on disks of a Linux/Unix system via SNMP
SNMP NetApp Disk Free sensor 	Free space on disks of a NetApp storage system via SNMP
SNMP NetApp Enclosure sensor 	Power supply and cooling of an enclosure that is part of a NetApp storage system via SNMP
SNMP NetApp I/O sensor 	Input/output operations per second (IOPS) on a NetApp storage system via SNMP
SNMP NetApp License sensor 	Licenses for the services of a NetApp storage system via SNMP
SNMP NetApp Logical Unit sensor 	IOPS on a logical unit of a NetApp storage system via SNMP
SNMP NetApp Network Interface sensor 	A network card of a NetApp storage system via SNMP
SNMP NetApp System Health sensor 	Status of a NetApp storage system via SNMP
SNMP Nutanix Cluster Health sensor 	Status and performance of a Nutanix cluster via SNMP
SNMP Nutanix Hypervisor sensor 	A Nutanix hypervisor via SNMP
SNMP QNAP Logical Disk sensor 	A logical disk in a QNAP NAS via SNMP
SNMP QNAP Physical Disk sensor 	A physical disk in a QNAP NAS via SNMP
SNMP QNAP System Health sensor 	System health of a QNAP NAS via SNMP
SNMP Synology Logical Disk sensor 	A logical disk in a Synology NAS via SNMP

Sensor	What It Monitors
SNMP Synology Physical Disk sensor 	A physical disk in a Synology NAS via SNMP
SNMP Synology System Health sensor 	System health of a Synology NAS via SNMP
SSH SAN Enclosure sensor 	A SAN enclosure via SSH
SSH SAN Logical Disk sensor 	A logical disk on a SAN via SSH
SSH SAN Physical Disk sensor 	A physical disk on a SAN via SSH
SSH SAN System Health sensor 	System health of a SAN via SSH
TFTP sensor 	A TFTP server to check if a certain file is available for download
VMware Datastore (SOAP) sensor 	Disk usage of a VMware datastore via SOAP
Windows Physical Disk I/O sensor 	Input/output parameters of a hard disk on a Windows system via WMI or Windows performance counters
WMI Disk Health sensor 	Health of a physical disk on a Windows system via WMI
WMI File sensor 	A file via WMI
WMI Free Disk Space (Multi Disk) sensor 	Free disk space of one or more drives via WMI
WMI Logical Disk I/O sensor 	Disk usage of a logical disk or mount point on a Windows system via WMI
WMI Storage Pool sensor 	A storage pool via WMI
WMI Volume sensor 	Free disk space on a drive, logical volume, or mount point via WMI

Various Server Sensors

Sensor	What It Monitors
DHCP sensor 	A DHCP server
DNS sensor 	A DNS server

Sensor	What It Monitors
DNS v2 sensor  930	A DNS server, resolves domain name records, and compares them to a filter
IPMI System Health sensor  1491	Status of a system via the IPMI
LDAP sensor  1536	Directory services using the LDAP
OPC UA Certificate sensor  1889	Certificate of an OPC UA server
OPC UA Custom sensor  1900	Up to five numeric values returned by specific OPC UA node IDs
OPC UA Server Status sensor  1912	Server status, uptime, and diagnostic information of an OPC UA server
Ping sensor  2010	Availability of a device
Ping Jitter sensor  2020	A statistical jitter value and the execution time
Port sensor  2041	A network service by connecting to the sensor's port
Port Range sensor  2054	A network service by connecting to various TCP/IP ports
RADIUS v2 sensor  2129	A RADIUS server according to RFC 2865
RDP (Remote Desktop) sensor  2141	Remote desktop services (RDP, Terminal Services Client)
SNMP Trap Receiver sensor  3107	SNMP traps
SNTP sensor  3133	An SNTP server
SSL Security Check sensor  3315	SSL/TLS connectivity to the port of a device
Syslog Receiver sensor  3326	Syslog messages
Traceroute Hop Count sensor  3359	Number of hops needed from the probe system that the sensor runs on to the IP Address/DNS Name defined in the sensor's parent device

Virtual Server Sensors

Sensor	What It Monitors
Citrix XenServer Host sensor 	A Xen host server via HTTP
Citrix XenServer Virtual Machine sensor 	A VM on a Citrix XenServer via HTTP
Dell EMC Unity VMware Datastore v2 sensor 	A VMware datastore on a Dell EMC storage system via the REST API
Docker Container Status sensor 	Status of a Docker container
Hyper-V Cluster Shared Volume Disk Free sensor 	A Microsoft Hyper-V cluster shared volume via PowerShell
Hyper-V Host Server sensor 	A Microsoft Hyper-V host server via WMI or Windows performance counters
Hyper-V Virtual Machine sensor 	A VM running on a Microsoft Hyper-V host server via WMI or Windows performance counters
Hyper-V Virtual Network Adapter sensor 	Virtual network adapters running on a Microsoft Hyper-V host server via WMI or Windows performance counters
Hyper-V Virtual Storage Device sensor 	A virtual storage device running on a Microsoft Hyper-V host server via WMI or Windows performance counters
Microsoft Azure Virtual Machine sensor 	Status of a virtual machine in a Microsoft Azure subscription
SNMP Nutanix Cluster Health sensor 	Status and performance of a Nutanix cluster via SNMP
SNMP Nutanix Hypervisor sensor 	A Nutanix hypervisor via SNMP
VMware Datastore (SOAP) sensor 	Disk usage of a VMware datastore via SOAP
VMware Host Hardware (WBEM) sensor 	Hardware information of an ESXi server using WBEM
VMware Host Hardware Status (SOAP) sensor 	Hardware status of a VMware host server via SOAP
VMware Host Performance (SOAP) sensor 	A VMware host server via SOAP

Sensor	What It Monitors
VMware Virtual Machine (SOAP) sensor 	A VM on a VMware host server via SOAP

VoIP and QoS Sensors

Sensor	What It Monitors
Cisco IP SLA sensor 	VoIP network parameters using IP SLAs from Cisco via SNMP
QoS (Quality of Service) One Way sensor 	Parameters regarding the quality of a network connection between two probes
QoS (Quality of Service) Round Trip sensor 	Parameters regarding the quality of a network connection between a probe and a target device at the endpoint of the connection
SIP Options Ping sensor 	Connectivity for a SIP server using SIP options "Ping"
SNMP Cisco CBQoS sensor 	VoIP network parameters using Cisco's CBQoS via SNMP

Web Server (HTTP) Sensors

Sensor	What It Monitors
Cloud HTTP sensor 	Loading time of a web server via HTTP from different locations worldwide
Cloud HTTP v2 sensor 	Loading time of a web server via HTTP from different locations worldwide
Common SaaS sensor 	Availability of several SaaS providers
HTTP sensor 	A web server using HTTP
HTTP Advanced sensor 	Source code of a web page using HTTP
HTTP Apache ModStatus PerfStats sensor 	Performance statistics of an Apache web server using mod_status over HTTP

Sensor	What It Monitors
HTTP Apache ModStatus Totals sensor 	Activity of an Apache web server using mod_status over HTTP
HTTP Content sensor 	A numeric value returned by an HTTP request
HTTP Data Advanced sensor 	Values returned by the web server in multiple channels
HTTP Full Web Page sensor 	Full download time of a web page including assets such as images
HTTP IoT Push Data Advanced sensor 	Received values and a message encoded in valid XML or JSON in multiple channels
HTTP Push Count sensor 	Received messages that are pushed via an HTTP request to PRTG
HTTP Push Data sensor 	Numeric values from received messages that are pushed via an HTTP request to PRTG
HTTP Push Data Advanced sensor 	Data from received messages that are pushed via an HTTP request to PRTG
HTTP Transaction sensor 	An interactive website by performing a transaction using a set of HTTP URLs
HTTP XML/REST Value sensor 	An .xml file from a specified URL
REST Custom sensor 	Values returned by a REST API in multiple channels
SSL Certificate sensor 	Certificate of an SSL/TLS connection
SSL Security Check sensor 	SSL connectivity to the port of a device
Windows IIS Application sensor 	A Microsoft IIS server via WMI

Windows WMI/Performance Counter Sensors

Sensor	What It Monitors
Active Directory Replication Errors sensor 	A Windows DC for replication errors
Event Log (Windows API) sensor 	Event Log entries using the Windows API

Sensor	What It Monitors
PerfCounter Custom sensor 	A configured set of Windows performance counters
PerfCounter IIS Application Pool sensor 	A Microsoft IIS application pool using Windows performance counters
Windows CPU Load sensor 	CPU load on a computer via WMI or Windows performance counters
Windows IIS 6.0 SMTP Received sensor 	Number of received emails for a IIS 6.0 SMTP service (Exchange 2003) via WMI or Windows performance counters
Windows IIS 6.0 SMTP Sent sensor 	Number of sent emails for a IIS 6.0 SMTP service (Exchange 2003) via WMI or Windows performance counters
Windows IIS Application sensor 	A Microsoft IIS application pool using Windows performance counters
Windows MSMQ Queue Length sensor 	Number of messages in a message queue of the parent device
Windows Network Card sensor 	Bandwidth usage and traffic of a network interface via WMI or Windows performance counters
Windows Pagefile sensor 	Windows pagefile usage via WMI or Windows performance counters
Windows Physical Disk I/O sensor 	Input/output parameters of a hard disk on a Windows system via WMI or Windows performance counters
Windows Print Queue sensor 	Print queue on the sensor's parent device
Windows Process sensor 	A Windows process via WMI or Windows performance counters
Windows System Uptime sensor 	Uptime of a Windows system via WMI or Windows performance counters
Windows Updates Status (PowerShell) sensor 	Status of Windows updates on a computer
WMI Battery sensor 	Available capacity and state of connected batteries of a Windows-based device via WMI

Sensor	What It Monitors
WMI Custom sensor  3596	Numeric values (integers and floats)
WMI Custom String sensor  3608	Retrieved string value in the sensor message and response time
WMI Disk Health sensor  3622	Health of a physical disk on a Windows system via WMI
WMI Event Log sensor  3634	A specific Windows logfile via WMI
WMI Exchange Server sensor  3646	A Microsoft Exchange Server 2003 or later via WMI
WMI Exchange Transport Queue sensor  3660	Length of transport queues of a Microsoft Exchange Server 2003 or later via WMI
WMI File sensor  3674	A file via WMI
WMI Free Disk Space (Multi Disk) sensor  3685	Free disk space of one or more drives via WMI
WMI HDD Health sensor  3700	Health of IDE disk drives on the target system using S.M.A.R.T.
WMI Logical Disk I/O sensor  3713	Disk usage of a logical disk or mount point on a Windows system via WMI
WMI Memory sensor  3725	Available (free) system memory on Windows systems via WMI
WMI Microsoft SQL Server 2005 sensor  3736	Performance of a Microsoft SQL Server via WMI
WMI Microsoft SQL Server 2008 sensor  3749	Performance of a Microsoft SQL Server via WMI
WMI Microsoft SQL Server 2012 sensor  3762	Performance of a Microsoft SQL Server via WMI
WMI Microsoft SQL Server 2014 sensor  3775	Performance of a Microsoft SQL Server via WMI
WMI Microsoft SQL Server 2016 sensor  3788	Performance of a Microsoft SQL Server via WMI
WMI Microsoft SQL Server 2017 sensor  3801	Performance of a Microsoft SQL Server via WMI
WMI Microsoft SQL Server 2019 sensor  3814	Performance of a Microsoft SQL Server via WMI
WMI Remote Ping sensor  3827	Ping time from the remote device to the target device that is being pinged

Sensor	What It Monitors
WMI Security Center sensor 	Security status of a Windows client computer via WMI
WMI Service sensor 	A Windows service via WMI
WMI Share sensor 	A shared resource on a Windows system via WMI
WMI SharePoint Process sensor 	A Microsoft SharePoint server via WMI
WMI Storage Pool sensor 	A storage pool via WMI
WMI Terminal Services (Windows 2008+) sensor 	Number of sessions on a Windows Terminal Services (Remote Desktop Services) server via WMI
WMI Terminal Services (Windows XP/Vista/2003) sensor 	Number of sessions on a Windows Terminal Services (Remote Desktop Services) server via WMI
WMI UTC Time sensor 	UTC time of a target device via WMI
WMI Vital System Data v2 sensor 	Vital system parameters (CPU, thread, memory, network, pagefile) via WMI
WMI Volume sensor 	Free disk space on a drive, logical volume, or mount point via WMI
WSUS Statistics sensor 	Various statistics on a WSUS server via WMI

15.6 List of Default Ports

Here you can find lists for all default ports used in PRTG:

- [Ports Used by Sensors](#) 
- [Ports Used in Other Contexts](#)

Ports Used by Sensors

Sensors	Default Port Numbers	Description
Cloud HTTP and Cloud Ping sensors	443	Port for the communication via the PRTG Cloud
Cloud Ping sensors	80	Port for the TCP ping
Dell EMC sensors	443	Port for the connection to the Dell EMC system
DICOM sensors	104	Port for the connection to the DICOM interface
DNS sensors	53	Port for the connection to the device that runs the DNS service
Docker Container Status sensor 	2376 (Docker over TLS)	Port for the connection to the Docker container
FTP sensor 	21	Port for the connection to the file server
HL7 sensor 	104	Port for the connection to the HL7 interface
HTTP sensors	8080	Port of the proxy
HTTP IoT Push Data Advanced sensor 	5051	Port on which the sensor listens for incoming HTTPS requests  This port is fixed. You cannot change it.
HTTP Push sensors	<ul style="list-style-type: none"> ▪ 5050 (unsecure) ▪ 5051 (secure) 	Port on which the sensor listens for incoming HTTP or HTTPS requests
IMAP sensor 	<ul style="list-style-type: none"> ▪ 143 (unsecure) ▪ 993 (secure) 	Port for the IMAP connection

Sensors	Default Port Numbers	Description
LDAP sensor 	<ul style="list-style-type: none"> ▪ 389 (unsecure) ▪ 636 (secure) 	Port for the connection to the LDAP server
NetApp sensors	443	Port for the NetApp API access
Microsoft SQL v2 sensor	1433	Port for the connection to the Microsoft SQL database
MySQL v2 sensor	3306	Port for the connection to the MySQL database
Modbus TCP Custom sensor 	502	Port for the connection to the Modbus TCP server
MQTT sensors	<ul style="list-style-type: none"> ▪ 1883 (unsecure) ▪ 8883 (secure) 	Port for the MQTT connection
OPC UA sensors	4840	Port for the connection to the OPC UA server
Oracle sensors	1521	Port for the connection to the Oracle SQL database
POP3 sensor 	<ul style="list-style-type: none"> ▪ 110 (unsecure) ▪ 995 (secure) 	Port for the POP3 connection
PostgreSQL sensor 	5432	Port for the connection to the PostgreSQL database
QoS sensors	50000	Port on which the sensor listens for the UDP packets
RADIUS v2 sensor 	1812	Port for the connection to the RADIUS server
RDP (Remote Desktop) sensor 	3389	Port for the RDP connection
REST sensors	8080	Port for the proxy
SIP Options Ping sensor 	5060	Port for the UDP connection

Sensors	Default Port Numbers	Description
SMTP sensors	<ul style="list-style-type: none"> ▪ 25 (unsecure) ▪ 465 or 587 (secure) 	Port used to send an email via SMTP
SMTP&IMAP Round Trip sensor 	<ul style="list-style-type: none"> ▪ 143 (unsecure) ▪ 993 (secure) 	Port for the IMAP connection
SMTP&POP3 Round Trip sensor 	<ul style="list-style-type: none"> ▪ 110 (unsecure) ▪ 995 (secure) 	Port for the POP3 connection
SNMP sensors	161	Port for the SNMP connection
SNMP Trap Receiver sensor 	162	Port on which the sensor listens for SNMP traps and on which trap messages are sent
SSL sensors	443	Port for the Secure Sockets Layer (SSL)/Transport Layer Security (TLS) connection
Syslog Receiver sensor 	514	Port on which the sensor listens for Syslog messages and on which Syslog messages are sent
TFTP sensor 	69	Port of the device on which the TFTP service runs
Veeam Backup Job Status sensor 	9398	Port for the connection to the Veeam Backup Enterprise Manager
WBEM sensors	<ul style="list-style-type: none"> ▪ 5988 (unsecure) ▪ 5989 (secure) 	Port for the communication via WBEM
Windows Updates Status (PowerShell) sensor 	5985	Port for the connection to Microsoft or to the local WSUS server
WSUS Statistics sensor 	8530	Port for the connection to the device on which the WSUS server service runs

Ports Used in Other Contexts

Context	Default Port Numbers	Description
Cluster communication	23570	Port for the communication between cluster nodes
Incoming probe connections	23560	Port on which PRTG listens for incoming remote probe connections
PRTG Cloud	443	Port used by the PRTG Cloud for support tickets, for example
PRTG web server	<ul style="list-style-type: none"> ▪ 80 (unsecure) ▪ 443 (secure) 	Port used by the PRTG web server
Report generation	8085	Port used for report generation

15.7 List of Icons

See below for a list of icons used in this documentation.

	Notes that contain additional information.
	Notes that contain critical information on the functioning of PRTG. Pay close attention to this information to avoid serious consequences for PRTG.
	There is more information on this topic in a different section of the PRTG Manual or in the Knowledge Base.
	This feature is in beta status and might not function properly in all situations.
	There is a video on this topic.
	Examples on how to use a feature.
	This information is relevant for PRTG Hosted Monitor.
	This information is relevant for PRTG on premises.
	There is a Paessler tool that you can use.
	There is more information on this topic in the PRTG Manual, the Knowledge Base, the Paessler Blog, on the Paessler Website, or on other websites. This icon is only used in More sections.

15.8 List of New Sensors

Here you can find a list of sensors that are new.

Sensor	Description
Microsoft Azure Subscription Cost sensor 	Monitors the cost in a Microsoft Azure subscription.
MQTT Subscribe Custom sensor 	Subscribes to an MQTT topic and monitors up to five numeric values from the received JSON data.
OPC UA Certificate sensor 	Monitors the certificate of an OPC UA server.
OPC UA Custom sensor 	Monitors up to five numeric values returned by specific OPC UA node IDs.
OPC UA Server Status sensor 	Monitors the server status, uptime, and diagnostic information of an OPC UA server.
Veeam Backup Job Status sensor 	Monitors the status of all backup job runs on the Veeam Backup Enterprise Manager in the last 24 hours.

15.10 List of Placeholders for Notifications

Here you can find a list of all placeholders for notifications. You can use placeholders in different settings fields of a notification when editing [notification templates](#).

- [Notification Settings Fields](#)
- [Placeholders in Summarized Notifications](#)
- [List of Available Placeholders](#)

Notification Settings Fields

Notification	Settings field
Send Email	<ul style="list-style-type: none"> ▪ Subject ▪ Custom Text if you select the option Custom text
Add Entry to Event Log	Event Log Message
Send SMS/Pager Message	Message
Execute HTTP Action	Payload if you select the options POST, PUT, or PATCH
Execute Program	Parameters
Send Syslog Message	Message
Send SNMP Trap	Message
Send Amazon Simple Notification Service Message	Message
Assign Ticket	<ul style="list-style-type: none"> ▪ Subject ▪ Content
Send Push Notification	Message
Send Microsoft Teams Message	<ul style="list-style-type: none"> ▪ Title ▪ Subtitle
Send Slack Message	<ul style="list-style-type: none"> ▪ Sender Name ▪ Title ▪ Subtitle
Send MQTT Publish Notification	Message

- ❶ Placeholders are **not** case sensitive.
- ❷ Depending on **where** you use a placeholder in a notification, PRTG might resolve the placeholder differently. A resolved placeholder in the **body** of a notification, for example, can contain more information compared to when PRTG resolves the same placeholder in the **subject** of a notification. The reason for this is to save space in the subject line.

Placeholders in Summarized Notifications

Placeholders in summarized notifications have a limited functionality:

- PRTG does **not** resolve placeholders in the subject field of summarized notifications if more than one trigger was evoked during the summarized time span. An exception are the placeholders %sitename and %summarycount. These are **always resolved** in summarized notifications.
- If only one event is triggered during the time span you defined, PRTG does not send a summarized notification, it only sends a common notification. A summarized notification requires at least two triggered events.

List of Available Placeholders

Placeholder	Resolved Content	Synonym	Comment
%colorofstate	Color of the current object status (hex code)		Might not work in older versions.
%company	Copyright string of Paessler AG		
%comments	Comments entered for the sensor	%commentssensor	As of PRTG 15.4.21, resolved placeholders contain the heading Sensor Comments .
%commentssensor	Comments entered for the sensor	%comments	As of PRTG 15.4.21, resolved placeholders contain the heading Sensor Comments .
%commentsdevice	Comments entered for the parent device		As of PRTG 15.4.21, resolved placeholders contain the heading Device Comments .
%commentsgroup	Comments entered for the parent group		As of PRTG 15.4.21, resolved placeholders contain the heading Group Comments .

Placeholder	Resolved Content	Synonym	Comment
%commentsprobe	Comments entered for the parent probe		Available as of PRTG 12.4. As of PRTG 15.4.21, resolved placeholders contain the heading Probe Comments .
%coverage	Covered time span		Might not work in older versions.
%cumsince	Since when data has been accumulated		
%date	An event's date in the PRTG core server system's timezone		
%datetime	An event's date and time in the PRTG core server system's timezone		
%device	Name of the device in which the event was triggered	%server	
%deviceid	ID number of the device in which the event was triggered		
%down	Time the item was down		
%downtime	Accumulated downtime		
%elapsed_lastcheck	Elapsed time since the sensor's last scan		Available as of PRTG 20.1.57.
%elapsed_lastdown	Elapsed time since the sensor last showed a Down status		Available as of PRTG 20.1.57.

Placeholder	Resolved Content	Synonym	Comment
%elapsed_lastup	Elapsed time since the sensor last showed an Up status		Available as of PRTG 20.1.57.
%group	Group in which the event was triggered		
%groupid	ID number of the group in which the event was triggered		
%history	History of sensor events		
%home	URL of the PRTG web server		
%host	IP or DNS name of the device that triggered the event		As of PRTG 13.x.7, the placeholder can be used as Agent IP in SNMP trap notifications sent by PRTG.
%iconofstate	File name including the extension of the icon for the current object status		Might not work in older versions.
%lastcheck	Point in time of the sensor's last scan including time stamp		
%lastdown	Point in time when the sensor last showed a Down status, including the time stamp		
%lastmessage	Message that the sensor sent the last time	%message	
%laststatus	Current sensor status		Available as of PRTG 20.1.57.

Placeholder	Resolved Content	Synonym	Comment
%lastup	Point in time when the sensor last showed an Up status, including the time stamp		
%lastvalue	Value that the sensor sent the last time		
%linkprobe	URL of the probe that triggered the event		Might not work in older versions.
%linkgroup	URL of the group that triggered the event		Might not work in older versions.
%linkdevice	URL of the device that triggered the event		Might not work in older versions.
%linksensor	URL of the sensor that triggered the event		Might not work in older versions.
%location	Location of the device or server for which the event was triggered		
%message	Message that the sensor sent the last time	%lastmessage	
%name	Name of the sensor that triggered the event, including the sensor type	%sensor	
%nodename	Name of the node if PRTG runs in a cluster		Might not work in older versions.
%objecttags	All tags of a sensor		Available as of PRTG 20.1.56.
%parenttags	All tags of a sensor's parent objects		Available as of PRTG 20.1.56.

Placeholder	Resolved Content	Synonym	Comment
%prio	A sensor's priority setting	%priority	
%priority	A sensor's priority setting	%prio	
%probe	Probe under which the event was triggered		
%probeid	ID number of the probe under which the event was triggered		
%programname	Official name of PRTG		
%programversion	Program version of PRTG		
%sensor	Name of the sensor that triggered the event, including the sensor type	%name	
%sensorid	ID number of the sensor that triggered the event		
%server	Name of the device under which the event was triggered	%device	
%serviceurl	Service URL configured for the device under which the event was triggered		Available as of PRTG 9.1.
%settings	Miscellaneous sensor settings, such as the user name for Windows, HTTP, POP3 credentials, and so on		

Placeholder	Resolved Content	Synonym	Comment
%shortname	Name of the sensor that triggered the event		
%since	Point in time since the current object status has been active	%statesince	
%sitename	Name of the PRTG web server		
%statesince	Point in time since the current object status has been active	%since	
%status	Old sensor status and current sensor status		
%summarycount	Number of events triggered during the defined time span		<p> For summarized notifications only.</p>
%syslogerrors	Max. last 20 syslog entries before the notification trigger		<p>Available as of PRTG 14.x.10.</p> <p> Works only with Syslog Receiver sensors <small>3326</small>.</p> <p> Can only be used in the Custom Content field of Send Email notifications.</p>
%syslogmessages	Max. last 20 syslog entries before the notification trigger		<p>Available as of PRTG 14.x.10.</p> <p> Works only with Syslog Receiver sensors <small>3326</small>.</p> <p> Can only be used in the Custom Content field of Send Email notifications.</p>

Placeholder	Resolved Content	Synonym	Comment
%syslogwarnings	Max. last 20 syslog entries before the notification trigger		<p>Available as of PRTG 14.x.10.</p> <p> Works only with Syslog Receiver sensors  <small>3326</small>.</p> <p> Can only be used in the Custom Content field of Send Email notifications.</p>
%systemdatetime	Date and time when the notification was sent in the PRTG core server system's time zone		
%tags	All tags of a sensor and its parent objects		Available as of PRTG 20.1.56.
%time	An event's time in the PRTG core server system's time zone		
%timezone	Time zone name of the PRTG core server system		
%toaddress	Address to which the notification was sent		
%traperrors	Max. last 20 SNMP trap entries before the notification trigger		<p>Available as of PRTG 14.x.10.</p> <p> Works only with SNMP Trap Receiver sensors  <small>3107</small>.</p> <p> Can only be used in the Custom Content field of Send Email notifications.</p>
%trapmessages	Max. last 20 SNMP trap entries before the notification trigger		Available as of PRTG 14.x.10.

Placeholder	Resolved Content	Synonym	Comment
			<p>i Works only with SNMP Trap Receiver sensors ³¹⁰⁷.</p> <p>i Can only be used in the Custom Content field of Send Email notifications.</p>
%trapwarnings	Max. last 20 SNMP trap entries before the notification trigger		<p>Available as of PRTG 14.x.10.</p> <p>i Works only with SNMP Trap Receiver sensors ³¹⁰⁷.</p> <p>i Can only be used in the Custom Content field of Send Email notifications.</p>
%uptime	Accumulated uptime		

i As of PRTG 15.4.21, PRTG uses default content in HTML email notifications. You can still change the content of emails in plain text in the Send Email notification settings and also use placeholders there.

i As of PRTG 16.x.24, the placeholder %state has been deprecated. You can use the placeholder %status with the same functionality instead.

■ For a list of placeholders that are available for EXE/Script and other custom sensors, as well as for command-line parameters, see section [Custom Sensors](#) ⁴⁴³⁷.

15.11 List of Sensors by Performance Impact

Here you can find a list of sensors sorted by their performance impact.

i You can also see a sensor's performance impact in the Add Sensor dialog or on a sensor's Overview tab.

A sensor can have one of the following types of performance impact:

- [Very Low Performance Impact](#) 
- [Low Performance Impact](#) 
- [Medium Performance Impact](#) 
- [High Performance Impact](#) 
- [Very High Performance Impact](#)

Very Low Performance Impact

Sensor	Description
Cluster Health sensor 	Monitors the health of a cluster and indicates the system health status of PRTG.
Common SaaS sensor 	Monitors the availability of several SaaS providers.
Core Health sensor 	Monitors internal PRTG parameters and shows the status of the PRTG core server.
Core Health (Autonomous) sensor 	Monitors internal PRTG parameters and shows the status of the PRTG core server.
Dell EMC Unity Enclosure Health v2 sensor 	Monitors the health of an enclosure on a Dell EMC storage system via the REST API.
Dell EMC Unity File System v2 sensor 	Monitors a file system on a Dell EMC storage system via the REST API.
Dell EMC Unity Storage Capacity v2 sensor 	Monitors a Dell EMC storage system via the REST API.
Dell EMC Unity Storage LUN v2 sensor 	Monitors a LUN on a Dell EMC storage system via the REST API.

Sensor	Description
Dell EMC Unity Storage Pool v2 sensor 	Monitors a storage pool on a Dell EMC storage system via the REST API.
Dell EMC Unity VMware Datastore v2 sensor 	Monitors a VMware datastore on a Dell EMC storage system via the REST API.
DNS sensor 	Monitors a DNS server. It resolves a domain name and compares it to a specific IP address.
Microsoft Azure Subscription Cost sensor 	Monitors the cost in a Microsoft Azure subscription.
Microsoft Azure Virtual Machine sensor 	Monitors the status of a virtual machine in a Microsoft Azure subscription.
Modbus TCP Custom sensor 	Monitors up to five values returned by a Modbus TCP server.
NetApp Aggregate sensor 	Monitors the status of a NetApp cDOT or ONTAP storage aggregate accessing the API via SOAP.
NetApp I/O sensor 	Monitors input and output operations of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp LIF sensor 	Monitors logical interfaces of a NetApp cDOT or ONTAP cluster accessing the API via SOAP.
NetApp LUN sensor 	Monitors the LUN of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp NIC sensor 	Monitors the NIC of a NetApp cDOT or ONTAP cluster accessing the API via SOAP.
NetApp Physical Disk sensor 	Monitors disks of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp SnapMirror sensor 	Monitors SnapMirror relationships of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp System Health sensor 	Monitors the health of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp Volume sensor 	Monitors volumes on a NetApp cDOT or ONTAP storage system accessing the API via SOAP.

Sensor	Description
OPC UA Certificate sensor 	Monitors the certificate of an OPC UA server.
OPC UA Server Status sensor 	Monitors the server status, uptime, and diagnostic information of an OPC UA server.
Ping sensor 	Sends an ICMP echo request ("Ping") from the probe system to the device it is created on to monitor the availability of a device.
Port sensor 	Monitors a network service by connecting to its port.
Port Range sensor 	Monitors a network service by connecting to various TCP/IP ports.
Probe Health sensor 	Monitors internal PRTG parameters and shows the status of the probe system.
SNMP APC Hardware sensor 	Monitors performance counters on an APC UPS device via SNMP.
SNMP Cisco ASA VPN Connections sensor 	Monitors the VPN connections on a Cisco Adaptive Security Appliance via SNMP.
SNMP Cisco CBQoS sensor 	Monitors network parameters using Cisco's CBQoS via SNMP.
SNMP Cisco UCS Blade sensor 	Monitors the health status of a Cisco UCS blade server via SNMP.
SNMP Cisco UCS Chassis sensor 	Monitors the health status of the chassis of a Cisco UCS device via SNMP.
SNMP Custom sensor 	Monitors a single parameter that is returned by a specific OID via SNMP.
SNMP Custom String sensor 	Monitors a string returned by a specific OID via SNMP.
SNMP Custom String Lookup sensor 	Monitors a string returned by a specific OID via SNMP and can map the string directly to a sensor status.
SNMP Dell Hardware sensor 	Monitors performance counters on a Dell hardware device via SNMP.

Sensor	Description
SNMP Dell PowerEdge System Health sensor 	Monitors the system health of a Dell PowerEdge server via SNMP.
SNMP Hardware Status sensor 	Monitors the status of a server's hardware component via SNMP.
SNMP HP LaserJet Hardware sensor 	Monitors performance counters on an HP LaserJet hardware device via SNMP.
SNMP HPE ProLiant Logical Disk sensor 	Monitors a logical disk in an HPE server via SNMP.
SNMP HPE ProLiant Memory Controller sensor 	Monitors a memory controller in an HPE server via SNMP.
SNMP IBM System X Logical Disk sensor 	Monitors a logical disk in an IBM server via SNMP.
SNMP IBM System X Physical Disk sensor 	Monitors a physical disk in an IBM server via SNMP.
SNMP IBM System X Physical Memory sensor 	Monitors the memory modules in an IBM server via SNMP.
SNMP interSeptor Pro Environment sensor 	Queries data from a Jacarta interSeptor Pro environmental monitoring system via SNMP.
SNMP LenovoEMC Physical Disk sensor 	Monitors a physical disk in a LenovoEMC NAS via SNMP.
SNMP LenovoEMC System Health sensor 	Monitors the system health of a LenovoEMC NAS via SNMP.
SNMP Library sensor 	Uses a compiled MIB file to create sensors that monitor a device via SNMP.
SNMP Linux Load Average sensor 	Monitors the system load average of a Linux/Unix system via SNMP.

Sensor	Description
SNMP Linux Meminfo sensor 	Monitors the memory usage of a Linux/Unix system via SNMP.
SNMP NetApp I/O sensor 	Monitors the IOPS on a NetApp storage system via SNMP.
SNMP NetApp System Health sensor 	Monitors the status of a NetApp storage system via SNMP.
SNMP Poseidon Environment sensor 	Monitors performance counters for environmental measurements on Poseidon hardware via SNMP.
SNMP Printer sensor 	Monitors various types of printers via SNMP.
SNMP QNAP Logical Disk sensor 	Monitors a logical disk in a QNAP NAS via SNMP.
SNMP QNAP Physical Disk sensor 	Monitors a physical disk in a QNAP NAS via SNMP.
SNMP RMON sensor 	Monitors traffic on a device using the Remote Monitoring (RMON) standard via SNMP.
SNMP SonicWall System Health sensor 	Monitors health values of a SonicWall NSA via SNMP.
SNMP SonicWall VPN Traffic sensor 	Monitors the traffic of an IPsec VPN on a SonicWall NSA via SNMP.
SNMP Synology Logical Disk sensor 	Monitors a logical disk in a Synology NAS via SNMP.
SNMP Synology Physical Disk sensor 	Monitors a physical disk in a Synology NAS via SNMP.
SNMP Synology System Health sensor 	Monitors the system health of a Synology NAS via SNMP.
SNMP System Uptime sensor 	Monitors the time that a device runs via SNMP.

Sensor	Description
SNMP Traffic sensor 	Monitors traffic on a device via SNMP.
SNMP Windows Service sensor 	Monitors a Windows service via SNMP.
SSL Certificate sensor 	Monitors the certificate of an SSL/TLS connection.
SSL Security Check sensor 	Monitors SSL/TLS connectivity to the port of a device.
System Health sensor 	Monitors internal PRTG parameters and shows the status of the probe system.
Veeam Backup Job Status sensor 	Monitors the status of all backup job runs on the Veeam Backup Enterprise Manager in the last 24 hours.
VMware Datastore (SOAP) sensor 	Monitors the disk usage of a VMware datastore via SOAP.
Zoom Service Status sensor 	Monitors the global status of all Zoom services.

Low Performance Impact

Sensor	Description
AWS Cost sensor 	Monitors the cost of an AWS account by reading its data from the AWS Cost Explorer API.
Cisco IP SLA sensor 	Monitors VoIP network parameters using IP SLAs from Cisco via SNMP.
Cloud HTTP sensor 	Monitors the response time and response code of the target server.
Cloud HTTP v2 sensor 	Monitors the response time and response code of the target server.
Cloud Ping sensor 	Monitors the response time of the target server.
Cloud Ping v2 sensor 	Monitors the response time of the target server using TCP ping.

Sensor	Description
DHCP sensor 	Monitors a DHCP server. It sends a broadcast message to the network and waits for a DHCP server to respond.
Docker Container Status sensor 	Monitors the status of a Docker container.
Dropbox sensor 	Monitors a Dropbox account using the Dropbox API and OAuth2.
EXE/Script sensor 	Runs an executable file (.exe, .dll) or a script (batch file, VBScript, PowerShell) on the probe system.
Google Analytics sensor 	Queries and monitors several metrics from a Google Analytics account using the Google API and OAuth2.
Google Drive sensor 	Monitors a Google Drive account using the Google API and OAuth2.
HTTP sensor 	Monitors a web server using HTTP to see if a website (or a specific website element) is reachable.
HTTP Apache ModStatus PerfStats sensor 	Monitors performance statistics of an Apache web server using <code>mod_status</code> over HTTP.
HTTP Apache ModStatus Totals sensor 	Monitors the activity of an Apache web server using <code>mod_status</code> over HTTP.
HTTP IoT Push Data Advanced sensor 	Displays data from messages that are received from IoT-capable devices and that are pushed via an HTTPS request to PRTG.
HTTP Push Count sensor 	Counts received messages that are pushed via an HTTP request to PRTG.
HTTP Push Data sensor 	Displays numeric values from received messages that are pushed via an HTTP request to PRTG.
HTTP Push Data Advanced sensor 	Displays data from received messages that are pushed via an HTTP request to PRTG.
Microsoft 365 Service Status sensor 	Monitors the overall status of all services of a Microsoft 365 subscription.

Sensor	Description
Microsoft 365 Service Status Advanced sensor  1537	Monitors the detailed status of all services of a Microsoft 365 subscription.
Microsoft OneDrive sensor  1595	Monitors a Microsoft personal OneDrive account using the OneDrive API and OAuth2.
MQTT Round Trip sensor  1639	Monitors the availability of an MQTT broker (server), connects to the broker as a publishing and subscribing client, and sends the data packets using a predefined topic.
OPC UA Custom sensor  1900	Monitors up to five numeric values returned by specific OPC UA node IDs.
PerfCounter Custom sensor  1986	Monitors a configured set of Windows performance counters.
PerfCounter IIS Application Pool sensor  1998	Monitors a Microsoft IIS application pool using Windows performance counters.
POP3 sensor  2030	Monitors an email server using POP3.
RDP (Remote Desktop) sensor  2141	Monitors remote desktop services (RDP, Terminal Services Client).
SIP Options Ping sensor  2251	Monitors the connectivity to a SIP server using SIP options "Ping".
SMTP sensor  2263	Monitors a mail server using SMTP and can optionally send a test email with every check.
SNMP Buffalo TS System Health sensor  2316	Monitors the system health of a Buffalo TeraStation NAS via SNMP.
SNMP Cisco ADSL sensor  2326	Monitors ADSL statistics of a Cisco router via SNMP.
SNMP Cisco ASA VPN Traffic sensor  2348	Monitors the traffic of an IPsec VPN connection on a Cisco Adaptive Security Appliance via SNMP.
SNMP Cisco ASA VPN Users sensor  2361	Monitors account connections to a VPN on a Cisco Adaptive Security Appliance via SNMP.

Sensor	Description
SNMP Cisco System Health sensor 	Monitors the system health of a Cisco device via SNMP.
SNMP CPU Load sensor 	Monitors the system load via SNMP.
SNMP Custom Advanced sensor 	Monitors numeric values returned for OIDs via SNMP.
SNMP Custom Table sensor 	Monitors entries from a table that is provided via SNMP.
SNMP Dell EqualLogic Logical Disk sensor 	Monitors a volume of a Dell EqualLogic storage system via SNMP.
SNMP Dell EqualLogic Member Health sensor 	Monitors the health of an array member of an EqualLogic storage system via SNMP.
SNMP Dell EqualLogic Physical Disk sensor 	Monitors a disk in a Dell EqualLogic storage system via SNMP.
SNMP Dell PowerEdge Physical Disk sensor 	Monitors a physical disk in a Dell PowerEdge server via via SNMP.
SNMP Disk Free sensor 	Monitors the free disk space on a logical disk via SNMP.
SNMP Fujitsu System Health v2 sensor 	Monitors the status of a Fujitsu PRIMERGY server via the iRMS and SNMP.
SNMP HPE BladeSystem Blade sensor 	Monitors the status of an HPE BladeSystem via SNMP.
SNMP HPE BladeSystem Enclosure System Health sensor 	Monitors the system health of an HPE BladeSystem device via SNMP.
SNMP HPE ProLiant Network Interface sensor 	Monitors a network interface in an HPE server via SNMP.
SNMP HPE ProLiant Physical Disk sensor 	Monitors a physical disk in an HPE server via SNMP.

Sensor	Description
SNMP HPE ProLiant System Health sensor 	Monitors the system health of an HPE ProLiant server via SNMP.
SNMP IBM System X System Health sensor 	Monitors the system health of an IBM device via SNMP.
SNMP Juniper NS System Health sensor 	Monitors the system health of a Juniper NetScreen device via SNMP.
SNMP Linux Disk Free sensor 	Monitors free space on disks of a Linux/Unix system via SNMP.
SNMP Linux Physical Disk sensor 	Monitors the I/O on disks of a Linux/Unix system via SNMP.
SNMP Memory sensor 	Monitors the memory usage of a system via SNMP.
SNMP NetApp Disk Free sensor 	Monitors free space on disks of a NetApp storage system via SNMP.
SNMP NetApp Enclosure sensor 	Monitors the power supply and cooling of an enclosure that is part of a NetApp storage system via SNMP.
SNMP NetApp License sensor 	Monitors the licenses for the services of a NetApp storage system via SNMP.
SNMP NetApp Logical Unit sensor 	Monitors the IOPS on a logical unit of a NetApp storage system via SNMP.
SNMP NetApp Network Interface sensor 	Monitors a network card of a NetApp storage system via SNMP.
SNMP Nutanix Cluster Health sensor 	Monitors the status and the performance of a Nutanix cluster via SNMP.
SNMP Nutanix Hypervisor sensor 	Monitors a Nutanix hypervisor via SNMP.
SNMP QNAP System Health sensor 	Monitors the system health of a QNAP NAS via SNMP.

Sensor	Description
SNTP sensor 	Monitors an SNTP server.
WMI UTC Time sensor 	Monitors the UTC time of a target device via WMI.

Medium Performance Impact

Sensor	Description
Amazon CloudWatch Alarm sensor 	Monitors the status of an Amazon CloudWatch alarm.
Amazon CloudWatch EBS sensor 	Monitors the performance of the Amazon Cloud service EBS.
Amazon CloudWatch EC2 sensor 	Monitors the performance of the Amazon Cloud service EC2.
Amazon CloudWatch ElastiCache sensor 	Monitors the performance of the Amazon Cloud service ElastiCache.
Amazon CloudWatch ELB sensor 	Monitors the performance of the Amazon Cloud service ELB.
Amazon CloudWatch RDS sensor 	Monitors the performance of the Amazon Cloud service RDS.
Amazon CloudWatch SNS sensor 	Monitors the performance of the Amazon Cloud service SNS.
Amazon CloudWatch SQS sensor 	Monitors the performance of the Amazon Cloud service SQS.
Business Process sensor 	Gives you a summarized status of entire business processes while monitoring several process components.
DNS v2 sensor 	Monitors a DNS server, resolves domain name records, and compares them to a filter.
EXE/Script Advanced sensor 	Runs an executable file (.exe, .dll) or a script (batch file, VBScript, PowerShell) on the probe system.
FTP sensor 	Monitors file servers using FTP and FTPS.

Sensor	Description
HL7 sensor 	Monitors the availability of HL7 interfaces.
HTTP Advanced sensor 	Monitors the source code of a web page using HTTP. It supports authentication, content checks, and other advanced parameters.
HTTP Content sensor 	Monitors a numeric value returned by an HTTP request.
HTTP Data Advanced sensor 	Accesses a web server and retrieves XML-encoded or JSON-encoded data.
Hyper-V Cluster Shared Volume Disk Free sensor 	Monitors a Microsoft Hyper-V cluster shared volume via PowerShell.
IMAP sensor 	Monitors an email server using IMAP.
IPMI System Health sensor 	Monitors the status of a system via the IPMI.
LDAP sensor 	Monitors directory services using the LDAP.
MQTT Statistics sensor 	Monitors an MQTT topic.
MQTT Subscribe Custom sensor 	Subscribes to an MQTT topic and monitors up to five numeric values from the received JSON data.
Ping Jitter sensor 	Sends a series of ICMP echo requests ("Pings") to the specified URI to determine the statistical jitter.
Python Script Advanced sensor 	Executes a Python script on the probe system.
REST Custom sensor 	Queries a REST API endpoint and maps the JSON or XML result to sensor values.
SFTP Secure File Transfer Protocol sensor 	Monitors FTP servers of a Linux/Unix system using the SSH File Transfer Protocol (FTP over SSH).
Share Disk Free sensor 	Monitors free disk space of a share (Windows/Samba) using SMB.

Sensor	Description
SNMP Cisco UCS Physical Disk sensor  2419	Monitors a physical disk of a Cisco UCS device via SNMP.
SNMP Cisco UCS System Health sensor  2430	Monitors the system health of a Cisco UCS device via SNMP.
Soffico Orchestra Channel Health sensor  3142	Monitors the state and the overall number of successful or failed channel calls.
SSH Disk Free sensor  3154	Monitors free space on disks of a Linux/Unix system via SSH.
SSH INodes Free sensor  3170	Monitors the free index nodes on disks of Linux/Unix and macOS systems via SSH.
SSH Load Average sensor  3182	Monitors the load average of a Linux/Unix system via SSH.
SSH Meminfo sensor  3194	Monitors the memory usage of a Linux/Unix system via SSH.
SSH SAN Logical Disk sensor  3231	Monitors a logical disk on a SAN via SSH.
SSH SAN Physical Disk sensor  3244	Monitors a physical disk on a SAN via SSH.
SSH SAN System Health sensor  3258	Monitors the system health of a SAN via SSH.
TFTP sensor  3349	Monitors a TFTP server and checks if a certain file is available for download.
VMware Host Hardware Status (SOAP) sensor  3404	Monitors the hardware status of a VMware host server via SOAP.
Windows IIS Application sensor  3475	Monitors a Microsoft IIS server via WMI. It can also monitor applications that use IIS, such as Microsoft SharePoint or Microsoft Reporting Services (SSRS).
WMI HDD Health sensor  3700	Connects to the parent device via WMI and monitors the health of IDE disk drives on the target system using S.M.A.R.T.

High Performance Impact

Sensor	Description
Active Directory Replication Errors sensor <small>477</small>	Checks a Windows DC for replication errors.
ADO SQL v2 sensor <small>490</small>	Monitors a database using an ADO connection and executes an SQL query.
Citrix XenServer Host sensor <small>670</small>	Monitors a Xen host server via HTTP.
Citrix XenServer Virtual Machine sensor <small>681</small>	Monitors a VM on a Citrix XenServer via HTTP.
Dell PowerVault MDi Logical Disk sensor <small>850</small>	Monitors a virtual disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i.
Dell PowerVault MDi Physical Disk sensor <small>861</small>	Monitors a physical disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, or MD3620f.
DICOM Bandwidth sensor <small>885</small>	Monitors the bandwidth usage of a C-STORE request to a DICOM-capable device.
DICOM C-ECHO sensor <small>896</small>	Monitors the availability of DICOM-capable systems and devices by sending C-ECHO requests to the target system.
DICOM Query/Retrieve sensor <small>907</small>	Monitors the C-FIND capability of DICOM-capable systems and devices. It sends a C-FIND request or MWL query to the target device and counts all found items.
Enterprise Virtual Array sensor <small>968</small>	Monitors an HPE Storage EVA using the sssu.exe from HPE P6000 Command View Software.
Exchange Backup (PowerShell) sensor <small>993</small>	Monitors backups of an Exchange server using Remote PowerShell.
Exchange Database (PowerShell) sensor <small>1004</small>	Monitors database information of an Exchange server using Remote PowerShell.
Exchange Database DAG (PowerShell) sensor <small>1017</small>	Monitors the DAG status of a database on an Exchange server using Remote PowerShell.

Sensor	Description
Exchange Mail Queue (PowerShell) sensor  1030	Monitors the number of items in the outgoing mail queue of an Exchange server using Remote PowerShell.
Exchange Mailbox (PowerShell) sensor  1041	Monitors mailboxes of an Exchange server using Remote PowerShell.
Exchange Public Folder (PowerShell) sensor  1052	Monitors the public folders and subfolders of an Exchange server using Remote PowerShell.
File sensor  1082	Monitors a file located on the local disk on the probe system, parent device, or a file that is accessible via SMB.
File Content sensor  1104	Checks a text file (for example, logfiles) for certain strings.
Folder sensor  1116	Monitors a folder using SMB. You can monitor file changes and file ages.
FTP Server File Count sensor  1140	Logs in to an FTP server and can monitor changes to files.
HTTP Transaction sensor  1339	Monitors an interactive website, such as a web shop, by performing a transaction using a set of HTTP URLs. The sensor monitors whether logins or shopping carts work properly.
HTTP XML/REST Value sensor  1355	Retrieves an .xml file from a URL and parses it.
Hyper-V Host Server sensor  1384	Monitors a Microsoft Hyper-V host server via WMI.
Hyper-V Virtual Machine sensor  1395	Monitors a VM running on a Microsoft Hyper-V host server via WMI.
Hyper-V Virtual Network Adapter sensor  1407	Monitors virtual network adapters running on a Microsoft Hyper-V host server via WMI.
Hyper-V Virtual Storage Device sensor  1419	Monitors a virtual storage device running on a Microsoft Hyper-V host server via WMI.
IP on DNS Blacklist sensor  1448	Checks if the IP address of the sensor's parent device is listed on specific blacklist servers.

Sensor	Description
Microsoft SQL v2 sensor 	Monitors a database on a Microsoft SQL server and executes a defined query.
MySQL v2 sensor 	Monitors a database on a MySQL server and executes a defined query.
Oracle SQL v2 sensor 	Monitors a database on an Oracle server and executes a defined query.
Oracle Tablespace sensor 	Monitors a tablespace on an Oracle server.
PostgreSQL sensor 	Monitors a database on a PostgreSQL server and executes a defined query.
QoS (Quality of Service) One Way sensor 	Monitors parameters regarding the quality of a network connection between two probes.
QoS (Quality of Service) Round Trip sensor 	Monitors parameters regarding the quality of a network connection between two probes.
RADIUS v2 sensor 	Monitors a RADIUS server according to RFC 2865. The sensor tries to authenticate itself against the server.
SMTP&IMAP Round Trip sensor 	Monitors the time it takes for an email to reach an IMAP mailbox after being sent using SMTP.
SMTP&POP3 Round Trip sensor 	Monitors the time it takes for an email to reach a POP3 mailbox after being sent using SMTP.
SSH Remote Ping sensor 	Remotely monitors the connectivity between a system running Linux/macOS X and another device, using ICMP echo requests (Ping) and SSH.
SSH SAN Enclosure sensor 	Monitors a SAN enclosure via SSH.
Traceroute Hop Count sensor 	Traces the number of hops that are needed from the probe system to the IP address or DNS name defined in the sensor's parent device.
VMware Host Hardware (WBEM) sensor 	Monitors hardware information of an ESXi server using WBEM.

Sensor	Description
Windows CPU Load sensor 	Monitors the CPU load on a computer via WMI.
Windows IIS 6.0 SMTP Received sensor 	Monitors the number of received emails for a Microsoft IIS 6.0 SMTP service (Exchange 2003) via WMI.
Windows IIS 6.0 SMTP Sent sensor 	monitors the number of sent emails for an IIS 6.0 SMTP service (Exchange 2003) via WMI.
Windows MSMQ Queue Length sensor 	Reads the number of messages in a Microsoft message queue of the parent device.
Windows Network Card sensor 	Monitors bandwidth usage and traffic of a network interface via WMI.
Windows Pagefile sensor 	Monitors the Windows pagefile usage via WMI.
Windows Physical Disk I/O sensor 	Monitors the I/O parameters of a hard disk on a Windows system via WMI.
Windows Print Queue sensor 	Reads the print queue on the sensor's parent device and returns the number of jobs in the print queue.
Windows Process sensor 	Monitors a Windows process via WMI.
Windows System Uptime sensor 	Monitors the uptime of a Windows system via WMI.
WMI Battery sensor 	Monitors the available capacity and the state of connected batteries of a Windows-based device via WMI.
WMI Custom sensor 	Performs a custom query via WMI and monitors numeric values (integers and floats).
WMI Custom String sensor 	Performs a custom string query via WMI.
WMI Disk Health sensor 	Monitors the health of a physical disk on a Windows system via WMI.
WMI Exchange Server sensor 	Monitors a Microsoft Exchange Server 2003 or later via WMI.

Sensor	Description
WMI Exchange Transport Queue sensor 	Monitors the length of transport queues of a Microsoft Exchange Server 2003 or later via WMI.
WMI File sensor 	Monitors a file via WMI.
WMI Free Disk Space (Multi Disk) sensor 	Monitors the free disk space of one or more drives via WMI.
WMI Logical Disk I/O sensor 	Monitors the disk usage of a logical disk or mount point on a Windows system via WMI.
WMI Memory sensor 	Monitors available (free) system memory on Windows systems via WMI.
WMI Microsoft SQL Server 2008 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2012 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2014 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2016 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2017 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2019 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Remote Ping sensor 	Remotely connects to a Windows system via WMI and performs an ICMP echo request (Ping) from this device to a specified target.
WMI Security Center sensor 	Monitors the security status of a Windows client computer via WMI.
WMI Service sensor 	Monitors a Windows service via WMI.

Sensor	Description
WMI Share sensor 	Monitors a shared resource on a Windows system via WMI.
WMI SharePoint Process sensor 	Monitors a Microsoft SharePoint server via WMI.
WMI Storage Pool sensor 	Monitors a storage pool via WMI.
WMI Terminal Services (Windows 2008+) sensor 	Monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server via WMI.
WMI Terminal Services (Windows XP/Vista/2003) sensor 	Monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server via WMI.
WMI Vital System Data v2 sensor 	Monitors vital system parameters (CPU, thread, memory, network, pagefile) via WMI.
WMI Volume sensor 	Monitors the free disk space on a drive, logical volume, or mount point via WMI.
WSUS Statistics sensor 	Monitors various statistics on a WSUS server via WMI.

Very High Performance Impact

Sensor	Description
Event Log (Windows API) sensor 	Monitors Event Log entries using the Windows API.
HTTP Full Web Page sensor 	Monitors the full download time of a web page including assets such as images.
IPFIX sensor 	Receives traffic data from an IPFIX-compatible device and shows traffic by type.
IPFIX (Custom) sensor 	Receives traffic data from an IPFIX-compatible device and shows traffic by type.
jFlow v5 sensor 	Receives traffic data from a jFlow v5 compatible device and shows the traffic by type.

Sensor	Description
jFlow v5 (Custom) sensor  1521	Receives traffic data from a jFlow v5-compatible device and shows the traffic by type.
NetFlow v5 sensor  1824	Receives traffic data from a NetFlow v5 compatible device and shows the traffic by type.
NetFlow v5 (Custom) sensor  1841	Receives traffic data from a NetFlow v5 compatible device and shows the traffic by type.
NetFlow v9 sensor  1856	Receives traffic data from a NetFlow v9 compatible device and shows the traffic by type.
NetFlow v9 (Custom) sensor  1873	Receives traffic data from a NetFlow v9 compatible device and shows the traffic by type.
Packet Sniffer sensor  1956	Monitors headers of data packets that pass a local network card.
Packet Sniffer (Custom) sensor  1972	Monitors headers of data packets that pass a local network card.
Sensor Factory sensor  2178	Monitors entire business processes that involve several components.
sFlow sensor  2196	Receives traffic data from an sFlow v5-compatible device and shows the traffic by type.
sFlow (Custom) sensor  2213	Receives traffic data from an sFlow v5-compatible device and shows the traffic by type.
SNMP Trap Receiver sensor  3107	Receives and analyzes SNMP traps.
SSH Script sensor  3273	Connects to a Linux/Unix system via SSH and executes a script file located on the target system.
SSH Script Advanced sensor  3288	Connects to a Linux/Unix system via SSH and executes a script file located on the target system.
Syslog Receiver sensor  3338	Receives and analyzes Syslog messages.
VMware Host Performance (SOAP) sensor  3418	Monitors a VMware host server via SOAP.

Sensor	Description
VMware Virtual Machine (SOAP) sensor  3428	Monitors a VM on a VMware host server via SOAP.
Windows Updates Status (PowerShell) sensor  3372	Monitors the status of Windows updates on a computer and counts the available and installed Windows updates that are either from Microsoft or from the local WSUS server.
WMI Event Log sensor  3634	Monitors a specific Windows logfile via WMI.

15.12 List of Sensors with IPv6 Support

Here you can find a list of sensors that you can use to query devices via the IPv6 protocol.

i You can also see which sensors support the IPv6 protocol in the Add Sensor dialog.

Sensor	Description
Active Directory Replication Errors sensor ⁴⁷⁷	Checks a Windows DC for replication errors.
ADO SQL v2 sensor ⁴⁹⁰	Monitors a database using an ADO connection and executes an SQL query.
Amazon CloudWatch Alarm sensor ⁵⁰⁹	Monitors the status of an Amazon CloudWatch alarm.
Amazon CloudWatch EBS sensor ⁵²³	Monitors the performance of the Amazon Cloud service EBS.
Amazon CloudWatch EC2 sensor ⁵³⁸	Monitors the performance of the Amazon Cloud service EC2.
Amazon CloudWatch ElastiCache sensor ⁵⁵⁴	Monitors the performance of the Amazon Cloud service ElastiCache.
Amazon CloudWatch ELB sensor ⁵⁷⁰	Monitors the performance of the Amazon Cloud service ELB.
Amazon CloudWatch RDS sensor ⁵⁸⁵	Monitors the performance of the Amazon Cloud service RDS.
Amazon CloudWatch SNS sensor ⁶⁰¹	Monitors the performance of the Amazon Cloud service SNS.
Amazon CloudWatch SQS sensor ⁶¹⁵	Monitors the performance of the Amazon Cloud service SQS.
AWS Cost sensor ⁶³⁰	Monitors the cost of an AWS account.
Business Process sensor ⁶⁴⁴	Gives you a summarized status of entire business processes while monitoring several process components.
Common SaaS sensor ⁷⁵¹	Monitors the availability of several SaaS providers.

Sensor	Description
Dell EMC Unity Enclosure Health v2 sensor ^[778]	Monitors the health of an enclosure on a Dell EMC storage system via the REST API.
Dell EMC Unity File System v2 sensor ^[790]	Monitors a file system on a Dell EMC storage system via the REST API.
Dell EMC Unity Storage Capacity v2 sensor ^[802]	Monitors a Dell EMC storage system via the REST API.
Dell EMC Unity Storage LUN v2 sensor ^[813]	Monitors a LUN on a Dell EMC storage system via the REST API.
Dell EMC Unity Storage Pool v2 sensor ^[825]	Monitors a storage pool on a Dell EMC storage system via the REST API.
Dell EMC Unity VMware Datastore v2 sensor ^[838]	Monitors a VMware datastore on a Dell EMC storage system via the REST API.
Dell PowerVault MDi Physical Disk sensor ^[861]	Monitors a physical disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, or MD3620f.
DICOM Bandwidth sensor ^[885]	Monitors the bandwidth usage of a C-STORE request to a DICOM-capable device.
DICOM C-ECHO sensor ^[896]	Monitors the availability of DICOM-capable systems and devices by sending C-ECHO requests to the target system.
DICOM Query/Retrieve sensor ^[907]	Monitors the C-FIND capability of DICOM-capable systems and devices.
DNS sensor ^[919]	Monitors a DNS server. It resolves a domain name and compares it to a specific IP address.
DNS v2 sensor ^[930]	Monitors a DNS server, resolves domain name records, and compares them to a filter.
Enterprise Virtual Array sensor ^[968]	Monitors an HPE Storage EVA using the sssu.exe from HPE P6000 Command View Software.
Event Log (Windows API) sensor ^[980]	Monitors Event Log entries using the Windows API.

Sensor	Description
File sensor 	Monitors a file located on the local disk on the probe system, parent device, or a file that is accessible via SMB.
File Content sensor 	Checks a text file (for example, logfiles) for certain strings.
Folder sensor 	Monitors a folder using SMB. You can monitor file changes and file ages.
FTP Server File Count sensor 	Logs in to an FTP server and can monitor changes to files.
HL7 sensor 	Monitors the availability of HL7 interfaces.
HTTP sensor 	Monitors a web server using HTTP.
HTTP Advanced sensor 	Monitors the source code of a web page using HTTP.
HTTP Apache ModStatus PerfStats sensor 	Monitors the performance statistics of an Apache web server using mod_status over HTTP.
HTTP Apache ModStatus Totals sensor 	Monitors the activity of an Apache web server using mod_status over HTTP.
HTTP Content sensor 	Monitors a numeric value returned by an HTTP request.
HTTP Data Advanced sensor 	Monitors the values returned by the web server in multiple channels.
HTTP Full Web Page sensor 	Monitors the full download time of a web page including assets such as images.
HTTP IoT Push Data Advanced sensor 	Monitors the received values and a message encoded in valid XML or JSON in multiple channels.
HTTP Push Count sensor 	Monitors the received messages that are pushed via an HTTP request to PRTG.
HTTP Push Data sensor 	Monitors numeric values from received messages that are pushed via an HTTP request to PRTG.

Sensor	Description
HTTP Push Data Advanced sensor 	Monitors data from received messages that are pushed via an HTTP request to PRTG.
HTTP Transaction sensor 	Monitors an interactive website by performing a transaction using a set of HTTP URLs.
HTTP XML/REST Value sensor 	Monitors an .xml file from a specified URL.
Hyper-V Cluster Shared Volume Disk Free sensor 	Monitors a Microsoft Hyper-V cluster shared volume via PowerShell.
Hyper-V Host Server sensor 	Monitors a Microsoft Hyper-V host server via WMI or Windows performance counters.
Hyper-V Virtual Machine sensor 	Monitors a VM running on a Microsoft Hyper-V host server via WMI or Windows performance counters.
Hyper-V Virtual Network Adapter sensor 	Monitors virtual network adapters running on a Microsoft Hyper-V host server via WMI or Windows performance counters.
Hyper-V Virtual Storage Device sensor 	Monitors a virtual storage device running on a Microsoft Hyper-V host server via WMI or Windows performance counters.
IP on DNS Blacklist sensor 	Checks if the IP address of the parent device is listed on specific blacklist servers.
IPMI System Health sensor 	Monitors the status of a system via the IPMI.
Microsoft 365 Service Status sensor 	Monitors the overall status of all services of a Microsoft 365 subscription.
Microsoft 365 Service Status Advanced sensor 	Monitors the detailed status of all services of a Microsoft 365 subscription.
Microsoft Azure Subscription Cost sensor 	Monitors the cost in a Microsoft Azure subscription.
Microsoft Azure Virtual Machine sensor 	Monitors the status of a virtual machine in a Microsoft Azure subscription.

Sensor	Description
Microsoft SQL v2 sensor 	Monitors a database on a Microsoft SQL server and executes a defined query.
Modbus TCP Custom sensor 	Monitors up to five values returned by a Modbus TCP server.
MQTT Round Trip sensor 	Monitors the availability of an MQTT broker (server), connects to the broker as a publishing and subscribing client, and sends the data packets using a predefined topic.
MQTT Statistics sensor 	Monitors an MQTT topic.
MQTT Subscribe Custom sensor 	Subscribes to an MQTT topic and monitors up to five numeric values from the received JSON data.
MySQL v2 sensor 	Monitors a database on a MySQL server and executes a defined query.
NetApp Aggregate sensor 	Monitors the status of a NetApp cDOT or ONTAP storage aggregate accessing the API via SOAP.
NetApp I/O sensor 	Monitors the input and output operations of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp LIF sensor 	Monitors the logical interfaces of a NetApp cDOT or ONTAP cluster accessing the API via SOAP.
NetApp LUN sensor 	Monitors the LUN of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp NIC sensor 	Monitors the NIC of a NetApp cDOT or ONTAP cluster accessing the API via SOAP.
NetApp Physical Disk sensor 	Monitors the disks of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp SnapMirror sensor 	Monitors the SnapMirror relationships of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp System Health sensor 	Monitors the health of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp Volume sensor 	Monitors the volumes on a NetApp cDOT or ONTAP storage system accessing the API via SOAP.

Sensor	Description
OPC UA Certificate sensor 	Monitors the certificate of an OPC UA server.
OPC UA Custom sensor 	Monitors up to five numeric values returned by specific OPC UA node IDs.
OPC UA Server Status sensor 	Monitors the server status, uptime, and diagnostic information of an OPC UA server.
Oracle SQL v2 sensor 	Monitors a database on an Oracle server and executes a defined query.
Oracle Tablespace sensor 	Monitors a tablespace on an Oracle server.
Packet Sniffer sensor 	Monitors the headers of data packets that pass a local network card using a built-in packet sniffer.
Packet Sniffer (Custom) sensor 	Monitors the headers of data packets that pass a local network card using a built-in packet sniffer.
PerfCounter Custom sensor 	Monitors a configured set of Windows performance counters.
PerfCounter IIS Application Pool sensor 	Monitors a Microsoft IIS application pool using Windows performance counters.
Ping sensor 	Sends an ICMP echo request ("Ping") from the probe system to the device it is created on to monitor the availability of a device.
Ping Jitter sensor 	Sends a series of ICMP echo requests ("Pings") to the specified URI to determine the statistical jitter.
Port sensor 	Monitors a network service by connecting to its port.
Port Range sensor 	Monitors a network service by connecting to various TCP/IP ports.
PostgreSQL sensor 	Monitors a database on a PostgreSQL server and executes a defined query.
RDP (Remote Desktop) sensor 	Monitors remote desktop services (RDP, Terminal Services Client).

Sensor	Description
REST Custom sensor 	Queries a REST API endpoint and maps the JSON or XML result to sensor values.
Share Disk Free sensor 	Monitors free disk space of a share (Windows/Samba) using SMB.
SIP Options Ping sensor 	Monitors the connectivity to a SIP server using SIP options "Ping".
SNMP APC Hardware sensor 	Monitors the performance counters on an APC UPS device via SNMP.
SNMP Buffalo TS System Health sensor 	Monitors the system health of a Buffalo TeraStation NAS via SNMP.
SNMP Cisco ADSL sensor 	Monitors the ADSL statistics of a Cisco router via SNMP.
SNMP Cisco ASA VPN Connections sensor 	Monitors the VPN connections on a Cisco Adaptive Security Appliance via SNMP.
SNMP Cisco ASA VPN Traffic sensor 	Monitors the traffic of an IPsec VPN connection on a Cisco Adaptive Security Appliance via SNMP.
SNMP Cisco ASA VPN Users sensor 	Monitors the account connections to a VPN on a Cisco Adaptive Security Appliance via SNMP.
SNMP Cisco System Health sensor 	Monitors the system health of a Cisco device via SNMP.
SNMP Cisco UCS Blade sensor 	Monitors the health status of a Cisco UCS blade server via SNMP.
SNMP Cisco UCS Chassis sensor 	Monitors the health status of the chassis of a Cisco UCS device via SNMP.
SNMP Cisco UCS Physical Disk sensor 	Monitors a physical disk of a Cisco UCS device via SNMP.
SNMP Cisco UCS System Health sensor 	Monitors the system health of a Cisco UCS device via SNMP.

Sensor	Description
SNMP CPU Load sensor 	Monitors the system load via SNMP.
SNMP Custom sensor 	Monitors a single parameter returned by a specific OID via SNMP.
SNMP Custom Advanced sensor 	Monitors numeric values returned for OIDs via SNMP.
SNMP Custom String sensor 	Monitors a string returned by a specific OID via SNMP.
SNMP Custom String Lookup sensor 	Monitors a string returned by a specific OID via SNMP directly mapped to a sensor status.
SNMP Custom Table sensor 	Monitors entries from a table that is provided via SNMP.
SNMP Dell EqualLogic Logical Disk sensor 	Monitors a volume of a Dell EqualLogic storage system via SNMP.
SNMP Dell EqualLogic Member Health sensor 	Monitors the health of an array member of a Dell EqualLogic storage system via SNMP.
SNMP Dell EqualLogic Physical Disk sensor 	Monitors a disk in a Dell EqualLogic storage system via SNMP.
SNMP Dell Hardware sensor 	Monitors the performance counters on a Dell hardware device via SNMP.
SNMP Dell PowerEdge Physical Disk sensor 	Monitors a physical disk in a Dell PowerEdge server via SNMP.
SNMP Dell PowerEdge System Health sensor 	Monitors the system health of a Dell PowerEdge server via SNMP.
SNMP Disk Free sensor 	Monitors the free disk space on a logical disk via SNMP.
SNMP Fujitsu System Health v2 sensor 	Monitors the status of a Fujitsu PRIMERGY server via the iRMC and SNMP.

Sensor	Description
SNMP Hardware Status sensor ^[2609]	Monitors the status of a hardware component of a server via SNMP.
SNMP HP LaserJet Hardware sensor ^[2619]	Monitors the performance counters on an HP LaserJet hardware device via SNMP.
SNMP HPE BladeSystem Blade sensor ^[2629]	Monitors the status of an HPE BladeSystem via SNMP.
SNMP HPE BladeSystem Enclosure System Health sensor ^[2640]	Monitors the system health of an HPE BladeSystem device via SNMP.
SNMP HPE ProLiant Logical Disk sensor ^[2650]	Monitors a logical disk in an HPE server via SNMP.
SNMP HPE ProLiant Memory Controller sensor ^[2661]	Monitors a memory controller in an HPE server via SNMP.
SNMP HPE ProLiant Network Interface sensor ^[2673]	Monitors a network interface in an HPE server via SNMP.
SNMP HPE ProLiant Physical Disk sensor ^[2685]	Monitors a physical disk in an HPE server via SNMP.
SNMP HPE ProLiant System Health sensor ^[2698]	Monitors the system health of an HPE ProLiant server via SNMP.
SNMP IBM System X Logical Disk sensor ^[2711]	Monitors a logical disk in an IBM server via SNMP.
SNMP IBM System X Physical Disk sensor ^[2722]	Monitors a physical disk in an IBM server via SNMP.
SNMP IBM System X Physical Memory sensor ^[2733]	Monitors the memory modules in an IBM server via SNMP.
SNMP IBM System X System Health sensor ^[2745]	Monitors the system health of an IBM device via SNMP.

Sensor	Description
SNMP interSector Pro Environment sensor  2757	Monitors the data from a Jakarta interSector Pro environmental monitoring system via SNMP.
SNMP Juniper NS System Health sensor  2768	Monitors the system health of a Juniper NetScreen device via SNMP.
SNMP LenovoEMC Physical Disk sensor  2778	Monitors a physical disk in a LenovoEMC NAS via SNMP.
SNMP LenovoEMC System Health sensor  2788	Monitors the system health of a LenovoEMC NAS via SNMP.
SNMP Library sensor  2797	Uses a compiled MIB file to create sensors that monitor a device via SNMP.
SNMP Linux Disk Free sensor  2811	Monitors the free space on disks of a Linux/Unix system via SNMP.
SNMP Linux Load Average sensor  2825	Monitors the system load average of a Linux/Unix system via SNMP.
SNMP Linux Meminfo sensor  2834	Monitors the memory usage of a Linux/Unix system via SNMP.
SNMP Linux Physical Disk sensor  2844	Monitors the I/O on disks of a Linux/Unix system via SNMP.
SNMP Memory sensor  2855	Monitors the memory usage of a system via SNMP.
SNMP NetApp Disk Free sensor  2866	Monitors the free space on disks of a NetApp storage system via SNMP.
SNMP NetApp Enclosure sensor  2878	Monitors the power supply and cooling of an enclosure that is part of a NetApp storage system via SNMP.
SNMP NetApp I/O sensor  2890	Monitors the IOPS on a NetApp storage system via SNMP.
SNMP NetApp License sensor  2901	Monitors the licenses for the services of a NetApp storage system via SNMP.

Sensor	Description
SNMP NetApp Logical Unit sensor  2912	Monitors IOPS on a logical unit of a NetApp storage system via SNMP.
SNMP NetApp Network Interface sensor  2924	Monitors a network card of a NetApp storage system via SNMP.
SNMP NetApp System Health sensor  2935	Monitors the status of a NetApp storage system via SNMP.
SNMP Nutanix Cluster Health sensor  2946	Monitors the status and performance of a Nutanix cluster via SNMP.
SNMP Nutanix Hypervisor sensor  2959	Monitors a Nutanix hypervisor via SNMP.
SNMP Poseidon Environment sensor  2970	Monitors the performance counters for environmental measurements on Poseidon hardware via SNMP.
SNMP Printer sensor  2980	Monitors various types of printers via SNMP.
SNMP QNAP Logical Disk sensor  2990	Monitors a logical disk in a QNAP NAS via SNMP.
SNMP QNAP Physical Disk sensor  3000	Monitors a physical disk in a QNAP NAS via SNMP.
SNMP QNAP System Health sensor  3011	Monitors the system health of a QNAP NAS via SNMP.
SNMP RMON sensor  3021	Monitors the traffic on a device using the RMON standard via SNMP.
SNMP SonicWall System Health sensor  3033	Monitors the health values of a SonicWall NSA via SNMP.
SNMP SonicWall VPN Traffic sensor  3043	Monitors the traffic of an IPsec VPN on a SonicWall NSA via SNMP.
SNMP Synology Logical Disk sensor  3055	Monitors a logical disk in a Synology NAS via SNMP.

Sensor	Description
SNMP Synology Physical Disk sensor  3065	Monitors a logical disk in a Synology NAS via SNMP.
SNMP Synology System Health sensor  3075	Monitors the system health of a Synology NAS via SNMP.
SNMP System Uptime sensor  3085	Monitors the time a device runs via SNMP.
SNMP Traffic sensor  3094	Monitors the traffic on a device via SNMP.
SNMP Trap Receiver sensor  3107	Monitors SNMP traps.
SNMP Windows Service sensor  3125	Monitors a Windows service via SNMP.
SNTP sensor  3135	Monitors an SNTP server.
Soffico Orchestra Channel Health sensor  3142	Monitors the state and the overall number of successful or failed channel calls.
SSL Certificate sensor  3302	Monitors the certificate of an SSL/TLS connection.
SSL Security Check sensor  3315	Monitors the SSL/TLS connectivity to the port of a device.
Syslog Receiver sensor  3328	Receives and analyzes Syslog messages.
Traceroute Hop Count sensor  3359	Traces the number of hops that are needed from the probe system to the IP address or DNS name defined in the sensor's parent device.
Veeam Backup Job Status sensor  3369	Monitors the status of all backup job runs on the Veeam Backup Enterprise Manager in the last 24 hours.
VMware Datastore (SOAP) sensor  3380	Monitors the disk usage of a VMware datastore using SOAP.
VMware Host Hardware Status (SOAP) sensor  3404	Monitors the hardware status of a VMware host server using SOAP.

Sensor	Description
VMware Host Performance (SOAP) sensor  3416	Monitors a VMware host server using SOAP.
VMware Virtual Machine (SOAP) sensor  3428	Monitors a virtual machine on a VMware host server using SOAP.
Windows CPU Load sensor  3441	Monitors the CPU load on a computer using WMI or Windows performance counters.
Windows IIS 6.0 SMTP Received sensor  3453	Monitors the number of received emails for an IIS 6.0 SMTP service (Exchange 2003) using WMI or Windows performance counters.
Windows IIS 6.0 SMTP Sent sensor  3464	Monitors the number of sent emails for an IIS 6.0 SMTP service (Exchange 2003) using WMI or Windows performance counters.
Windows IIS Application sensor  3475	Monitors a Microsoft IIS application pool using Windows performance counters.
Windows MSMQ Queue Length sensor  3487	Monitors the number of messages in a message queue of the parent device.
Windows Network Card sensor  3499	Monitors the bandwidth usage and traffic of a network interface using WMI or Windows performance counters.
Windows Pagefile sensor  3512	Monitors the Windows pagefile usage via Windows WMI or Windows performance counters.
Windows Physical Disk I/O sensor  3522	Monitors the I/O parameters of a hard disk on a Windows system using WMI or Windows performance counters.
Windows Print Queue sensor  3535	Monitors the print queue on the sensor's parent device.
Windows Process sensor  3549	Monitors a Windows process using WMI or Windows performance counters.
Windows System Uptime sensor  3561	Monitors the uptime of a Windows system using WMI or Windows performance counters.
Windows Updates Status (PowerShell) sensor  3572	Monitors the status of Windows updates on a computer.

Sensor	Description
WMI Battery sensor 	Monitors the available capacity and state of connected batteries of a Windows-based device via WMI.
WMI Custom sensor 	Monitors numeric values (integers and floats).
WMI Custom String sensor 	Performs a custom string query via WMI.
WMI Disk Health sensor 	Monitors the health of a physical disk on a Windows system via WMI.
WMI Event Log sensor 	Monitors a specific Windows logfile via WMI.
WMI Exchange Server sensor 	Monitors a Microsoft Exchange Server 2003 or later via WMI.
WMI Exchange Transport Queue sensor 	Monitors the length of transport queues of a Microsoft Exchange Server 2003 or later via WMI.
WMI File sensor 	Monitors a file via WMI.
WMI Free Disk Space (Multi Disk) sensor 	Monitors the free disk space of one or more drives via WMI.
WMI Logical Disk I/O sensor 	Monitors the disk usage of a logical disk or mount point on a Windows system via WMI.
WMI Memory sensor 	Monitors the available (free) system memory on Windows systems via WMI.
WMI Microsoft SQL Server 2005 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2008 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2012 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2014 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.

Sensor	Description
WMI Microsoft SQL Server 2016 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2017 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2019 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Remote Ping sensor 	Monitors the ping time from the remote device to the target device that is being pinged.
WMI Security Center sensor 	Monitors the security status of a Windows client computer via WMI.
WMI Service sensor 	Monitors a Windows service via WMI.
WMI Share sensor 	Monitors a shared resource on a Windows system via WMI.
WMI SharePoint Process sensor 	Monitors a Microsoft SharePoint server via WMI.
WMI Storage Pool sensor 	Monitors a storage pool via WMI.
WMI Terminal Services (Windows 2008+) sensor 	Monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server via WMI.
WMI Terminal Services (Windows XP/Vista/2003) sensor 	Monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server via WMI.
WMI Vital System Data v2 sensor 	Monitors vital system parameters (CPU, thread, memory, network, pagefile) via WMI.
WMI Volume sensor 	Monitors the free disk space on a drive, logical volume, or mount point via WMI.
WSUS Statistics sensor 	Monitors various statistics on a WSUS server via WMI.
Zoom Service Status sensor 	Monitors the global status of all Zoom services.

15.13 List of Sensors with Meta-Scan Functionality

Here you can find a list of sensors that perform a meta-scan before sensor creation to dynamically scan for available monitoring objects.

Sensor	Description
Active Directory Replication Errors sensor ⁴⁷⁷	Checks a Windows DC for replication errors.
ADO SQL v2 sensor ⁴⁹⁰	Monitors a database using an ADO connection and executes an SQL query.
Amazon CloudWatch Alarm sensor ⁵⁰⁹	Monitors the status of an Amazon CloudWatch alarm.
Amazon CloudWatch EBS sensor ⁵²³	Monitors the performance of the Amazon Cloud service EBS.
Amazon CloudWatch EC2 sensor ⁵³⁸	Monitors the performance of the Amazon Cloud service EC2.
Amazon CloudWatch ElastiCache sensor ⁵⁵⁴	Monitors the performance of the Amazon Cloud service ElastiCache.
Amazon CloudWatch ELB sensor ⁵⁷⁰	Monitors the performance of the Amazon Cloud service ELB.
Amazon CloudWatch RDS sensor ⁵⁸⁵	Monitors the performance of the Amazon Cloud service RDS.
Amazon CloudWatch SNS sensor ⁶⁰¹	Monitors the performance of the Amazon Cloud service SNS.
Amazon CloudWatch SQS sensor ⁶¹⁵	Monitors the performance of the Amazon Cloud service SQS.
Cisco IP SLA sensor ⁶⁵⁸	Monitors VoIP network parameters using IP SLAs from Cisco via SNMP.
Citrix XenServer Host sensor ⁶⁷⁰	Monitors a Xen host server via HTTP.
Citrix XenServer Virtual Machine sensor ⁶⁸¹	Monitors a VM on a Citrix XenServer via HTTP.
Dell EMC Unity Enclosure Health v2 sensor ⁷⁷⁸	Monitors the health of an enclosure on a Dell EMC storage system via the REST API.

Sensor	Description
Dell EMC Unity File System v2 sensor 	Monitors a file system on a Dell EMC storage system via the REST API.
Dell EMC Unity Storage LUN v2 sensor 	Monitors a LUN on a Dell EMC storage system via the REST API.
Dell EMC Unity Storage Pool v2 sensor 	Monitors a storage pool on a Dell EMC storage system via the REST API.
Dell EMC Unity VMware Datastore v2 sensor 	Monitors a VMware datastore on a Dell EMC storage system via the REST API.
Dell PowerVault MDi Logical Disk sensor 	Monitors a virtual disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i.
Dell PowerVault MDi Physical Disk sensor 	Monitors a physical disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, or MD3620f.
DHCP sensor 	Monitors a DHCP server. It sends a broadcast message to the network and waits for a DHCP server to respond.
Docker Container Status sensor 	Monitors the status of a Docker container.
Dropbox sensor 	Monitors a Dropbox account using the Dropbox API and OAuth2.
Enterprise Virtual Array sensor 	Monitors an HPE Storage EVA using the sssu.exe from HPE P6000 Command View Software.
Exchange Backup (PowerShell) sensor 	Monitors backups of an Exchange server using Remote PowerShell.
Exchange Database (PowerShell) sensor 	Monitors database information of an Exchange server using Remote PowerShell.
Exchange Database DAG (PowerShell) sensor 	Monitors the DAG status of a database on an Exchange server using Remote PowerShell.
Exchange Mail Queue (PowerShell) sensor 	Monitors the number of items in the outgoing mail queue of an Exchange server using Remote PowerShell.
Exchange Mailbox (PowerShell) sensor 	Monitors mailboxes of an Exchange server using Remote PowerShell.

Sensor	Description
Exchange Public Folder (PowerShell) sensor 	Monitors the public folders and subfolders of an Exchange server using Remote PowerShell.
EXE/Script sensor 	Runs an executable file (.exe, .dll) or a script (batch file, VBScript, PowerShell) on the probe system.
EXE/Script Advanced sensor 	Runs an executable file (.exe, .dll) or a script (batch file, VBScript, PowerShell) on the probe system.
Google Analytics sensor 	Queries and monitors several metrics from a Google Analytics account using the Google API and OAuth2.
Google Drive sensor 	Monitors a Google Drive account using the Google API and OAuth2.
HL7 sensor 	Monitors the availability of HL7 interfaces.
Hyper-V Cluster Shared Volume Disk Free sensor 	Monitors a Microsoft Hyper-V cluster shared volume via PowerShell.
Hyper-V Virtual Machine sensor 	Monitors a VM running on a Microsoft Hyper-V host server via WMI.
Hyper-V Virtual Network Adapter sensor 	Monitors virtual network adapters running on a Microsoft Hyper-V host server via WMI.
Hyper-V Virtual Storage Device sensor 	Monitors a virtual storage device running on a Microsoft Hyper-V host server via WMI.
IPMI System Health sensor 	Monitors the status of a system via the IPMI.
Microsoft 365 Service Status Advanced sensor 	Monitors the detailed status of all services of a Microsoft 365 subscription.
Microsoft Azure Virtual Machine sensor 	Monitors the status of a virtual machine in a Microsoft Azure subscription.
Microsoft OneDrive sensor 	Monitors a Microsoft personal OneDrive account using the OneDrive API and OAuth2.
Microsoft SQL v2 sensor 	Monitors a database on a Microsoft SQL server and executes a defined query.
MySQL v2 sensor 	Monitors a database on a MySQL server and executes a defined query.

Sensor	Description
NetApp Aggregate sensor 	Monitors the status of a NetApp cDOT or ONTAP storage aggregate accessing the API via SOAP.
NetApp I/O sensor 	Monitors input and output operations of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp LIF sensor 	Monitors logical interfaces of a NetApp cDOT or ONTAP cluster accessing the API via SOAP.
NetApp LUN sensor 	Monitors the LUN of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp NIC sensor 	Monitors the NIC of a NetApp cDOT or ONTAP cluster accessing the API via SOAP.
NetApp Physical Disk sensor  	Monitors disks of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp SnapMirror sensor 	Monitors SnapMirror relationships of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp System Health sensor 	Monitors the health of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp Volume sensor 	Monitors volumes on a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
Oracle SQL v2 sensor 	Monitors a database on an Oracle server and executes a defined query.
Oracle Tablespace sensor 	Monitors a tablespace on an Oracle server.
PerfCounter IIS Application Pool sensor 	Monitors a Microsoft IIS application pool using Windows performance counters.
PostgreSQL sensor 	Monitors a database on a PostgreSQL server and executes a defined query.
Python Script Advanced sensor 	Executes a Python script on the probe system.
REST Custom sensor 	Queries a REST API endpoint and maps the JSON or XML result to sensor values.
Share Disk Free sensor 	Monitors free disk space of a share (Windows/Samba) using SMB.

Sensor	Description
SIP Options Ping sensor 	Monitors the connectivity to a SIP server using SIP options "Ping".
SMTP sensor 	Monitors a mail server using SMTP and can optionally send a test email with every check.
SMTP&IMAP Round Trip sensor 	Monitors the time it takes for an email to reach an IMAP mailbox after being sent using SMTP.
SMTP&POP3 Round Trip sensor 	Monitors the time it takes for an email to reach a POP3 mailbox after being sent using SMTP.
SNMP APC Hardware sensor 	Monitors performance counters on an APC UPS device via SNMP.
SNMP Cisco ADSL sensor 	Monitors ADSL statistics of a Cisco router via SNMP.
SNMP Cisco ASA VPN Traffic sensor 	Monitors the traffic of an IPsec VPN connection on a Cisco Adaptive Security Appliance via SNMP.
SNMP Cisco CBQoS sensor 	Monitors network parameters using Cisco's CBQoS via SNMP.
SNMP Cisco System Health sensor 	Monitors the system health of a Cisco device via SNMP.
SNMP Cisco UCS Blade sensor 	Monitors the health status of a Cisco UCS blade server via SNMP.
SNMP Cisco UCS Chassis sensor 	Monitors the health status of the chassis of a Cisco UCS device via SNMP.
SNMP Cisco UCS Physical Disk sensor 	Monitors a physical disk of a Cisco UCS device via SNMP.
SNMP Custom String Lookup sensor 	Monitors a string returned by a specific OID via SNMP and can map the string directly to a sensor status.
SNMP Custom Table sensor 	Monitors entries from a table that is provided via SNMP.
SNMP Dell EqualLogic Logical Disk sensor 	Monitors a volume of a Dell EqualLogic storage system via SNMP.
SNMP Dell EqualLogic Member Health sensor 	Monitors the health of an array member of an EqualLogic storage system via SNMP.

Sensor	Description
SNMP Dell EqualLogic Physical Disk sensor 	Monitors a disk in a Dell EqualLogic storage system via SNMP.
SNMP Dell Hardware sensor 	Monitors performance counters on a Dell hardware device via SNMP.
SNMP Dell PowerEdge Physical Disk sensor 	Monitors a physical disk in a Dell PowerEdge server via via SNMP.
SNMP Dell PowerEdge System Health sensor 	Monitors the system health of a Dell PowerEdge server via SNMP.
SNMP Disk Free sensor 	Monitors the free disk space on a logical disk via SNMP.
SNMP Fujitsu System Health v2 sensor 	Monitors the status of a Fujitsu PRIMERGY server via the iRMS and SNMP.
SNMP Hardware Status sensor 	Monitors the status of a server's hardware component via SNMP.
SNMP HP LaserJet Hardware sensor 	Monitors performance counters on an HP LaserJet hardware device via SNMP.
SNMP HPE BladeSystem Blade sensor 	Monitors the status of an HPE BladeSystem via SNMP.
SNMP HPE ProLiant Logical Disk sensor 	Monitors a logical disk in an HPE server via SNMP.
SNMP HPE ProLiant Memory Controller sensor 	Monitors a memory controller in an HPE server via SNMP.
SNMP HPE ProLiant Network Interface sensor 	Monitors a network interface in an HPE server via SNMP.
SNMP HPE ProLiant Physical Disk sensor 	Monitors a physical disk in an HPE server via SNMP.
SNMP IBM System X Logical Disk sensor 	Monitors a logical disk in an IBM server via SNMP.
SNMP IBM System X Physical Disk sensor 	Monitors a physical disk in an IBM server via SNMP.

Sensor	Description
SNMP IBM System X Physical Memory sensor 	Monitors the memory modules in an IBM server via SNMP.
SNMP IBM System X System Health sensor 	Monitors the system health of an IBM device via SNMP.
SNMP interSeptor Pro Environment sensor 	Queries data from a Jakarta interSeptor Pro environmental monitoring system via SNMP.
SNMP LenovoEMC Physical Disk sensor 	Monitors a physical disk in a LenovoEMC NAS via SNMP.
SNMP Library sensor 	Uses a compiled MIB file to create sensors that monitor a device via SNMP.
SNMP Linux Physical Disk sensor 	Monitors the I/O on disks of a Linux/Unix system via SNMP.
SNMP Memory sensor 	Monitors the memory usage of a system via SNMP.
SNMP NetApp Disk Free sensor 	Monitors free space on disks of a NetApp storage system via SNMP.
SNMP NetApp Enclosure sensor 	Monitors the power supply and cooling of an enclosure that is part of a NetApp storage system via SNMP.
SNMP NetApp License sensor 	Monitors the licenses for the services of a NetApp storage system via SNMP.
SNMP NetApp Logical Unit sensor  	Monitors the IOPS on a logical unit of a NetApp storage system via SNMP.
SNMP NetApp Network Interface sensor 	Monitors a network card of a NetApp storage system via SNMP.
SNMP Nutanix Cluster Health sensor 	Monitors the status and the performance of a Nutanix cluster via SNMP.
SNMP Nutanix Hypervisor sensor 	Monitors a Nutanix hypervisor via SNMP.
SNMP Poseidon Environment sensor 	Monitors performance counters for environmental measurements on Poseidon hardware via SNMP.
SNMP QNAP Logical Disk sensor 	Monitors a logical disk in a QNAP NAS via SNMP.

Sensor	Description
SNMP QNAP Physical Disk sensor 	Monitors a physical disk in a QNAP NAS via SNMP.
SNMP QNAP System Health sensor 	Monitors the system health of a QNAP NAS via SNMP.
SNMP RMON sensor 	Monitors traffic on a device using the Remote Monitoring (RMON) standard via SNMP.
SNMP SonicWall VPN Traffic sensor 	Monitors the traffic of an IPsec VPN on a SonicWall NSA via SNMP.
SNMP Synology Logical Disk sensor 	Monitors a logical disk in a Synology NAS via SNMP.
SNMP Synology Physical Disk sensor 	Monitors a physical disk in a Synology NAS via SNMP.
SNMP Traffic sensor 	Monitors traffic on a device via SNMP.
SNMP Windows Service sensor 	Monitors a Windows service via SNMP.
Soffico Orchestra Channel Health sensor 	Monitors the state and the overall number of successful or failed channel calls.
SSH Disk Free sensor 	Monitors free space on disks of a Linux/Unix system via SSH.
SSH SAN Enclosure sensor 	Monitors a SAN enclosure via SSH.
SSH SAN Logical Disk sensor 	Monitors a logical disk on a SAN via SSH.
SSH SAN Physical Disk sensor 	Monitors a physical disk on a SAN via SSH.
SSH SAN System Health sensor 	Monitors the system health of a SAN via SSH.
SSH Script sensor 	Connects to a Linux/Unix system via SSH and executes a script file located on the target system.
SSH Script Advanced sensor 	Connects to a Linux/Unix system via SSH and executes a script file located on the target system.
VMware Datastore (SOAP) sensor 	Monitors the disk usage of a VMware datastore via SOAP.

Sensor	Description
VMware Host Hardware (WBEM) sensor 	Monitors hardware information of an ESXi server using WBEM.
VMware Host Hardware Status (SOAP) sensor 	Monitors the hardware status of a VMware host server via SOAP.
VMware Host Performance (SOAP) sensor 	Monitors a VMware host server via SOAP.
VMware Virtual Machine (SOAP) sensor 	Monitors a VM on a VMware host server via SOAP.
Windows IIS Application sensor 	Monitors a Microsoft IIS server via WMI. It can also monitor applications that use IIS, such as Microsoft SharePoint or Microsoft Reporting Services (SSRS).
Windows MSMQ Queue Length sensor 	Reads the number of messages in a Microsoft message queue of the parent device.
Windows Network Card sensor 	Monitors bandwidth usage and traffic of a network interface via WMI.
Windows Physical Disk I/O sensor 	Monitors the I/O parameters of a hard disk on a Windows system via WMI.
Windows Print Queue sensor 	Reads the print queue on the sensor's parent device and returns the number of jobs in the print queue.
Windows Updates Status (PowerShell) sensor 	Monitors the status of Windows updates on a computer and counts the available and installed Windows updates that are either from Microsoft or from the local WSUS server.
WMI Battery sensor 	Monitors the available capacity and the state of connected batteries of a Windows-based device via WMI.
WMI Custom sensor 	Performs a custom query via WMI and monitors numeric values (integers and floats).
WMI Custom String sensor 	Performs a custom string query via WMI.
WMI Disk Health sensor 	Monitors the health of a physical disk on a Windows system via WMI.
WMI Event Log sensor 	Monitors a specific Windows logfile via WMI.

Sensor	Description
WMI Exchange Server sensor 	Monitors a Microsoft Exchange Server 2003 or later via WMI.
WMI Exchange Transport Queue sensor 	Monitors the length of transport queues of a Microsoft Exchange Server 2003 or later via WMI.
WMI HDD Health sensor 	Connects to the parent device via WMI and monitors the health of IDE disk drives on the target system using S.M.A.R.T.
WMI Logical Disk I/O sensor 	Monitors the disk usage of a logical disk or mount point on a Windows system via WMI.
WMI Microsoft SQL Server 2008 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2012 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2014 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2016 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2017 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Microsoft SQL Server 2019 sensor 	Monitors the performance of a Microsoft SQL Server via WMI.
WMI Security Center sensor 	Monitors the security status of a Windows client computer via WMI.
WMI Service sensor 	Monitors a Windows service via WMI.
WMI Share sensor 	Monitors a shared resource on a Windows system via WMI.
WMI SharePoint Process sensor 	Monitors a Microsoft SharePoint server via WMI.
WMI Storage Pool sensor 	Monitors a storage pool via WMI.
WMI Vital System Data v2 sensor 	Monitors vital system parameters (CPU, thread, memory, network, pagefile) via WMI.

Sensor	Description
WMI Volume sensor 	Monitors the free disk space on a drive, logical volume, or mount point via WMI.

15.14 List of Sensors without Device Template Capability

Here you can find a list of sensors that are **not** device template capable and that you can therefore not save to device templates.

For more information, see section [Create Device Template](#).

Sensor	Description
AWS Cost sensor	Monitors the cost of an AWS account by reading its data from the AWS Cost Explorer API.
Business Process sensor	Gives you a summarized status of entire business processes while monitoring several process components.
Cloud HTTP v2 sensor	Monitors the response time and response code of the target server.
Cloud Ping v2 sensor	Monitors the response time of the target server using TCP ping.
Cluster Health sensor	Monitors the health of a cluster and indicates the system health status of PRTG.
Core Health sensor	Monitors internal PRTG parameters and shows the status of the PRTG core server.
Core Health (Autonomous) sensor	Monitors internal PRTG parameters and shows the status of the PRTG core server.
DHCP sensor	Monitors a DHCP server. It sends a broadcast message to the network and waits for a DHCP server to respond.
DICOM Bandwidth sensor	Monitors the bandwidth usage of a C-STORE request to a DICOM-capable device.
DICOM C-ECHO sensor	Monitors the availability of DICOM-capable systems and devices by sending C-ECHO requests to the target system.
DICOM Query/Retrieve sensor	Monitors the C-FIND capability of DICOM-capable systems and devices. It sends a C-FIND request or MWL query to the target device and counts all found items.
Docker Container Status sensor	Monitors the status of a Docker container.
Dropbox sensor	Monitors a Dropbox account using the Dropbox API and OAuth2.

Sensor	Description
Enterprise Virtual Array sensor 	Monitors an HPE Storage EVA using the <code>sssu.exe</code> from HPE P6000 Command View Software.
Exchange Backup (PowerShell) sensor 	Monitors backups of an Exchange server using Remote PowerShell.
Exchange Database (PowerShell) sensor 	Monitors database information of an Exchange server using Remote PowerShell.
Exchange Database DAG (PowerShell) sensor 	Monitors the DAG status of a database on an Exchange server using Remote PowerShell.
Exchange Mail Queue (PowerShell) sensor 	Monitors the number of items in the outgoing mail queue of an Exchange server using Remote PowerShell.
Exchange Mailbox (PowerShell) sensor 	Monitors mailboxes of an Exchange server using Remote PowerShell.
Exchange Public Folder (PowerShell) sensor 	Monitors the public folders and subfolders of an Exchange server using Remote PowerShell.
Google Analytics sensor 	Queries and monitors several metrics from a Google Analytics account using the Google API and OAuth2.
Google Drive sensor 	Monitors a Google Drive account using the Google API and OAuth2.
HL7 sensor 	Monitors the availability of HL7 interfaces.
IPFIX sensor 	Receives traffic data from an IPFIX-compatible device and shows traffic by type.
IPFIX (Custom) sensor 	Receives traffic data from an IPFIX-compatible device and shows traffic by type.
IPMI System Health sensor 	Monitors the status of a system via the IPMI.
jFlow v5 sensor 	Receives traffic data from a jFlow v5 compatible device and shows the traffic by type.
jFlow v5 (Custom) sensor 	Receives traffic data from a jFlow v5-compatible device and shows the traffic by type.
Microsoft 365 Service Status sensor 	Monitors the overall status of all services of a Microsoft 365 subscription.

Sensor	Description
Microsoft 365 Service Status Advanced sensor  1557	Monitors the detailed status of all services of a Microsoft 365 subscription.
Microsoft OneDrive sensor  1595	Monitors a Microsoft personal OneDrive account using the OneDrive API and OAuth2.
NetApp Aggregate sensor  1693	Monitors the status of a NetApp cDOT or ONTAP storage aggregate accessing the API via SOAP.
NetApp I/O sensor  1707	Monitors input and output operations of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp LIF sensor  1722	Monitors logical interfaces of a NetApp cDOT or ONTAP cluster accessing the API via SOAP.
NetApp LUN sensor  1736	Monitors the LUN of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp NIC sensor  1751	Monitors the NIC of a NetApp cDOT or ONTAP cluster accessing the API via SOAP.
NetApp Physical Disk sensor  1765  1765	Monitors disks of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp SnapMirror sensor  1779	Monitors SnapMirror relationships of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp System Health sensor  1794	Monitors the health of a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetApp Volume sensor  1809	Monitors volumes on a NetApp cDOT or ONTAP storage system accessing the API via SOAP.
NetFlow v5 sensor  1824	Receives traffic data from a NetFlow v5 compatible device and shows the traffic by type.
NetFlow v5 (Custom) sensor  1841	Receives traffic data from a NetFlow v5 compatible device and shows the traffic by type.
NetFlow v9 sensor  1856	Receives traffic data from a NetFlow v9 compatible device and shows the traffic by type.
NetFlow v9 (Custom) sensor  1873	Receives traffic data from a NetFlow v9 compatible device and shows the traffic by type.

Sensor	Description
Packet Sniffer sensor 	Monitors headers of data packets that pass a local network card.
Packet Sniffer (Custom) sensor 	Monitors headers of data packets that pass a local network card.
Probe Health sensor 	Monitors internal PRTG parameters and shows the status of the probe system.
QoS (Quality of Service) One Way sensor 	Monitors parameters regarding the quality of a network connection between two probes.
QoS (Quality of Service) Round Trip sensor 	Monitors parameters regarding the quality of a network connection between two probes.
REST Custom sensor 	Queries a REST API endpoint and maps the JSON or XML result to sensor values.
Sensor Factory sensor 	Monitors entire business processes that involve several components.
sFlow sensor 	Receives traffic data from an sFlow v5-compatible device and shows the traffic by type.
sFlow (Custom) sensor 	Receives traffic data from an sFlow v5-compatible device and shows the traffic by type.
SNMP Trap Receiver sensor 	Receives and analyzes SNMP traps.
Soffico Orchestra Channel Health sensor 	Monitors the state and the overall number of successful or failed channel calls.
Syslog Receiver sensor 	Receives and analyzes Syslog messages.
System Health sensor 	Monitors internal PRTG parameters and shows the status of the probe system.
Zoom Service Status sensor 	Monitors the global status of all Zoom services.

15.15 List of Standard Lookup Files

Here you can find a list of all PRTG standard lookup files that are located in the \lookups subfolder of the [PRTG program directory](#).

i The actual number of standard lookup files in the \lookups subfolder of your PRTG installation depends on your system configuration and might differ from this list.

■ For more information, see section [Define Lookups](#).

Standard Lookup	Used by
oid.paessler.hplaserjet.jamstatus.ovl	SNMP HP LaserJet Hardware sensor
oid.paessler.hplaserjet.paperstatus.ovl	SNMP HP LaserJet Hardware sensor

15.16 Support and Troubleshooting

If you need help with PRTG, there are several ways to get support and to troubleshoot issues that might come up.

Video Tutorials

Watch tutorials for PRTG from Paessler and other users.

- <https://www.paessler.com/learn/videos>

Paessler Knowledge Base

Search for information about PRTG in thousands of articles. You can also post your own questions and answers.

- <https://kb.paessler.com>

Open a Support Ticket

Users that purchased a license can open support tickets, which are usually answered by the Paessler support team in fewer than 24 hours on business days. Use the [support form](#)⁴²⁶⁶ that is available in PRTG to contact our the Paessler support team. This is the best way to quickly get detailed help. If you cannot use this form, contact us via our web page.
