
Sensor in Other Languages

- Dutch: HTTP Apache ModStatus PerfStats
- French: HTTP Apache ModStatus PerfStats
- German: HTTP Apache ModStatus PerfStats
- Japanese: HTTP Apache ModStatus 性能統計
- Portuguese: HTTP Apache ModStatus PerfStats
- Russian: HTTP Apache ModStatus — . -
- Simplified Chinese: HTTP Apache ModStatus PerfStats
- Spanish: ModStatus PerfStats de HTTP Apache

Remarks

- This sensor does not support Secure Remote Password (SRP) ciphers.
- This sensor supports smart URL replacement.

- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- See the Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a 'Basic Sensor Settings' dialog box. It has three main sections: 'Sensor Name' with a text input field containing 'Example Name'; 'Tags' with a text input field containing 'exampletag' and a plus sign icon; and 'Priority' with a star rating of five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ httpsensor ▪ httpapachemodstatusperfstatssensor ▪ apache
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

HTTP Specific

HTTP Specific

Timeout (Sec.) **i** 60

URL **i** <http://www.accessories.be/services/insertservice.aspx?CardEvent>

HTTP Specific

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
URL	<p>Enter the URL to the mod_status module on your Apache server. PRTG automatically appends /server-status?auto to it. If you enter an absolute URL, the sensor uses this address independently of the IP Address/DNS Name setting of the parent device.</p> <p>■ PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section Smart URL Replacement [1233].</p>

i This sensor implicitly supports SNI, an extension to the Transport Layer Security (TLS) protocol.

Authentication

Authentication Authentication ⓘ

Web page does not need authentication

Authentication

Setting	Description
Authentication	Define if authentication is necessary on the web page: <ul style="list-style-type: none"> Web page does not need authentication Web page needs authentication
User Name	This setting is only visible if you select Web page needs authentication above. Enter a user name. Enter a string.
Password	This setting is only visible if you select Web page needs authentication above. Enter a password. Enter a string.
Authentication Method	This setting is only visible if you select Web page needs authentication above. Select the authentication method that the URL uses: <ul style="list-style-type: none"> HTTP authentication: Use simple HTTP authentication. ⓘ This authentication method transmits credentials as plain text. NT LAN Manager authentication: Use the Microsoft NT LAN Manager (NTLM) protocol for authentication. Digest access authentication: Use digest access authentication. This applies a hash function to the password, which is safer than HTTP authentication.

Sensor Display

Sensor Display Primary Channel ⓘ Downtime

Graph Type ⓘ
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.

Setting	Description
	<p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Proxy Settings for HTTP Sensors

Click  to interrupt the [inheritance](#)¹⁴².

The proxy settings determine how a sensor connects to a URL. You can enter data for an HTTP proxy server that sensors use when they connect via HTTP or HTTPS.

 This setting only applies to HTTP sensors and how they monitor. To change the proxy settings for the PRTG core server, see section [Core & Probes](#)⁴²⁰³.

Proxy Settings for HTTP Sensors

IP Address/DNS Name ⓘ	192.0.2.0
Port ⓘ	8080
User Name ⓘ	johnqpublic
Password ⓘ

Proxy Settings for HTTP Sensors

Setting	Description
IP Address/DNS Name	Enter the IP address or Domain Name System (DNS) name of the proxy server. If you leave this field empty, HTTP sensors do not use a proxy.
Port	Enter the port number of the proxy. The default is 8080. Enter an integer value.
User Name	If the proxy requires authentication, enter the user name for the proxy login. ⓘ Only basic authentication is available. Enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. ⓘ Only basic authentication is available. Enter a string or leave the field empty.

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

<input checked="" type="checkbox"/> inherit from  Root	Scanning Interval ⓘ	60 seconds
	If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from: <ul style="list-style-type: none"> ▪ 30 seconds

Setting	Description
	<ul style="list-style-type: none"> ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **None**

Maintenance Window **Do not set up a one-time maintenance window**
 Set up a one-time maintenance window

Dependency Type **Use parent**
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

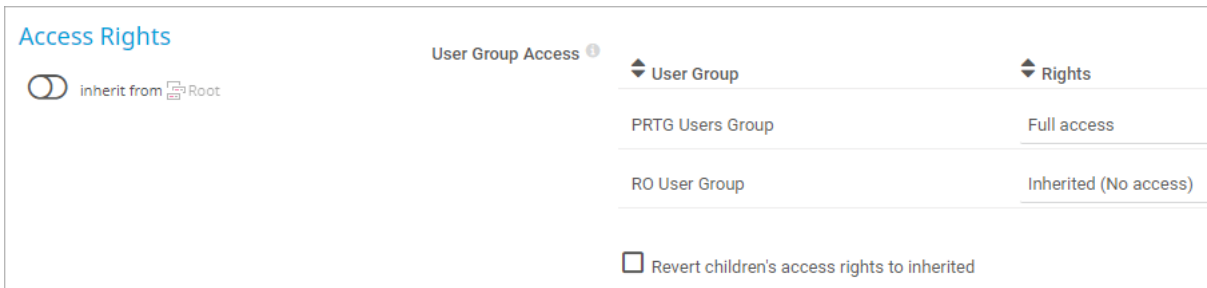

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either <http://> or <https://>, or even a simple forward slash / as the equivalent for <http://>). PRTG automatically fills in the parent device's IP address or DNS name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name www.mycompany.com and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter <https://> in the URL field, PRTG automatically creates the URL <https://www.mycompany.com/>
- If you enter [/help](http://www.mycompany.com/help) in the URL field, PRTG automatically creates and monitor the URL <http://www.mycompany.com/help>
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, <http://:8080/>

 Smart URL replacement does not work for sensors that run on the probe device.

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
BusyWorkers	The number of busy worker threads
BytesPerReq	The number of bytes per request
CPUload	The CPU load  This channel is the primary channel by default.
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
IdleWorkers	The number of idle worker threads
ReqPerSec	The number of requests per second
Uptime	The server uptime

Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either <http://> or <https://>, or even a simple forward slash / as the equivalent for <http://>). PRTG automatically fills in the parent device's IP address or DNS name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name www.mycompany.com and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter <https://> in the URL field, PRTG automatically creates the URL <https://www.mycompany.com/>
- If you enter [/help](http://www.mycompany.com/help) in the URL field, PRTG automatically creates and monitor the URL <http://www.mycompany.com/help>
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, <http://:8080/>

 Smart URL replacement does not work for sensors that run on the probe device.

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Accesses	The number of accesses per second
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
KBytes	The data transferred in bytes per second  This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

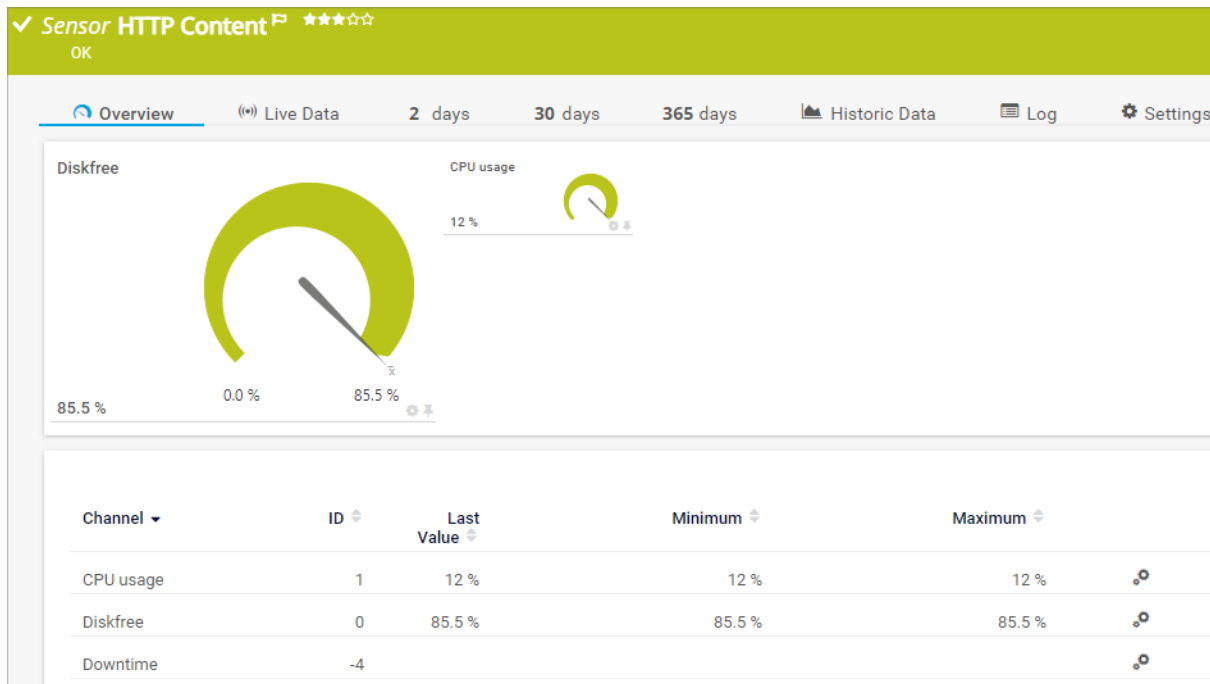

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3977

7.8.62 HTTP Content Sensor

The HTTP Content sensor monitors numeric values returned by an HTTP request.

i In the returned HTML page, each value must be placed between brackets []. See the [example](#).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

HTTP Content Sensor

Sensor in Other Languages

- Dutch: HTTP (Inhoud)
- French: HTTP (contenu)
- German: HTTP (Inhalt)
- Japanese: HTTP コンテンツ
- Portuguese: Conteúdo HTTP
- Russian: HTTP:
- Simplified Chinese: HTTP 内容
- Spanish: Contenido HTTP

Remarks

- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.
- This sensor does not support Secure Remote Password (SRP) ciphers.

- This sensor supports smart URL replacement.
- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- For an example configuration, see section [Example](#).
- See the Knowledge Base: [How can I monitor internal values of a web application with PRTG?](#)
- See the Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

HTTP Specific

Setting	Description
Value Type	<p>Define what kind of values the .html file returns:</p> <ul style="list-style-type: none"> ▪ Integer: Returns integers. ▪ Float: Returns floats with a dot . between the predecimal position and the decimal places. The sensor also displays integer values unless they do not produce a buffer overflow. <p>i The sensor cannot handle string values.</p>
Number of Channels	<p>Define how many values the .html file returns. The sensor handles each value in its own channel. Each value must be placed between brackets []. Enter the number of bracket-value pairs that the URL returns. Enter an integer value.</p> <p>i Do not enter a number that is smaller than the number of values that the HTTP request returns. Otherwise, you get an error message.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Result Handling ⁱ

Discard result

Store result

Advanced Sensor Data

Setting	Description
If Content Changes	<p>Define what the sensor does if the content of the web page changes:</p> <ul style="list-style-type: none"> Ignore changes: Take no action on change. Trigger 'change' notification: Send an internal message that indicates changes to the web page content. In combination with a change trigger ⁴¹³⁸, you can use this mechanism to trigger a notification ³⁹⁸⁷ when the web page content changes.
Result Handling	<p>Define what PRTG does with the sensor result:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Authentication

Authentication ⓘ

Web page does not need authentication
 Web page needs authentication

Authentication

Setting	Description
Authentication	Define if authentication is necessary on the web page: <ul style="list-style-type: none"> ▪ Web page does not need authentication ▪ Web page needs authentication
User Name	This setting is only visible if you select Web page needs authentication above. Enter a user name. Enter a string.
Password	This setting is only visible if you select Web page needs authentication above. Enter a password. Enter a string.
Authentication Method	This setting is only visible if you select Web page needs authentication above. Select the authentication method that the URL uses: <ul style="list-style-type: none"> ▪ HTTP authentication: Use simple HTTP authentication. ⓘ This authentication method transmits credentials as plain text. ▪ NT LAN Manager authentication: Use the Microsoft NT LAN Manager (NTLM) protocol for authentication. ▪ Digest access authentication: Use digest access authentication. This applies a hash function to the password, which is safer than HTTP authentication.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ⓘ).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ⓘ if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ⓘ.

Proxy Settings for HTTP Sensors

Click ⓘ to interrupt the [inheritance](#) ⓘ.

The proxy settings determine how a sensor connects to a URL. You can enter data for an HTTP proxy server that sensors use when they connect via HTTP or HTTPS.

i This setting only applies to HTTP sensors and how they monitor. To change the proxy settings for the PRTG core server, see section [Core & Probes](#)⁴²⁰³.

Proxy Settings for HTTP Sensors

IP Address/DNS Name i	192.0.2.0
Port i	8080
User Name i	johnqpublic
Password i

Proxy Settings for HTTP Sensors

Setting	Description
IP Address/DNS Name	Enter the IP address or Domain Name System (DNS) name of the proxy server. If you leave this field empty, HTTP sensors do not use a proxy.
Port	Enter the port number of the proxy. The default is 8080. Enter an integer value.
User Name	<p>If the proxy requires authentication, enter the user name for the proxy login.</p> <p>i Only basic authentication is available. Enter a string or leave the field empty.</p>
Password	<p>If the proxy requires authentication, enter the password for the proxy login.</p> <p>i Only basic authentication is available. Enter a string or leave the field empty.</p>

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

 inherit from  Root	Scanning Interval i	60 seconds
	If a Sensor Query Fails i	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails.

Setting	Description
	<p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies ⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>

Setting	Description
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

inherit from  Root

User Group Access 	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>For more details on access rights, see section Access Rights Management.</p>

Example

For example, consider the URL <http://www.example.com/status.html> that returns a PHP script with the current system status in a simple HTML page as follows:

```
<html>
<body>
  Description: Script gives back current status of disk free (%) and CPU usage (%).
  [85.5][12.0]
</body>
</html>
```

You would configure the HTTP Content sensor using

- the script URL from above,
- the value type Float,
- and the number of channels 2.

The sensor calls the URL with every scanning interval and only regards the two values in brackets [] and handles each of them in one channel. The additional description text and HTML tags are not necessary. In this example, they are added in case a human calls the URL.

i If you define the number of channels as 1, the sensor only reads the first value. The second value is ignored. Using 3 as the number of channels results in a sensor error message.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either <http://> or <https://>, or even a simple forward slash / as the equivalent for <http://>). PRTG automatically fills in the parent device's IP address or DNS name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name www.mycompany.com and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter <https://> in the URL field, PRTG automatically creates the URL <https://www.mycompany.com/>
- If you enter [/help](http://www.mycompany.com/help) in the URL field, PRTG automatically creates and monitor the URL <http://www.mycompany.com/help>
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, <http://:8080/>

 Smart URL replacement does not work for sensors that run on the probe device.

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
[Value]	The numeric values that an HTTP request returns in several channels

Sensor Settings Overview

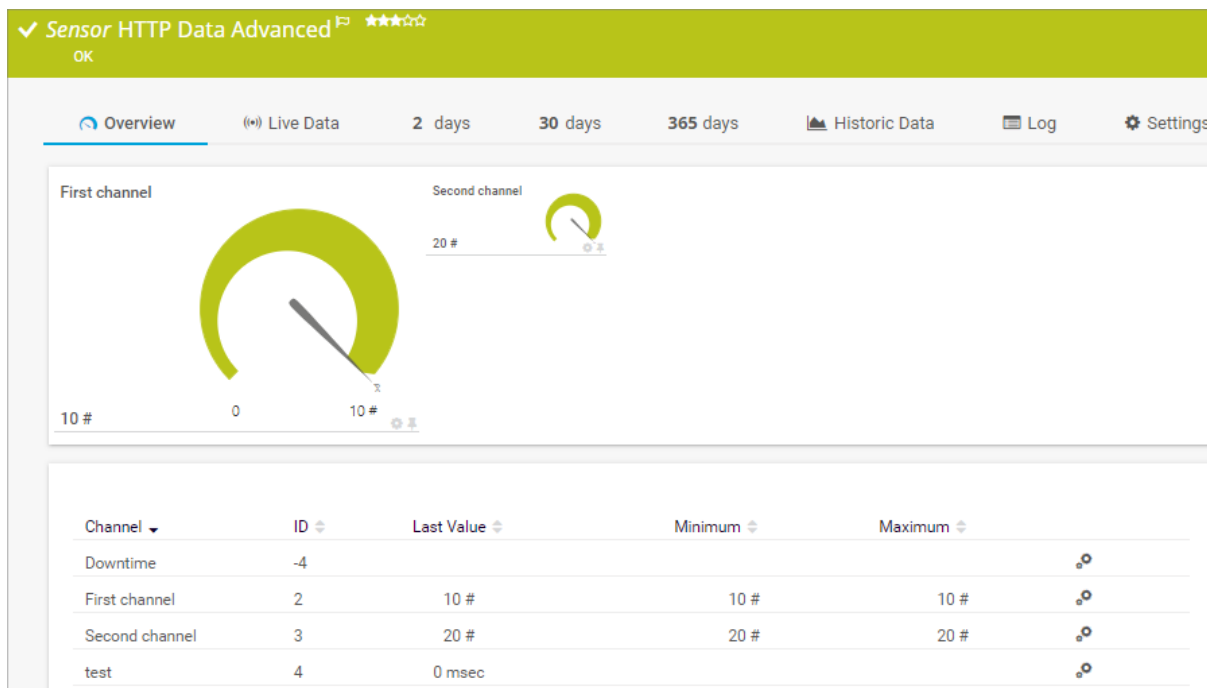

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.63 HTTP Data Advanced Sensor

The HTTP Data Advanced sensor accesses a web server and retrieves Extensible Markup Language (XML) encoded or JavaScript Object Notation (JSON) encoded data.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

HTTP Data Advanced Sensor

Sensor in Other Languages

- Dutch: HTTP Data Geavanceerd
- French: Données avancées HTTP
- German: HTTP Daten (Erweitert)
- Japanese: HTTP データアドバンスト
- Portuguese: Dados HTTP Avançado
- Russian: HTTP: ()
- Simplified Chinese: HTTP 数据高级
- Spanish: Datos HTTP avanzados

Remarks

- The requested web server must return XML-encoded or JSON-encoded data that matches the format as defined in section [Custom Sensors](#).
- This sensor does not support Secure Remote Password (SRP) ciphers.
- This sensor supports smart URL replacement.
- This sensor supports the IPv6 protocol.

- This sensor has a medium performance impact.
- For best sensor performance, we recommend that you specify the content type on the target server, which is [application/xml](#) or [application/json](#).
- See the Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections: 'Sensor Name' with a text input field containing 'Example Name'; 'Tags' with a text input field containing 'exampletag' and a plus sign icon; and 'Priority' with a star rating of five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ httpsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>

Setting	Description
URL	<p>Enter the URL that the sensor connects to. If you enter an absolute URL, the sensor uses this address independently of the IP Address/DNS Name setting of the parent device. You can enter the URL of a web page (to measure the loading time of the page's source code), or enter the URL of an image or of a page asset to measure this element's availability and loading time.</p> <ul style="list-style-type: none">  The URL must be URL encoded.  If you monitor an image or a page asset, this can create a high amount of memory load. We recommend that the size of the elements that you want to monitor does not exceed 200 MB. <p> PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section Smart URL Replacement ¹²⁷⁴.</p>
Request Method	<p>Select an HTTP request method to determine how the sensor requests the URL:</p> <ul style="list-style-type: none"> ▪ GET: Directly request the website. <ul style="list-style-type: none">  We recommend that you use this setting for a simple check of the web page. ▪ POST: Send post form data to the URL. <ul style="list-style-type: none">  If you select this setting, you must enter the data in the Postdata field below. ▪ HEAD: Only request the HTTP header from the server without the actual web page. <ul style="list-style-type: none">  Although this saves bandwidth because it transfers less data, we do not recommend that you use this. This is because the measured request time is not the one that your users experience and you might not be notified of slow results or timeouts.
Postdata	<p>This setting is only visible if you select POST above. Enter the data part for the POST request.</p> <ul style="list-style-type: none">  No Extensible Markup Language (XML) is allowed here.
Content Type	<p>This setting is only visible if you select POST above. Define the content type of the POST request:</p> <ul style="list-style-type: none"> ▪ Default (application/x-www-form-urlencoded): Use the default content type to encode the form data set for submission to the server. ▪ Custom: Use a custom content type. Enter the content type below.
Custom Content Type	<p>This setting is only visible if you select Custom above. Define the custom content type, for example, XML, JavaScript Object Notation (JSON), or HTTP.</p>

Setting	Description
Server Name Indication	<p>Shows the Server Name Identification (SNI) that the sensor automatically determines from the host address of the parent device⁴⁴⁷ or from the target URL of the sensor.</p> <p>i The SNI must be a fully qualified domain name (FQDN). Make sure that it matches the configuration of the target server.</p> <p>■ For details, see the Knowledge Base: My HTTP sensors fail to monitor websites which use SNI. What can I do?</p>
SNI Inheritance	<p>Define if you want to inherit the SNI from the parent device:</p> <ul style="list-style-type: none"> ▪ Inherit SNI from parent device: Determine the SNI from the host address of the parent device. ▪ Do not inherit SNI from parent device: Determine the SNI from the target URL as defined in the settings of this sensor.
Result Handling	<p>Define what the sensor does with the data loaded at the URL:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last result of the requested data in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID]-A.txt, and Result of Sensor [ID].Data.txt. This setting is for debugging purposes, especially in combination with content checks. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Advanced Sensor Data

Advanced Sensor Data

HTTP Version ⓘ HTTP 1.0
 HTTP 1.1

User Agent ⓘ Use the default string
 Use a custom string

Use Custom HTTP Headers ⓘ Do not use custom HTTP headers
 Use custom HTTP headers

Advanced Sensor Data

Setting	Description
HTTP Version	<p>Define the HTTP version that the sensor uses when it connects to the target URL:</p> <ul style="list-style-type: none"> ▪ HTTP 1.0: Use HTTP version 1.0. ▪ HTTP 1.1: Use HTTP version 1.1.
User Agent	<p>Choose which user agent string the sensor sends when it connects to the target URL:</p> <ul style="list-style-type: none"> ▪ Use the default string: Do not enter a specific user agent and use the default string. Usually, this is Mozilla/5.0 (compatible; PRTG Network Monitor (www.paessler.com); Windows). ▪ Use a custom string: Use a custom user agent. Define the custom user agent below.
Custom User Agent	<p>This setting is only visible if you enable Use a custom string above. Enter the string that the sensor uses as the user agent when it connects to the target URL.</p>
HTTP Headers	<p>Define if you want to send custom HTTP headers to the target URL:</p> <ul style="list-style-type: none"> ▪ Do not use custom HTTP headers: Do not use custom HTTP headers. ▪ Use custom HTTP headers: Use custom headers. Define below.
Custom HTTP Headers	<p>This setting is only visible if you enable Use custom HTTP headers above. Enter a list of custom HTTP headers and values that you want to transmit to the URL, each pair in one line. The syntax of a header-value pair is header1:value1</p> <ul style="list-style-type: none"> ⓘ The sensor does not support the header field names user-agent, content-length, and host. ⓘ Ensure that the HTTP header statement is valid. Otherwise, the sensor request cannot be successful.

Authentication

Authentication Authentication ⓘ Web page does not need authentication Web page needs authentication

Authentication

Setting	Description
Authentication	Define if authentication is necessary on the web page:

Setting	Description
	<ul style="list-style-type: none"> ▪ Web page does not need authentication ▪ Web page needs authentication
User Name	This setting is only visible if you select Web page needs authentication above. Enter a user name. Enter a string.
Password	This setting is only visible if you select Web page needs authentication above. Enter a password. Enter a string.
Authentication Method	<p>This setting is only visible if you select Web page needs authentication above. Select the authentication method that the URL uses:</p> <ul style="list-style-type: none"> ▪ HTTP authentication: Use simple HTTP authentication. <ul style="list-style-type: none"> i This authentication method transmits credentials as plain text. ▪ NT LAN Manager authentication: Use the Microsoft NT LAN Manager (NTLM) protocol for authentication. ▪ Digest access authentication: Use digest access authentication. This applies a hash function to the password, which is safer than HTTP authentication.

Sensor Display

Sensor Display

Primary Channel Downtime

Graph Type
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel.

Setting	Description
	<ul style="list-style-type: none"> Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁸ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Proxy Settings for HTTP Sensors

Click  to interrupt the [inheritance](#)¹⁴².

The proxy settings determine how a sensor connects to a URL. You can enter data for an HTTP proxy server that sensors use when they connect via HTTP or HTTPS.

i This setting only applies to HTTP sensors and how they monitor. To change the proxy settings for the PRTG core server, see section [Core & Probes](#)⁴²⁰³.

Proxy Settings for HTTP Sensors

IP Address/DNS Name i	192.0.2.0
Port i	8080
User Name i	johnqpublic
Password i

Proxy Settings for HTTP Sensors

Setting	Description
IP Address/DNS Name	Enter the IP address or Domain Name System (DNS) name of the proxy server. If you leave this field empty, HTTP sensors do not use a proxy.
Port	Enter the port number of the proxy. The default is 8080. Enter an integer value.
User Name	If the proxy requires authentication, enter the user name for the proxy login.  Only basic authentication is available. Enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login.  Only basic authentication is available. Enter a string or leave the field empty.

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from: <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules 4170.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

inherit from Root

User Group Access ⓘ

User Group	Rights

RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click to interrupt the [inheritance](#) ¹⁴².

ⓘ Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

inherit from Root

Channel Unit Types ?

Channel Type	Unit
Bytes (Bandwidth)	KB v
	kbit v
	/ v
	sec... v
Bytes (Memory)	MB v
Bytes (Disk)	MB v
Bytes (File)	Byte v

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either <http://> or <https://>, or even a simple forward slash / as the equivalent for <http://>). PRTG automatically fills in the parent device's IP address or DNS name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name www.mycompany.com and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter <https://> in the URL field, PRTG automatically creates the URL <https://www.mycompany.com/>
 - If you enter [/help](#) in the URL field, PRTG automatically creates and monitor the URL <http://www.mycompany.com/help>
 - It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, <http://:8080/>
- i** Smart URL replacement does not work for sensors that run on the probe device.

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
[Value]	<p>The values that the web server returns in several channels</p> <p>i This channel is the primary channel by default.</p> <p>■ For details about the return value format, see section Custom Sensors ⁴⁴⁴⁰.</p>

63 HTTP Data Advanced Sensor

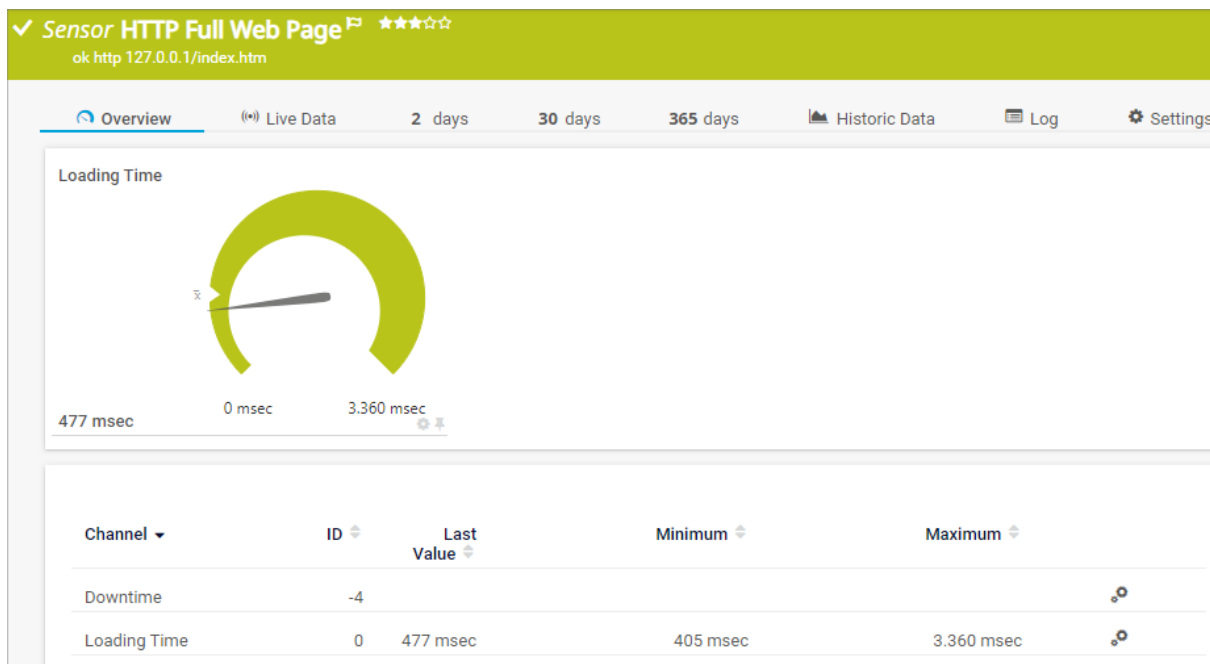

- [Channel Settings](#) 
- [Notification Triggers Settings](#) 

7.8.64 HTTP Full Web Page Sensor

The HTTP Full Web Page sensor monitors the full download time of a web page including assets such as images. In the background, it opens the web page in a browser instance to perform the measurement. It does not follow links.

i Be careful with this sensor because it can generate a considerable amount of internet traffic if you use it with a short scanning interval.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

HTTP Full Web Page Sensor

Sensor in Other Languages

- Dutch: HTTP Volledige Webpagina
- French: HTTP (page Web complète)
- German: HTTP (Komplette Webseite)
- Japanese: HTTP 完全ウェブページ監視
- Portuguese: HTTP Página Completa
- Russian: HTTP: -
- Simplified Chinese: HTTP 完整网页
- Spanish: HTTP Página Web Completa

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- This sensor does not support Secure Remote Password (SRP) ciphers.

- This sensor supports smart URL replacement.
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [What to do when I see a CreateUniqueTempDir\(\) error message for my HTTP Full Web Page sensor?](#)
- See the Knowledge Base: [HTTP Full Web Page sensor is unable to navigate. What can I do?](#)
- See the Knowledge Base: [How can I change the size of PhantomJS full web page screenshots?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A list box containing 'exampletag' with a close button (X) and an add button (+).
- Priority:** A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets . ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe .

Setting	Description
	<p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ httpfullsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

Use security context of PRTG probe service (default)

Use Windows credentials of parent device

Full Web Page Download Settings

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>

Setting	Description
URL	<p>Enter the address of the web page that the sensor loads. If you enter an absolute URL, the sensor uses this address independently of the IP Address/DNS Name setting of the parent device.</p> <ul style="list-style-type: none"> ❗ The URL must be URL encoded. ■ PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section Smart URL Replacement¹²⁸⁰.
Browser Engine	<p>Define which browser engine the sensor uses to load the web page:</p> <ul style="list-style-type: none"> ▪ Chromium (recommended): Use the WebKit engine that is delivered with PRTG to measure the loading time. With each scanning interval, PRTG loads the URL in an instance of Chromium and measures the time it takes to fully load the page. This is the recommended setting. <ul style="list-style-type: none"> ❗ Chromium does not support TLS 1.2-only connections. In this case, we recommend that you use the PhantomJS engine or Internet Explorer instead. ▪ PhantomJS (Headless WebKit): Use the PhantomJS engine. This engine can have a high impact on the probe system's CPU and memory load but additional options for result handling¹²⁸¹ are available. ▪ Internet Explorer: With each scanning interval, the URL is loaded in the background in an instance of Internet Explorer. PRTG uses the Internet Explorer of the probe system. <ul style="list-style-type: none"> ❗ For full functionality, we strongly recommend that you install Internet Explorer 11 or higher on the probe system. ❗ If you select Internet Explorer as browser engine, you might face issues with the creation of temporary files. In this case, we recommend that you use the Chromium or the PhantomJS browser engines. For more information, see the Knowledge Base: Why is my HTTP Full Web Page sensor generating so many temporary files? ❗ All browser engines use the proxy settings from the Windows user account that the probe runs under (this is usually the local Windows "system" user account). To use a proxy, adjust the settings accordingly on the probe system (on all cluster nodes, if in a cluster). For more information, see the Knowledge Base: How can I access proxy settings for the HTTP Full Web Page Sensor?
Security Context	<p>Define the Windows user account that the sensor uses to run the browser engine:</p> <ul style="list-style-type: none"> ▪ Use security context of PRTG probe service (default): Run the browser engine under the same Windows user account that the probe runs under. By default, this is the local Windows "system" user account.

Setting	Description
Result Handling	<ul style="list-style-type: none"> ▪ Use Windows credentials of parent device: Use the Windows user account from the parent device settings ⁴⁵². ⓘ We recommended that you use this setting if you use Chromium as browser engine. <p>This setting is only visible if you select PhantomJS (Headless Webkit) above. Specify how the browser engine handles the web page result:</p> <ul style="list-style-type: none"> ▪ Discard result (recommended): Do not store the sensor result. ▪ Render and store a screenshot of most recent result as JPG: Render and store the web page result in the \Logs\sensors subfolder of the PRTG data directory ^{452b} on the probe system. The file name is Fullpage of Sensor (ID).jpg. This setting is for debugging purposes. PRTG overwrites the file with each scanning interval. ▪ Render and store screenshots of all results as JPGs (requires lots of disk space): Render and store one new screenshot of the web page with each sensor scan, and store the screenshots in the \Screenshots (Fullpage Sensor) subfolder of the PRTG data directory on the probe system. You can use this option to create a visual history of the web page. <ul style="list-style-type: none"> ⓘ Depending on the monitored website and the scanning interval of the sensor, this option can create a very high amount of data. Use this option with care and make sure you set appropriate data purging limits in the Core & Probes ^{420b} settings. ■ If necessary, you can change the window size of the rendered screenshots. For details, see the Knowledge Base: How can I change the size of PhantomJS full web page screenshots? ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.
Authentication	<p>This setting is only visible if you select PhantomJS (Headless WebKit) above. Define if the monitored web page needs authentication for access:</p> <ul style="list-style-type: none"> ▪ Web page does not need authentication: Access to the web page is granted without authentication. ▪ Web page needs authentication: PRTG automatically tries to use HTTP basic authentication (BA) or Windows NT LAN Manager (NTLM) to access the web page with authentication. Enter the credentials below. <ul style="list-style-type: none"> ⓘ Basic access authentication forwards the credentials in plain text.
User Name	<p>This setting is only visible if you select PhantomJS (Headless Webkit) above. Enter the user name for the web page.</p>

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management.</p>

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either [http://](#) or [https://](#), or even a simple forward slash / as the equivalent for [http://](#)). PRTG automatically fills in the parent device's IP address or DNS name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.mycompany.com](#) and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter [https://](#) in the URL field, PRTG automatically creates the URL [https://www.mycompany.com/](#)
- If you enter [/help](#) in the URL field, PRTG automatically creates and monitor the URL [http://www.mycompany.com/help](#)
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, [http://:8080/](#)

i Smart URL replacement does not work for sensors that run on the probe device.

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Loading Time	The loading time of the full web page in milliseconds (msec)  This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977

- [Notification Triggers Settings](#) 

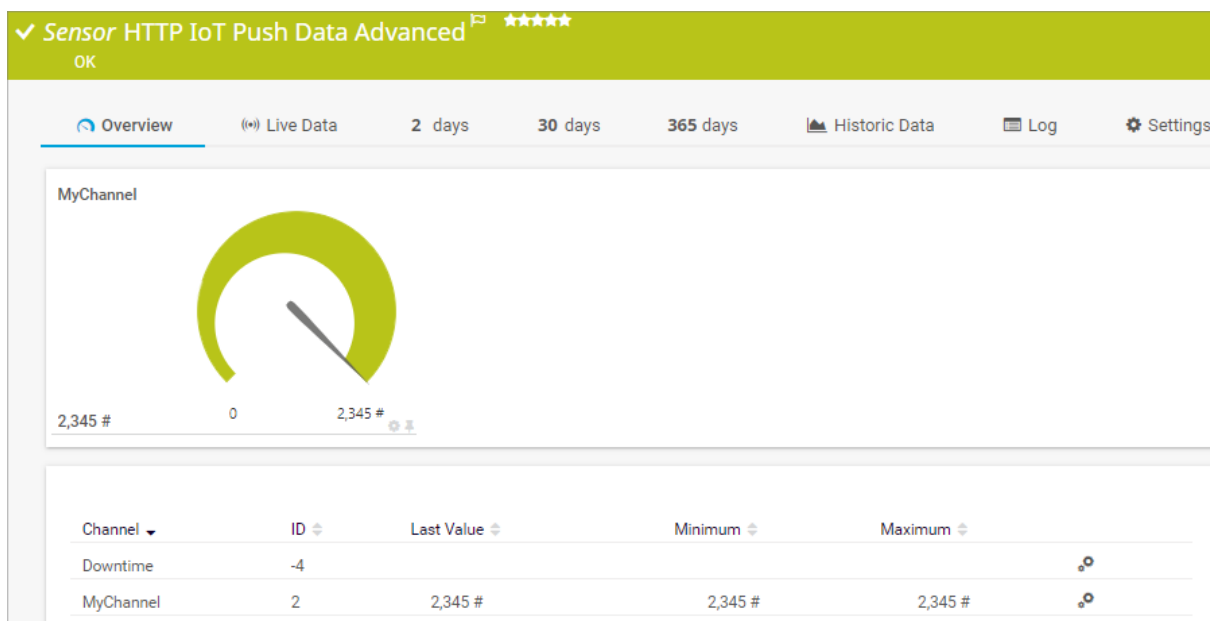

7.8.65 HTTP IoT Push Data Advanced Sensor

The HTTP IoT Push Data Advanced sensor displays data from messages that are received from Internet of Things (IoT) capable devices (for example, Sigfox devices) and that are pushed via an HTTPS request to PRTG. It provides a URL that you can use to push messages to the probe system via HTTPS (secured with TLS 1.2).

i This sensor is especially useful when you want to push data to a PRTG Hosted Monitor instance.

■ For more information about the sensor usage, see section [How to Use](#)¹²⁹⁹.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)¹³⁰⁰.

HTTP IoT Push Data Advanced Sensor

Sensor in Other Languages

- Dutch: HTTP IoT Push Data Geavanceerd
- French: Données avancées Push HTTP IoT
- German: HTTP IoT Push-Daten (Erweitert)
- Japanese: HTTP IoT プッシュデータ (アドバンスト)
- Portuguese: Dados de push IoT HTTP avançados
- Russian: push- HTTP IoT
- Simplified Chinese: HTTP IoT 高级推送数据
- Spanish: HTTP Push de datos IoT Avanzado

Remarks

- This sensor has a fixed port (5051). You cannot change it.
- This sensor has a fixed SSL/TLS version (HTTPS secured with TLS 1.2 only). You cannot change it.

- If you use this sensor with multiple channels, we recommend that you [simultaneously](#) push the data for [all](#) your channels to PRTG. You can push data to only one of your channels but, in this case, all other channels record the value of **0** for this push message.
- If you want to install this sensor on a remote probe and use an HTTPS connection to send push notifications, you need to make sure that you import the same Secure Sockets Layer (SSL) certificates to the `\cert` subfolder of the [PRTG program directory](#) on the remote probe that you use on the PRTG core server.
 ■ For more information, see the PRTG Manual: [Using Your Own SSL Certificate with the PRTG Web Server](#).
- You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
- This sensor might result in false alerts if the parent probe disconnects from the PRTG core server. In this case, the sensor shows the error message: [The latest push message that the sensor received is older than the specified time threshold allows.](#) (code: PE222).
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- For more information about the sensor usage, see the PRTG Manual: [How to Use](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A list box containing 'exampletag' with a close button (X) and an add button (+).
- Priority:** A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ pushsensor ▪ pushdata ▪ httppushsensor ▪ iot ▪ sigfox
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

SSL/TLS Settings

SSL/TLS Settings

SSL/TLS Version ⓘ *HTTPS (secured with TLS 1.2 only)*

SSL/TLS Port ⓘ *5051*

SSL/TLS Settings

Setting	Description
SSL/TLS Version	<p>The security of the incoming HTTPS push requests:</p> <ul style="list-style-type: none"> ▪ HTTPS (secured with TLS 1.2 only): Send push messages to the probe system via HTTPS. The sensor only supports connections that are secured with TLS 1.2. It uses the SSL certificate that is delivered with PRTG or your own trusted SSL certificate ⁴⁵³⁷ that you imported for the PRTG web server. <p>i If you install the sensor on a remote probe, make sure that you import the same SSL certificates to the remote probe as you use on the PRTG core server.</p> <p>i PRTG shows this setting for your information only. You cannot change it.</p>
SSL/TLS Port	<p>The number of the port on which this sensor listens for incoming HTTPS requests. This is always 5051.</p> <p>i PRTG shows this setting for your information only. You cannot change it.</p>

HTTP Push Authentication

HTTP Push Authentication

Identification Token **i** 9ACF62D4-4911-4C0C-9C98-A4CAAB3E26CC

HTTP Push Data

Setting	Description
Identification Token	<p>This is the token that PRTG uses to find the matching sensor for the incoming message. When you create the sensor, this token is <code>{_guid_}</code>.</p> <p>PRTG replaces this token with an automatically generated token after sensor creation. If you want to use a different identification token, you can edit it during or after sensor creation.</p> <p>i PRTG does not automatically replace the token if you change it already during sensor creation.</p>

HTTP Push Data

HTTP Push Data

No Incoming Data **i**

- Ignore and keep last status (default)
- Switch to unknown status
- Switch to down status after x minutes

HTTP Push Data

Setting	Description
No Incoming Data	<p>Define which status ¹⁹⁷ the sensor shows if it does not receive a push message for at least two scanning intervals:</p> <ul style="list-style-type: none"> Ignore and keep last status (default): Keep the status as defined by the last message that the sensor received. <ul style="list-style-type: none"> i The parent probe must be connected to keep the last status. If the parent probe disconnects, the sensor shows the Unknown status. If the parent probe connects again, the sensor does not automatically switch from the Unknown status to the last status before the parent probe disconnected. Switch to unknown status: Show the Unknown status if the sensor does not receive a message for at least two scanning intervals. Switch to down status after x minutes: Show the Down status if the sensor does not receive a message within a specific time span. Define the time threshold below.
Time Threshold (Minutes)	<p>This setting is only visible if you select Switch to down status after x minutes above. Enter a time threshold in minutes. If this time elapses, the sensor shows the Down status if it does not receive a push message within this time span.</p> <p>Enter an integer value. The maximum threshold is 1440 minutes.</p>

User Group Access	<p>Define the user groups^[4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management^[153].</p>

How to Use

This function is known as a [webhook](#). Basically, a webhook works like a push notification. Webhooks are usually triggered by an event (for example, a new comment on a blog post) and send according information to a specified URL. The HTTP IoT Push Data Advanced sensor then displays the data of pushed and received messages.

 The data that is pushed to this sensor must be valid XML or JSON.

 For details about the return value format, see section [Custom Sensors](#)^[4440].

The HTTP IoT Push Data Advanced sensor uses the following URLs depending on the type of HTTPS request.

- GET requests: `https://<probe_ip>:5051/<token>?content=<valid XML_or_JSON>`

The XML-encoded value of the content parameter has to match the format defined in section [Custom Sensors](#) ⁴⁴⁴⁰.

- POST requests: `https://<probe_ip>:5051/<token>`

This HTTPS request method sends the XML-encoded or JSON-encoded HTTPS body as POST data. The body has to match the format defined in section [Custom Sensors](#) ⁴⁴⁴⁰. We strongly recommend the HTTPS content type `application/xml` or `application/json`.

Replace the parameters `<probe_ip>`, `<token>`, and `<valid XML_or_JSON>` (for GET requests) with the corresponding values:

- For PRTG on premises, the probe IP is the IP address of the probe system. For PRTG Hosted Monitor instances, the probe IP is the Domain Name System (DNS) name of the instance.
- The port number is always `5051`. You cannot change this.
- You can define identification token in the sensor settings.
- The content of GET requests has to be valid XML or JSON in the PRTG API format.
 - ① The content has to be URL encoded (for example, the whitespaces in the sample URL below). Most browsers do the URL-encoding automatically.

Minimum example for the GET method that returns one static channel value:

```
https://127.0.0.1:5051/XYZ123?
content=<prtg><result><channel>MyChannel</channel><value>10</value></result><text>this
%20is%20a%20message</text></prtg>
```

- ① By default, values within the `<value>` tags in the returned XML or JSON must be `integers` for them to be processed. If `float` values are returned, you have to explicitly define this value type as defined in section [Custom Sensors](#) ⁴⁴⁴² with `<float>` tags, otherwise the sensor shows 0 values in affected channels. Example:

```
https://127.0.0.1:5051/XYZ123?
content=<prtg><result><channel>MyChannel</channel><value>10.45</value><float>1</float>
</result><text>this%20is%20a%20message</text></prtg>
```

- ① You can use several sensors with the same port and identification token. In this case, push message data is shown in each of these sensors.

Channel List

- ① Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.

Channel	Description
[Value]	<p>The data received from the message encoded in valid Extensible Markup Language (XML) or JavaScript Object Notation (JSON) in several channels</p> <p> This channel is the primary channel by default.</p> <p> For details about the return value format, see section Custom Sensors⁴⁴⁴⁶.</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

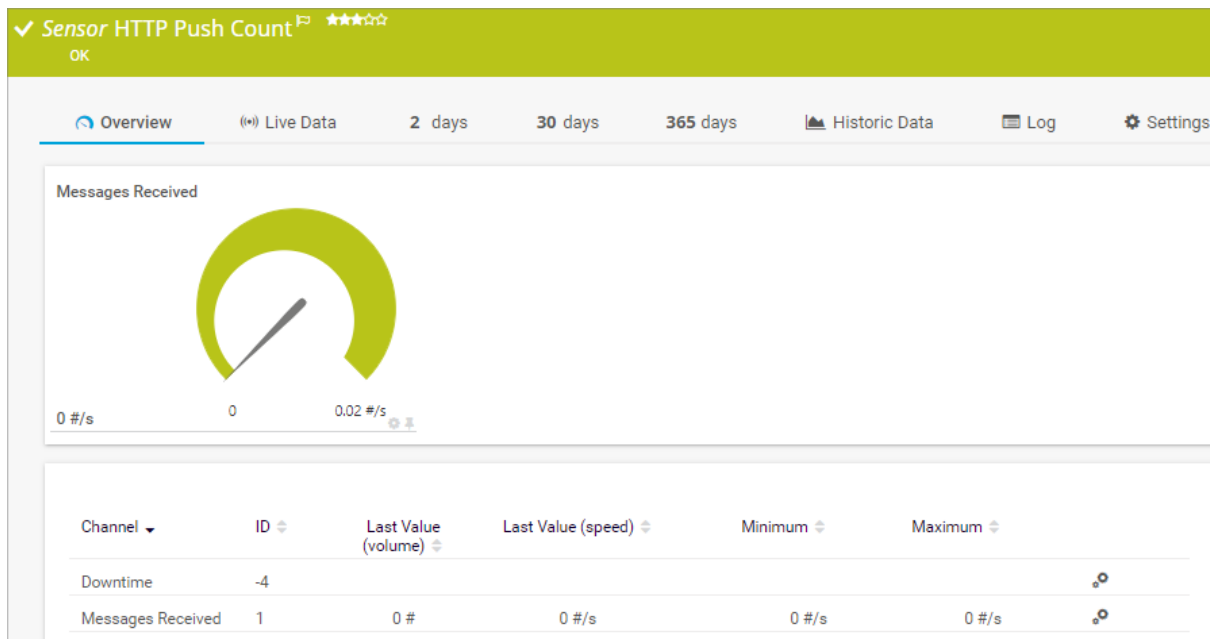

- [List of Available Sensor Types](#)⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁸⁷

7.8.66 HTTP Push Count Sensor

The HTTP Push Count sensor counts received messages that are pushed via an HTTP request to PRTG. It provides a URL that you can use to push messages to the probe system via HTTP (secured with TLS 1.2 or not secure).

For more information about the sensor usage, see section [How to Use](#) ¹³¹¹.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ¹³¹².

HTTP Push Count Sensor

Sensor in Other Languages

- Dutch: HTTP Push Aantal
- French: Nombre de Push HTTP
- German: HTTP Push-Anzahl
- Japanese: HTTP プッシュ数
- Portuguese: Contagem de push HTTP
- Russian: HTTP: push-
- Simplified Chinese: HTTP 推送计数
- Spanish: Recuento HTTP Push

Remarks

- If you want to install this sensor on a remote probe and use an HTTPS connection to send push notifications, you need to make sure that you import the same Secure Sockets Layer (SSL) certificates to the \cert subfolder of the [PRTG program directory](#) on the remote probe that you use on the PRTG core server.
■ For more information, see the PRTG Manual: [Using Your Own SSL Certificate with the PRTG Web Server](#).
 - You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
 - This sensor supports the IPv6 protocol.
 - This sensor has a low performance impact.
 - For more information about the sensor usage, see the PRTG Manual: [How to Use](#).
- ☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

HTTP Push

Setting	Description
SSL/TLS Settings	<p>Define the security of the incoming HTTP push requests:</p> <ul style="list-style-type: none"> ▪ HTTP (unsecure): Send push messages to the probe system via HTTP (not secure). ▪ HTTPS (secured with TLS 1.2 only): Send push messages to the probe system via HTTPS. The sensor only supports connections secured with TLS 1.2. It uses the SSL certificate that is delivered with PRTG or your own trusted SSL certificate that you imported for the PRTG web server. i If you install the sensor on a remote probe, make sure that you import the same SSL certificates to the remote probe that you use on the PRTG core server.
Port	This setting is only visible if you enable HTTP (unsecure) above. Enter the number of the port on which this sensor listens for incoming HTTP requests. The default port is 5050.
SSL/TLS Port	This setting is only visible if you enable HTTPS (secured with TLS 1.2 only) above. Enter the number of the port on which this sensor listens for incoming HTTPS requests. The default port is 5051.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ pushsensor ▪ pushcount ▪ httppushsensor

Setting	Description
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

HTTP Push

Setting	Description
SSL/TLS Settings	Shows whether the sensor accepts push messages via HTTP or HTTPS. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Port	This setting is only visible for sensors that accept push messages via HTTP. It shows the port number on which this sensor listens for incoming HTTP requests. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
SSL/TLS Port	This setting is only visible for sensors that accept push messages via HTTPS. It shows the port number on which this sensor listens for incoming HTTPS requests. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Setting	Description
Request Method	<p>Select the request method of the webhook:</p> <ul style="list-style-type: none"> ▪ ANY: Do not use any filter for the request method. ▪ GET: Select this method if the webhook uses GET. ▪ POST: Select this method if the webhook sends POST data. <ul style="list-style-type: none"> ❗ POST data must be form-encoded request bodies with the same parameters as for GET requests.
Identification Token	<p>This is the token that PRTG uses to find the matching sensor for the incoming message. When you create the sensor, this token is <code>{__guid__}</code>.</p> <p>PRTG replaces this token with an automatically generated token after sensor creation. If you want to use a different identification token, you can edit it during or after sensor creation.</p> <p>❗ PRTG does not automatically replace the token if you change it already during sensor creation.</p>
Request Handling	<p>Define what PRTG does with the incoming messages:</p> <ul style="list-style-type: none"> ▪ Discard request: Do not store the pushed messages. ▪ Store request: Store the last message received from the sensor in the <code>\Logs\sensors</code> subfolder of the PRTG data directory on the probe system. The file name is <code>Request for Sensor [ID].txt</code>. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>❗ You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>

Setting	Description
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

inherit from  Root

User Group Access ¹	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups^[4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management^[153].</p>

How to Use

This function is known as [webhook](#). Basically, a webhook works like a push notification. Webhooks are usually triggered by an event (for example, a new comment on a blog post) and send according information to a specified URL. The HTTP Push Count sensor then displays the number of pushed and received messages.

The HTTP Push Count sensor uses the following URL:

`http://<probe_ip>:<port_number>/<token>`

Replace the parameters `<probe_ip>`, `<port_number>`, and `<token>` with the corresponding values.

- The `<probe_ip>` is the IP address of the probe system with the sensor.

- The `<port_number>` is where the sensor listens for incoming HTTP calls.
- The `<token>` is used to define the matching sensor.

Example:

```
http://192.0.2.0:5050/XYZ123
```

- ⓘ You can use several sensors with the same port and identification token. In this case, the number of push messages is shown in each of these sensors.

Channel List

- ⓘ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Messages Received	The number of messages received per second <ul style="list-style-type: none"> ⓘ This channel is the primary channel by default.

- <https://kb.paessler.com/en/topic/85284>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

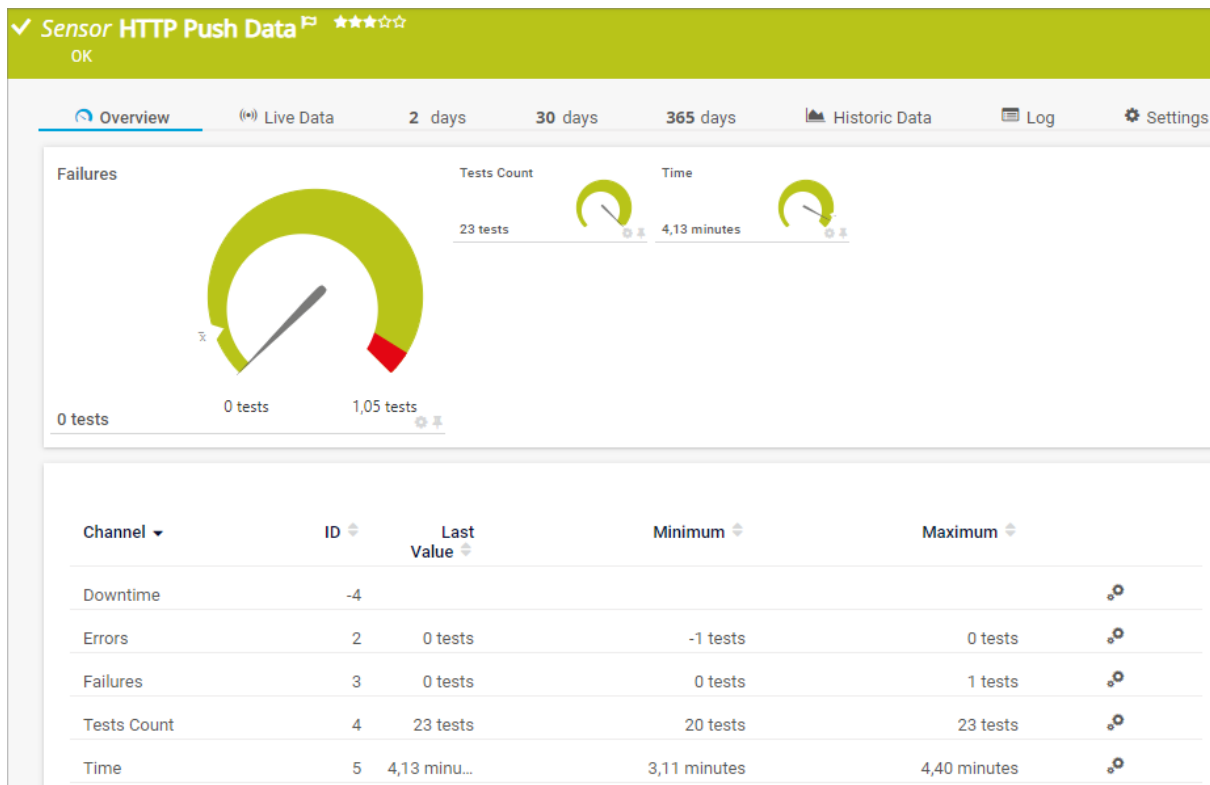

- [List of Available Sensor Types](#) 4581
- [Additional Sensor Types \(Custom Sensors\)](#) 3972
- [Channel Settings](#) 3977
- [Notification Triggers Settings](#) 3987

7.8.67 HTTP Push Data Sensor

The HTTP Push Data sensor displays numeric values from received messages that are pushed via an HTTP request to PRTG. It provides a URL that you can use to push messages to the probe system via HTTP (secured with TLS 1.2 or not secure).

For more information about the sensor usage, see section [How to Use](#).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

HTTP Push Data Sensor

Sensor in Other Languages

- Dutch: HTTP Push Data
- French: Données Push HTTP
- German: HTTP Push-Daten
- Japanese: HTTP プッシュデータ
- Portuguese: Dados HTTP via Push
- Russian: push- HTTP
- Simplified Chinese: HTTP 推送数据
- Spanish: HTTP Push de datos

Remarks

- If you want to install this sensor on a remote probe and use an HTTPS connection to send push notifications, you need to make sure that you import the same Secure Sockets Layer (SSL) certificates to the \cert subfolder of the [PRTG program directory](#) on the remote probe that you use on the PRTG core server.
■ For more information, see the PRTG Manual: [Using Your Own SSL Certificate with the PRTG Web Server](#).
 - You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
 - This sensor might result in false alerts if the parent probe disconnects from the PRTG core server. In this case, the sensor shows the error message: [The latest push message that the sensor received is older than the specified time threshold allows. \(code: PE222\)](#).
 - This sensor supports the IPv6 protocol.
 - This sensor has a low performance impact.
 - For more information about the sensor usage, see the PRTG Manual: [How to Use](#).
- ☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

HTTP Push

Setting	Description
SSL/TLS Settings	<p>Define the security of the incoming HTTP push requests:</p> <ul style="list-style-type: none"> ▪ HTTP (unsecure): Send push messages to the probe system via HTTP (not secure). ▪ HTTPS (secured with TLS 1.2 only): Send push messages to the probe system via HTTPS. The sensor only supports connections secured with TLS 1.2. It uses the SSL certificate that is delivered with PRTG or your own trusted SSL certificate that you imported for the PRTG web server. ❗ If you install the sensor on a remote probe, make sure that you import the same SSL certificates to the remote probe that you use on the PRTG core server.
Port	<p>This setting is only visible if you enable HTTP (unsecure) above. Enter the number of the port on which this sensor listens for incoming HTTP requests. The default port is 5050.</p>

Setting	Description
SSL/TLS Port	This setting is only visible if you enable HTTPS (secured with TLS 1.2 only) above. Enter the number of the port on which this sensor listens for incoming HTTPS requests. The default port is 5051.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus icon, and a 'Priority' field with five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[406], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
SSL/TLS Port	This setting is only visible for sensors that accept push messages via HTTPS. It shows the port number on which this sensor listens for incoming HTTPS requests.
Request Method	Select the request method of the webhook: <ul style="list-style-type: none"> ▪ ANY: Do not use any filter for the request method. ▪ GET: Select this method if the webhook uses GET. ▪ POST: Select this method if the webhook sends POST data. <ul style="list-style-type: none"> ❗ POST data must be form-encoded request bodies with the same parameters as for GET requests.
Identification Token	This is the token that PRTG uses to find the matching sensor for the incoming message. When you create the sensor, this token is <code>{_guid_}</code> . PRTG replaces this token with an automatically generated token after sensor creation. If you want to use a different identification token, you can edit it during or after sensor creation. <ul style="list-style-type: none"> ❗ PRTG does not automatically replace the token if you change it already during sensor creation.
Request Handling	Define what PRTG does with the incoming messages: <ul style="list-style-type: none"> ▪ Discard request: Do not store the pushed messages. ▪ Store request: Store the last message received from the sensor in the <code>\Logs\sensors</code> subfolder of the PRTG data directory on the probe system. The file name is <code>Request for Sensor [ID].txt</code>. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.

HTTP Push Data

HTTP Push Data

No Incoming Data ⓘ

Ignore and keep last status (default)

Switch to unknown status

Switch to down status after x minutes

Value Type ⓘ

Integer

HTTP Push Data

Setting	Description
No Incoming Data	<p>Define which status the sensor shows if it does not receive a push message for at least two scanning intervals:</p> <ul style="list-style-type: none"> Ignore and keep last status (default): Keep the status as defined by the last message that the sensor received. <ul style="list-style-type: none"> i The parent probe must be connected to keep the last status. If the parent probe disconnects, the sensor shows the Unknown status. If the parent probe connects again, the sensor does not automatically switch from the Unknown status to the last status before the parent probe disconnected. Switch to unknown status: Show the Unknown status if the sensor does not receive a message for at least two scanning intervals. Switch to down status after x minutes: Show the Down status if the sensor does not receive a message within a specific time span. Define the time threshold below.
Time Threshold (Minutes)	<p>This setting is only visible if you select Switch to down status after x minutes above. Enter a time threshold in minutes. If this time elapses, the sensor shows the Down status if it does not receive a push message within this time span.</p> <p>Enter an integer value. The maximum threshold is 1440 minutes.</p>
Value Type	<p>Define the type of the value of the received data:</p> <ul style="list-style-type: none"> Integer Float (with a dot . between the predecimal position and the decimal places) <p>i If this setting does not match, the sensor shows the Down status.</p>

Sensor Display

Sensor Display

Primary Channel Downtime

Graph Type
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p>

Setting	Description
	<p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁸⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval  60 seconds

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds

Setting	Description
	<ul style="list-style-type: none"> ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p>

Setting	Description
	<p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

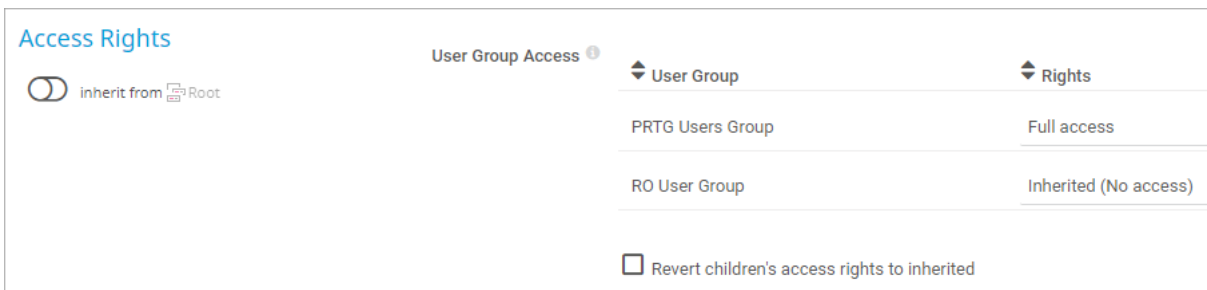

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p>

Setting	Description
Maintenance Begins	<ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

How to Use

This function is known as **webhook**. Basically, a webhook works like a push notification. Webhooks are usually triggered by an event (for example, a new comment on a blog post) and send according information to a specified URL. The HTTP Push Data sensor then displays the data of pushed and received messages.

The HTTP Push Data sensor uses the following URL:

```
http://<probe_ip>:<port_number>/<token>?value=<integer_or_float>&text=<text message>
```

Replace the parameters **<probe_ip>**, **<port_number>**, **<token>**, and **<integer_or_float>** with the corresponding values. The **&text** parameter is optional: You can omit it.

- You can define the port number and identification token in the sensor settings.
- The probe IP is the IP address of the probe system with this sensor.
- The value can be an integer or a float value depending on the data of your application. You have to set the value type accordingly in the sensor settings. This parameter is the sensor value.
 - ❶ If this parameter is missing, the sensor shows a Down [status](#)^[197].
- You can optionally add a custom text message by replacing the parameter **<text message>** with your custom text. The text is shown as the sensor message. If there is no value but only a text, the text is shown as an error message.
 - ❶ This text message has to be URL encoded (for example, the whitespaces in the sample URL below). Most browsers do URL-encoding automatically.

Example:

```
http://192.0.2.0:5050/XYZ123?value=0&text=this%20is%20a%20message
```

- ❶ You can use several sensors with the same port and identification token. In this case, the data of push messages is shown in each of these sensors.

Channel List

- ❶ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
[Value]	The received value and an optional message in one channel ❶ This channel is the primary channel by default.

More

KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

My HTTP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/85284>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

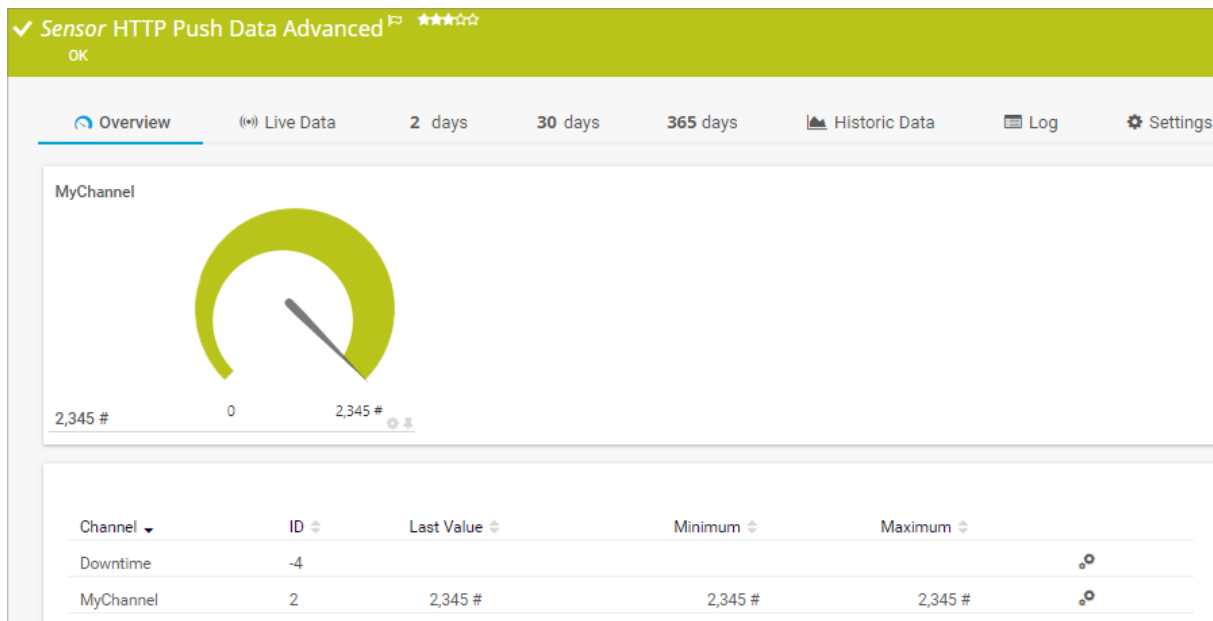

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3967

7.8.68 HTTP Push Data Advanced Sensor

The HTTP Push Data Advanced sensor displays data from received messages that are pushed via an HTTP request to PRTG. It provides a URL that you can use to push messages to the probe system via HTTP (secured with TLS 1.2 or not secure).

For more information about the sensor usage, see section [How to Use](#) ¹³³⁶.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ¹³³⁷.

HTTP Push Data Advanced Sensor

Sensor in Other Languages

- Dutch: HTTP Push Data geavanceerd
- French: Données avancées Push HTTP
- German: HTTP Push-Daten (Erweitert)
- Japanese: HTTP プッシュデータ(アドバンスト)
- Portuguese: Dados HTTP Avançado via Push
- Russian: HTTP: push- ()
- Simplified Chinese: HTTP 高级推送数据
- Spanish: HTTP Push de datos Avanzado

Remarks

- If you use this sensor with multiple channels, we recommend that you **simultaneously** push the data for **all** your channels to PRTG. You can push data to only one of your channels but, in this case, all other channels record the value of **0** for this push message.

- If you want to install this sensor on a remote probe and use an HTTPS connection to send push notifications, you need to make sure that you import the same Secure Sockets Layer (SSL) certificates to the \cert subfolder of the [PRTG program directory](#) on the remote probe that you use on the PRTG core server.
 - For more information, see the PRTG Manual: [Using Your Own SSL Certificate with the PRTG Web Server](#)
 - You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
 - This sensor might result in false alerts if the parent probe disconnects from the PRTG core server. In this case, the sensor shows the error message: [The latest push message that the sensor received is older than the specified time threshold allows. \(code: PE222\)](#).
 - This sensor supports the IPv6 protocol.
 - This sensor has a low performance impact.
 - For more information about the sensor usage, see the PRTG Manual: [How to Use](#).
- ☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

HTTP Push

Setting	Description
SSL/TLS Settings	Define the security of the incoming HTTP push requests: <ul style="list-style-type: none"> ▪ HTTP (unsecure): Send push messages to the probe system via HTTP (not secure). ▪ HTTPS (secured with TLS 1.2 only): Send push messages to the probe system via HTTPS. The sensor only supports connections secured with TLS 1.2. It uses the SSL certificate that is delivered with PRTG or your own trusted SSL certificate that you imported for the PRTG web server. <ul style="list-style-type: none"> ⓘ If you install the sensor on a remote probe, make sure that you import the same SSL certificates to the remote probe that you use on the PRTG core server.
Port	This setting is only visible if you enable HTTP (unsecure) above. Enter the number of the port on which this sensor listens for incoming HTTP requests. The default port is 5050.
SSL/TLS Port	This setting is only visible if you enable HTTPS (secured with TLS 1.2 only) above. Enter the number of the port on which this sensor listens for incoming HTTPS requests. The default port is 5051.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ pushsensor ▪ pushdata ▪ httppushsensor

Setting	Description
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

HTTP Push

HTTP Push

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

How to Use

This function is known as [webhook](#). Basically, a webhook works like a [push notification](#). Webhooks are usually triggered by some event (for example, a new comment on a blog post) and send according information to a specified URL. The HTTP Push Data Advanced sensor then displays the data of pushed and received messages.

The data that is pushed to this sensor must be valid XML or JSON.

■ For details about the return value format, see section [Custom Sensors](#) ⁴⁴⁴⁰.

The HTTP Push Data Advanced sensor uses the following URLs depending on the type of HTTP request.

- GET requests: `http://<probe_ip>:<port_number>/<token>?content=<valid XML_or_JSON>`

The XML encoded value of the content parameter has to match the format as defined in section [Custom Sensors](#) ⁴⁴⁴⁰.

- POST requests: `http://<probe_ip>:<port_number>/<token>`

This HTTP request method sends the XML or JSON encoded HTTP body as POST data. The body has to match the format as defined in section [Custom Sensors](#)^[4440]. For POST requests, use an HTTP content type other than `application/x-www-form-urlencoded`. We strongly recommend the HTTP content type `application/xml` or `application/json`.

Replace the parameters `<probe_ip>`, `<port_number>`, `<token>`, and `<valid XML_or_JSON>` (for GET requests) with the corresponding values:

- You can define port number and identification token in the sensor settings.
- The probe IP is the IP address of the probe system with this sensor.
- The content of GET requests has to be valid XML or JSON in the PRTG API format.
 - ❗ The content has to be URL encoded (for example, the whitespaces in the sample URL below). Most browsers do URL-encoding automatically.

Minimum example for the GET method that returns one static channel value:

```
http://127.0.0.1:5050/XYZ123?
content=<prtg><result><channel>MyChannel</channel><value>10</value></result><text>this
%20is%20a%20message</text></prtg>
```

- ❗ By default, values within the `<value>` tags in the returned XML or JSON must be `integers` to be processed. If `float` values are returned, you have to explicitly define this value type as defined in section [Custom Sensors](#)^[4442] with `<float>` tags, otherwise the sensor shows 0 values in affected channels. Example:

```
http://127.0.0.1:5050/XYZ123?
content=<prtg><result><channel>MyChannel</channel><value>10.45</value><float>1</float>
</result><text>this%20is%20a%20message</text></prtg>
```

- ❗ You can use several sensors with the same port and identification token. In this case, the data of push messages is shown in each of these sensors.

Channel List

- ❗ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
[Value]	The data received from the message encoded in valid Extensible Markup Language (XML) or JavaScript Object Notation (JSON) in several channels

Channel	Description
	<p> This channel is the primary channel by default.</p> <p> For details about the return value format, see section Custom Sensors .</p>

My HTTP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/85284>

Sensor Settings Overview

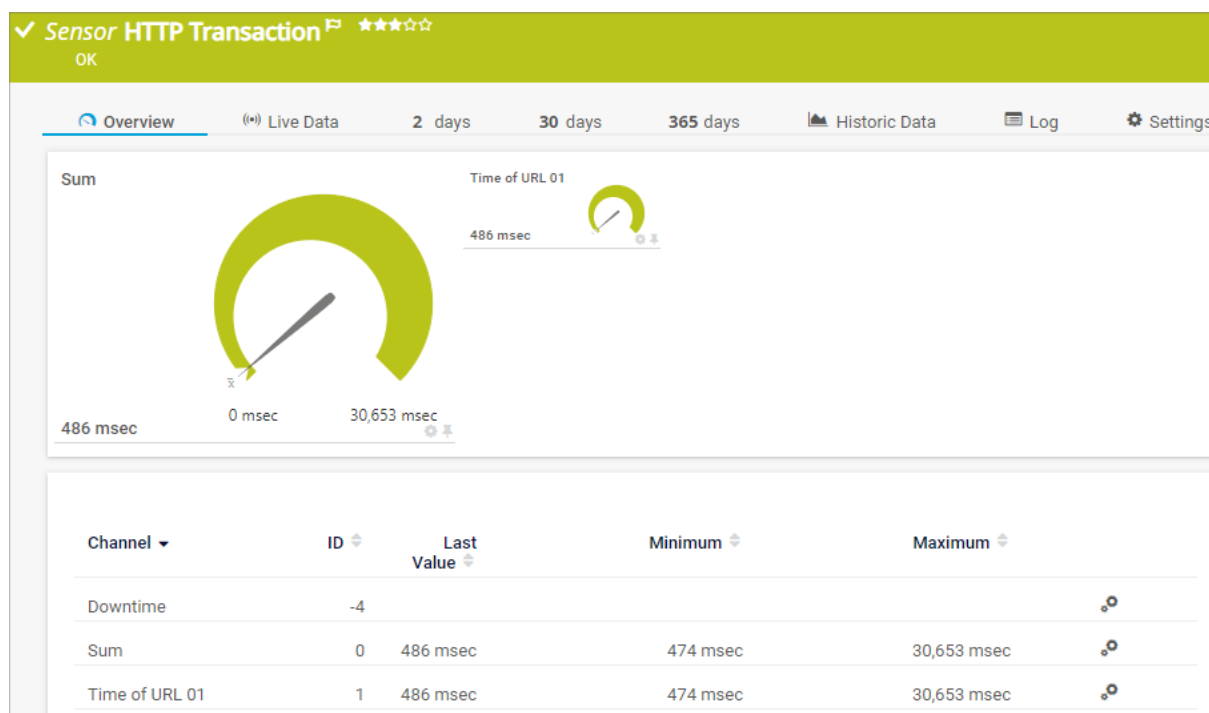

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#) 
- [Additional Sensor Types \(Custom Sensors\)](#) 
- [Channel Settings](#) 
- [Notification Triggers Settings](#) 

7.8.69 HTTP Transaction Sensor

The HTTP Transaction sensor monitors an interactive website, such as a web shop, by performing a transaction using a set of HTTP URLs. The sensor monitors whether logins or shopping carts work properly.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

HTTP Transaction Sensor

Sensor in Other Languages

- Dutch: HTTP (Transactie)
- French: Transaction HTTP
- German: HTTP (Transaktion)
- Japanese: HTTP トランザクション
- Portuguese: Transação HTTP
- Russian: HTTP
- Simplified Chinese: HTTP 处理
- Spanish: HTTP Transacción

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor does not support Secure Remote Password (SRP) ciphers. If you need to use SRP ciphers, use the Alternate/Compatibility Mode in the sensor settings.

- This sensor supports smart URL replacement.
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [Configuration Tips for HTTP Transaction Sensors needed](#)
- See the Knowledge Base: [Which user agent should I use in the HTTP Advanced sensor's settings?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a 'Basic Sensor Settings' dialog box. It has three main sections: 'Sensor Name' with a text input field containing 'Example Name'; 'Tags' with a text input field containing 'exampletag' and a plus sign icon; and 'Priority' with a star rating of three stars out of five.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ httptransactionsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

HTTP Specific

HTTP Specific

Timeout (Sec.) **i**

Single URL Timeout (Sec.) **i**

HTTP Specific

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for all HTTP requests. Enter an integer value. The maximum value is 900 seconds (15 minutes).</p> <p>i If the complete transaction takes longer than this value, the sensor cancels the request and shows an according error message. If two consecutive requests are unsuccessful (for whatever reason), the sensor shows the Down status ¹⁹⁷.</p>
Single URL Timeout (Sec.)	<p>Enter a timeout in seconds for one single HTTP request. Enter an integer value. The maximum value is 900 seconds (15 minutes).</p> <p>i If the reply of any single request takes longer than this value, the sensor cancels the transaction and shows an according error message.</p>

HTTP Engine

HTTP Engine

Monitoring Engine **i**

Default engine (recommended)
 Compatibility engine

HTTP Engine

Setting	Description
Monitoring Engine	<p>Choose the monitoring engine that the sensor uses:</p> <ul style="list-style-type: none"> ▪ Default engine (recommended): Use the default monitoring engine. ▪ Compatibility engine: Execute an external executable program. Use this method as an alternative for websites that do not work with the default monitoring engine. <ul style="list-style-type: none"> ⓘ This method needs more resources but it can be helpful in some cases. ⓘ If you select the compatibility mode, the options for the SSL method are different. You can also check for trusted certificates. See below. ⓘ Smart URL Replacement does not work with the compatibility mode, so this sensor does not automatically use the IP Address/DNS value of the parent device.
SSL/TLS Method	<p>This option is only visible if you select Alternate/Compatibility Mode above. Choose from:</p> <ul style="list-style-type: none"> ▪ SSLv3 ▪ TLS 1.0, TLS 1.1, TLS 1.2 ▪ SSLv3, TLS 1.0, TLS 1.1, TLS 1.2 (default)
Check SSL Certificates	<p>This option is only visible if you select Alternate/Compatibility Mode above. Specify if the sensor checks the certificate of the URL:</p> <ul style="list-style-type: none"> ▪ Do not check certificates: Do not check the certificates of the web pages. This the default setting. ▪ Check if certificates are trusted: Check the certificates of the web pages. If the certificate of the server is not trusted, the sensor shows a Down status¹⁹⁷ and displays a corresponding message.

ⓘ This sensor implicitly supports SNI, an extension to the Transport Layer Security (TLS) protocol.

Advanced Sensor Data

Advanced Sensor Data

Download Limit (KB) ⓘ

Cookie Management ⓘ

Use cookies (recommended)

Ignore cookies

User Agent ⓘ

Use the default string

Use a custom string

Result Handling ⓘ

Discard result

Store result

Advanced Sensor Data

Setting	Description
Download Limit (KB)	<p>Enter a number that defines the maximum amount of data (in kilobytes) that the sensor transfers per request.</p> <p>i If you set content checks, be aware that they might be incomplete. This is because the sensor only checks the content that is downloaded up to this limit for search expressions.</p>
Cookie Management	<p>Select if you want to allow cookies for the transaction:</p> <ul style="list-style-type: none"> Use cookies (recommended): Allow cookies to be set and read during the transaction cycle. We recommend that you use this option. Ignore cookies: Do not allow cookies. Use this option if you want to test the transaction without the use of cookies.
User Agent	<p>Choose which user agent string the sensor sends when it connects to the target URL:</p> <ul style="list-style-type: none"> Use the default string: Do not enter a specific user agent and use the default string. Usually, this is Mozilla/5.0 (compatible; PRTG Network Monitor (www.paessler.com); Windows). Use a custom string: Use a custom user agent. Define the custom user agent below.
Custom User Agent	<p>This setting is only visible if you enable Use a custom string above. Enter the string that the sensor uses as the user agent when it connects to the target URL.</p>
Result Handling	<p>Define what PRTG does with the web page that is loaded at the URL:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result.

Setting	Description
	<ul style="list-style-type: none"> Store result: Store the last result of the web page in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID]-1.txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes, especially in combination with content checks. PRTG overwrites the files with each scanning interval. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Authentication

Authentication Authentication 

Web page does not need authentication
 Web page needs authentication

Authentication

Setting	Description
Authentication	Define if authentication is necessary on the web page: <ul style="list-style-type: none"> Web page does not need authentication Web page needs authentication
User Name	This setting is only visible if you select Web page needs authentication above. Enter a user name. Enter a string.
Password	This setting is only visible if you select Web page needs authentication above. Enter a password. Enter a string.
Authentication Method	This setting is only visible if you select Web page needs authentication above. Select the authentication method that the URL uses: <ul style="list-style-type: none"> HTTP authentication: Use simple HTTP authentication.  This authentication method transmits credentials as plain text. NT LAN Manager authentication: Use the Microsoft NT LAN Manager (NTLM) protocol for authentication. Digest access authentication: Use digest access authentication. This applies a hash function to the password, which is safer than HTTP authentication.

Transaction URL

You can define up to 10 different transaction URLs, which are all called in a row. If the transaction can be completed, the sensor shows the Up status. Using this mechanism, you can set up extended monitoring with multiple URLs.

Enter settings for at least one transaction URL. You can use as many steps as necessary and disable the other steps.

Transaction URL #1

URL ⓘ

Request Method ⓘ GET
 POST
 HEAD

Require Keyword ⓘ Do not check for keyword (default)
 Set sensor to warning if keyword is missing
 Set sensor to down status if keyword is missing

Exclude Keyword ⓘ Do not check for keyword (default)
 Set sensor to warning if keyword is found
 Set sensor to down status if keyword is found

Transaction URL #2

Transaction Step #2 ⓘ Disable step #2
 Enable step #2

Transaction URL #x

Setting	Description
Transaction Step #x	<p>This setting is available for URL #2 through #10. Define if you want to use this step for the transaction check:</p> <ul style="list-style-type: none"> Disable step #x: Do not use this step. Choose this option if you do not need all 10 steps for the transaction check. Enable step #x: Enable this step. Further options are available.
URL	<p>Enter the URL that the sensor connects to. If you enter an absolute URL, the sensor uses this address independently of the IP Address/DNS Name setting of the parent device.</p> <p>i The URL must not be URL encoded.</p> <p>■ PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section Smart URL Replacement ¹³⁵³.</p>

Setting	Description
Request Method	<p>Select an HTTP request method to determine how the sensor requests the URL:</p> <ul style="list-style-type: none"> ▪ GET: Directly request the website. <ul style="list-style-type: none"> ⓘ We recommend that you use this setting for a simple check of the web page. ▪ POST: Send post form data to the URL. <ul style="list-style-type: none"> ⓘ If you select this setting, you must enter the data in the Postdata field below. ▪ HEAD: Only request the HTTP header from the server without the actual web page. <ul style="list-style-type: none"> ⓘ Although this saves bandwidth because it transfers less data, we do not recommend that you use this. This is because the measured request time is not the one that your users experience and you might not be notified of slow results or timeouts.
Postdata	<p>This setting is only visible if you select POST above. Enter the data part for the POST request.</p> <ul style="list-style-type: none"> ⓘ No Extensible Markup Language (XML) is allowed here.
Require Keyword	<p>Define if the sensor checks the result at the URL for keywords:</p> <ul style="list-style-type: none"> ▪ Do not check for keyword (default): Do not search for keywords in the result. ▪ Set sensor to warning if keyword is missing: Check if a keyword exists in the result. If it exists, set the sensor to the Warning status. ▪ Set sensor to error if keyword is missing: Check if a keyword exists in the result. If it exists, set the sensor to the Down status. <p>ⓘ The content check is only intended for HTML websites and might not work with other target URLs.</p>
Response Must Include	<p>This setting is only visible if you select keyword checking above. Define the search string that must be part of the result at the URL.</p> <ul style="list-style-type: none"> ⓘ If the result at the URL does not include the search pattern, the sensor shows the status defined above and displays this string along with the affected URL in the sensor message. ⓘ Only simple text search is available here. ⓘ The characters * and ? work as placeholders. * stands for no number or any number of characters and ? stands for exactly one character. You cannot change this behavior. The literal search for these characters is not possible.
Exclude Keyword	<p>Define if the sensor checks the result at the URL for keywords:</p>

Setting	Description
	<ul style="list-style-type: none"> Do not check for keyword (default): Do not search for keywords in the result. Set sensor to warning if keyword is found: Check if a keyword exists in the result. If it exists, set the sensor to the Warning status. Set sensor to error if keyword is found: Check if a keyword exists in the result. If it exists, set the sensor to the Down status. <p>i The content check is only intended for HTML websites and might not work with other target URLs.</p>
Response Must Not Include	<p>Define a string that must not be part of the result at the URL. If the data includes this string, the sensor shows the Down status and displays this string along with the affected URL in the sensor message. Enter a string.</p> <p>i Only simple text search is available here.</p> <p>i The characters * and ? work as placeholders. * stands for no number or any number of characters and ? stands for exactly one character. You cannot change this behavior. The literal search for these characters is not possible.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking + below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel.

Setting	Description
	<ul style="list-style-type: none"> Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁸ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Proxy Settings for HTTP Sensors

Click  to interrupt the [inheritance](#)¹⁴².

The proxy settings determine how a sensor connects to a URL. You can enter data for an HTTP proxy server that sensors use when they connect via HTTP or HTTPS.

i This setting only applies to HTTP sensors and how they monitor. To change the proxy settings for the PRTG core server, see section [Core & Probes](#)⁴²⁰³.

Proxy Settings for HTTP Sensors

IP Address/DNS Name i	192.0.2.0
Port i	8080
User Name i	johnqpublic
Password i

Proxy Settings for HTTP Sensors

Setting	Description
IP Address/DNS Name	Enter the IP address or Domain Name System (DNS) name of the proxy server. If you leave this field empty, HTTP sensors do not use a proxy.
Port	Enter the port number of the proxy. The default is 8080. Enter an integer value.
User Name	If the proxy requires authentication, enter the user name for the proxy login.  Only basic authentication is available. Enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login.  Only basic authentication is available. Enter a string or leave the field empty.

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from: <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either <http://> or <https://>, or even a simple forward slash / as the equivalent for <http://>). PRTG automatically fills in the parent device's IP address or DNS name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name www.mycompany.com and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter <https://> in the URL field, PRTG automatically creates the URL <https://www.mycompany.com/>
- If you enter [/help](http://www.mycompany.com/help) in the URL field, PRTG automatically creates and monitor the URL <http://www.mycompany.com/help>

- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, <http://:8080/>

 Smart URL replacement does not work for sensors that run on the probe device.

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Sum	The loading time of the complete transaction in milliseconds (msec)  This channel is the primary channel by default.
Time of URL [#]	The loading time of single URLs in msec

Sensor Settings Overview

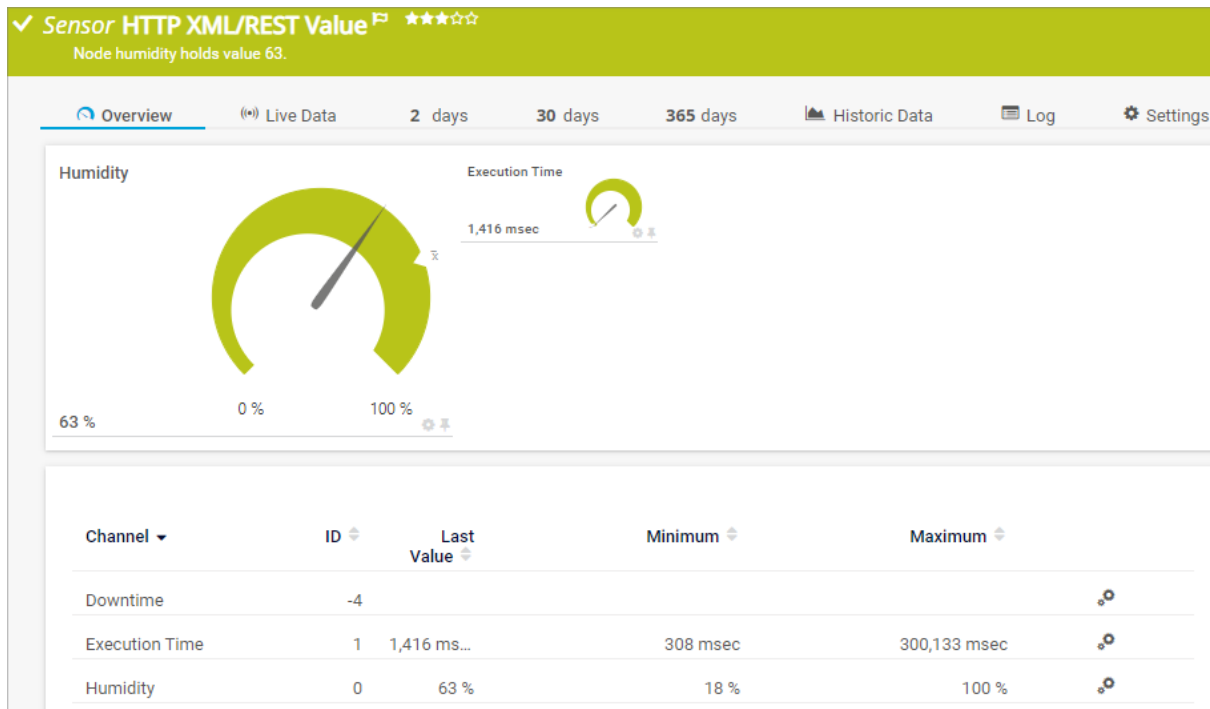

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3957

7.8.70 HTTP XML/REST Value Sensor

The HTTP XML/REST Value sensor retrieves an .xml file from a URL and parses it.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

HTTP XML/REST Value Sensor

Sensor in Other Languages

- Dutch: HTTP XML/REST Waarde
- French: Valeur HTTP XML/REST
- German: HTTP XML-/REST-Wert
- Japanese: HTTP XML/REST 値
- Portuguese: Valor HTTP XML/REST
- Russian: HTTP XML/REST
- Simplified Chinese: HTTP XML/REST 值
- Spanish: Valor HTTP XML/REST

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires .NET 4.7.2 or later on the probe system. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.
- This sensor does not support Secure Remote Password (SRP) ciphers.

- This sensor supports smart URL replacement.
- This sensor supports the IPv6 protocol.
- This sensor can monitor only one single node in an .xml file and shows the value in one channel. If you need to monitor more than one node of an .xml document, add the sensor for each target node anew.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- See the Knowledge Base: [Where can I find more information about the HTTP XML/REST Value sensor?](#)
- See the Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Sensor Settings

Setting	Description
Channel Name	Enter a name for the channel that displays the value at the URL.

Sensor Settings

Setting	Description
URL	<p>Enter the URL that returns the .xml file. If you enter an absolute URL, the sensor uses this address independently of the IP Address/DNS Name setting of the parent device.</p> <p>ⓘ The URL must be URL encoded.</p> <p>■ PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section Smart URL Replacement ¹³⁶⁸.</p>
XML Node (and optional property)	<p>Enter the name of the node that this sensor checks, or enter a node name and a property name to check a property value. To obtain a value from nested tags, enter the tag names and separate them with a forward slash (/). For example, use myTag/myTagInside as XML node value.</p> <p>ⓘ You can also check values in JavaScript Object Notation (JSON). See section Checking JSON ¹³⁶⁷.</p>

Setting	Description
	<p> You can try to use XPath syntax here but it does not work in all cases and we do not provide any technical support for XPath issues. For further documentation about XPath, see the Knowledge Base: How can I use XPath with the HTTP XML/REST Value Sensor?</p>
HTTP User Name	If the URL requires authentication, enter the user name. Enter a string or leave the field empty.
HTTP Password	If the URL requires authentication, enter the password. Enter a string or leave the field empty.
Sensor Value	<p>Define what value the sensor shows:</p> <ul style="list-style-type: none"> ▪ Use the value of the selected XML node: Return the value that the sensor finds at the XML node. If this is a non-numeric value, the sensor shows 0. ▪ Use the number of occurrences of the selected XML node or its children/siblings: Return the number of occurrences found. Define further settings below.
Count XML Nodes	<p>This setting is only visible if you select Use the number of occurrences of the selected XML node or its children/siblings above. Define which count the sensor shows:</p> <ul style="list-style-type: none"> ▪ Occurrences of the selected XML node: Return how often the defined XML node occurs at the URL. ▪ Child nodes of the selected XML node: Return the number of child nodes that exist below the node at the URL. ▪ Sibling nodes of the selected XML node: Return the number of sibling nodes that exist next to the node at the URL.
Name Space Handling	<p>Define whether to use namespaces in the .xml document or not:</p> <ul style="list-style-type: none"> ▪ Use name spaces: Process the value you enter in the XML Node (and optional property) field, possibly including namespace information. ▪ Remove name spaces: Ignore namespace information in the .xml document and process the value you enter in the XML Node (and optional property) field as node names only. <p> For more information see section About Namespaces </p>
Content Type	<p>Define what to include in the header of the request that the sensor sends to the URL:</p> <ul style="list-style-type: none"> ▪ Enable (recommended): This works for most web servers and is the recommended setting.

Setting	Description
	<ul style="list-style-type: none"> ▪ Disable: Only very few web servers cannot handle this content type and need this setting. Try this if you get an error message with the enabled option. ▪ Custom: You can use a custom content type.
Custom Content Type	This setting is only visible if you select Custom above. Enter a custom content type like text/xml or text/html .
HTTP Headers	<p>Optionally enter a list of custom HTTP headers with their respective values that you want to transmit to the URL. The syntax of a list with header-value pairs is header1:value1 header2:value2 ... headerx:valuex</p> <p>i The sensor does not accept header field names that include a dash (–) character. If you want to use such an HTTP header, leave out the dash in the name. For example, enter ContentType:value instead of Content-Type:value. Example: From:johnqpublic@example.com AcceptLanguage:en-us</p> <p>i Ensure that the HTTP header statement is valid. Otherwise, the sensor request cannot be successful.</p>
Remove Characters	<p>This setting is only visible if you select Use the value of the selected XML node above. Optionally enter a string that the sensor removes from the returned XML value.</p> <p>Use this to remove any unwanted characters from the result, for example to remove a thousands separator from numeric values. Enter a string or leave the field empty.</p>
Decimal Delimiter	This setting is only visible if you select Use the value of the selected XML node above. If the sensor value of the returned XML node is of the type float , you can define any character as the decimal delimiter. Enter one character or leave the field empty.
Custom Message	Optionally enter a custom sensor message. Use %1 as a placeholder to automatically fill in the returned XML value. Enter a string or leave the field empty.
If Channel Value Changes	<p>Define what the sensor does when the channel value changes:</p> <ul style="list-style-type: none"> ▪ Ignore changes (default): Take no action on change. ▪ Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger⁴¹³⁸, you can use this mechanism to trigger a notification³⁹⁸⁷ whenever the sensor value changes. <p>i The notification for this sensor can only be triggered if the returned value is a numeric value. This option does not support strings.</p>

Setting	Description
Unit String	<p>Enter the unit for the values that this sensor returns. Enter a string. PRTG uses the unit string for display purposes and shows it in graphs, data tables, and gauges.</p> <p>i If you want to change the unit after sensor creation, you can change it in the sensor's channel settings.</p>

Debug Options

Debug Options

Result Handling **i**

Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i**

Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

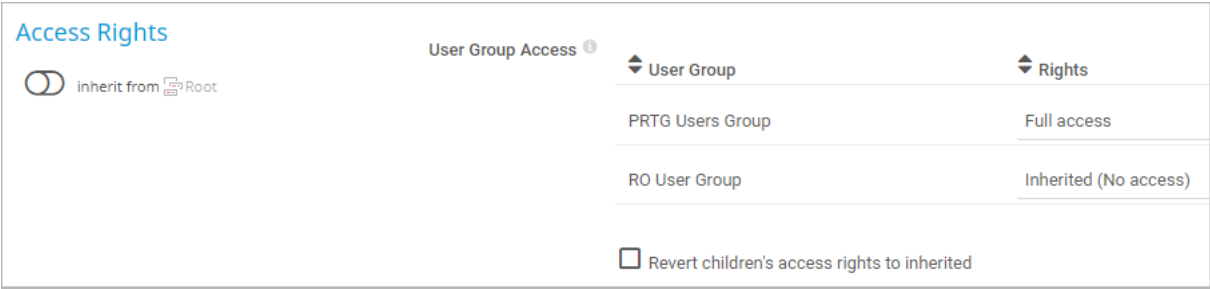

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

i Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

inherit from  Root

Channel Unit Types **i**

Channel Type	Unit
Bytes (Bandwidth)	KB ▼
	kbit ▼
	/ ▼
	sec... ▼
Bytes (Memory)	MB ▼
Bytes (Disk)	MB ▼
Bytes (File)	Byte ▼

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Checking JSON

With the XML Node (and optional property) field, you can also check values that are returned in JSON notation under the defined URL.

 Example

A JSON notated section might look like the following:

```
{
  "test": "Hello World",
  "object": {
    "value": "content",
    "AnotherValue": "AnotherContent"
  },
  "arraytest": [
    "one",
    "two"
  ]
}
```

Depending on your entries in the XML Node field, the sensor processes the respective values:

Entry in Sensor's "XML Node" Field (from Example Above)	Processed Value (from Example Above)
test	Hello World
object/value	content
object/AnotherValue	AnotherContent
object	contentAnotherContent
arraytest[1]	one
arraytest[2]	two

 The sensor converts whitespaces in JSON keys into underscores (_). So, for example, if you look for the node **some node** in the JSON, you need to enter **some_node** into the node field. If you count the number of nodes (for example, **some_node**), both **some node** and **some_node** would be counted if they appear in the JSON.

 If a key exists more than once in the JSON, the value of the first appearance is returned (no difference between whitespace and underscore).

About Namespaces

In an .xml document, tags may use namespaces.

 Example

A namespace notated section might look like the following:

```
<myNamespace:myNode>
  some information
</myNamespace:myNode>
```

If you set this sensor to Use namespaces (this is the default setting), it expects the full node name, including the namespace information, in the XML Node (and optional property) field. In the example above, this is [myNamespace:myNode](#).

If your node names are unique even without the namespace information, you can simplify the settings by setting this sensor to Remove namespaces. The sensor then expects the node name only in the XML Node (and optional property) field. In the example above, this is [myNode](#).

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either [http://](#) or [https://](#), or even a simple forward slash [/](#) as the equivalent for [http://](#)). PRTG automatically fills in the parent device's IP address or DNS name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.mycompany.com](#) and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter [https://](#) in the URL field, PRTG automatically creates the URL [https://www.mycompany.com/](#)
- If you enter [/help](#) in the URL field, PRTG automatically creates and monitor the URL [http://www.mycompany.com/help](#)
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, [http://:8080/](#)

 Smart URL replacement does not work for sensors that run on the probe device.

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Execution Time	The execution time in milliseconds (msec)
[Value]	The value of one defined XML node
	 This channel is the primary channel by default.

Sensor Settings Overview

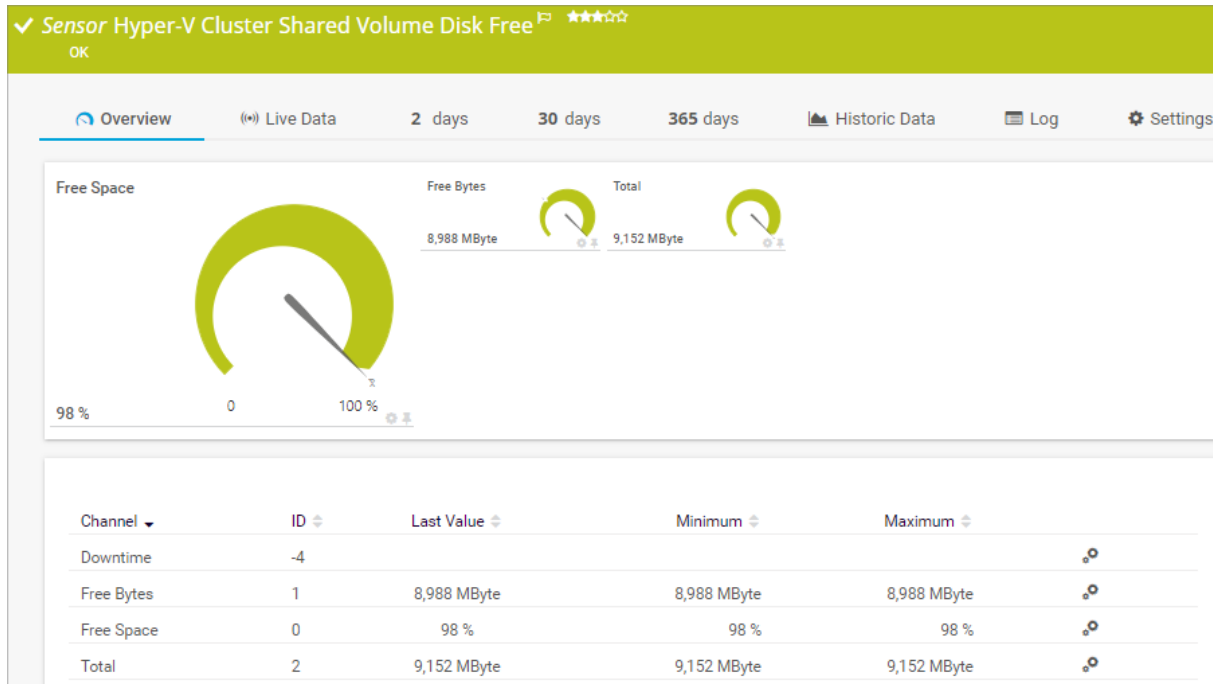

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.71 Hyper-V Cluster Shared Volume Disk Free Sensor

The Hyper-V Cluster Shared Volume Disk Free sensor monitors a Microsoft Hyper-V cluster shared volume via PowerShell.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Hyper-V Cluster Shared Volume Disk Free Sensor

Sensor in Other Languages

- Dutch: Hyper-V Cluster Shared Volume Disk Free
- French: Disque disponible Hyper-V Cluster Shared Volume
- German: Hyper-V Freigegebenes Clustervolume Freier Speicher
- Japanese: Hyper-V クラスタ共有ボリュームディスク空き容量
- Portuguese: Disco de volume compartilhado do cluster Hyper-V livre
- Russian: Hyper-V
- Simplified Chinese: Hyper-V 群集共享卷磁盘可用空间
- Spanish: Espacio en disco libre de volumen compartido en clúster de Hyper-V

Remarks

- The parent device of this sensor must be a Windows server that runs Hyper-V.
- This sensor [requires](#) Remote PowerShell on the target device.
- This sensor requires WSFC PowerShell Interface on the target device.
- This sensor requires .NET 4.7.2 or later on the probe system.

- This sensor requires [credentials for Windows systems](#) ⁴⁵² in the settings of the parent device.
- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- See the Knowledge Base: [Why don't my Hyper-V sensors work after changing names?](#)
- See the Knowledge Base: [Where can I find more information about PowerShell sensors?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Remote PowerShell	<p>This sensor uses PowerShell commands. To monitor devices with this sensor, Remote PowerShell must be enabled.</p> <p>i In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message The WSMAN provider host process did not return a proper response. In this case, increase the memory limit for Remote PowerShell.</p> <p>■ For more information, see the Knowledge Base: How do I enable and use remote commands in Windows PowerShell? and How can I increase memory for Remote PowerShell?</p>
WSFC PowerShell Interface	<p>This sensor requires the WSFC (Windows Server Failover Clustering) PowerShell Interface to be installed on the target machine. You can list all modules in the PowerShell console with the command Get-Module - ListAvailable. Here, FailoverClusters has to appear. Under Windows Server 2008 (not officially supported) and Windows Server 2012, the interface is part of the VMM Administrator Console, or the VMM 2012 Management Console.</p> <p>The interface is available everywhere the WSFC feature is installed: Windows Server 2008 R2 (SP1) Full and Core (not installed by default), Microsoft Hyper-V Server 2008 R2 (SP1), and Remote Server Administration Tools (RSAT) for Windows 10, Windows 8.1, Windows 8, and Windows 7 (SP1).</p>
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i If the framework is missing, you cannot create this sensor.</p> <p>■ For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Disk Free Settings

Setting	Description
Disk	<p>Select the disks that you want to monitor. PRTG creates one sensor for each disk that you select.</p> <ul style="list-style-type: none"> i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. i Make sure that the resource names of your disks do not contain unsupported characters, especially avoid the number sign (#). In general, the sensor supports UTF-8 characters. We recommend that you do not rename resource disk names once you have set up monitoring. For detailed information, see the Knowledge Base: Why don't my Hyper-V sensors work after changing names?

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It includes the following elements:

- Sensor Name:** A text input field containing 'Example Name' with an information icon.
- Tags:** A text input field containing 'exampletag' with a close button (X) and an add button (+), and an information icon.
- Priority:** A set of five star icons, with the first three filled, and an information icon.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ hyperv ▪ powershell ▪ diskfree
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Disk Free Settings

Setting	Description
Disk	Shows the name of the disk that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor. ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.
Graph Type	Define how different channels are shown for this sensor: <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷),

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Sensor Settings Overview

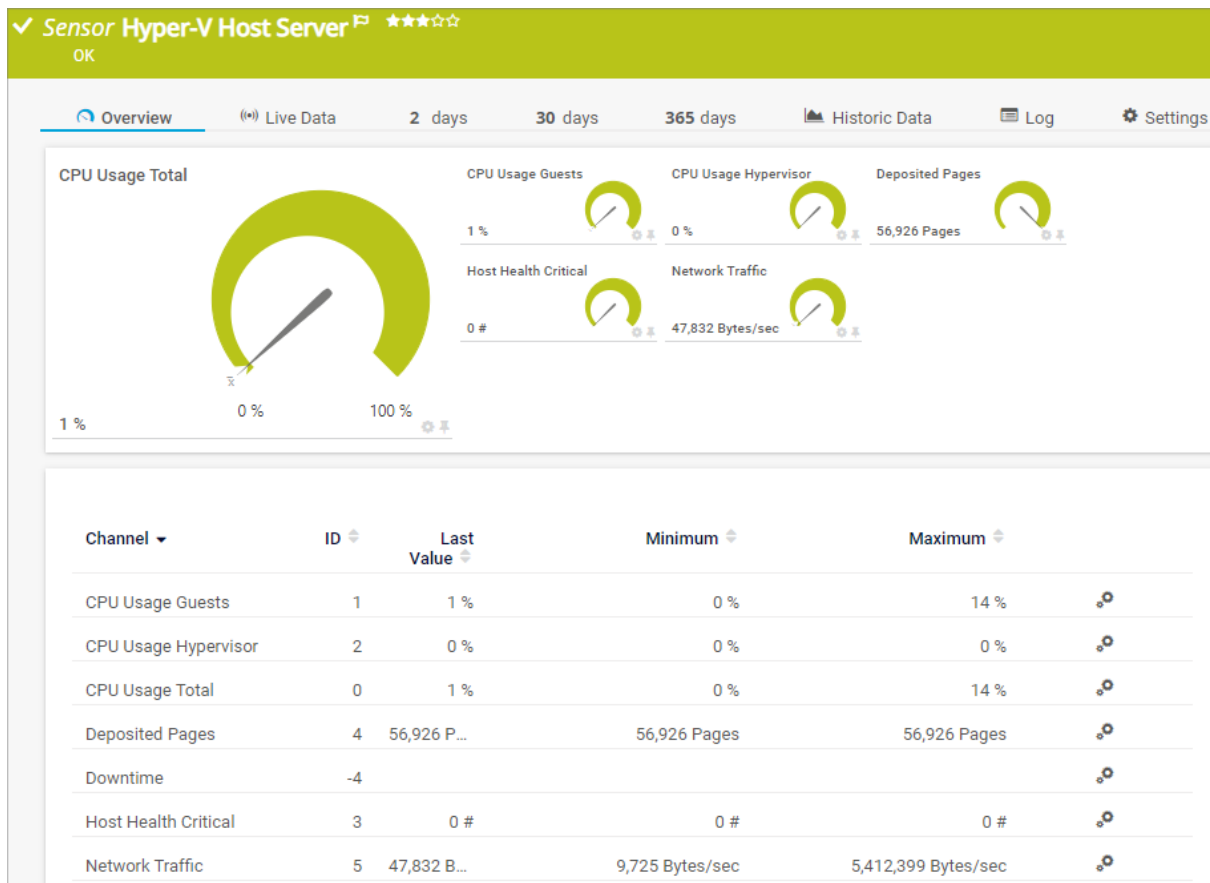

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3967

7.8.72 Hyper-V Host Server Sensor

The Hyper-V Host Server sensor monitors a Microsoft Hyper-V host server via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) ⁴⁶⁴ of the parent device.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ¹³⁸³.

Hyper-V Host Server Sensor

Sensor in Other Languages

- Dutch: Hyper-V Host Server
- French: Serveur hôte Hyper-V
- German: Hyper-V Host Server
- Japanese: Hyper-V ホストサーバー
- Portuguese: Hyper-V Host
- Russian: Hyper-V
- Simplified Chinese: Hyper-V 主机服务器
- Spanish: Servidor Hyper-V Host

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- The parent device of this sensor must be a Windows server that runs Hyper-V.
- This sensor requires [credentials for Windows systems](#) ^[452] in the settings of the parent device.
- This sensor requires Windows Server 2008 R2 or later on the probe system.
- This sensor requires that the Remote Registry Windows service runs on the target computer.
- This sensor can use a hybrid approach with Windows performance counters and WMI as fallback to query data.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems ^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Hybrid Approach: Performance Counters and WMI

i By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#) [464] on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

i Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#) [130]. Above this number, consider using multiple [remote probes](#) [493] for load balancing.

i For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#) [426].

Add Sensor

The [Add Sensor](#) [361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name**: A text input field containing "Example Name".
- Tags**: A list of tags with "exampletag" selected, and a plus sign icon to add more.
- Priority**: A star rating system showing 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [183], as well as in alarms [228], logs [237], notifications [4031], reports [4069], maps [4095], libraries [4047], and tickets [240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags [145] that the sensor inherits [145] from its parent device [140], parent group [139], and parent probe [139].</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ¹⁴⁵.</p> <ul style="list-style-type: none"> ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ hypervserversensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

Debug Options

Debug Options

Result Handling ⓘ

 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click ⓘ to interrupt the [inheritance](#).

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor in Other Languages

- Dutch: Virtuele Hyper-V-Machine
- French: Machine virtuelle Hyper-V
- German: Hyper-V Virtuelle Maschine
- Japanese: Hyper-V 仮想マシン
- Portuguese: Máquina virtual Hyper-V
- Russian: Hyper-V
- Simplified Chinese: Hyper-V 虚拟机
- Spanish: Máquina virtual Hyper-V

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- The parent device of this sensor must be a Windows server that runs Hyper-V.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor requires Windows Server 2008 R2 or later on the probe system.
- This sensor requires that the Remote Registry Windows service runs on the target computer.
- This sensor can use a hybrid approach with Windows performance counters and WMI as fallback to query data.
- This sensor does not support [Live Migration](#).
- This sensor supports the IPv6 protocol.
- To monitor a VM with this sensor, disable User Account Control (UAC) in the control panel of the Windows operating system that runs on this VM. Otherwise, the sensor might change to the Down status showing the error message [The virtual machine is not running or is powered off](#).
- See the Knowledge Base: [Why don't my Hyper-V sensors work after changing names?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p>

Requirement	Description
	To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Hybrid Approach: Performance Counters and WMI

- i** By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#)^[464] on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.
- i** Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[4503] for load balancing.
- i** For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)^[4258].

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Virtual Machine Settings

Setting	Description
Virtual Machines	<p>Select the VMs that you want to monitor, including the ones that do not run. PRTG creates one sensor for each VM that you select.</p> <ul style="list-style-type: none"> i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. i Make sure that the names of your VMs do not contain unsupported characters, especially avoid the number sign (#). We recommend that you not rename VMs once you have set up monitoring. For detailed information, see the Knowledge Base: Why don't my Hyper-V sensors work after changing names?

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ wmihypersensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Virtual Machine Settings

Virtual Machine Settings

GUID ⓘ

Name ⓘ

Description ⓘ

Powered Off VMs ⓘ Alarm when powered off
 Ignore power state

Result Handling ⓘ Discard result
 Store result

Virtual Machine Settings

Setting	Description
GUID	Shows the globally unique identifier (GUID) of the VM that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Name	Shows the name of the VM that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Description	Shows the description of the VM that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Powered Off VMs	Define how the sensor reacts to VMs that are powered off: <ul style="list-style-type: none"> ▪ Alarm when powered off: Change to the Down status^[197] if the VM is powered off. i If the sensor is in the Down status, it does not record any data in any of its channels. ▪ Ignore powered off state: Do not change to the Down status if the VM is powered off. It reports zero values instead.
Result Handling	Define what PRTG does with the sensor result:

Setting	Description
	<ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **ⓘ** Downtime

Graph Type **ⓘ** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration^[4187] on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
CPU Usage Guest	The CPU usage of the guests in percent
CPU Usage Hypervisor	The CPU usage of the hypervisor in percent
CPU Usage Total	The total CPU usage in percent
	This channel is the primary channel by default.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
IDE: Read Bytes/Sec	The disk read speed of the integrated development environment (IDE) in bytes per second
IDE: Write Bytes/Sec	The disk write speed of the IDE in bytes per second

Sensor Settings Overview

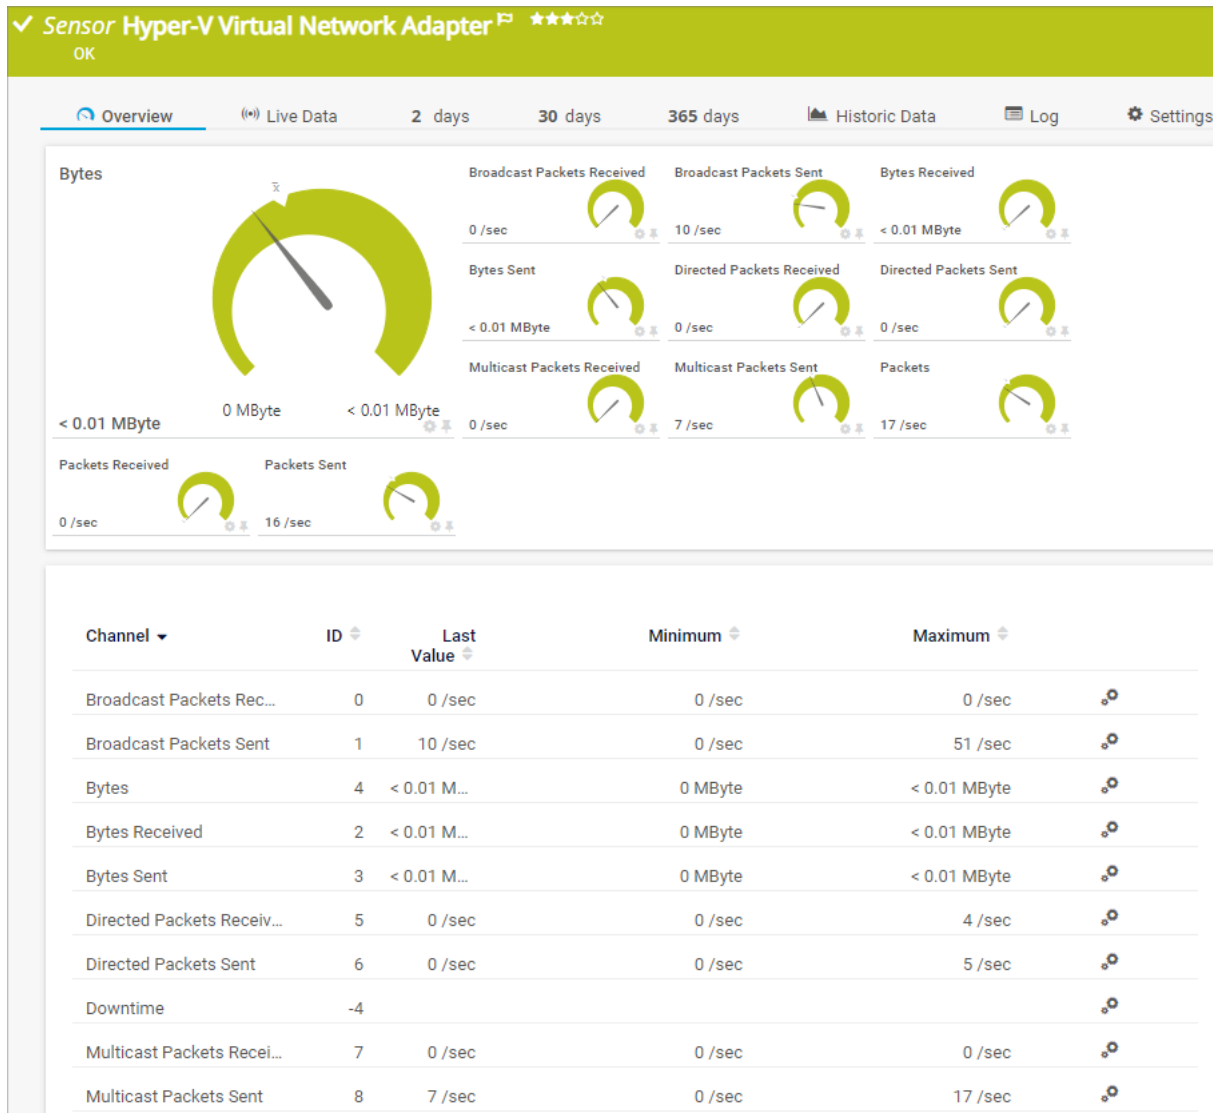

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3957

7.8.74 Hyper-V Virtual Network Adapter Sensor

The Hyper-V Virtual Network Adapter sensor monitors virtual network adapters that run on a Microsoft Hyper-V host server via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#)^[464] of the parent device.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)^[1418].

Hyper-V Virtual Network Adapter Sensor

Sensor in Other Languages

- Dutch: Hyper-V Virtuele Network Adapter
- French: Carte réseau virtuel Hyper-V
- German: Hyper-V Virtueller Netzwerkadapter
- Japanese: Hyper-V 仮想ネットワークアダプター
- Portuguese: Hyper-V Adaptador de rede virtual

- Russian: Hyper-V
- Simplified Chinese: Hyper-V 虚拟网络适配器
- Spanish: Adaptador de red virtual Hyper-V

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- The parent device of this sensor must be a Windows server that runs Hyper-V.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor requires Windows Server 2008 R2 or later on the probe system.
- This sensor requires that the Remote Registry Windows service runs on the target computer.
- This sensor can use a hybrid approach with Windows performance counters and WMI as fallback to query data.
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [Why don't my Hyper-V sensors work after changing names?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p>

Requirement	Description
	To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Hybrid Approach: Performance Counters and WMI

- i** By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#)⁴⁶⁴ on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.
- i** Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)¹³⁰. Above this number, consider using multiple [remote probes](#)⁴⁵⁰³ for load balancing.
- i** For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)⁴²⁸.

Add Sensor

The [Add Sensor](#)³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Virtual Machine Settings

Setting	Description
Virtual Network Adapters	<p>Select the virtual network adapters that you want to monitor. PRTG creates one sensor for each virtual network adapter that you select.</p> <ul style="list-style-type: none"> i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. i We recommend that you do not rename virtual machines (VM) once you have set up monitoring. Renaming VMs also changes the internal virtual network adapter names, so monitoring might be interrupted. For detailed information about VM naming, see the Knowledge Base: Why don't my Hyper-V sensors work after changing names?

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ wmihypervirtualnetworkadapter
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> i You can change the available intervals in the system administration on PRTG on premises installations. </p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p> i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply. </p> <p> i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply. </p> <p> i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply. </p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ¹⁴².

Access Rights

inherit from  Root

User Group Access ¹	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵³.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Broadcast Packets Received	The number of broadcast packets received per second
Broadcast Packets Sent	The number of broadcast packets sent per second

Channel	Description
Bytes	The number of bytes transferred in total i This channel is the primary channel by default.
Bytes Received	The number of received bytes
Bytes Sent	The number of sent bytes
Directed Packets Received	The number of directed packets received per second
Directed Packets Sent	The number of directed packets sent per second
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Multicast Packets Received	The number of multicast packets received per second
Multicast Packets Sent	The number of multicast packets sent per second
Packets	The number of packets transferred in total per second
Packets Received	The number of packets received per second
Packets Sent	The number of packets sent per second

- [Additional Sensor Types \(Custom Sensors\)](#) ³⁹⁷²

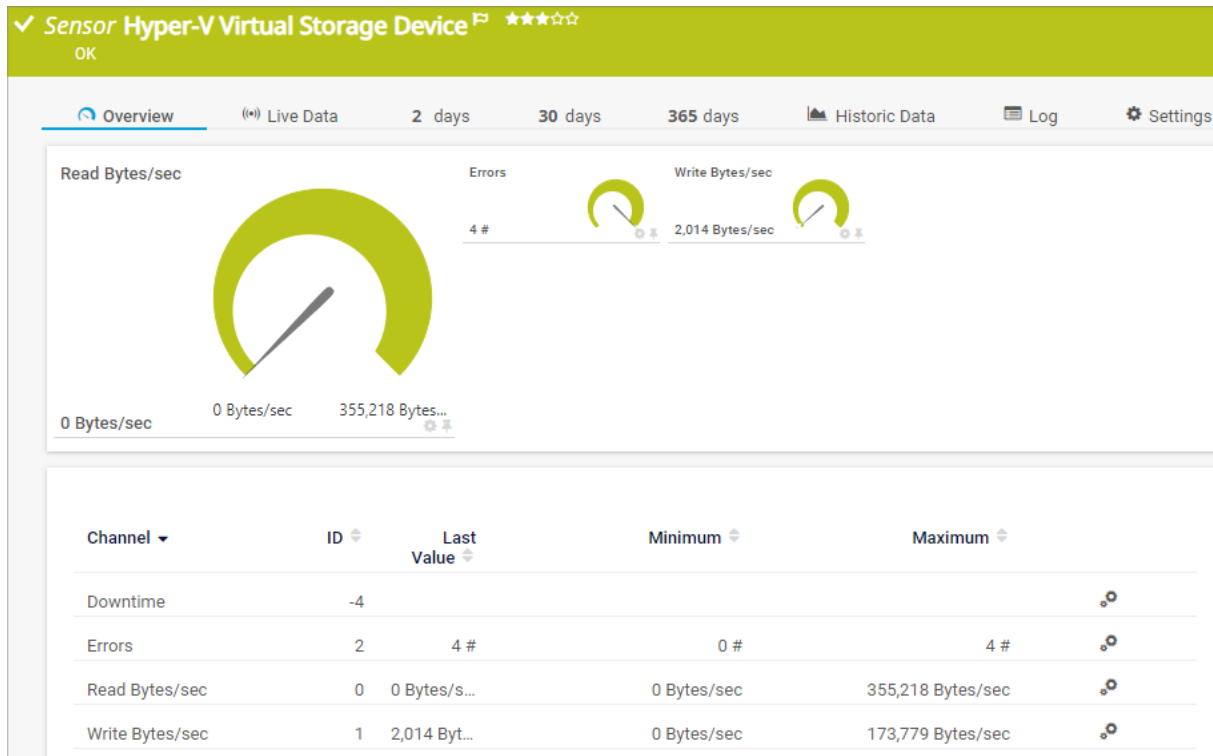

Part 7: Device and Sensor Setup | 8 Sensor Settings
74 Hyper-V Virtual Network Adapter Sensor

- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.75 Hyper-V Virtual Storage Device Sensor

The Hyper-V Virtual Storage Device sensor monitors a virtual storage device that runs on a Microsoft Hyper-V host server via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#)^[464] of the parent device.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)^[1428].

Hyper-V Virtual Storage Device Sensor

Sensor in Other Languages

- Dutch: Hyper-V Virtueel Opslag Apparaat
- French: Equipement de stockage virtuel Hyper-V
- German: Hyper-V Virtuelles Speichergerät
- Japanese: Hyper-V 仮想ストレージデバイス
- Portuguese: Dispositivo de armazenamento virtual Hyper-V
- Russian: Hyper-V
- Simplified Chinese: Hyper-V 虚拟存储设备
- Spanish: Dispositivo de almacenamiento virtual Hyper-V

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- The parent device of this sensor must be a Windows server that runs Hyper-V.

- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor requires Windows Server 2008 R2 or later on the probe system.
- This sensor requires that the Remote Registry Windows service runs on the target computer.
- This sensor can use a hybrid approach with Windows performance counters and WMI as fallback to query data.
- This sensor does not support [Live Migration](#).
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [Why don't my Hyper-V sensors work after changing names?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Hybrid Approach: Performance Counters and WMI

i By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#)^[464] on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

i Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[493] for load balancing.

i For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)^[426].

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Hyper-V Virtual Storage Device Settings

Setting	Description
Virtual Storage Devices	<p>Select the virtual storage devices that you want to monitor. PRTG creates one sensor for each virtual storage device that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Discard result

Store result

Hyper-V Virtual Storage Device Settings

Setting	Description
Virtual Storage Device	Shows the unique identifier of the virtual storage device that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Host Operating System	Shows the host operating system of the virtual storage device that this sensor monitors.
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor. ⓘ You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.
Graph Type	Define how different channels are shown for this sensor: <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel.

Setting	Description
	<ul style="list-style-type: none"> Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁸ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes 30 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

- <https://kb.paessler.com/en/topic/15533>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

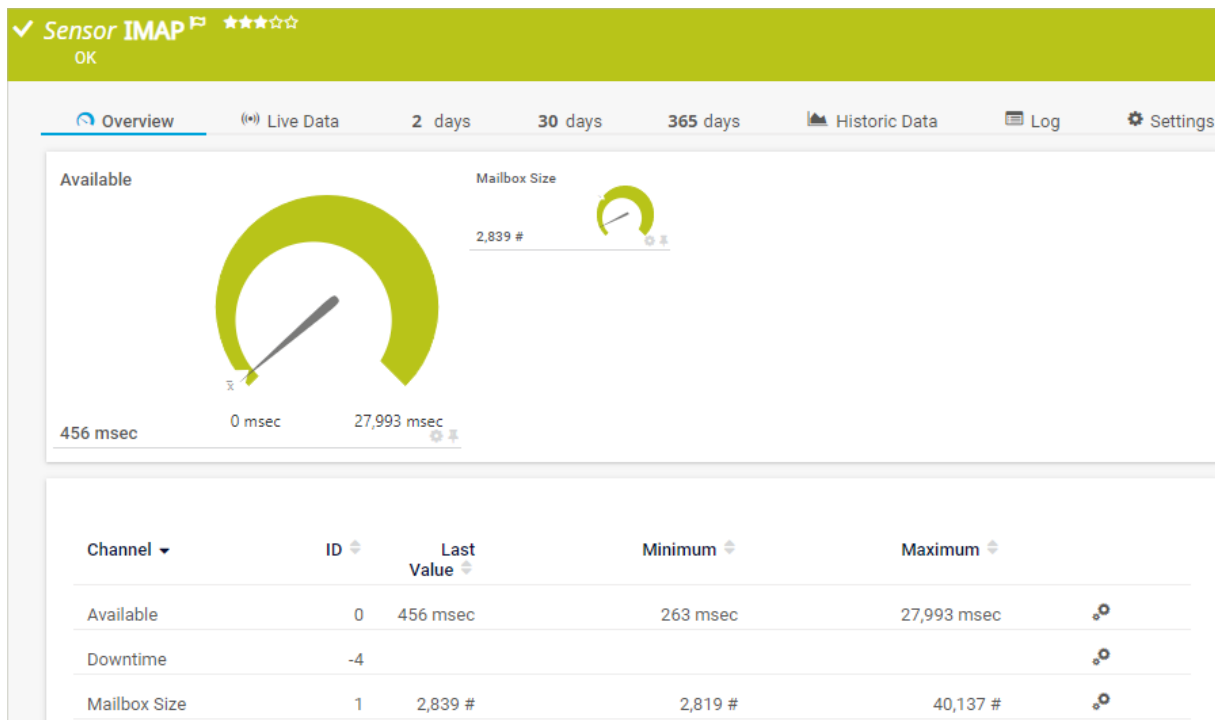

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.76 IMAP Sensor

The IMAP sensor monitors an email server via the Internet Message Access Protocol (IMAP).

The sensor can check the content of emails for certain keywords. This way, you can use the sensor to monitor backup solutions via emails that are sent by these solutions. For more information, see the Knowledge Base: [How can I monitor my backup software to be sure backup succeeded last night?](#)

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

IMAP Sensor

Sensor in Other Languages

- Dutch: IMAP
- French: IMAP
- German: IMAP
- Japanese: IMAP
- Portuguese: IMAP
- Russian: IMAP
- Simplified Chinese: IMAP
- Spanish: IMAP

Remarks

- This sensor does not support Secure Remote Password (SRP) ciphers.

- If you use content checks, we recommend that you use a dedicated IMAP account that is only checked by PRTG. Editing mails in the mailbox of the monitored IMAP account can lead to false alarms or malfunctions of this sensor.
- This sensor might not work properly when monitoring subfolders of mailboxes. If it has to check subsequent emails with identical subjects, emails coming in later might not be recognized.
- Emails that arrive during the Daylight Saving Time (winter time to summer time) change might not be processed properly. If you experience this issue, delete the respective emails.
- This sensor has a medium performance impact.
- See the Knowledge Base: [My IMAP sensor does not process HTML emails correctly using regex. What can I do?](#)
- See the Knowledge Base: [How can I monitor my backup software to be sure backup succeeded last night?](#)
- See the Knowledge Base: [Can I analyze multipart emails using the IMAP sensor?](#)
- See the Knowledge Base: [My IMAP sensor does not find emails when I check for message date. What can I do?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name**: A text input field containing "Example Name".
- Tags**: A list of tags with "exampletag" selected, accompanied by a plus sign to add more.
- Priority**: A star rating system showing three stars selected out of five.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited . ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ imapsensor ▪ mailsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Connectivity

Connectivity

Timeout (Sec.) ⓘ 60

Port ⓘ 143

Transport-Level Security ⓘ

- Use transport-level security if available using StartTLS (default)
- Use transport-level security if available
- Enforce transport-level security using StartTLS
- Enforce transport-level security

Connectivity

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
Port	<p>Specify the port that the sensor uses for the IMAP connection. The default port for unsecure connections is 143 and the default port for secure connections is 993. The actual setting depends on the server you connect to. Enter an integer value.</p> <p>i We recommend that you use the default value.</p> <p>i If the connection is unsuccessful, try a different port number.</p>
Transport-Level Security	<p>Define how the sensor handles the security of the connection:</p> <ul style="list-style-type: none"> ▪ Use transport-level security if available using StartTLS (default): Try to connect to the server via a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection and StartTLS. If the server does not support this, the sensor tries to connect without connection security. ▪ Use transport-level security if available: Try to connect to the server via an SSL/TLS-secured connection. If the server does not support this, the sensor tries to connect without connection security. ▪ Enforce transport-level security using StartTLS: Try to connect to the server via an SSL/TLS-secured connection and StartTLS. If the server does not support this, the sensor shows the Down status¹⁹⁷. ▪ Enforce transport-level security: Try to connect to the server via an SSL/TLS-secured connection. If the server does not support this, the sensor shows the Down status. <p>i If the sensor connects to a server via StartTLS, the connection is first established without connection security. After the connection has been established, the sensor sends a certain command (StartTLS) over the unsecured connection to negotiate a secure connection via SSL/TLS.</p> <p>i If the sensor does not use StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If no secure connection is possible, no communication takes place.</p>

Search String	<p>This setting is only visible if you select If subject contains, If subject does not contain, If email body contains, or If email body does not contain above. Define the string that you want to search the email subject or body for. You can enter a simple string in plain text or a regex.</p> <p>i The search string must be case sensitive.</p>
Error Message	<p>This setting is only visible if you select Always, If subject contains, If subject does not contain, If email body contains, or If email body does not contain above. Define the message that the sensor shows for the Down status.</p>
Based on Message Age, Set Sensor to "Warning" Status	<p>Define if you want to check the age of the latest matching email in the mailbox:</p> <ul style="list-style-type: none"> ▪ Never (default): Do not check the age of the email. ▪ If email is older than: Set the sensor to the Warning status if the found email is older than you define below.

Setting	Description
Message Age (Hours)	<p>This setting is only visible if you select the message age check above. Enter the maximum age in hours. If the processed email is older, the sensor shows the Warning status. Enter an integer value.</p> <p>i Ensure you do not manually edit emails in this mailbox with a different email client because this can result in malfunctions of the message age check.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Available	<p>The response time in milliseconds (msec)</p> <p> This channel is the primary channel by default.</p>
Downtime	<p>In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.</p>

Channel	Description
Mailbox Size	The number of emails in the defined mailbox

Sensor Settings Overview

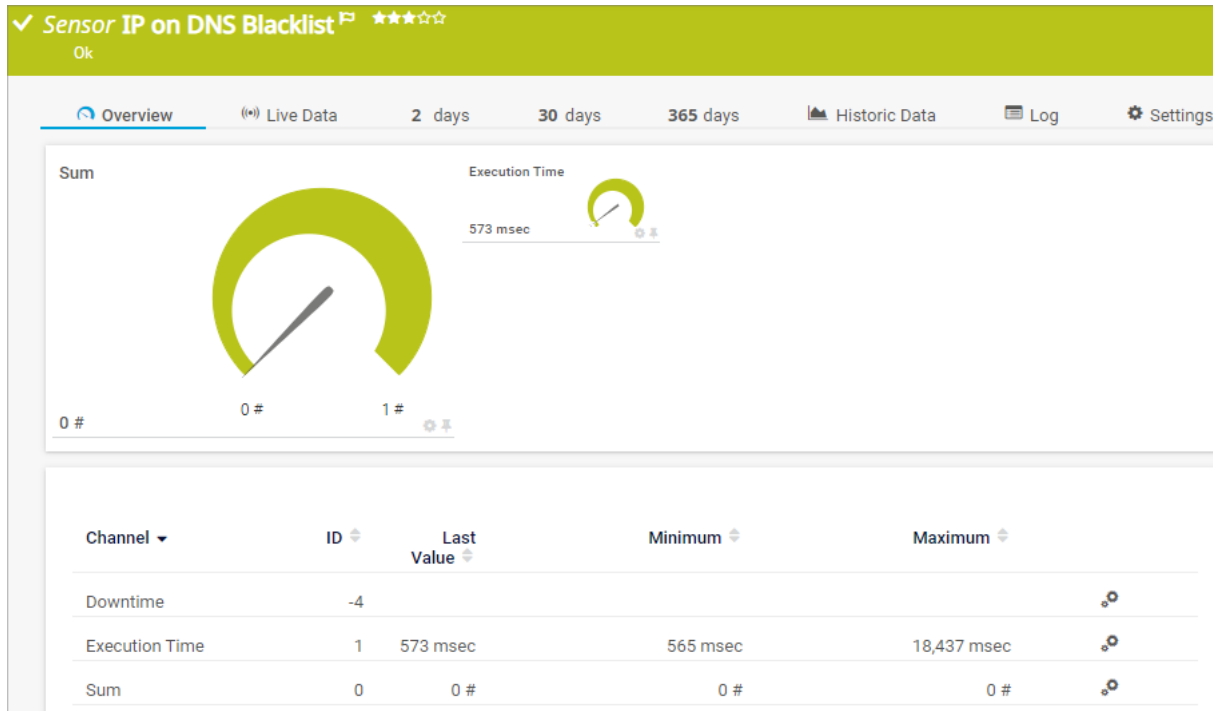

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3957

7.8.77 IP on DNS Blacklist Sensor

The IP on DNS Blacklist sensor checks if the IP address of its parent device is listed on specific blacklist servers.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

IP on DNS Blacklist Sensor

Sensor in Other Languages

- Dutch: IP op DNS Blacklist
- French: IP sur liste noire du DNS
- German: IP auf Schwarzer Liste des DNS
- Japanese: DNS ブラックリスト記載の IP
- Portuguese: IP em Blacklist DNS
- Russian: IP- DNS
- Simplified Chinese: DNS 黑名单 IP
- Spanish: Blacklist IP sobre DNS

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires .NET 4.7.2 or later on the probe system. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.

- This sensor supports the IPv6 protocol.
- If a Domain Name System (DNS) name is used as the host name of the parent device, PRTG resolves it to an IP address before querying blacklist servers.
- During normal operation, there should be 0 hits and the sensor should show the Up [status](#)¹⁹⁷. If the sensor can find the IP address on at least one of the blacklist servers, it shows the Warning status by default. You can set additional thresholds in the [channel settings](#)³⁹⁷⁷.
- See the Knowledge Base: [Is there a list of anti spam black list servers?](#)

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#)³⁶⁷ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Sensor Name ⓘ Example Name

Tags ⓘ X +

Priority ⓘ ★★☆☆☆

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ ptfsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

Sensor Settings

Sensor Settings

Blacklist Servers ⓘ
bl.spamcop.net

Sensor Settings

Setting	Description
Blacklist Servers	<p>Define the blacklist servers that the sensor uses for the check. You can enter a comma-separated list. The default is bl.spamcop.net.</p>

Setting	Description
	<ul style="list-style-type: none"> ■ For a list of servers, see the Knowledge Base: Is there a list of anti spam black list servers? ⓘ With each scanning interval, PRTG queries all servers in the list. We recommend that you do not enter more than 10 servers to make sure that the check can be completed within the scanning interval of this sensor. If you use too many blacklist servers, the sensor shows the error message Timeout (code: PE018).

Graph Type ⓘ
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

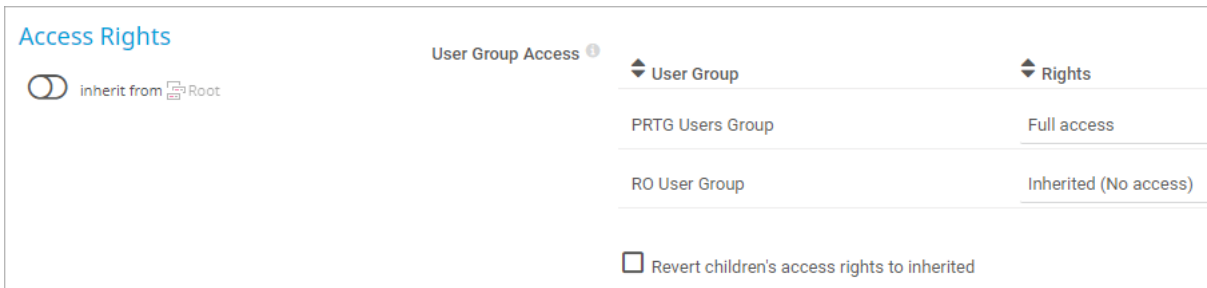

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Execution Time	The execution time in milliseconds (msec)
Sum	The number of blacklist hits found i This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

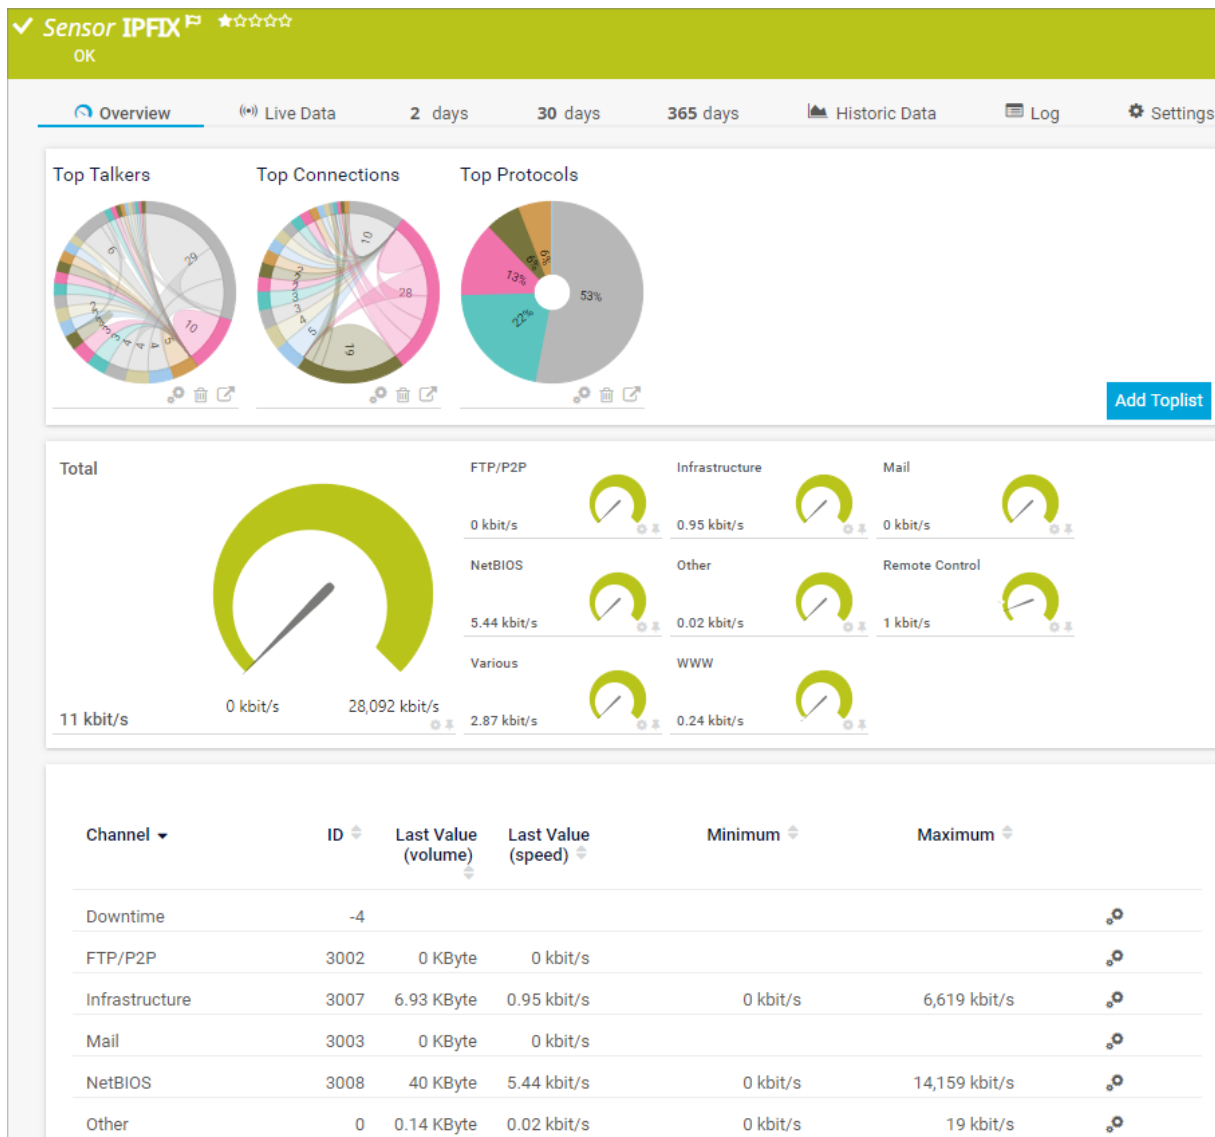

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.78 IPFIX Sensor

The IPFIX sensor receives traffic data from an Internet Protocol Flow Information Export (IPFIX) compatible device and shows traffic by type. This sensor has several filter options to divide traffic into different channels.

i Make sure that the target device supports IPFIX if you want to use this sensor.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

IPFIX Sensor

Sensor in Other Languages

- Dutch: IPFIX
- French: IPFIX
- German: IPFIX

- Japanese: IPFIX
- Portuguese: IPFIX
- Russian: IPFIX
- Simplified Chinese: IPFIX
- Spanish: IPFIX

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- You must enable IPFIX export on the device for this sensor to work. The device must send the flow data stream to the IP address of the probe system.
- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.
- You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
- For a general introduction to the technology behind xFlow monitoring, see section [Monitoring Bandwidth via xFlows](#) ⁴³⁰⁵.
- See the Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)

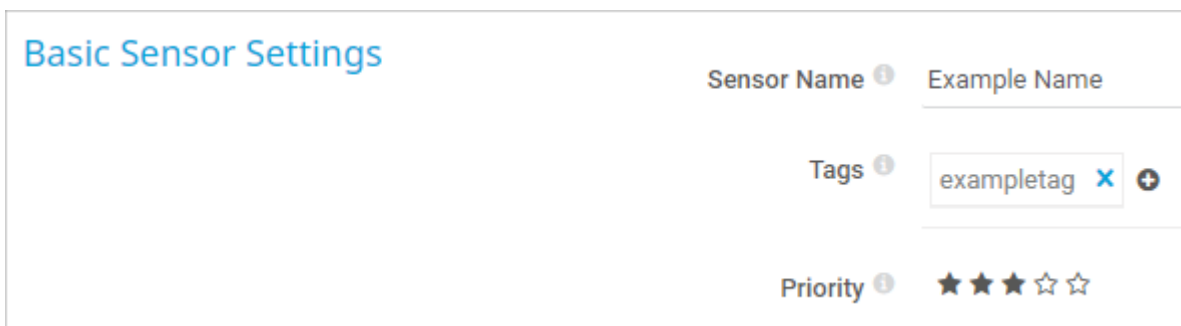

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[406], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ bandwidthsensor ▪ netflowsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

IPFIX Specific Settings

IPFIX Specific Settings

Receive IPFIX Packets on UDP Port

Sender IP Address

Receive IPFIX Packets on IP Address ▼ Probe's Local IP Addresses

192.0.2.0

Active Flow Timeout (Minutes)

Sampling Mode Off
 On

Stream Data Handling Discard stream data (recommended)
 Store stream data only for the 'Other' channel
 Store all stream data

IPFIX Specific Settings

Setting	Description
Receive IPFIX Packets on UDP Port	Enter the UDP port number on which PRTG receives the flow packets. It must match the UDP port number in the IPFIX export options of the hardware router device. Enter an integer value.
Sender IP Address	Enter the IP address of the sending device that you want to receive the IPFIX data from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the UDP port.
Receive IPFIX Packets on IP Address	<p>Select the IP address(es) on which PRTG listens to IPFIX packets. The list of IP addresses is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address that you select must match the IP address in the IPFIX export options of the hardware router device.</p> <p>i You can also select all items or cancel the selection by using the check box in the table header.</p>
Active Flow Timeout (Minutes)	Enter a time span in minutes after which the sensor must receive new flow data. If the timeout elapses and the sensor receives no new data during this time, it shows the Unknown status ¹⁹⁷ . Enter an integer value. The maximum timeout is 60 minutes.

Setting	Description
Sampling Mode	<p> We recommend that you set the timeout one minute longer than the timeout in the hardware router device.</p> <p> If you set this value too low, flow information might be lost.</p> <p> For more details, see the Knowledge Base: What is the Active Flow Timeout in Flow sensors?</p>
Sampling Rate	<p>Define if you want to use the sampling mode:</p> <ul style="list-style-type: none"> ▪ Off: Use the standard flow. ▪ On: Use the sampling mode and specify the Sampling Rate below. <p> This setting must match the setting in the xFlow exporter.</p> <p>This setting is only visible if you select On above. Enter a number that matches the sampling rate in the exporting device. If the number is different, monitoring results will be incorrect. Enter an integer value.</p>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> ▪ Discard stream data (recommended): Do not store the stream and packet data. ▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the PRTG data directory on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. ▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p> Use with caution. If you enable this setting, it can create huge data files. We recommend that you only use this setting for a short time.</p>

Note You can change the default settings for the selected channels. This way, you do not have to customize this setting each time that you add this sensor type to PRTG. For details, see [this article](#) in the Knowledge Base.

Channel Configuration

Setting	Description
Channel Selection	<p>Define the categories that the sensor accounts the traffic to:</p> <ul style="list-style-type: none"> ▪ Web: Internet web traffic. ▪ File Transfer: Traffic from FTP. ▪ Mail: Internet mail traffic. ▪ Chat: Traffic from chat and instant messaging. ▪ Remote Control: Traffic from remote control applications such as RDP, SSH, Telnet, and VNC. ▪ Infrastructure: Traffic from network services such as DHCP, DNS, Ident, ICMP, and SNMP. ▪ NetBIOS: Traffic from NetBIOS communication. ▪ Citrix: Traffic from Citrix applications. ▪ Other Protocols: Traffic from various other protocols via UDP and TCP. <p>For each group, you can select how many channels the sensor uses, that is, how detailed the sensor divides the traffic. For each group, choose from:</p> <ul style="list-style-type: none"> ▪ No (✘): Do not account traffic of this group in its own channel. The sensor accounts all traffic of this group to the default channel named Other. ▪ Yes (✔): Count all traffic of this group and summarize it in one channel.

Setting	Description
	<ul style="list-style-type: none"> ▪ Detail (🔍): Count all traffic of this group and further divide it into different channels. The traffic appears in several channels that you can see in the Content column. <ul style="list-style-type: none"> ⓘ Extensive use of this option can cause load problems on the probe system. We recommend that you set specific, well-chosen filters for the data that you really want to analyze. ■ You can change the default configuration for groups and channels. For details, see the Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?

Filtering

■ For detailed information, see section [Filter Rules](#) ¹⁴⁷¹.

Filtering

Filters To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

Fields:

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

Additional IPFIX fields:

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax.
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

Sensor Display

Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Toplists

For all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

 For more information, see section [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#) .

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name
Port	Any number
SourceIP	IP address or Domain Name System (DNS) name
SourcePort	Any number
DestinationIP	IP address or Domain Name System (DNS) name
DestinationPort	Any number

Field	Possible Filter Values
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to IPFIX sensors only.

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel. Possible values: IP address or DNS name
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in the form of a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in the form of a single number (number of contiguous bits).
NextHop	IP address or Domain Name System (DNS) name

Field	Possible Filter Values
VLAN	VLAN values represent a VLAN identifier (any number)
SourceVLAN	VLAN values represent a VLAN identifier (any number)
DestinationVLAN	VLAN values represent a VLAN identifier (any number)

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Chat	The traffic from chat and instant messaging (Internet Relay Chat (IRC), AOL Instant Messenger (AIM)) in bytes per second
Citrix	The traffic from Citrix applications in bytes per second
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
FTP/P2P	The traffic from file transfer (File Transfer Protocol (FTP)/Peer-to-Peer (P2P)) in bytes per second
Infrastructure	The traffic from network services (Dynamic Host Configuration Protocol (DHCP), Domain Name System (DNS), Ident, Internet Control Message Protocol (ICMP), Simple Network Management Protocol (SNMP)) in bytes per second
Mail	The internet mail traffic (Internet Message Access Protocol (IMAP), Post Office Protocol version 3 (POP3), Simple Mail Transfer Protocol (SMTP)) in bytes per second
NetBIOS	The traffic from NetBIOS communication in bytes per second
Other	The traffic from various other protocols (User Datagram Protocol (UDP), Transmission Control Protocol (TCP)) in bytes per second
Remote Control	The traffic from remote control applications (Remote Desktop Protocol (RDP), Secure Shell (SSH), Telnet, Virtual Network Computing (VNC)) in bytes per second

Channel	Description
Total	The total traffic in bytes per second  This channel is the primary channel by default.
Various	The traffic from various other sources in bytes per second
WWW	The traffic from the web (HTTP, HTTPS) in bytes per second

Sensor Settings Overview

For more information about sensor settings, see the following sections:

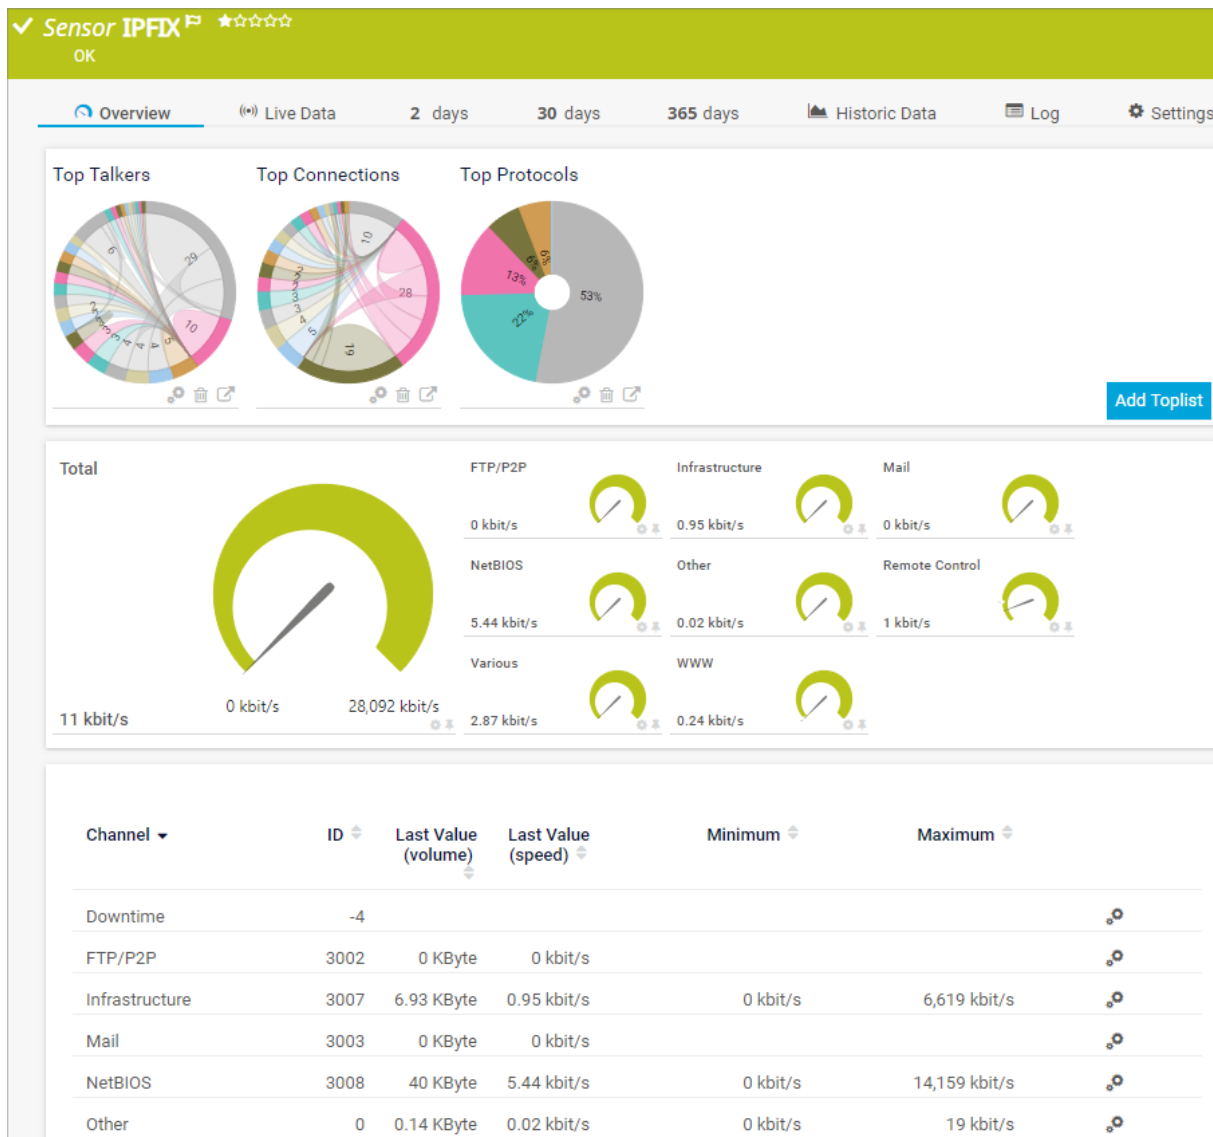

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.79 IPFIX (Custom) Sensor

The IPFIX (Custom) sensor receives traffic data from an Internet Protocol Flow Information Export (IPFIX) compatible device and shows the traffic by type. With this sensor, you can define your own channel definitions to divide traffic into different channels.

i Make sure that the target device supports IPFIX if you want to use this sensor.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

IPFIX (Custom) Sensor

Sensor in Other Languages

- Dutch: IPFIX (aangepast)
- French: IPFIX (Personnalisé)
- German: IPFIX (Benutzerdef.)

- Japanese: IPFIX(カスタム)
- Portuguese: IPFIX (customizado)
- Russian: IPFIX ()
- Simplified Chinese: IPFIX (自定义)
- Spanish: IPFIX (personalizado)

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- You must enable IPFIX export on the device for this sensor to work. The device must send the flow data stream to the IP address of the probe system.
- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.
- You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
- For a general introduction to the technology behind xFlow monitoring, see section [Monitoring Bandwidth via xFlows](#) ⁴³⁰⁵.
- See the Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[406], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ bandwidthsensor ▪ netflowsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

IPFIX Specific Settings

IPFIX Specific Settings

Receive IPFIX Packets on UDP Port

<input checked="" type="checkbox"/>	192.0.2.0

Active Flow Timeout (Minutes)

Sampling Mode Off On

Channel Definition

Stream Data Handling Discard stream data (recommended) Store stream data only for the 'Other' channel Store all stream data

IPFIX Specific Settings

Setting	Description
Receive IPFIX Packets on UDP Port	Enter the UDP port number on which PRTG receives the flow packets. It must match the UDP port number in the IPFIX export options of the hardware router device. Enter an integer value.
Sender IP Address	Enter the IP address of the sending device that you want to receive the IPFIX data from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the UDP port.
Receive IPFIX Packets on IP Address	<p>Select the IP address(es) on which PRTG listens to IPFIX packets. The list of IP addresses is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address that you select must match the IP address in the IPFIX export options of the hardware router device.</p> <p>i You can also select all items or cancel the selection by using the check box in the table header.</p>
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which the sensor must receive new flow data. If the timeout elapses and the sensor receives no new data during this time, it shows the Unknown status¹⁹⁷. Enter an integer value. The maximum timeout is 60 minutes.</p> <p>i We recommend that you set the timeout one minute longer than the timeout in the hardware router device.</p> <p>i If you set this value too low, flow information might be lost.</p>

Setting	Description
	<p>■ For more details, see the Knowledge Base: What is the Active Flow Timeout in Flow sensors?</p>
Sampling Mode	<p>Define if you want to use the sampling mode:</p> <ul style="list-style-type: none"> ▪ Off: Use the standard flow. ▪ On: Use the sampling mode and specify the Sampling Rate below. <p>ⓘ This setting must match the setting in the xFlow exporter.</p>
Sampling Rate	<p>This setting is only visible when sampling mode is On above. Enter a number that matches the sampling rate in your device that exports the xFlows. If the number is different, monitoring results will be incorrect. Enter an integer value.</p>
Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Enter each definition in one line. The sensor accounts all traffic that you do not define a channel for to the default channel Other.</p> <p>■ For detailed information, see section Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors ⁴⁴⁸¹.</p> <p>ⓘ Extensive use of many filters can cause load problems on the probe system. We recommend that you define specific, well-chosen filters for the data that you really want to analyze. We recommend that you do not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, we recommend that you add several sensors with fewer channels each.</p>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> ▪ Discard stream data (recommended): Do not store the stream and packet data. ▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. ▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>ⓘ Use with caution. If you enable this setting, it can create huge data files. We recommend that you only use this setting for a short time.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings¹⁴⁸⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Filtering

 For detailed information, see section [Filter Rules](#)¹⁴⁸⁷.

Filtering

Filters To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

Fields:

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

Additional IPFIX fields:

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax.
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

Primary Toplist

Primary Toplist

Primary Toplist ⓘ Top Connections

Primary Toplist

Setting	Description
Primary Toplist	<p>Define which Toplist is the primary Toplist of the sensor:</p> <ul style="list-style-type: none"> ▪ Top Talkers ▪ Top Connections ▪ Top Protocols ▪ [Any custom Toplists you add] <p> ⓘ PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Toplists

For all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

 For more information, see section [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#) .

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name
Port	Any number
SourceIP	IP address or Domain Name System (DNS) name
SourcePort	Any number
DestinationIP	IP address or Domain Name System (DNS) name
DestinationPort	Any number

Field	Possible Filter Values
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to IPFIX sensors only.

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel. Possible values: IP address or DNS name
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in the form of a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in the form of a single number (number of contiguous bits).
NextHop	IP address or Domain Name System (DNS) name

Field	Possible Filter Values
VLAN	VLAN values represent a VLAN identifier (any number)
SourceVLAN	VLAN values represent a VLAN identifier (any number)
DestinationVLAN	VLAN values represent a VLAN identifier (any number)

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
[Custom]	The traffic by type according to the channel definition
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Other	All traffic for which no channel is defined in bytes per second
Total	The total traffic in bytes per second i This channel is the primary channel by default.

Sensor Settings Overview

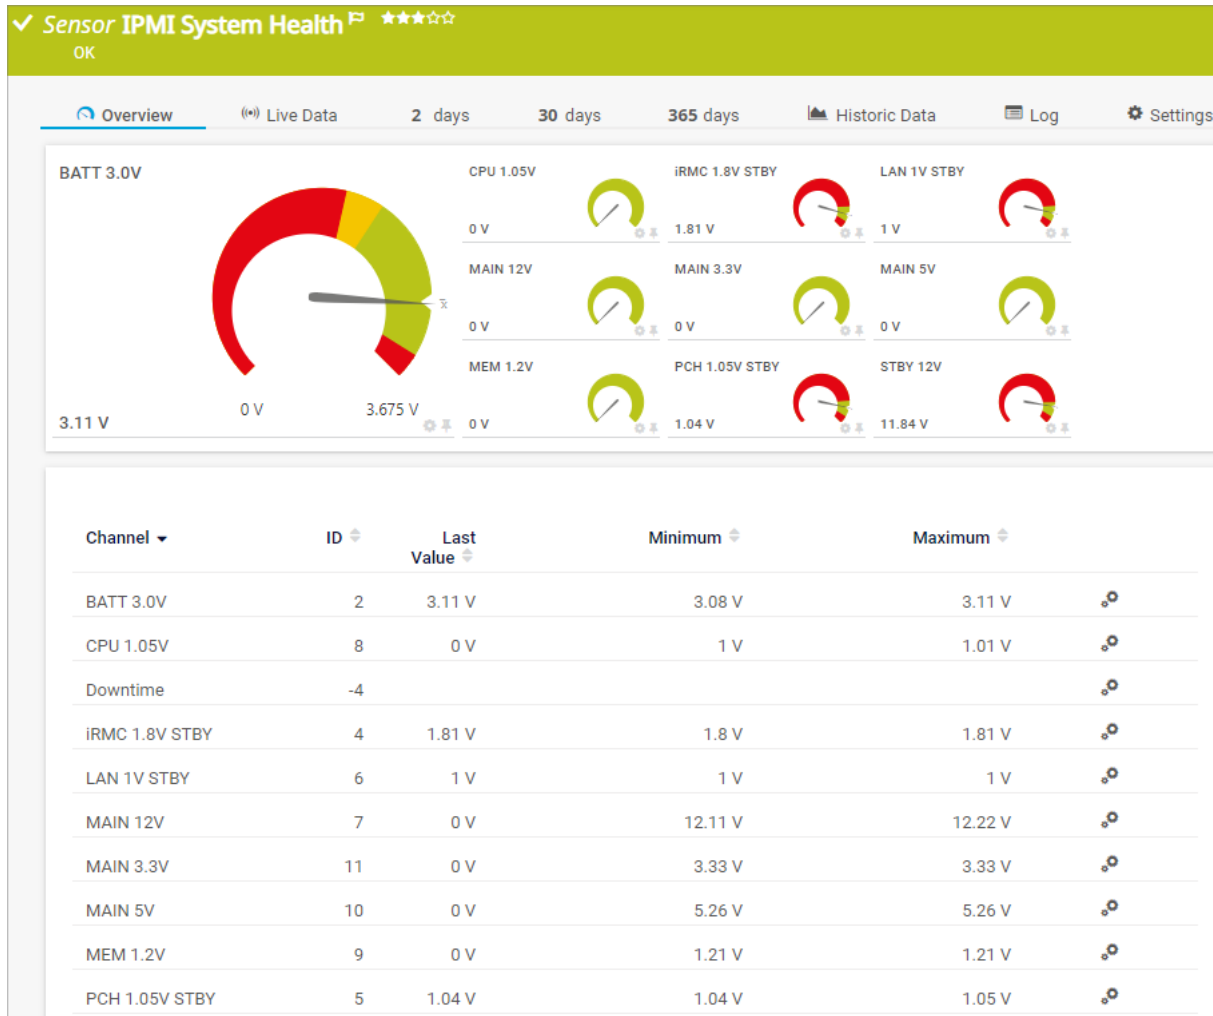

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.80 IPMI System Health Sensor

The IPMI System Health sensor monitors the status of a system via the Intelligent Platform Management Interface (IPMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

IPMI System Health Sensor

Sensor in Other Languages

- Dutch: IPMI System Health
- French: État du système IPMI
- German: IPMI Systemzustand
- Japanese: IPMI システム正常性
- Portuguese: Funcionamento do sistema via IPMI
- Russian: IPMI
- Simplified Chinese: IPMI 健康状况

- Spanish: Estado del sistema IPMI

Remarks

- You have to explicitly specify the credentials of the IPMI in the sensor settings.
- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).
- This sensor has predefined limits for several metrics. You can individually change these limits in the channel settings. For detailed information about channel limits, see section [Channel Settings](#).

 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Before you can add this sensor, PRTG asks you to provide your credentials for the IPMI.

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration^[4187] on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

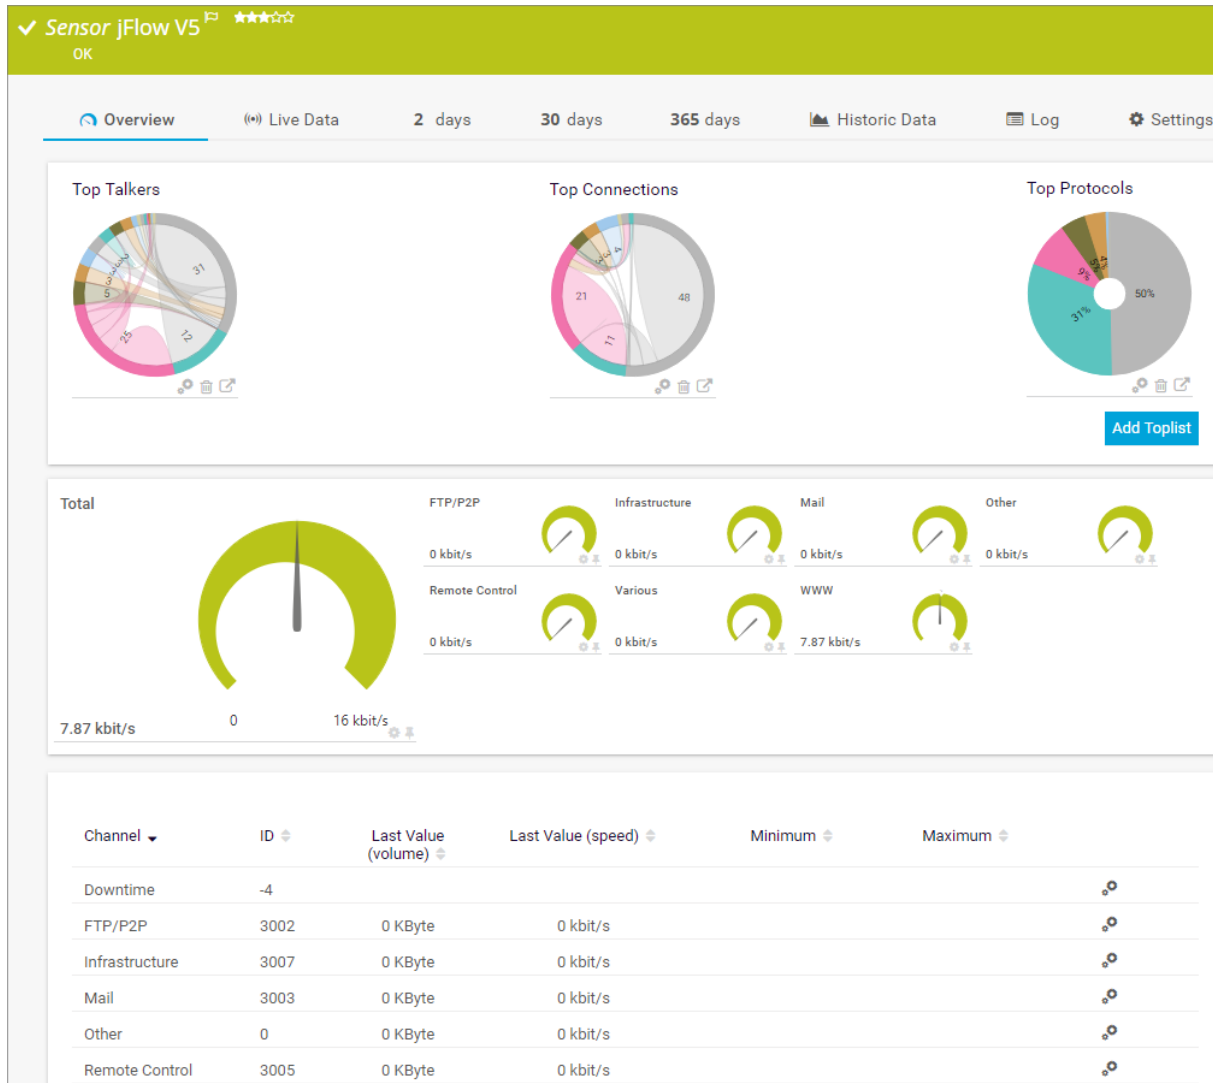

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.81 jFlow v5 Sensor

The jFlow v5 sensor receives traffic data from a jFlow v5-compatible device and shows the traffic by type. This sensor has several filter options to divide traffic into different channels.

i Make sure that the sensor matches the jFlow version that your device exports.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

jFlow v5 Sensor

Sensor in Other Languages

- Dutch: jFlow v5
- French: jFlow v5
- German: jFlow v5
- Japanese: jFlow v5
- Portuguese: jFlow v5

- Russian: jFlow v5
- Simplified Chinese: jFlow v5
- Spanish: jFlow v5

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- You must enable jFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the probe system.
- For cloning this sensor, the following rules apply. If you add the clone to the **same** probe, PRTG keeps the selected IP addresses on which it listens for xFlow (NetFlow, jFlow, sFlow, IPFIX) packets. If you add the clone to a **different** probe, PRTG selects **all** available IP addresses by default. You can change the selected IP addresses in the sensor settings.
- You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
- See the Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)
- See the Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains the following fields:

- Sensor Name**: Example Name
- Tags**: exampletag (with a plus icon to add more tags)
- Priority**: Four stars (★★★★)

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[406], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ bandwidthsensor ▪ jflowsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

jFlow v5 Specific Settings

Setting	Description
Receive jFlow Packets on UDP Port	Enter the UDP port number on which PRTG receives the flow packets. It must match the UDP port number that in the jFlow export options of the hardware router device. Enter an integer value. i When you configure the export, make sure that you select the appropriate jFlow version for this sensor.
Sender IP Address	Enter the IP address of the sending device that you want to receive the jFlow data from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the UDP port.
Receive jFlow Packets on IP Address	Select the IP address(es) on which PRTG listens to jFlow packets. The list of IP addresses is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address that you select must match the IP address in the jFlow export options of the hardware router device. i When you configure the export, make sure that you select the appropriate jFlow version for this sensor. i You can also select all items or cancel the selection by using the check box in the table header.

Setting	Description
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which the sensor must receive new flow data. If the timeout elapses and the sensor receives no new data during this time, it shows the Unknown status^[197]. Enter an integer value. The maximum timeout is 60 minutes.</p> <ul style="list-style-type: none">  We recommend that you set the timeout one minute longer than the timeout in the hardware router device.  If you set this value too low, flow information might be lost.  For more details, see the Knowledge Base: What is the Active Flow Timeout in Flow sensors?
Sampling Mode	<p>Define if you want to use the sampling mode:</p> <ul style="list-style-type: none"> ▪ Off: Use the standard flow. ▪ On: Use the sampling mode and specify the Sampling Rate below. <p> This setting must match the setting in the xFlow exporter.</p>
Sampling Rate	<p>This setting is only visible if you select On above. Enter a number that matches the sampling rate in the exporting device. If the number is different, monitoring results will be incorrect. Enter an integer value.</p>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> ▪ Discard stream data (recommended): Do not store the stream and packet data. ▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the PRTG data directory^[4526] on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. ▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p> Use with caution. If you enable this setting, it can create huge data files. We recommend that you only use this setting for a short time.</p>

Note You can change the default settings for the selected channels. This way, you do not have to customize this setting each time that you add this sensor type to PRTG. For details, see [this article](#) in the Knowledge Base.

Channel Configuration

Setting	Description
Channel Selection	<p>Define the categories that the sensor accounts the traffic to:</p> <ul style="list-style-type: none"> ▪ Web: Internet web traffic. ▪ File Transfer: Traffic from FTP. ▪ Mail: Internet mail traffic. ▪ Chat: Traffic from chat and instant messaging. ▪ Remote Control: Traffic from remote control applications such as RDP, SSH, Telnet, and VNC. ▪ Infrastructure: Traffic from network services such as DHCP, DNS, Ident, ICMP, and SNMP. ▪ NetBIOS: Traffic from NetBIOS communication. ▪ Citrix: Traffic from Citrix applications. ▪ Other Protocols: Traffic from various other protocols via UDP and TCP. <p>For each group, you can select how many channels the sensor uses, that is, how detailed the sensor divides the traffic. For each group, choose from:</p> <ul style="list-style-type: none"> ▪ No (✕): Do not account traffic of this group in its own channel. The sensor accounts all traffic of this group to the default channel named Other. ▪ Yes (✓): Count all traffic of this group and summarize it in one channel.

Setting	Description
	<ul style="list-style-type: none"> ▪ Detail (🔍): Count all traffic of this group and further divide it into different channels. The traffic appears in several channels that you can see in the Content column. <ul style="list-style-type: none"> ⓘ Extensive use of this option can cause load problems on the probe system. We recommend that you set specific, well-chosen filters for the data that you really want to analyze. ■ You can change the default configuration for groups and channels. For details, see the Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?

Filtering

■ For detailed information, see section [Filter Rules](#) ¹⁵¹⁷.

Filtering

Filters *To include and exclude specific traffic, you can define filter rules based on the following format guidelines:*

- field[filter]

Fields:

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

Additional IPFIX fields:

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax.
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Toplists

For all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

 For more information, see section [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#) .

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name
Port	Any number
SourceIP	IP address or Domain Name System (DNS) name
SourcePort	Any number
DestinationIP	IP address or Domain Name System (DNS) name
DestinationPort	Any number

Field	Possible Filter Values
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to jFlow v5 sensors only.

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel. Possible values: IP address or DNS name
SourceASI	Any number
DestinationASI	Any number

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Chat	The traffic from chat and instant messaging (Internet Relay Chat (IRC), AOL Instant Messenger (AIM)) in bytes per second
Citrix	The traffic from Citrix applications in bytes per second

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
FTP/P2P	The traffic from file transfer (File Transfer Protocol (FTP)/Peer-to-Peer (P2P)) in bytes per second
Infrastructure	The traffic from network services (Dynamic Host Configuration Protocol (DHCP), Domain Name System (DNS), Ident, Internet Control Message Protocol (ICMP), Simple Network Management Protocol (SNMP)) in bytes per second
Mail	The internet mail traffic (Internet Message Access Protocol (IMAP), Post Office Protocol version 3 (POP3), Simple Mail Transfer Protocol (SMTP)) in bytes per second
NetBIOS	The traffic from NetBIOS communication in bytes per second
Other	The traffic from various other protocols (User Datagram Protocol (UDP), Transmission Control Protocol (TCP)) in bytes per second
Remote Control	The traffic from remote control applications (Remote Desktop Protocol (RDP), Secure Shell (SSH), Telnet, Virtual Network Computing (VNC)) in bytes per second
Total	The total traffic in bytes per second  This channel is the primary channel by default.
Various	The traffic from various other sources in bytes per second
WWW	The traffic from the web (HTTP, HTTPS) in bytes per second

Sensor Settings Overview

For more information about sensor settings, see the following sections:

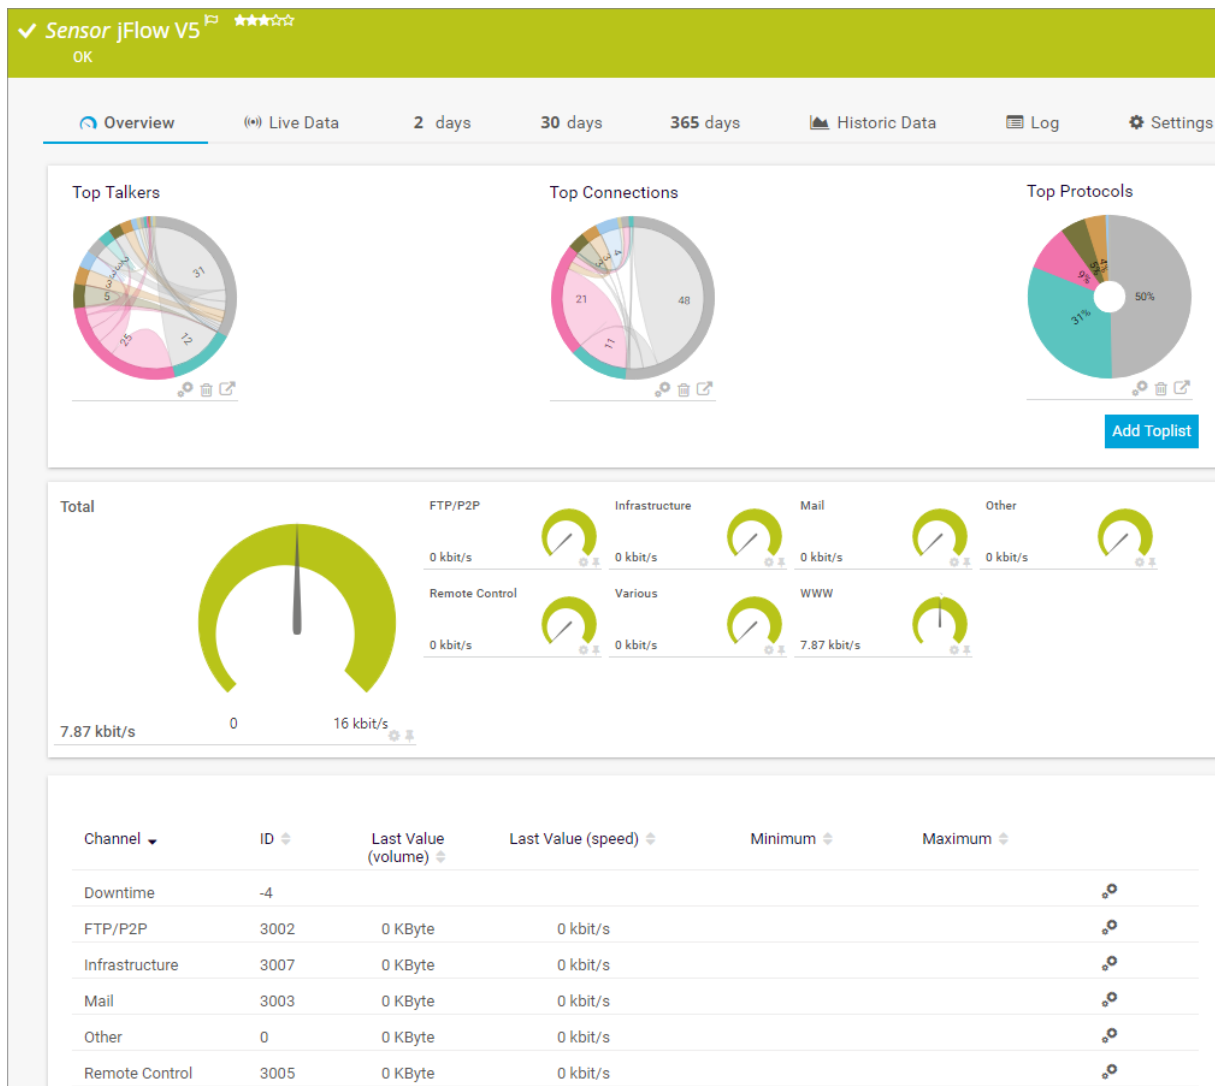

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.82 jFlow v5 (Custom) Sensor

The jFlow v5 (Custom) sensor receives traffic data from a jFlow v5-compatible device and shows the traffic by type. With this sensor, you can define your own channel definitions to divide traffic into different channels.

i Make sure that the sensor matches the jFlow version that your device exports.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

jFlow v5 (Custom) Sensor

Sensor in Other Languages

- Dutch: jFlow v5 (Klant specifiek)
- French: jFlow v5 (personnalisé)
- German: jFlow v5 (Benutzerdefiniert)
- Japanese: jFlow v5(カスタム)

- Portuguese: jFlow v5 (personalizado)
- Russian: jFlow v5 ()
- Simplified Chinese: jFlow v5 (自定义)
- Spanish: jFlow v5 (personalizado)

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- You must enable jFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the probe system.
- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.
- You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
- See the Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It includes the following fields and controls:

- Sensor Name:** A text input field with the value 'Example Name' and an information icon.
- Tags:** A text input field with the value 'exampletag', an 'X' icon to remove the tag, and a plus icon to add more tags.
- Priority:** A star rating system with five stars, where the first three are filled and the last two are empty.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[406], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ bandwidthsensor ▪ jflowsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Channel Definition

Stream Data Handling
 Discard stream data (recommended)
 Store stream data only for the 'Other' channel
 Store all stream data

jFlow v5 Specific Settings

Setting	Description
Receive jFlow Packets on UDP Port	<p>Enter the UDP port number on which PRTG receives the flow packets. It must match the UDP port number that in the jFlow export options of the hardware router device. Enter an integer value.</p> <p>❗ When you configure the export, make sure that you select the appropriate jFlow version for this sensor.</p>
Sender IP Address	<p>Enter the IP address of the sending device that you want to receive the jFlow data from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the UDP port.</p>
Receive jFlow Packets on IP Address	<p>Select the IP address(es) on which PRTG listens to jFlow packets. The list of IP addresses is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address that you select must match the IP address in the jFlow export options of the hardware router device.</p> <p>❗ When you configure the export, make sure that you select the appropriate jFlow version for this sensor.</p>

Setting	Description
	<p> You can also select all items or cancel the selection by using the check box in the table header.</p>
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which the sensor must receive new flow data. If the timeout elapses and the sensor receives no new data during this time, it shows the Unknown status^[197]. Enter an integer value. The maximum timeout is 60 minutes.</p> <p> We recommend that you set the timeout one minute longer than the timeout in the hardware router device.</p> <p> If you set this value too low, flow information might be lost.</p> <p> For more details, see the Knowledge Base: What is the Active Flow Timeout in Flow sensors?</p>
Sampling Mode	<p>Define if you want to use the sampling mode:</p> <ul style="list-style-type: none"> ▪ Off: Use the standard flow. ▪ On: Use the sampling mode and specify the Sampling Rate below. <p> This setting must match the setting in the xFlow exporter.</p>
Sampling Rate	<p>This setting is only visible when sampling mode is On above. Enter a number that matches the sampling rate in your device that exports the xFlows. If the number is different, monitoring results will be incorrect. Enter an integer value.</p>
Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Enter each definition in one line. The sensor accounts all traffic that you do not define a channel for to the default channel Other.</p> <p> For detailed information, see section Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors^[4481].</p> <p> Extensive use of many filters can cause load problems on the probe system. We recommend that you define specific, well-chosen filters for the data that you really want to analyze. We recommend that you do not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, we recommend that you add several sensors with fewer channels each.</p>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> ▪ Discard stream data (recommended): Do not store the stream and packet data.

Setting	Description
	<ul style="list-style-type: none"> Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>i Use with caution. If you enable this setting, it can create huge data files. We recommend that you only use this setting for a short time.</p>

Filtering

For detailed information, see section [Filter Rules](#) ¹⁵³³.

Filtering

Filters *To include and exclude specific traffic, you can define filter rules based on the following format guidelines:*

- field[filter]

Fields:

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

Additional IPFIX fields:

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⁱ

Exclude Filter ⁱ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax.
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

Sensor Display

Sensor Display

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ⓘ).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Primary Toplist

Primary Toplist

Primary Toplist ⓘ Top Connections

Primary Toplist

Setting	Description
Primary Toplist	<p>Define which Toplist is the primary Toplist of the sensor:</p> <ul style="list-style-type: none"> ▪ Top Talkers ▪ Top Connections

Setting	Description
	<ul style="list-style-type: none"> ▪ Top Protocols ▪ [Any custom Toplists you add] <p> PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ^[368] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ^[142].

Scanning Interval

Click  to interrupt the [inheritance](#) ^[142].

Scanning Interval

 inherit from  Root

Scanning Interval  60 seconds

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Field	Possible Filter Values
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to jFlow v5 sensors only.

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel. Possible values: IP address or DNS name
SourceASI	Any number
DestinationASI	Any number

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
[Custom]	The traffic by type according to the channel definition

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Other	All traffic for which no channel is defined in bytes per second
Total	The total traffic in bytes per second  This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

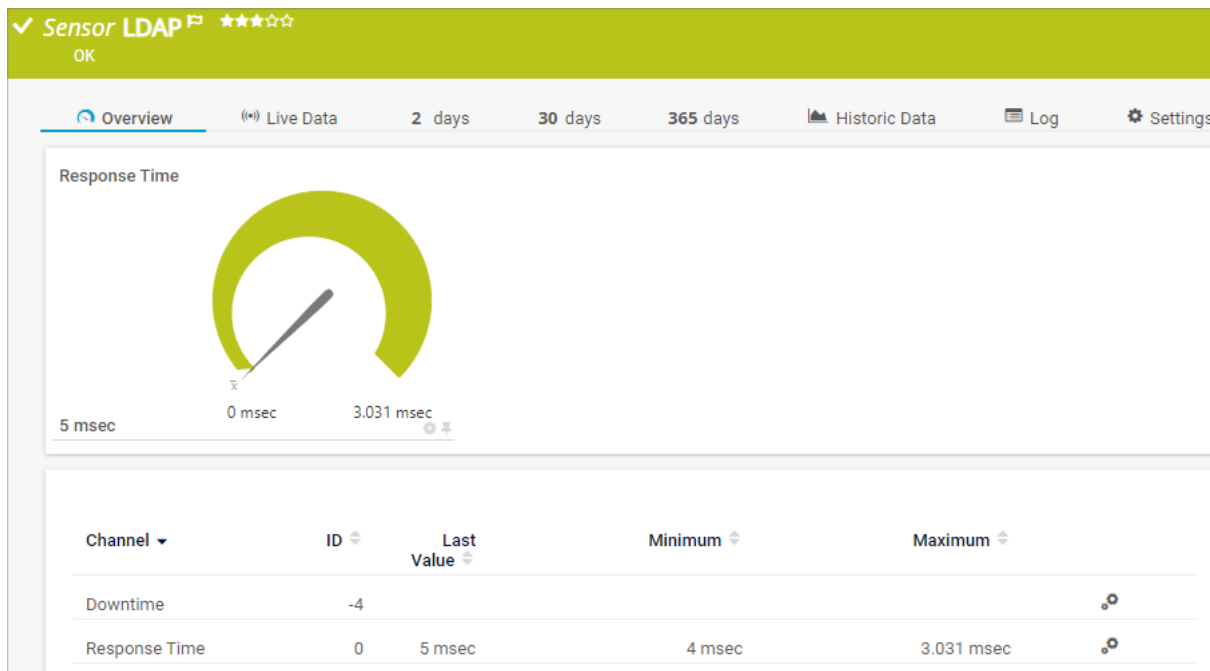

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3967

7.8.83 LDAP Sensor

The LDAP sensor monitors directory services via the Lightweight Directory Access Protocol (LDAP). It connects to the server by trying a "bind".

i If the server does not respond or authentication fails, the sensor shows the Down status.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

LDAP Sensor

Sensor in Other Languages

- Dutch: LDAP
- French: LDAP
- German: LDAP
- Japanese: LDAP
- Portuguese: LDAP
- Russian: LDAP
- Simplified Chinese: LDAP
- Spanish: LDAP

Remarks

- This sensor officially supports Microsoft implementations of LDAP. Other third-party LDAP implementations might work but are not officially supported.
- This sensor requires a DNS name in the [settings of the parent device](#) if you use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection to the LDAP server.

- This sensor has a medium performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a 'Basic Sensor Settings' dialog box. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A list of tags with 'exampletag' selected. There are 'x' and '+' icons for removing and adding tags.
- Priority:** A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ Idapsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Distinguished Name ⓘ

Password ⓘ

LDAP Specific

Setting	Description
Connection Security	<p>Define if the sensor uses an SSL/TLS-secured connection to the LDAP server:</p> <ul style="list-style-type: none"> ▪ Use LDAP without connection security (default) ▪ Use LDAP over SSL <p>i If you select Use LDAP over SSL, you need to enter a DNS name in the settings of the parent device⁴⁴⁷. The sensor does not work with an IP address.</p>
Port Selection	<p>Define if you want to use a default port or a custom port for the connection to the LDAP server:</p> <ul style="list-style-type: none"> ▪ Use default port (default): Use the default port. This is port 389 for unsecure connections and port 636 for secure connections. ▪ Use custom port: Use a custom port. Specify the Port below.

Setting	Description
Port	This setting is only visible if you select Use custom port. Enter a custom port for the connection to the LDAP server. Enter an integer value.
Distinguished Name	Enter the distinguished name (DN) that you want to authenticate against the LDAP server. Usually, this is the information for the user that you want to authenticate with. For example, use the format <code>cn=Manager,dc=my-domain,dc=com</code> for a DN on an OpenLDAP server.
Password	Enter the password for the Distinguished Name .

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type  Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration^[4187] on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent

How do I obtain credentials and set permissions for the Microsoft 365 sensors?

- <https://kb.paessler.com/en/topic/88462>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

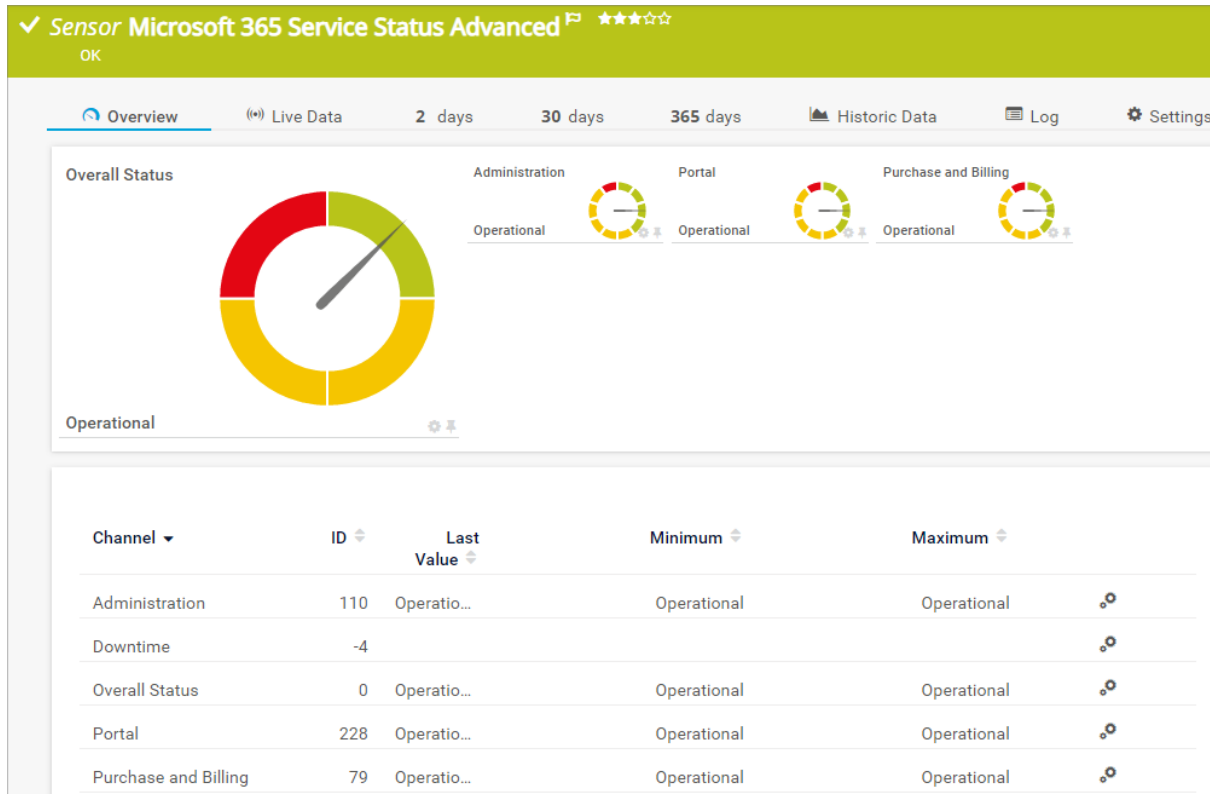

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.85 Microsoft 365 Service Status Advanced Sensor

The Microsoft 365 Service Status Advanced sensor monitors the detailed status of all services of a Microsoft 365 subscription.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Microsoft 365 Service Status Advanced Sensor

Sensor in Other Languages

- Dutch: Microsoft 365 Service Status Advanced
- French: Microsoft 365 Service Status Advanced
- German: Microsoft 365 Service Status Advanced
- Japanese: Microsoft 365 Service Status Advanced
- Portuguese: Microsoft 365 Service Status Advanced
- Russian: Microsoft 365 Service Status Advanced
- Simplified Chinese: Microsoft 365 Service Status Advanced
- Spanish: Microsoft 365 Service Status Advanced

Remarks

- Define [credentials for Microsoft 365](#) in settings that are higher in the [object hierarchy](#), for example, in the settings of the parent device.
- This sensor [requires](#) permissions for the Office 365 Management APIs.

- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).
- See the Knowledge Base: [How do I obtain credentials and set permissions for the Microsoft 365 sensors?](#)

Detailed Requirements

Requirement	Description
Permission for the APIs	<p>This sensor requires sufficient rights to query data from the Office 365 Management APIs:</p> <ul style="list-style-type: none"> ▪ API / Permissions name: Office 365 Management APIs / ServiceHealth.Read <p> For more information, see the Knowledge Base: How do I obtain credentials and set permissions for the Microsoft 365 sensors?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Microsoft 365 Specific

Setting	Description
Service	<p>Select the services that you want to monitor. PRTG creates one sensor for each service that you select.</p> <p> Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Sensor Name ⓘ

Tags ⓘ X +

Priority ⓘ ★ ★ ★ ☆ ☆

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>ⓘ This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ microsoft365 ▪ microsoft365sensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Microsoft 365 Specific

Service ⓘ *Microsoft 365 suite*

Workload ID ⓘ *OSDPPlatform*

Microsoft 365 Specific

Setting	Description
Service	Shows the name of the service that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Workload ID	Shows the Microsoft 365 Workload ID of the service that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
API Request Retry	Enter a number how often the sensor queries the Office 365 Management APIs if an API query returns no result before the sensor shows the Down status. Enter an integer value. The default value is 3 . The maximum value is 10 . If you enter 0 , the sensor does not retry to query the APIs.

Sensor Display

Sensor Display

Primary Channel ⓘ *Downtime*

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor. ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how different channels are shown for this sensor:

Setting	Description
	<ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Debug Options

Debug Options

Result Handling 

Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None ▼

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Part 7: Device and Sensor Setup | 8 Sensor Settings
85 Microsoft 365 Service Status Advanced Sensor

How do I obtain credentials and set permissions for the Microsoft 365 sensors?

- <https://kb.paessler.com/en/topic/88462>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

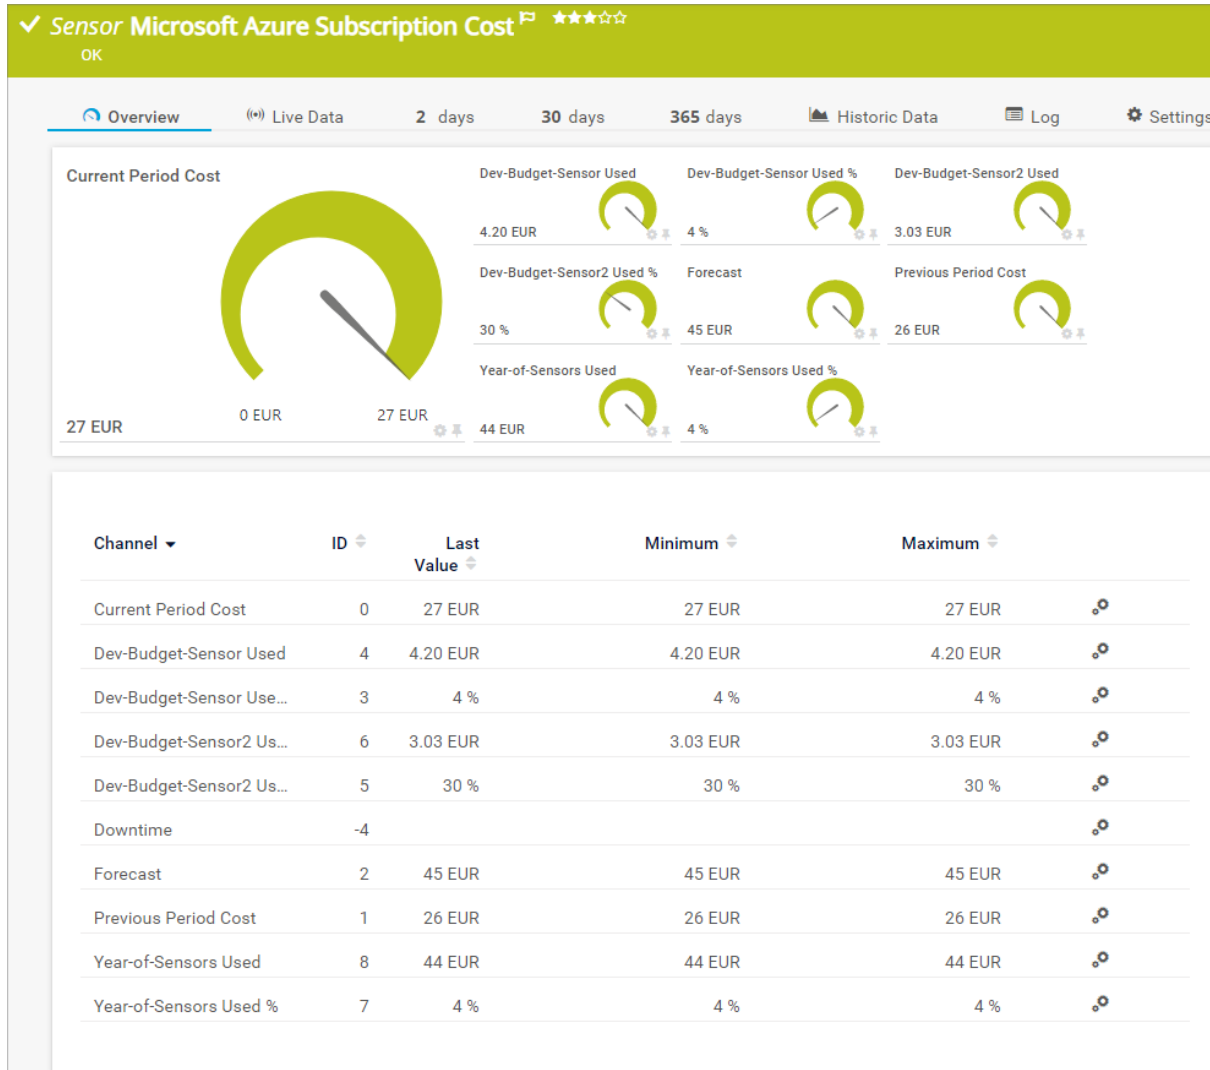

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.86 Microsoft Azure Subscription Cost Sensor

The Microsoft Azure Subscription Cost sensor monitors the cost in a Microsoft Azure subscription.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Microsoft Azure Subscription Cost Sensor

Sensor in Other Languages

- Dutch: Microsoft Azure Subscription Cost
- French: Microsoft Azure Subscription Cost
- German: Microsoft Azure Subscription Cost
- Japanese: Microsoft Azure Subscription Cost
- Portuguese: Microsoft Azure Subscription Cost
- Russian: Microsoft Azure Subscription Cost
- Simplified Chinese: Microsoft Azure Subscription Cost

- Spanish: Microsoft Azure Subscription Cost

Remarks

- This sensor requires [credentials for Microsoft Azure](#) in settings that are higher in the [object hierarchy](#), for example, in the settings of the parent device.
- This sensor [requires](#) an Azure custom role with permissions for specific actions.
- This sensor does not support cloud solution provider (CSP) subscriptions.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- See the Knowledge Base: [How do I obtain credentials and create custom roles for the Microsoft Azure sensors?](#)

Detailed Requirements

Requirement	Description
Permissions for the Azure custom role	<p>This sensor requires an Azure custom role with specific permissions. Create an Azure custom role and add permissions for the following actions:</p> <ul style="list-style-type: none"> ▪ "Microsoft.Consumption/*/read", ▪ "Microsoft.Consumption/*/action", ▪ "Microsoft.CostManagement/query/read", ▪ "Microsoft.Billing/*/read" <p> For more information, see the Knowledge Base: How do I obtain credentials and create custom roles for the Microsoft Azure sensors?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Microsoft Azure Specific

Setting	Description
Budgets	PRTG creates two default channels, one for the last period cost and one for the current period cost. Select if you want to create additional channels for the budget usage in your Microsoft Azure subscription.

Setting	Description
	<p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Cost Forecast	<p>Select if you want to create an additional channel with a cost forecast for your Microsoft Azure subscription.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a title 'Basic Sensor Settings' in blue. Below it are three settings: 'Sensor Name' with an information icon and the value 'Example Name'; 'Tags' with an information icon and a list containing 'exampletag' with a delete 'x' icon and an add '+' icon; and 'Priority' with an information icon and a star rating of 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p>

Setting	Description
	<p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ microsoftazure ▪ microsoftazuresubscriptioncost ▪ azure
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

PRTG overwrites this file with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval	
Scanning Interval ⓘ	60 seconds
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
Maintenance Window	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p> <p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

■ KNOWLEDGE BASE

How do I obtain credentials and create custom roles for the Microsoft Azure sensors?

- <https://kb.paessler.com/en/topic/88625>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

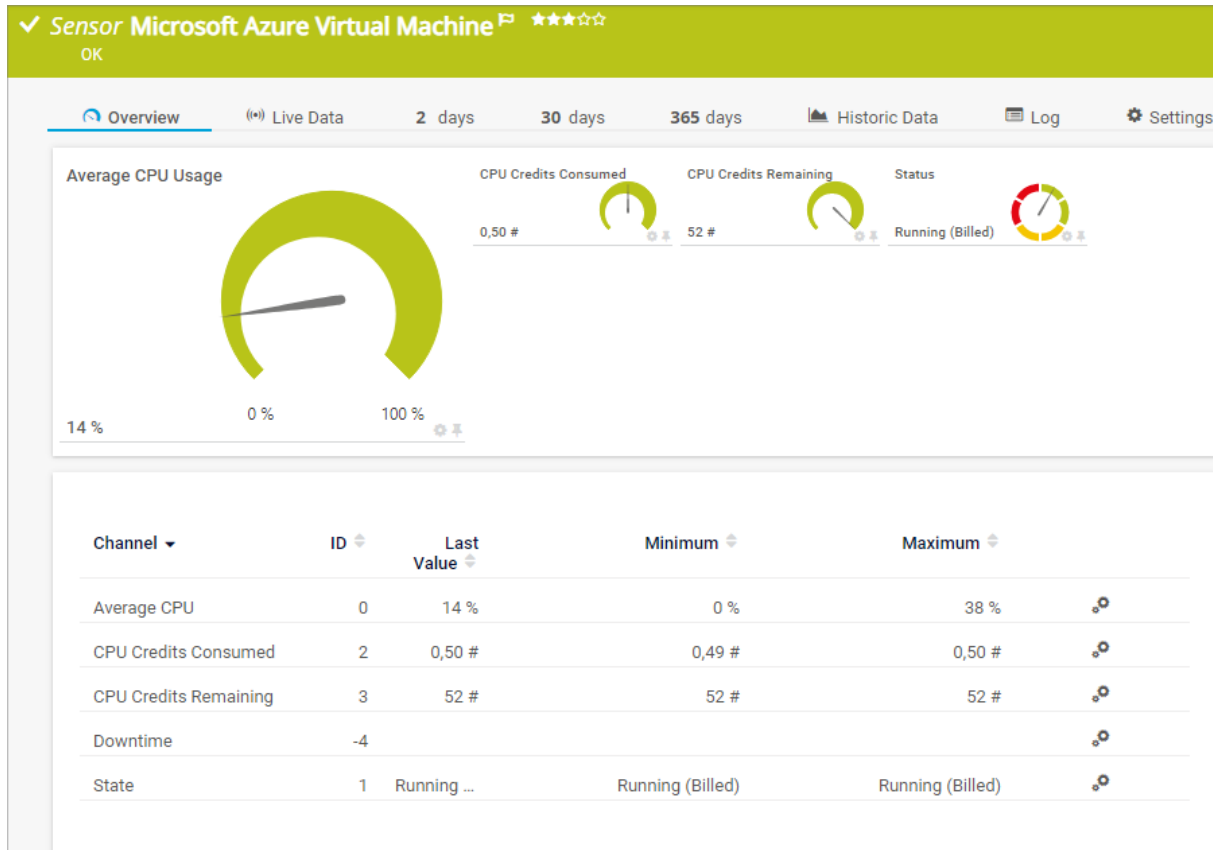

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.87 Microsoft Azure Virtual Machine Sensor

The Microsoft Azure Virtual Machine sensor monitors the status of a virtual machine in a Microsoft Azure subscription.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Microsoft Azure Virtual Machine Sensor

Sensor in Other Languages

- Dutch: Microsoft Azure Virtual Machine
- French: Microsoft Azure Virtual Machine
- German: Microsoft Azure Virtual Machine
- Japanese: Microsoft Azure Virtual Machine
- Portuguese: Microsoft Azure Virtual Machine
- Russian: Microsoft Azure Virtual Machine
- Simplified Chinese: Microsoft Azure Virtual Machine
- Spanish: Microsoft Azure Virtual Machine

Remarks

- This sensor requires [credentials for Microsoft Azure](#) in settings that are higher in the [object hierarchy](#), for example, in the settings of the parent device.
- This sensor [requires](#) an Azure custom role with permissions for specific actions.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).
- See the Knowledge Base: [How do I obtain credentials and create custom roles for the Microsoft Azure sensors?](#)

Detailed Requirements

Requirement	Description
Permissions for the Azure custom role	<p>This sensor requires an Azure custom role with specific permissions. Create an Azure custom role and add permissions for the following actions:</p> <ul style="list-style-type: none"> ▪ "Microsoft.Network/publicIPAddresses/read" ▪ "Microsoft.Network/virtualNetworks/read" ▪ "Microsoft.Network/loadBalancers/read" ▪ "Microsoft.Network/networkInterfaces/read" ▪ "Microsoft.Compute/virtualMachines/*/read" ▪ "Microsoft.Insights/Metrics/providers/Metrics/Read" ▪ "Microsoft.Insights/Metrics/Microsoft.Insights/Read" ▪ "Microsoft.Insights/Metrics/Read" ▪ "Microsoft.Insights/Metricnamespaces/Read" ▪ "Microsoft.Insights/MetricDefinitions/providers/Microsoft.Insights/Read" ▪ "Microsoft.Insights/Components/providers/Microsoft.Insights/MetricDefinitions/Read" <p>■ For more information, see the Knowledge Base: How do I obtain credentials and create custom roles for the Microsoft Azure sensors?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

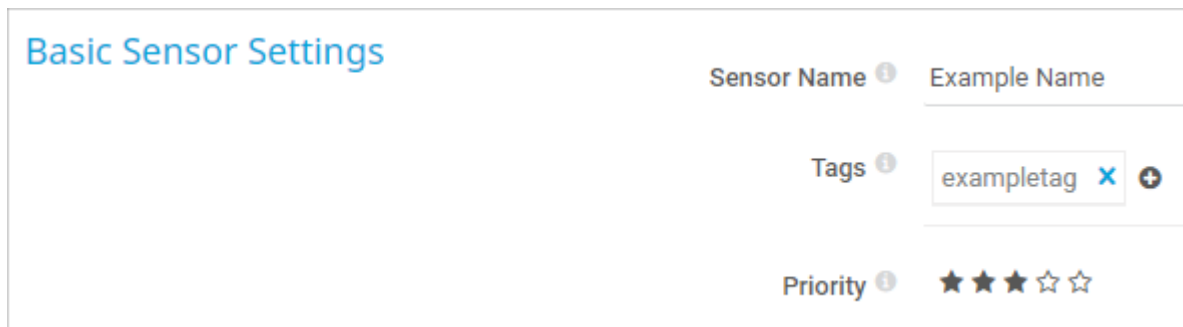

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Microsoft Azure Specific

Setting	Description
Virtual Machines	<p>You see a list of all VMs available in the monitored Microsoft Azure subscription. All VMs are listed by name, resource group, region, and the operating system that they run on. Select the VMs that you want to monitor. PRTG creates one sensor for each VM that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[406], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Virtual Machine ID	Shows the ID of the virtual machine that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Operating System	Shows the operating system of the server on which the virtual machine runs. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Resource Group	Shows the Microsoft Azure resource group of the virtual machine that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Region	Shows the Azure region of the virtual machine that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor. ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.
Graph Type	Define how different channels are shown for this sensor: <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel.

Setting	Description
	<ul style="list-style-type: none"> Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Debug Options

Debug Options

Result Handling 

Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory^[452] on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

How do I obtain credentials and create custom roles for the Microsoft Azure sensors?

Part 7: Device and Sensor Setup | 8 Sensor Settings
87 Microsoft Azure Virtual Machine Sensor

- <https://kb.paessler.com/en/topic/88625>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

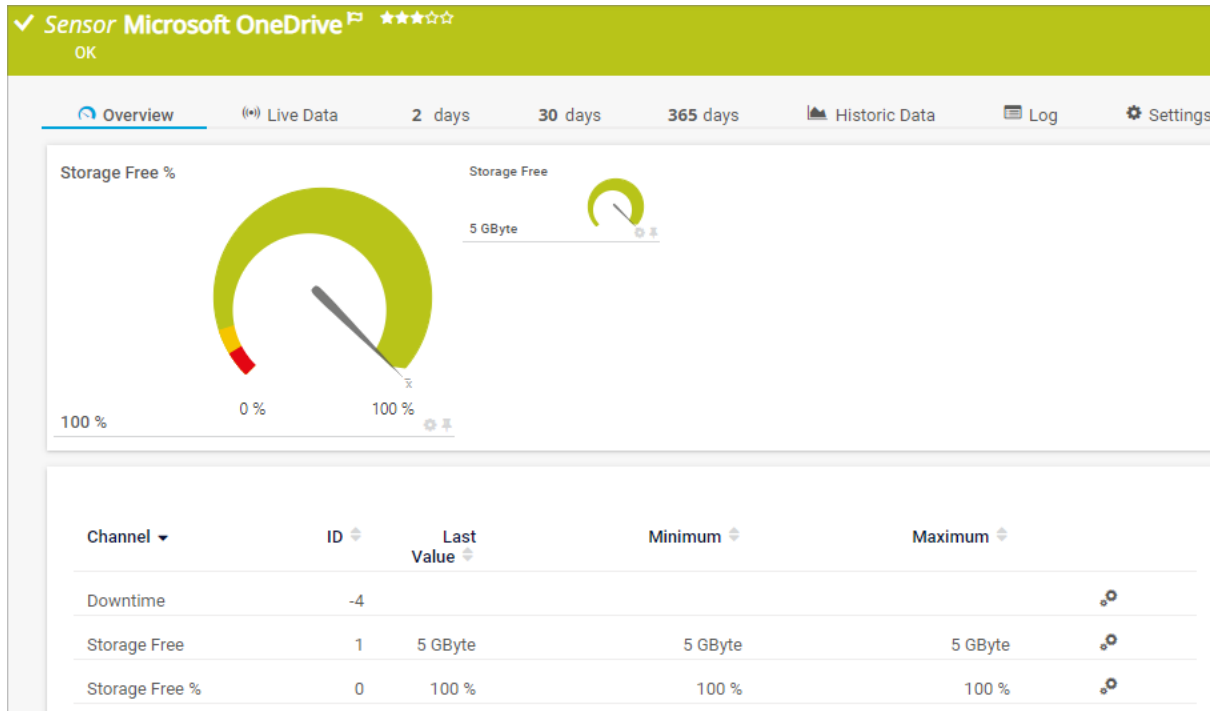

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3977

7.8.88 Microsoft OneDrive Sensor

The Microsoft OneDrive sensor monitors a Microsoft personal OneDrive account via the OneDrive application programming interface (API) and Open Authorization 2 (OAuth2).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Microsoft OneDrive Sensor

Sensor in Other Languages

- Dutch: Microsoft OneDrive
- French: Microsoft OneDrive
- German: Microsoft OneDrive
- Japanese: Microsoft OneDrive
- Portuguese: Microsoft OneDrive
- Russian: Microsoft OneDrive
- Simplified Chinese: Microsoft OneDrive
- Spanish: Microsoft OneDrive

Remarks

- The minimum scanning interval for this sensor is 30 minutes.
- This sensor only supports personal OneDrive accounts, it does not work with OneDrive for Business accounts.
- For details about OAuth2 authentication, see section [Authentication via OAuth2](#).

- This sensor has a low performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG requires OAuth2 authorization before you can add this sensor. Provide the required credentials in the dialog box that appears.

Microsoft Credentials

This sensor uses OAuth2 authentication to get access to your Microsoft account.

For details about this authentication approach, see section [Authentication via OAuth2](#).

Microsoft Credentials

Setting	Description
OAuth URL	Click Get Access Code to connect this sensor to your Microsoft OneDrive account using OAuth2. This is necessary to allow the sensor to query data from OneDrive. A new browser window appears.

Setting	Description
	Follow the steps in the browser window and confirm the permission for PRTG to connect to your OneDrive account. OneDrive forwards you to an empty page after you complete the authorization process. Copy the complete URL of this empty page and paste it into the OAuth Code field below.
OAuth Code	<p>Paste the complete URL of the empty page to which OneDrive forwards you. The empty page appears after you complete the authorization process for PRTG in your OneDrive account.</p> <p>i It is mandatory to connect this sensor to your OneDrive account to create this sensor. Complete the OAuth approach first to get the OAuth code.</p> <p>Click OK to define the sensor settings.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with five stars.

Basic Sensor Settings

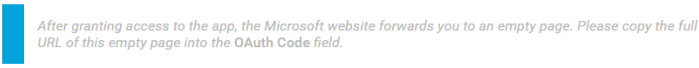

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <ul style="list-style-type: none"> ❗ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ❗ For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ msonedrivesensor ▪ cloudstorage
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

❗ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Microsoft Credentials

Microsoft Credentials

Where to find the code?  After granting access to the app, the Microsoft website forwards you to an empty page. Please copy the full URL of this empty page into the OAuth Code field.

OAuth Code 

Microsoft Credentials

Setting	Description
OAuth Code	<p>Shows the authorization code that the sensor uses to access your OneDrive account.</p> <ul style="list-style-type: none"> ❗ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

ⓘ This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#)⁴¹⁸⁷ settings are not available for this sensor.

Scanning Interval	
Scanning Interval ⓘ	60 seconds
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p> <p> ⓘ The minimum scanning interval for this sensor is 30 minutes.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups^[4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management^[155].</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#)^[142].

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Authentication via OAuth2

 This sensor uses the OAuth2 security protocol to access the account from which you want to retrieve and monitor data. OAuth2 enables you to grant access to the target account without sharing your password with PRTG. The authorization approach of PRTG using OAuth2 works as follows.

1. Authorization Request

First, you have to request authorization for this sensor to access service resources from your account. For this purpose, you are asked to get an access code for this sensor in the Add Sensor dialog. Click Get Access Code to start the authorization process using OAuth2. A new browser window opens on the authorization server of the target service.

2. Verifying Identity

This new window contains a login form for your account that you want to monitor. Log in to your account using your credentials for this service to authenticate your identity. This is a common login to your account on the target server so PRTG does not see your password. The service forwards you to the authorization page and asks you to permit PRTG to access the data in your account.

 If you are already logged in to the service with a user account, you do not have to enter credentials in this step and get directly to the access permission page.

3. Authorizing PRTG

Permit PRTG to access information on your account. Note that this permission holds only for this specific sensor, not for other sensors of this type or PRTG as a whole. For each sensor of this type you add, you have to confirm the access permission anew. You can change the account permissions at any time in your account at the target service.

4. Getting Authorization Code

Permitting PRTG to access your account data forwards you to a page where the service provides an authorization code. Copy this code and switch back to the Add Sensor dialog in PRTG.

 The code is only valid for a short period of time and expires after a few minutes. You can use a particular code only once.

5. Providing Authorization Code

Paste the authorization code into the OAuth Code field and complete the Add Sensor dialog. You do not have to go through further configuration steps manually. The sensor automatically accomplishes the following steps.

6. Requesting Access Token

After receiving the authorization code, PRTG requests an access token from the API of the target service. For this purpose, PRTG transmits the authorization code together with several authentication details. The API checks if the authorization is valid and returns the access token to PRTG. Access tokens are specific for one account and one application (here: PRTG). The authorization process to read data from your account is now complete.

7. Retrieving Data

The sensor transmits the access token with each sensor scan in the defined scanning interval to authenticate with your account. It is not necessary to use the original account credentials anew. The used tokens refresh automatically from time to time.

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Storage Free	The free storage in bytes
Storage Free %	The free storage in percent  This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

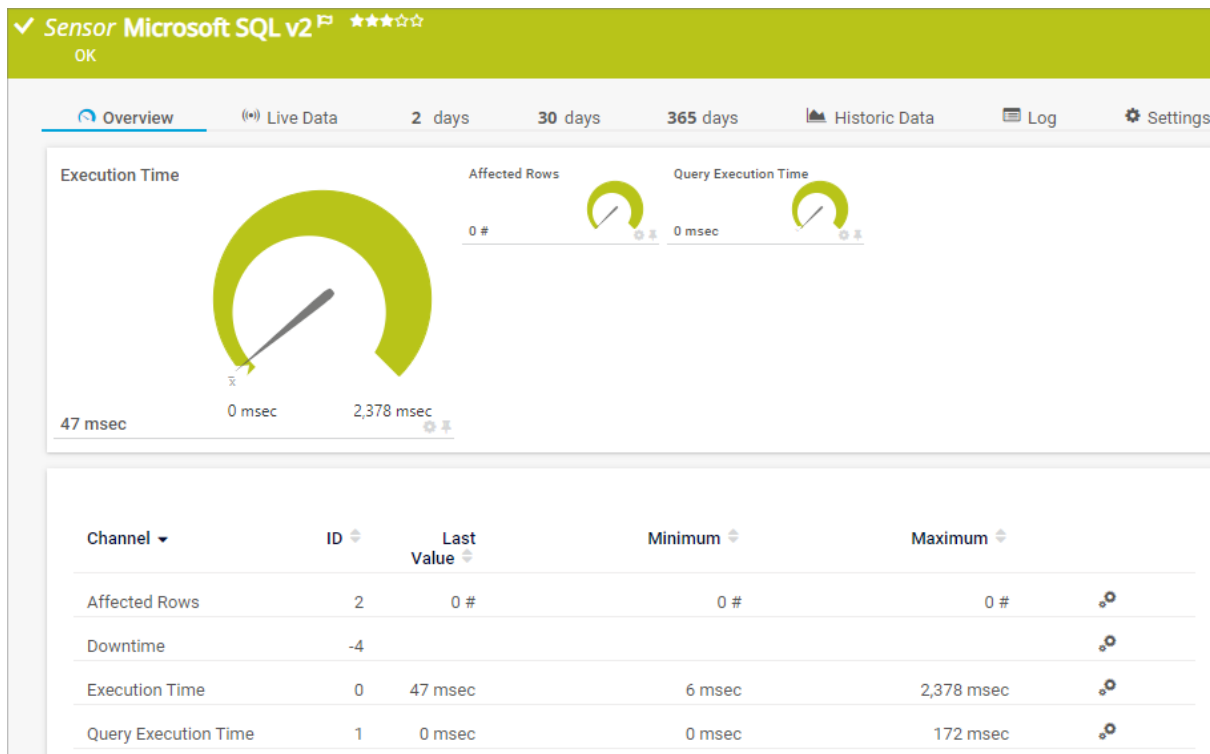

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.89 Microsoft SQL v2 Sensor

The Microsoft SQL v2 sensor monitors a database on a Microsoft SQL server and executes a query.

i The sensor can also process the data table and show the values that you define in individual channels.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Microsoft SQL v2 Sensor

Sensor in Other Languages

- Dutch: Microsoft SQL v2
- French: Microsoft SQL v2
- German: Microsoft SQL v2
- Japanese: Microsoft SQL v2
- Portuguese: Microsoft SQL v2
- Russian: Microsoft SQL v2
- Simplified Chinese: Microsoft SQL v2
- Spanish: Microsoft SQL v2

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.

- You must store your Structured Query Language (SQL) query in a file on the probe system. In a cluster, copy the file to every cluster node.
- This sensor requires .NET 4.7.2 or later on the probe system.
- Define credentials, custom port (if required), and timeout in the [credentials for database management systems](#) settings of the parent device, or in the settings of a group or probe above.
- This sensor supports Microsoft SQL server 2005 or later.
- This sensor supports the IPv6 protocol.
- See section [Monitoring Databases](#) for an [example](#) for channel value selection.
- See the Knowledge Base: [How to set up the SQL v2 sensors in PRTG? Is there a guide?](#)
- See the Knowledge Base: [How can I monitor strings from an SQL database and show a sensor status depending on it?](#)
- See the Knowledge Base: [How can I monitor error tables in SQL databases?](#)
- See the Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Data

Setting	Description
SQL Query File	<p>Select the SQL query file that includes a valid SQL statement that the sensor executes on the server with every scanning interval. The list contains SQL scripts from the \Custom Sensors\sql subfolder of the PRTG program directory on the probe system. Store your script there. If you use the script on a cluster probe, you must store the script on all cluster nodes.</p> <p>A correct expression in the file could be: <code>SELECT AVG(UnitPrice) FROM Products</code>. If you want to use transactions, separate the individual steps with semicolons ";".</p> <ul style="list-style-type: none"> i Note that with each request, PRTG transfers the full result set, so use filters and limits in your query. i The demo script Demo Serveruptime.sql is available by default. You can use the it to monitor the uptime of the target server. ■ See also the Knowledge Base: Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?
Data Processing	<p>Define whether the sensor processes data from the database:</p> <ul style="list-style-type: none"> ■ Only execute query: Only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed by the query (for example, created, deleted, or edited). ■ Count table rows: Execute a <code>SELECT</code> statement and monitor how many rows of the data table this statement returns. ■ Process data table: Read and analyze the data table. If you select this option, the sensor counts rows with <code>SELECT</code> statements as well.
Channel #2 – #10	<p>This setting is only visible if you select Process data table above. You can define up to 10 additional channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you automatically see all available settings for Channel #1. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> ■ Disable: Do not create this channel. ■ Enable: Create this channel. i It is not possible to enable or disable channels after sensor creation.
Channel #x Name	<p>This setting is only visible if you select Process data table above. Enter a unique name for the channel. Enter a string. PRTG dynamically generates channels with this name as the identifier.</p> <ul style="list-style-type: none"> i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?

Setting	Description
Channel #x Mode	<p>This setting is only visible if you select Process data table above. Define how to display the determined value in the channel:</p> <ul style="list-style-type: none"> ▪ Absolute (recommended): Show the value as the sensor retrieves it from the data table. ▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table. <ul style="list-style-type: none"> ❗ This mode is not compatible with the unit Lookup. ❗ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.
Channel #x Unit	<p>This setting is only visible if you select Process data table above. Define the unit of the channel value:</p> <ul style="list-style-type: none"> ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Lookup <p>■ For more information about the available units, see section Custom Sensors.</p> <p>❗ To use lookups with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor.</p> <p>❗ It is not possible to use the unit Lookup in combination with the Difference mode. You are not able to create the sensor in this case.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ sqlsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

Database Specific

Database Specific

Database ⓘ MyDatabase

SQL Server Instance ⓘ No instance name required (default)
 Use instance name

Instance Name ⓘ SQLEXPRESS

Encryption ⓘ Use server defaults (default)
 Enforce encryption but do not validate server certificate
 Enforce encryption and validate server certificate

Database Specific

Setting	Description
Database	Enter the name of the SQL database to which the sensor connects, for example, MyDatabase . This is a logical entity on the database server where database objects exist.
SQL Server Instance	Define if you want to use an instance name for the database connection: <ul style="list-style-type: none"> No instance name required (default): Use the default instance for the connection. Use instance name: Use a named instance. Specify the Instance Name below.
Instance Name	This setting is only visible if you select Use instance name above. Enter the name of the instance that you want to monitor.
Encryption	Define the encryption usage for the database connection: <ul style="list-style-type: none"> Use server defaults (default): Only encrypt the database connection if the database server enforces encryption. Enforce encryption but do not validate server certificate: Make sure that the database connection is encrypted. Enforce encryption and validate server certificate: Force encryption and validate the database server certificate. This approach provides the highest level of security and can help prevent man-in-the-middle attacks, for example. <ul style="list-style-type: none"> i The sensor only validates the certificate if the database server enforces encryption.

Data

Data

SQL Query File ⓘ *Demo Serveruptime.sql*

Input Parameter Handling ⓘ Do not use input parameter (default)
 Use input parameter

Transaction Handling ⓘ Do not use transaction (default)
 Use transaction and always roll back
 Use transaction and commit on success

Data Processing ⓘ *Only execute query*

Result Handling ⓘ Discard result
 Store result

Data

Setting	Description
SQL Query File	Shows the SQL script file that the sensor executes on the server. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Input Parameter Handling	Define if you want to pass a parameter to the SQL query file: <ul style="list-style-type: none"> ▪ Do not use input parameter (default): Execute the SQL query file without using variables. ▪ Use input parameter: Execute an SQL query file that contains a variable. Provide the parameter that you want to use in the query below.
Input Parameter	This setting is only visible if you select Input Parameter Handling above. Enter the parameter that you want to pass to the SQL query file. This parameter replaces the variables @prtg, :prtg, or ? in the SQL query, considering the general rules for SQL variables. You can also use PRTG placeholders for custom sensors (command-line parameters) as input parameters, for example, %sensorid or %deviceid. For details, see section Custom Sensors [444]. ⓘ Provide strings as they are and do not surround them with quotation marks. PRTG automatically and correctly inserts string parameters into the query.
Transaction Handling	Define if you want to use transactions and if they affect the database content: <ul style="list-style-type: none"> ▪ Do not use transaction (default): Do not execute transactions.

Setting	Description
	<ul style="list-style-type: none"> ▪ Use transaction and always roll back: The query does not change data in the database. In the SQL query file, separate the single steps of the transaction with semicolons. ▪ Use transaction and commit on success: The query changes data in the database. The changes only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons.
Data Processing	<p>Shows how the sensor processes data from the database.</p> <p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Handle DBNull in Channel Values as	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define the sensor behavior if the query returns DBNull:</p> <ul style="list-style-type: none"> ▪ Error: Show a Down status if the query returns DBNull. ▪ Number 0: Recognize the result DBNull as a valid value and interpret it as the number 0.
Select Channel Value by	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define how to select the desired cell in the database table:</p> <ul style="list-style-type: none"> ▪ Column number: Determine the channel value by using the value in row 0 of the column whose number you specify in Channel #x Column Number. ▪ Column name: Determine the channel value by using the value in row 0 of the column whose name you specify in Channel #x Column Name. ▪ Row number: Determine the channel value by using the value in column 0 of the row whose number you specify in Channel #x Row Number. ▪ Key value pair: Determine the channel value by searching in column 0 for the key you specify in Channel #x Key and by returning the value in column 1 of the same row where the key value was found. <p> Defining how the desired cell in the database table is selected is necessary to configure the cells that are used in the channels.</p> <p> The option you select here also defines the method of how to optionally determine a value for the sensor message. For details, see setting Use Data Table Value in Sensor Message.</p> <p> For an example for channel value selection, see section Monitoring Databases .</p>
Channel #x	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. The setting shows if the channel is disabled.</p>

Setting	Description
	<p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Channel #x Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Enter a unique name for the channel. Enter a string. The sensor dynamically generates channels with this name as identifier.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Channel #x Column Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column number for the setting Select Channel Value by. Provide the number of the column to use to determine the channel value in row 0. Enter an integer value.</p>
Channel #x Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column name for the setting Select Channel Value by. Provide the name of the column to use to determine the channel value in row 0. Enter an integer value.</p>
Channel #x Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Row number for the setting Select Channel Value by. Provide the number of the column to use to determine the channel value in row 0. Enter an integer value.</p>
Channel #x Key	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Key value pair for the setting Select Channel Value by. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found to use to determine the channel value. Enter a string.</p>
Channel #x Mode	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. The setting shows how you want to display the determined value in the channel.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Channel #x Unit	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define the unit of the channel value:</p> <ul style="list-style-type: none"> ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk

Setting	Description
	<ul style="list-style-type: none"> ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Lookup
Channel #x Custom Unit	This setting is only visible if you select the channel unit Custom above. Define a unit for the channel value. Enter a string.
Channel #x Lookup	This setting is only visible if you select the channel unit Lookup above. Select a lookup file that you want to use with this channel.
Use Data Table Value in Sensor Message	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define if the sensor message shows a value from the data table:</p> <ul style="list-style-type: none"> ▪ Disable: Do not use a custom sensor message. ▪ Enable: Define a custom sensor message with a defined value of the data table. Define the value selection below. <p>The method of how to determine a value for the sensor message is defined in the setting Select Channel Value by above.</p>
Sensor Message Column Number	This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column number for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the number of a column. The sensor message shows the value in row 0 of this column. Enter an integer value.
Sensor Message Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column name for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter a string.</p> <p> Columns start with index 0.</p>

Setting	Description
Sensor Message Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Row number for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter the number of a row. The sensor message shows the value in column 0 of this row. Enter an integer value.</p> <p>i Rows start with index 0.</p>
Sensor Message Key	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Key value pair for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter a key to search for in column 0 of the data table. The sensor message shows the value in column 1 of the row where the key was found. Enter a string.</p>
Sensor Message	<p>This setting is only visible if you enable Use Data Table Value in Sensor Message. Define the sensor message. Enter a string. Use the placeholder {0} at the position where you want to display the value.</p> <p>Example: The message is {0}</p> <p>i The number sign (#) is not supported in sensor messages. If a message contains a number sign, the message is clipped at this point.</p>
If Sensor Message Changes	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</p> <p>Define what the sensor does when the sensor message changes:</p> <ul style="list-style-type: none"> Ignore changes (default): Take no action on change. Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger⁴¹³⁶, you can use this mechanism to trigger a notification³³⁶⁷ whenever the sensor value changes.
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click ⓘ to interrupt the [inheritance](#).

Scanning Interval	
Scanning Interval ⓘ	60 seconds
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
Maintenance Window	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p> <p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Affected Rows	The number of rows that were addressed by the query (including SELECT statements if you process data tables)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Execution Time	<p>The execution time of the entire request (including connection buildup, query execution, transaction handling, disconnection) in milliseconds (msec)</p> <p>i This channel is the primary channel by default.</p>
Query Execution Time	The execution time of the specified query in msec

Sensor Settings Overview

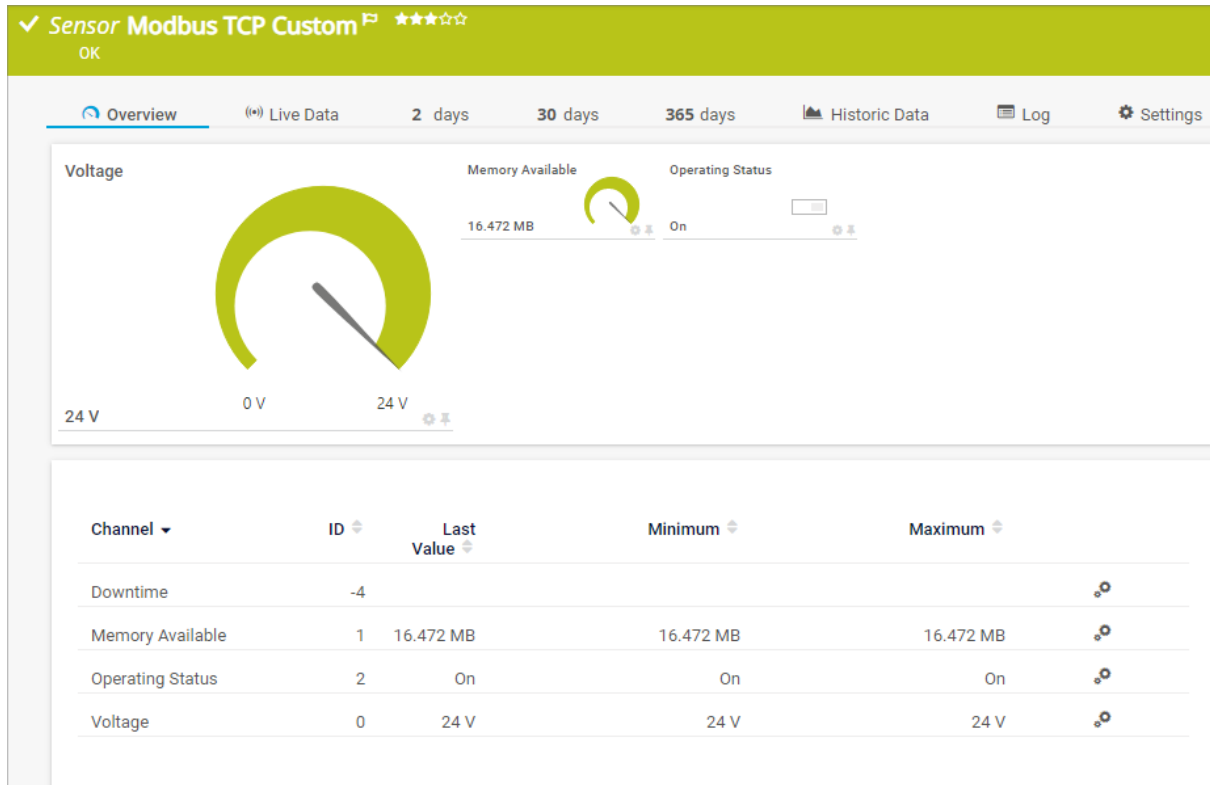

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.90 Modbus TCP Custom Sensor

The Modbus TCP Custom sensor connects to a Modbus Transmission Control Protocol (TCP) server and monitors up to five returned numeric values.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Modbus TCP Custom Sensor

Sensor in Other Languages

- Dutch: Modbus TCP Custom
- French: Modbus TCP Custom
- German: Modbus TCP Custom
- Japanese: Modbus TCP Custom
- Portuguese: Modbus TCP Custom
- Russian: Modbus TCP Custom
- Simplified Chinese: Modbus TCP Custom
- Spanish: Modbus TCP Custom

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Modbus Channel Specific

Setting	Description
Channel #1 – #5 Name	<p>Enter a meaningful name to identify the channel.</p> <p>Once you have created the sensor, you can change the name of the channel in the Channel Settings under Name.</p>
Channel #1 – #5 Register Type	<p>Enter the type of the register. Choose between:</p> <ul style="list-style-type: none"> ▪ Coil: Coil numbers start with 0 and range from 00001 to 09999. ▪ Discrete input: Discrete input numbers start with 1 and range from 10001 to 19999. ▪ Input register: Input register numbers start with 3 and range from 30001 to 39999. ▪ Holding register: Holding register numbers start with 4 and range from 40001 to 49999. <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Channel #1 – #5 Value Type	<p>This field is only visible if you select Input register or Holding register above. Choose between:</p> <ul style="list-style-type: none"> ▪ 16-bit integer ▪ Unsigned 16-bit integer ▪ 32-bit integer ▪ Unsigned 32-bit integer ▪ 64-bit integer ▪ Float ▪ Double <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Channel #1 – #5 Unit	<p>This field is only visible if you select Input register or Holding register under Channel #x Register Type. Enter a unit for the channel.</p> <p>Once you have created the sensor, you can change the unit of the channel in the Channel Settings under Unit.</p>

Setting	Description
Channel #2 – #5	<p>You can create up to 5 different channels for this sensor. You have to define at least one data channel, so you see all available settings for Channel #1 without manually enabling it. Additionally, you can define Channel #2 to Channel #5. To do so, choose between:</p> <ul style="list-style-type: none"> ▪ Disable (default): The sensor does not create this channel. ▪ Enable: The sensor creates this channel. Specify at least the name, type, and register number for this channel below. <p> You cannot add additional channels after creation.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p> If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p> This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ modbus
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Settings Overview

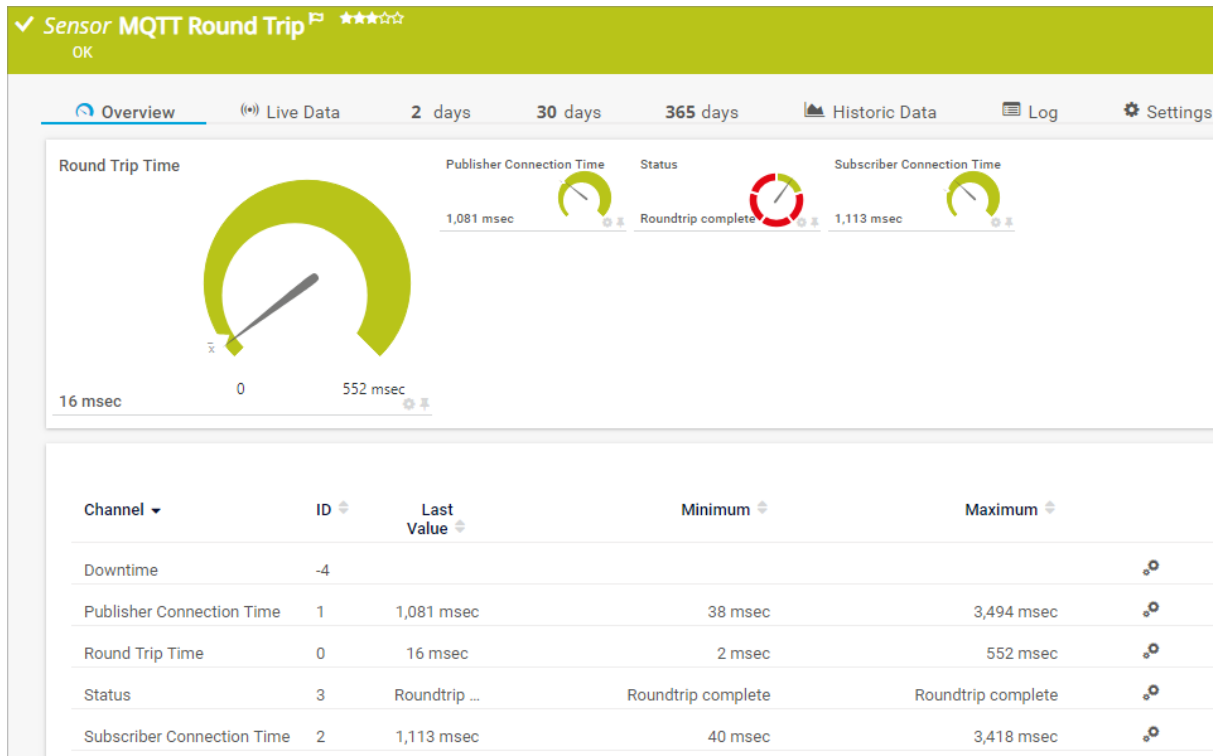

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.91 MQTT Round Trip Sensor

The MQTT Round Trip sensor monitors the availability of a Message Queue Telemetry Transport (MQTT) broker (server), connects to the broker as a publishing and subscribing client, and sends the data packets using a predefined topic.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

MQTT Round Trip Sensor

Sensor in Other Languages

- Dutch: MQTT Round Trip
- French: MQTT Round Trip
- German: MQTT Round Trip
- Japanese: MQTT Round Trip
- Portuguese: MQTT Round Trip
- Russian: MQTT Round Trip
- Simplified Chinese: MQTT Round Trip
- Spanish: MQTT Round Trip

Remarks

- This sensor requires MQTT credentials in the [settings of the parent device](#).
- This sensor supports the IPv6 protocol.

- This sensor has a low performance impact.
- This sensor was converted to a new framework. MQTT Round Trip sensors that were added before PRTG 20.2.59 do not work anymore. We recommend that you pause existing sensors to keep their historic data. To continue monitoring, please add a new MQTT Round Trip sensor.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A text input field containing "exampletag" with a blue 'x' icon to the right and a plus sign icon to the left of the input area.
- Priority:** A section with five star icons, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ mqtt ▪ roundtrip ▪ mqttroundtrip
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory^[4526] on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

 inherit from  Root

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails.

Setting	Description
	<p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies ⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>

Setting	Description
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Setting	Description
	<ul style="list-style-type: none"> Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies [4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector [251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Active Topics	The number of active MQTT topics
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Messages Received	<p>The number of messages received since the last scan</p> <p> This channel is the primary channel by default.</p>
Payload Received	The payload received in bytes

Sensor Settings Overview

For more information about sensor settings, see the following sections:

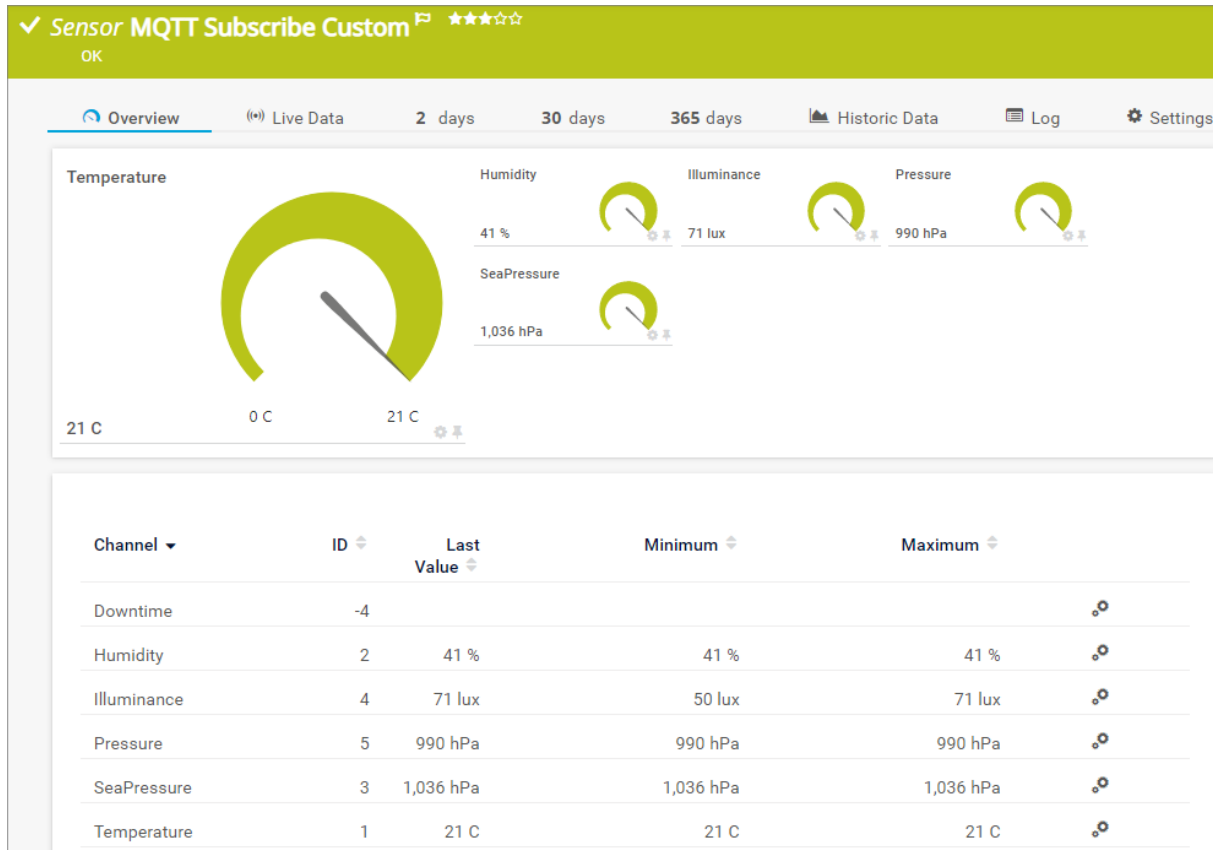

- [List of Available Sensor Types](#) 

- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.93 MQTT Subscribe Custom Sensor

The MQTT Subscribe Custom sensor subscribes to a Message Queue Telemetry Transport (MQTT) topic and monitors up to five numeric values from the received JavaScript Object Notation (JSON) data.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

MQTT Subscribe Custom Sensor

Sensor in Other Languages

- Dutch: MQTT Subscribe Custom
- French: MQTT Subscribe Custom
- German: MQTT Subscribe Custom
- Japanese: MQTT Subscribe Custom
- Portuguese: MQTT Subscribe Custom
- Russian: MQTT Subscribe Custom
- Simplified Chinese: MQTT Subscribe Custom
- Spanish: MQTT Subscribe Custom

Remarks

- This sensor requires MQTT credentials in the [settings of the parent device](#).

- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

MQTT Specific

Setting	Description
Channel #1 Name	<p>Enter a meaningful name to identify the channel.</p> <p>Once you have created the sensor, you can change the name of the channel in the Channel Settings under Name.</p>
Channel #1 Unit	<p>Enter the unit for the numeric value that this sensor monitors.</p> <p>Once you have created the sensor, you can change the unit in the Channel Settings under Unit.</p>
Channel #2 – #5	<p>You can create up to 5 different channels for this sensor. You have to define at least one data channel, so you see all available settings for Channel #1 without manually enabling it. Additionally, you can define Channel #2 up to Channel #5. To do so, choose between:</p> <ul style="list-style-type: none"> ▪ Disable (default): The sensor does not create this channel. ▪ Enable: The sensor creates this channel. Specify name, unit, and JSONPath for this channel below. <p>i You can add additional channels after creation in the sensor's Settings tab.</p>

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Debug Options

Debug Options

Result Handling ⓘ

Discard result

Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory^[4526] on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

 inherit from  Root

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails.

Setting	Description
	<p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies ⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>

Setting	Description
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

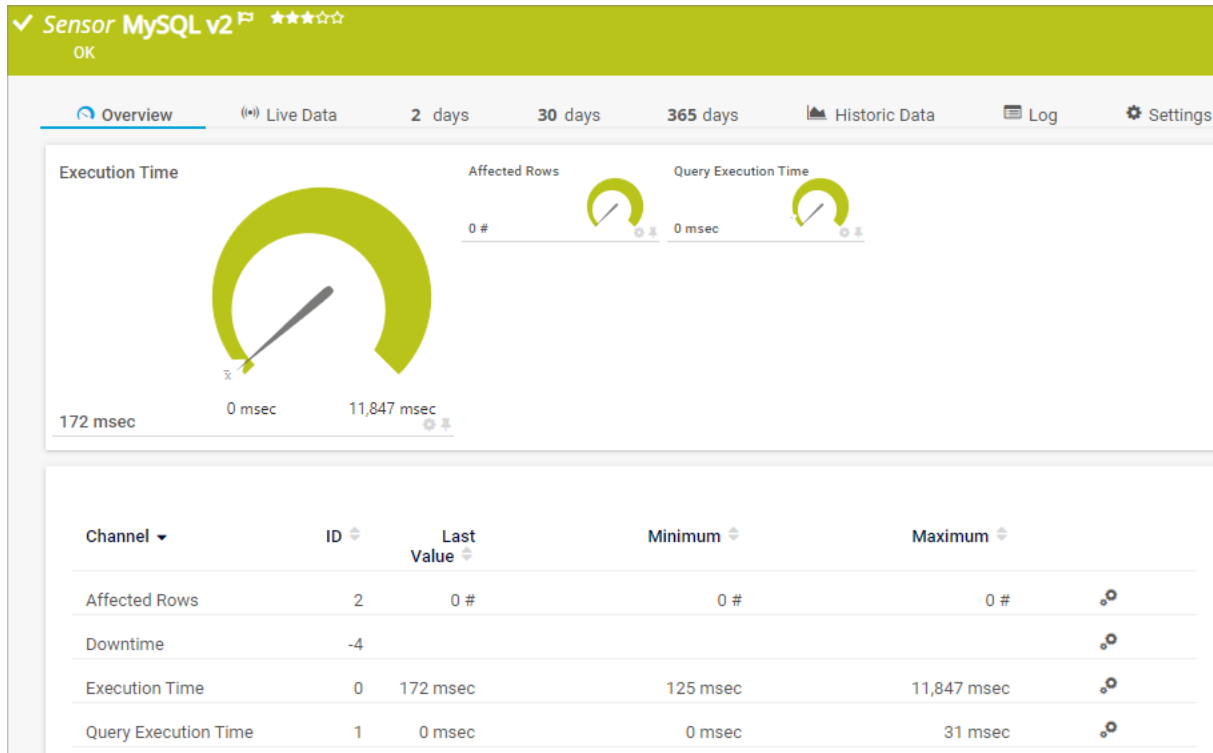

- [List of Available Sensor Types](#) 
- [Additional Sensor Types \(Custom Sensors\)](#) 
- [Channel Settings](#) 
- [Notification Triggers Settings](#) 

7.8.94 MySQL v2 Sensor

The MySQL v2 sensor monitors a database on a MySQL server and executes a query.

i The sensor can also process the data table and show the values that you define in individual channels.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

MySQL v2 Sensor

Sensor in Other Languages

- Dutch: MySQL v2
- French: MySQL v2
- German: MySQL v2
- Japanese: MySQL v2
- Portuguese: MySQL v2
- Russian: MySQL v2
- Simplified Chinese: MySQL v2
- Spanish: MySQL v2

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.

- You must store your Structured Query Language (SQL) query in a file on the probe system. In a cluster, copy the file to every cluster node.
- This sensor requires .NET 4.7.2 or later on the probe system.
- Define credentials, custom port (if required), and timeout in the [credentials for database management systems](#) settings of the parent device, or in the settings of a group or probe above.
- This sensor supports MySQL server versions as of 5.7.
- This sensor supports the IPv6 protocol.
- See section [Monitoring Databases](#) for an [example](#) for channel value selection.
- See the Knowledge Base: [How to set up the SQL v2 sensors in PRTG? Is there a guide?](#)
- See the Knowledge Base: [How can I monitor strings from an SQL database and show a sensor status depending on it?](#)
- See the Knowledge Base: [How can I monitor error tables in SQL databases?](#)
- See the Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Data

Setting	Description
SQL Query File	<p>Select the SQL query file that includes a valid SQL statement that the sensor executes on the server with every scanning interval. The list contains SQL scripts from the \Custom Sensors\sql subfolder of the PRTG program directory on the probe system. Store your script there. If you use the script on a cluster probe, you must store the script on all cluster nodes.</p> <p>A correct expression in the file could be: <code>SELECT AVG(UnitPrice) FROM Products</code>. If you want to use transactions, separate the individual steps with semicolons ";".</p> <ul style="list-style-type: none"> i Note that with each request, PRTG transfers the full result set, so use filters and limits in your query. i The demo script Demo Serveruptime.sql is available by default. You can use the it to monitor the uptime of the target server. ■ See also the Knowledge Base: Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?
Data Processing	<p>Define whether the sensor processes data from the database:</p> <ul style="list-style-type: none"> ■ Only execute query: Only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed by the query (for example, created, deleted, or edited). ■ Count table rows: Execute a <code>SELECT</code> statement and monitor how many rows of the data table this statement returns. ■ Process data table: Read and analyze the data table. If you select this option, the sensor counts rows with <code>SELECT</code> statements as well.
Channel #2 – #10	<p>This setting is only visible if you select Process data table above. You can define up to 10 additional channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you automatically see all available settings for Channel #1. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> ■ Disable: Do not create this channel. ■ Enable: Create this channel. i It is not possible to enable or disable channels after sensor creation.
Channel #x Name	<p>This setting is only visible if you select Process data table above. Enter a unique name for the channel. Enter a string. PRTG dynamically generates channels with this name as the identifier.</p> <ul style="list-style-type: none"> i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?

Setting	Description
Channel #x Mode	<p>This setting is only visible if you select Process data table above. Define how to display the determined value in the channel:</p> <ul style="list-style-type: none"> ▪ Absolute (recommended): Show the value as the sensor retrieves it from the data table. ▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table. <ul style="list-style-type: none"> ❗ This mode is not compatible with the unit Lookup. ❗ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.
Channel #x Unit	<p>This setting is only visible if you select Process data table above. Define the unit of the channel value:</p> <ul style="list-style-type: none"> ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Lookup <p>■ For more information about the available units, see section Custom Sensors.</p> <p>❗ To use lookups with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor.</p> <p>❗ It is not possible to use the unit Lookup in combination with the Difference mode. You are not able to create the sensor in this case.</p>

Database Specific

Setting	Description
Database	<p>Enter the name of the MySQL database to which the sensor connects, for example, MyDatabase. This is a logical entity on the database server where database objects exist.</p> <p>The database name of a MySQL server also reflects a physical directory structure where your database objects are stored. Enter the appropriate string, which is the same as you would supply when you invoke the mysql.exe admin tool (with the command-line switch <code>-p</code>) or after the login with mysql.exe with the command <code>use</code>.</p>
SSL Mode	<p>Select the MySQL Secure Sockets Layer (SSL) mode for the connection:</p> <ul style="list-style-type: none"> ▪ None: Do not use SSL. ▪ Preferred (default): Use SSL if the server supports it. ▪ Required: Always use SSL and deny the connection if the server does not support it. Do not perform a server certificate validation. <p>The SSL mode options that you can choose are the same as the values of the MySQL <code>sslmode</code> parameter. PRTG sends it with the sensor requests.</p> <p>i For details about the MySQL SSL modes, refer to the MySQL documentation.</p>

Data

Data

SQL Query File ⓘ *Demo Serveruptime.sql*

Input Parameter Handling ⓘ Do not use input parameter (default)
 Use input parameter

Transaction Handling ⓘ Do not use transaction (default)
 Use transaction and always roll back
 Use transaction and commit on success

Data Processing ⓘ *Only execute query*

Result Handling ⓘ Discard result
 Store result

Data

Setting	Description
SQL Query File	Shows the SQL script file that the sensor executes on the server. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Input Parameter Handling	Define if you want to pass a parameter to the SQL query file: <ul style="list-style-type: none"> ▪ Do not use input parameter (default): Execute the SQL query file without using variables. ▪ Use input parameter: Execute an SQL query file that contains a variable. Provide the parameter that you want to use in the query below.
Input Parameter	This setting is only visible if you select Input Parameter Handling above. Enter the parameter that you want to pass to the SQL query file. This parameter replaces the variables <code>@prtg</code> , <code>:prtg</code> , or <code>?</code> in the SQL query, considering the general rules for SQL variables. You can also use PRTG placeholders for custom sensors (command-line parameters) as input parameters, for example, <code>%sensorid</code> or <code>%deviceid</code> . For details, see section Custom Sensors [444]. ⓘ Provide strings as they are and do not surround them with quotation marks. PRTG automatically and correctly inserts string parameters into the query.
Transaction Handling	Define if you want to use transactions and if they affect the database content: <ul style="list-style-type: none"> ▪ Do not use transaction (default): Do not execute transactions.

Setting	Description
Data Processing	<ul style="list-style-type: none"> ▪ Use transaction and always roll back: The query does not change data in the database. In the SQL query file, separate the single steps of the transaction with semicolons. ▪ Use transaction and commit on success: The query changes data in the database. The changes only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons. <p>Shows how the sensor processes data from the database.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Handle DBNull in Channel Values as	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define the sensor behavior if the query returns DBNull:</p> <ul style="list-style-type: none"> ▪ Error: Show a Down status if the query returns DBNull. ▪ Number 0: Recognize the result DBNull as a valid value and interpret it as the number 0.
Select Channel Value by	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define how to select the desired cell in the database table:</p> <ul style="list-style-type: none"> ▪ Column number: Determine the channel value by using the value in row 0 of the column whose number you specify in Channel #x Column Number. ▪ Column name: Determine the channel value by using the value in row 0 of the column whose name you specify in Channel #x Column Name. ▪ Row number: Determine the channel value by using the value in column 0 of the row whose number you specify in Channel #x Row Number. ▪ Key value pair: Determine the channel value by searching in column 0 for the key you specify in Channel #x Key and by returning the value in column 1 of the same row where the key value was found. <p>i Defining how the desired cell in the database table is selected is necessary to configure the cells that are used in the channels.</p> <p>i The option you select here also defines the method of how to optionally determine a value for the sensor message. For details, see setting Use Data Table Value in Sensor Message.</p> <p>■ For an example for channel value selection, see section Monitoring Databases ⁴³²⁵.</p>
Channel #x	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. The setting shows if the channel is disabled.</p>

Setting	Description
	<p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Channel #x Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Enter a unique name for the channel. Enter a string. The sensor dynamically generates channels with this name as identifier.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Channel #x Column Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column number for the setting Select Channel Value by. Provide the number of the column to use to determine the channel value in row 0. Enter an integer value.</p>
Channel #x Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column name for the setting Select Channel Value by. Provide the name of the column to use to determine the channel value in row 0. Enter an integer value.</p>
Channel #x Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Row number for the setting Select Channel Value by. Provide the number of the column to use to determine the channel value in row 0. Enter an integer value.</p>
Channel #x Key	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Key value pair for the setting Select Channel Value by. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found to use to determine the channel value. Enter a string.</p>
Channel #x Mode	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. The setting shows how you want to display the determined value in the channel.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Channel #x Unit	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define the unit of the channel value:</p> <ul style="list-style-type: none"> ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk

Setting	Description
	<ul style="list-style-type: none"> ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Lookup
Channel #x Custom Unit	This setting is only visible if you select the channel unit Custom above. Define a unit for the channel value. Enter a string.
Channel #x Lookup	This setting is only visible if you select the channel unit Lookup above. Select a lookup file that you want to use with this channel.
Use Data Table Value in Sensor Message	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define if the sensor message shows a value from the data table:</p> <ul style="list-style-type: none"> ▪ Disable: Do not use a custom sensor message. ▪ Enable: Define a custom sensor message with a defined value of the data table. Define the value selection below. <p>The method of how to determine a value for the sensor message is defined in the setting Select Channel Value by above.</p>
Sensor Message Column Number	This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column number for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the number of a column. The sensor message shows the value in row 0 of this column. Enter an integer value.
Sensor Message Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column name for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter a string.</p> <p> Columns start with index 0.</p>

Setting	Description
Sensor Message Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Row number for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter the number of a row. The sensor message shows the value in column 0 of this row. Enter an integer value.</p> <p>i Rows start with index 0.</p>
Sensor Message Key	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Key value pair for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter a key to search for in column 0 of the data table. The sensor message shows the value in column 1 of the row where the key was found. Enter a string.</p>
Sensor Message	<p>This setting is only visible if you enable Use Data Table Value in Sensor Message. Define the sensor message. Enter a string. Use the placeholder {0} at the position where you want to display the value.</p> <p>Example: The message is {0}</p> <p>i The number sign (#) is not supported in sensor messages. If a message contains a number sign, the message is clipped at this point.</p>
If Sensor Message Changes	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</p> <p>Define what the sensor does when the sensor message changes:</p> <ul style="list-style-type: none"> Ignore changes (default): Take no action on change. Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger⁴¹³⁶, you can use this mechanism to trigger a notification³³⁶⁷ whenever the sensor value changes.
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click to interrupt the [inheritance](#)¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Affected Rows	The number of rows that were addressed by the query (including SELECT statements if you process data tables)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Execution Time	<p>The execution time of the entire request (including connection buildup, query execution, transaction handling, disconnection) in milliseconds (msec)</p> <p>i This channel is the primary channel by default.</p>
Query Execution Time	The execution time of the specified query in msec

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.95 NetApp Aggregate Sensor

The NetApp Aggregate sensor monitors the status of a NetApp cDOT or ONTAP storage aggregate accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

NetApp Aggregate Sensor

Sensor in Other Languages

- Dutch: NetApp Aggregate
- French: Agrégat NetApp
- German: NetApp Aggregat
- Japanese: NetApp の合計
- Portuguese: NetApp Aggregate
- Russian: NetApp
- Simplified Chinese: NetApp 聚合
- Spanish: Agregado de NetApp

Remarks

- This sensor requires .NET 4.7.2 or later on the probe system.
- The ONTAPI user account that you use with this sensor needs [access](#) to the DATA ONTAP API (ONTAPI) so that the sensor can request data from it. The access is enabled by default.
- For this sensor, read-only user rights are sufficient for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster | ClusterX | Configuration | Security | Users
- This sensor supersedes the deprecated NetApp cDOT Aggregate (SOAP) sensor.
- This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- You can define NetApp API credentials (User Name and Password) in the [credentials for Windows systems](#) settings of the parent device. This way, you do not have to individually enter credentials for each NetApp sensor that you add to the same device.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Enabled ONTAPI access	<p>NetApp sensors require access to ONTAPI for the utilized user account. This is enabled by default. If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web> modify -vserver clusterd -name ontapi -enabled true</pre>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG performs a meta-scan before you can add this sensor and requires basic information in advance. Provide the required information in the dialog box that appears. PRTG then recognizes all items that are available for monitoring based on your input.

Setting	Description
NetApp Credentials	Specify which credentials you want to use to connect to the NetApp API: <ul style="list-style-type: none"> ▪ Use explicit credentials: Use individual NetApp API credentials.

Setting	Description
	<ul style="list-style-type: none"> Use Windows credentials from parent device: Use the credentials (User Name and Password) in the parent device settings ¹⁶⁹² in section Credentials for Windows Systems. <ul style="list-style-type: none"> i Defining credentials in the parent device is useful if you add several NetApp sensors to this device because you do not have to individually enter credentials for each NetApp sensor.
User Name	<p>This setting is only visible if you select Use explicit credentials above. Enter a user name for access to the NetApp API. Enter a string.</p> <ul style="list-style-type: none"> i Read-only rights for this ONTAP user account are sufficient.
Password	<p>This setting is only visible if you select Use explicit credentials above. Enter the password of the user for access to the NetApp API. Enter a string.</p>
Port	<p>Enter a port number on which you can access the NetApp API. Enter an integer value. The default port is 443.</p>
Connection Security	<p>Define if the connection to the NetApp API is Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured:</p> <ul style="list-style-type: none"> HTTP: Use an unsecured HTTP connection. HTTPS: Use a secure connection to the defined port to send the query.
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <ul style="list-style-type: none"> i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message. <p>Click OK to define the sensor settings ¹⁶⁹⁷.</p>

NetApp Specific

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Setting	Description
Aggregates	<p>Select the aggregates that you want to monitor. PRTG creates one sensor for each aggregate that you select.</p> <ul style="list-style-type: none"> i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ netapp ▪ cdot ▪ ontap ▪ soap

Setting	Description
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Timeout (Sec.) **i** 60

NetApp Connection

Setting	Description
NetApp Credentials	Specify which credentials you want to use to connect to the NetApp API: <ul style="list-style-type: none"> Use explicit credentials: Use individual NetApp API credentials. Use Windows credentials from parent device: Use the credentials (User Name and Password) in the parent device settings [452] in section Credentials for Windows Systems. <p>i Defining credentials in the parent device is useful if you add several NetApp sensors to this device because you do not have to individually enter credentials for each NetApp sensor.</p>
User Name	This setting is only visible if you select Use explicit credentials above. Enter a user name for access to the NetApp API. Enter a string. <p>i Read-only rights for this ONTAP user account are sufficient.</p>
Password	This setting is only visible if you select Use explicit credentials above. Enter the password of the user for access to the NetApp API. Enter a string.

Setting	Description
Port	Enter a port number on which you can access the NetApp API. Enter an integer value. The default port is 443.
Connection Security	Define if the connection to the NetApp API is Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured: <ul style="list-style-type: none"> ▪ HTTP: Use an unsecured HTTP connection. ▪ HTTPS: Use a secure connection to the defined port to send the query.
Timeout (Sec.)	Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes). <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>

NetApp Specific

NetApp Specific
Aggregates **i** AGGR_00

NetApp Specific

Setting	Description
Aggregates	Shows the identifier of the aggregate that this sensor monitors. <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

Debug Options

Debug Options
Result Handling **i**

Discard result
 Store result

Debug Options

Setting	Description
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result.

Setting	Description
	<ul style="list-style-type: none"> Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration^[4187] on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules 4170.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

inherit from Root

User Group Access ⓘ

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Aggregate State	<p>The status of the aggregate</p> <ul style="list-style-type: none"> ▪ Up status ¹⁹⁷: Online ▪ Warning status: Restrict ▪ Down status: Offline, Other Error
Blocks Read	The number of blocks read per second

Channel	Description
Blocks Written	The number of blocks written per second
Bytes Free	The free bytes in total
Bytes Free %	The free bytes in percent  This channel is the primary channel by default.
Data Read	The data read speed in bytes per second
Data Written	The data write speed in bytes per second
Disks #	The number of disks on the aggregate
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Files	The number of files on the aggregate
Latency	The latency in milliseconds (msec)
User Reads	The number of user reads per second
User Writes	The number of user writes per second

Sensor Settings Overview

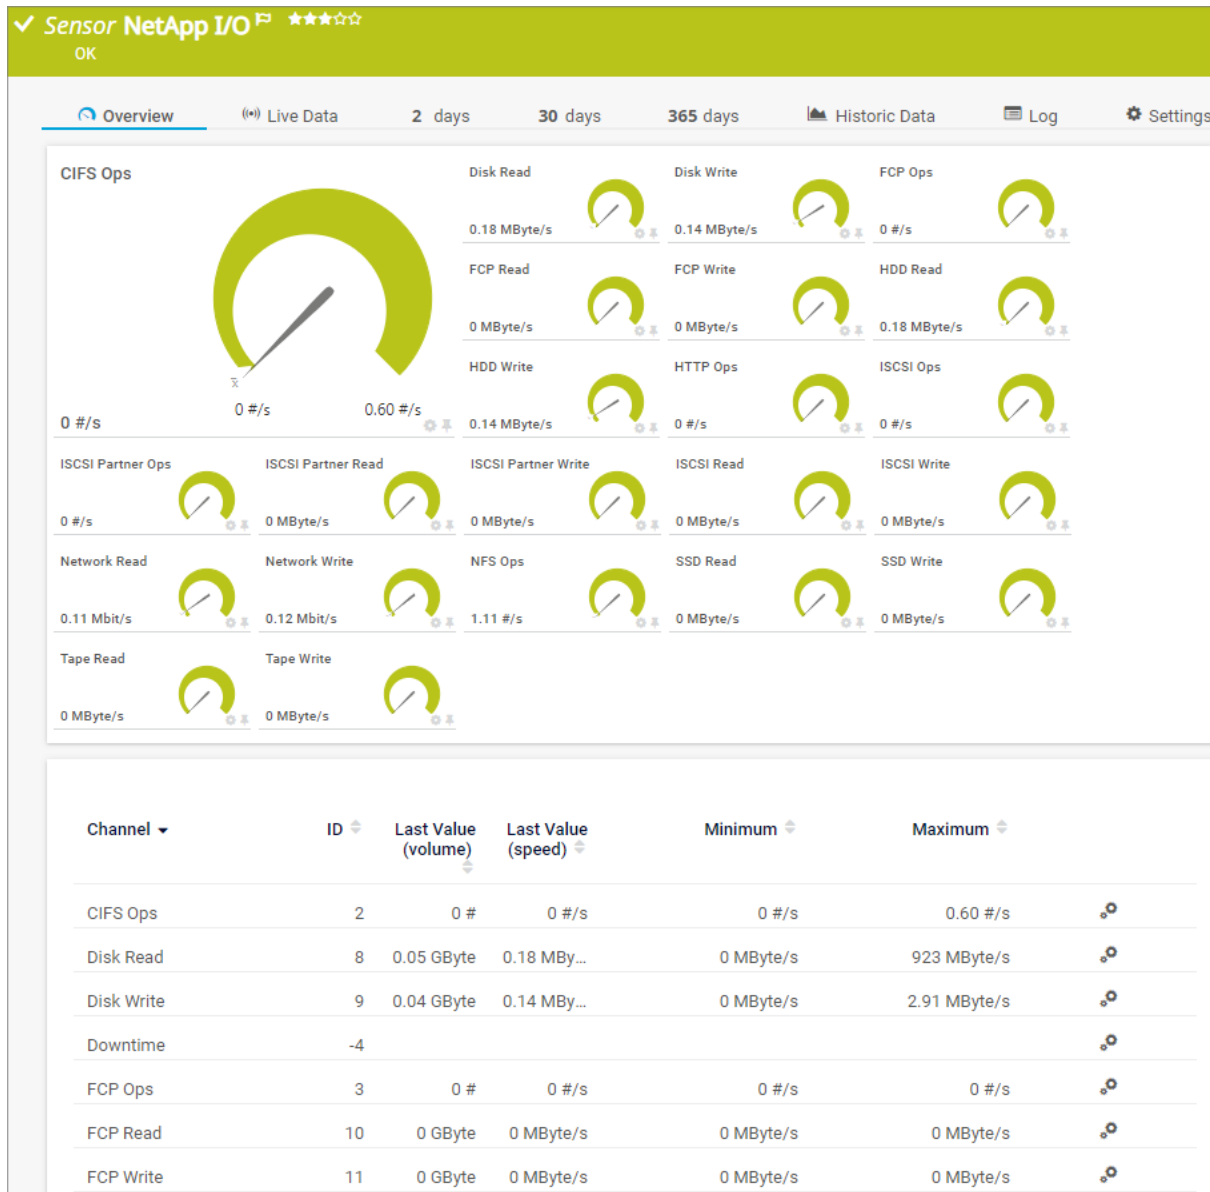

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.96 NetApp I/O Sensor

The NetApp I/O sensor monitors input and output operations of a NetApp cDOT or ONTAP storage system accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

NetApp I/O Sensor

Sensor in Other Languages

- Dutch: NetApp I/O
- French: E/S NetApp
- German: NetApp I/O

- Japanese: NetApp I/O
- Portuguese: NetApp E/S
- Russian: - NetApp
- Simplified Chinese: NetApp I/O
- Spanish: E/S de NetApp

Remarks

- This sensor requires .NET 4.7.2 or later on the probe system.
- The ONTAPI user account that you use with this sensor needs [access](#) to the DATA ONTAP API (ONTAPI) so that the sensor can request data from it. The access is enabled by default.
- For this sensor, read-only user rights are sufficient for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster | ClusterX | Configuration | Security | Users
- This sensor supersedes the deprecated NetApp cDOT I/O (SOAP) sensor.
- This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- You can define NetApp API credentials (User Name and Password) in the [credentials for Windows systems](#) settings of the parent device. This way, you do not have to individually enter credentials for each NetApp sensor that you add to the same device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Enabled ONTAPI access	<p>NetApp sensors require access to ONTAPI for the utilized user account. This is enabled by default. If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web> modify -vserver clusterd -name ontapi -enabled true</pre>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG performs a meta-scan before you can add this sensor and requires basic information in advance. Provide the required information in the dialog box that appears. PRTG then recognizes all items that are available for monitoring based on your input.

User Name	<p>This setting is only visible if you select Use explicit credentials above. Enter a user name for access to the NetApp API. Enter a string.</p> <p>i Read-only rights for this ONTAP user account are sufficient.</p>
Password	<p>This setting is only visible if you select Use explicit credentials above. Enter the password of the user for access to the NetApp API. Enter a string.</p>
Port	<p>Enter a port number on which you can access the NetApp API. Enter an integer value. The default port is 443.</p>
Connection Security	<p>Define if the connection to the NetApp API is Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unsecured HTTP connection. ▪ HTTPS: Use a secure connection to the defined port to send the query.
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p> <p>Click OK to define the sensor settings¹⁷¹¹.</p>

NetApp Specific

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Setting	Description
System Nodes	<p>Select the system nodes that you want monitor. PRTG creates one sensor for each system node that you select.</p>

Setting	Description
	<p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus icon, and a 'Priority' field with five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[4031], reports^[4069], maps^[4096], libraries^[4047], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ netapp ▪ cdot ▪ ontap ▪ soap
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
CIFS Ops	<p>The number of Common Internet File System (CIFS) operations per second</p> <p> This channel is the primary channel by default.</p>
Disk Read	The disk read speed in bytes per second
Disk Write	The disk write speed in bytes per second

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
FCP Ops	The number of Fibre Channel Protocol (FCP) operations per second
FCP Read	The FCP read speed in bytes per second
FCP Write	The FCP write speed in bytes per second
HDD Read	The hard disk drive (HDD) read speed in bytes per second
HDD Write	The HDD write speed in bytes per second
HTTP Ops	The number of HTTP operations per second
ISCSI Ops	The number of Internet Small Computer System Interface (iSCSI) operations per second
ISCSI Partner Ops	The number of iSCSI partner operations per second
ISCSI Partner Read	The iSCSI partner read speed in bytes per second
ISCSI Partner Write	The iSCSI partner write speed in bytes per second
ISCSI Read	The iSCSI read speed in bytes per second
ISCSI Write	The iSCSI write speed in bytes per second
Network Read	The network read speed in bytes per second
Network Write	The network write speed in bytes per second
NFS Ops	The number of network file system (NFS) operations per second
SSD Read	The solid-state drive (SSD) read speed in bytes per second
SSD Write	The SSD write speed in bytes per second
Tape Read	The tape read speed in bytes per second
Tape Write	The tape write speed in bytes per second

Sensor Settings Overview

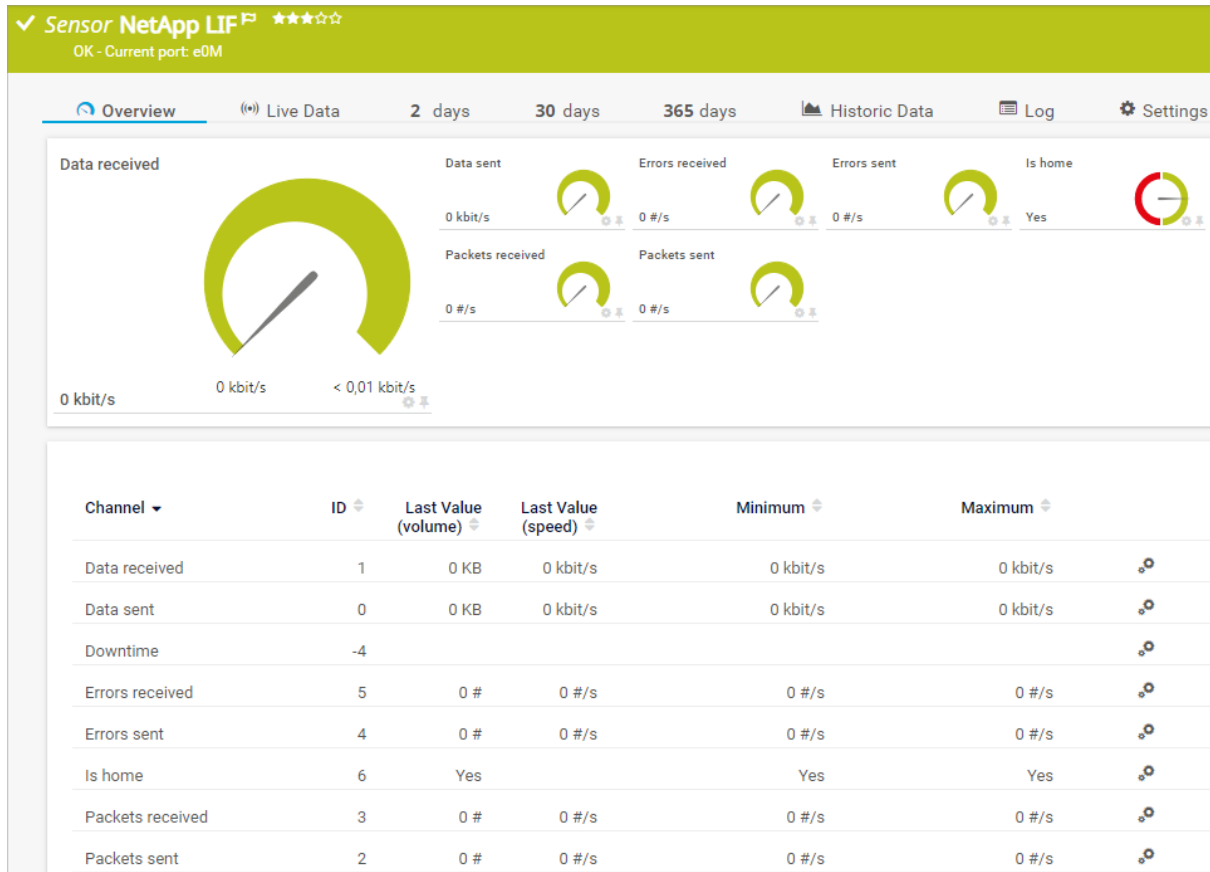

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3967

7.8.97 NetApp LIF Sensor

The NetApp LIF sensor monitors logical interfaces of a NetApp cDOT or ONTAP cluster accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

NetApp LIF Sensor

Sensor in Other Languages

- Dutch: NetApp LIF
- French: LIF NetApp
- German: NetApp LIF
- Japanese: NetApp LIF
- Portuguese: NetApp LIF
- Russian: LIF NetApp
- Simplified Chinese: NetApp LIF
- Spanish: LIF de NetApp

Remarks

- This sensor requires .NET 4.7.2 or later on the probe system.

- The ONTAPI user account that you use with this sensor needs [access](#) to the DATA ONTAP API (ONTAPI) so that the sensor can request data from it. The access is enabled by default.
- For this sensor, read-only user rights are sufficient for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster | ClusterX | Configuration | Security | Users
- This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- You can define NetApp API credentials (User Name and Password) in the [credentials for Windows systems](#) settings of the parent device. This way, you do not have to individually enter credentials for each NetApp sensor that you add to the same device.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Enabled ONTAPI access	<p>NetApp sensors require access to ONTAPI for the utilized user account. This is enabled by default. If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web> modify -vserver clusterd -name ontapi -enabled true</pre>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG performs a meta-scan before you can add this sensor and requires basic information in advance. Provide the required information in the dialog box that appears. PRTG then recognizes all items that are available for monitoring based on your input.

Debug Options Result Handling **i** Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].Data.txt and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p>

Setting	Description
	<p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type 
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None ▼

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Primary Channel ⓘ Downtime

Graph Type ⓘ

Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration^[4187] on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule None ▼

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Bytes Free	The free space in bytes
Bytes Free %	The free bytes in percent
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.

Channel	Description
LUN State	<p>The status of the LUN</p> <ul style="list-style-type: none"> Up status¹⁹⁷: Online Down status: LUN has been automatically taken offline due to a media error on the associated foreign LUN, LUN has been automatically taken offline due to an NVRAM failure, LUN has been automatically taken offline due to insufficient space Unknown status: LUN is administratively offline or a more detailed offline reason is not available <p> This channel is the primary channel by default.</p>
Mapped	<p>If the LUN is mapped</p> <ul style="list-style-type: none"> Up status: Yes Down status: No
Other Ops	The other operations per second
Read Blocks	The number of read blocks per second
Read Ops	The number of disk read operations per second
SCSI Errors	The number of Small Computer System Interface (SCSI) errors per second
Write Blocks	The number of write blocks per second
Write Ops	The number of disk write operations per second

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)⁴⁹⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²

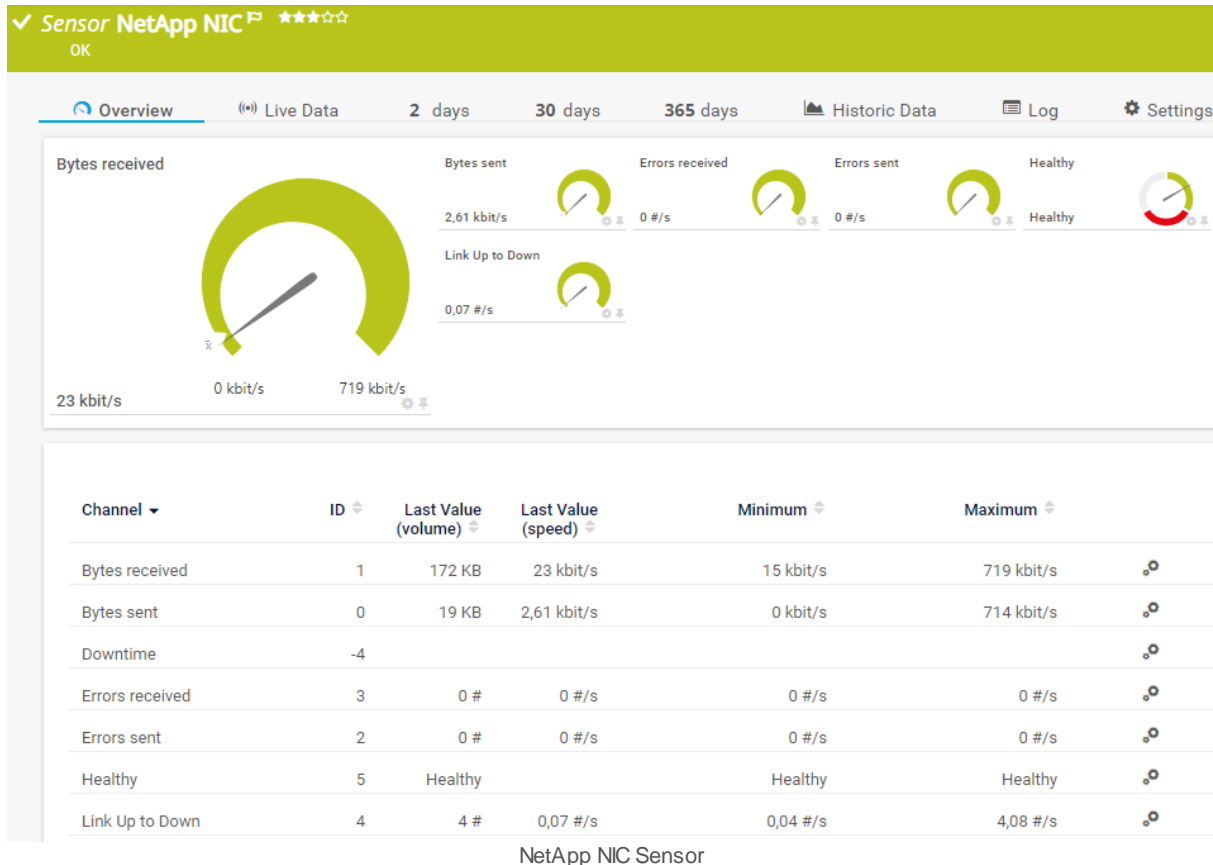

Part 7: Device and Sensor Setup | 8 Sensor Settings
98 NetApp LUN Sensor

- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.99 NetApp NIC Sensor

The NetApp NIC sensor monitors the network interface card (NIC) of a NetApp cDOT or ONTAP cluster accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Sensor in Other Languages

- Dutch: NetApp NIC
- French: NIC NetApp
- German: NetApp NIC
- Japanese: NetApp NIC
- Portuguese: NetApp NIC
- Russian: NIC NetApp
- Simplified Chinese: NetApp NIC
- Spanish: NIC de NetApp

Remarks

- This sensor requires .NET 4.7.2 or later on the probe system.

- The ONTAPI user account that you use with this sensor needs [access](#) to the DATA ONTAP API (ONTAPI) so that the sensor can request data from it. The access is enabled by default.
- For this sensor, read-only user rights are sufficient for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster | ClusterX | Configuration | Security | Users
- This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- You can define NetApp API credentials (User Name and Password) in the [credentials for Windows systems](#) settings of the parent device. This way, you do not have to individually enter credentials for each NetApp sensor that you add to the same device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Enabled ONTAPI access	<p>NetApp sensors require access to ONTAPI for the utilized user account. This is enabled by default. If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web> modify -vserver clusterd -name ontapi -enabled true</pre>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG performs a meta-scan before you can add this sensor and requires basic information in advance. Provide the required information in the dialog box that appears. PRTG then recognizes all items that are available for monitoring based on your input.

Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Sensor Settings Overview

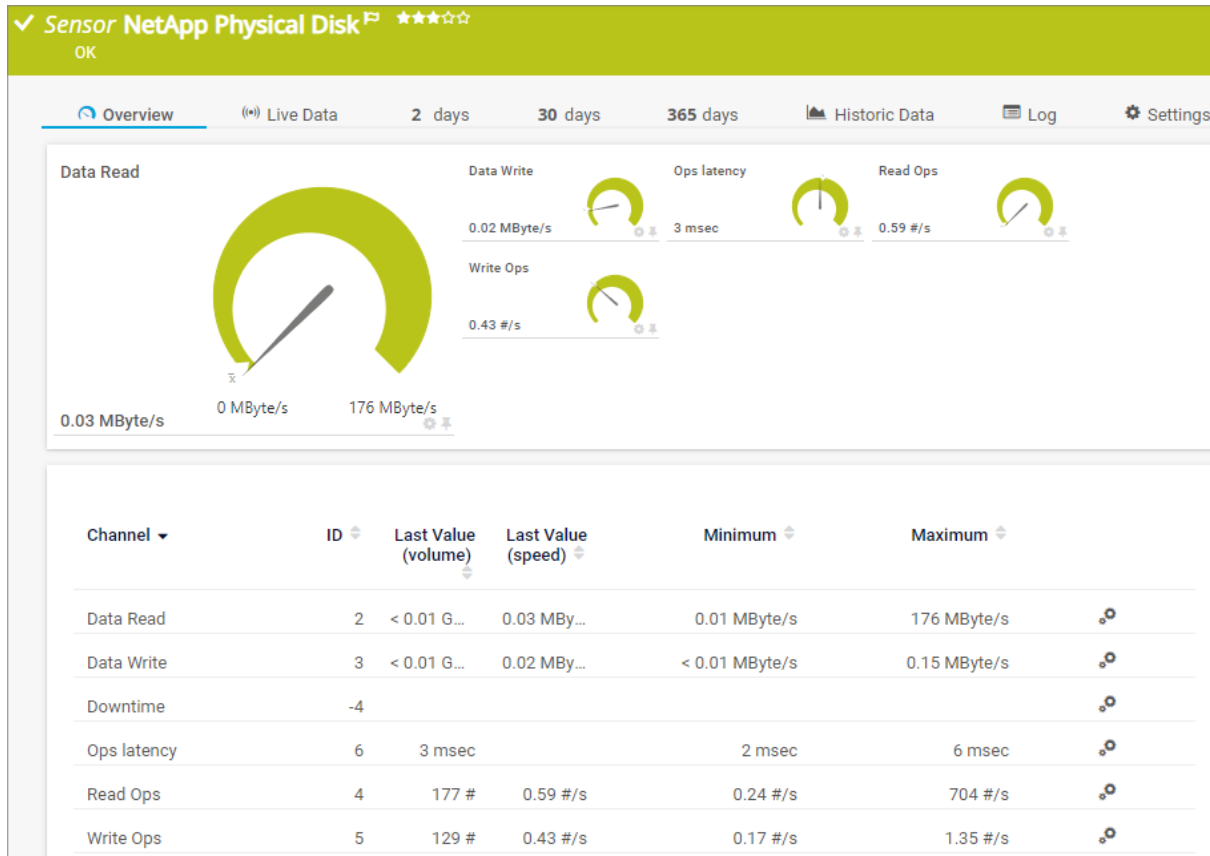

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.100 NetApp Physical Disk Sensor

The NetApp Physical Disk sensor monitors disks of a NetApp cDOT or ONTAP storage system accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

NetApp Physical Disk Sensor

Sensor in Other Languages

- Dutch: NetApp Fysieke Schijf
- French: Disque physique NetApp
- German: NetApp Physikal. Laufwerk
- Japanese: NetApp 物理ディスク
- Portuguese: NetApp Disco físico
- Russian: NetApp
- Simplified Chinese: NetApp 物理磁盘
- Spanish: Disco físico de NetApp

Remarks

- This sensor requires .NET 4.7.2 or later on the probe system.

- The ONTAPI user account that you use with this sensor needs [access](#) to the DATA ONTAP API (ONTAPI) so that the sensor can request data from it. The access is enabled by default.
- For this sensor, read-only user rights are sufficient for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster | ClusterX | Configuration | Security | Users
- This sensor supersedes the deprecated NetApp cDOT Physical Disk (SOAP) sensor.
- This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- You can define NetApp API credentials (User Name and Password) in the [credentials for Windows systems](#) settings of the parent device. This way, you do not have to individually enter credentials for each NetApp sensor that you add to the same device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Enabled ONTAPI access	<p>NetApp sensors require access to ONTAPI for the utilized user account. This is enabled by default. If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web> modify -vserver clusterd -name ontapi -enabled true</pre>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG performs a meta-scan before you can add this sensor and requires basic information in advance. Provide the required information in the dialog box that appears. PRTG then recognizes all items that are available for monitoring based on your input.

- Spanish: NetApp SnapMirror

Remarks

- This sensor requires .NET 4.7.2 or later on the probe system.
- The ONTAPI user account that you use with this sensor needs [access](#)¹⁷⁷³ to the DATA ONTAP API (ONTAPI) so that the sensor can request data from it. The access is enabled by default.
- For this sensor, read-only user rights are sufficient for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster | ClusterX | Configuration | Security | Users
- This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- You can define NetApp API credentials (User Name and Password) in the [credentials for Windows systems](#)⁴⁵² settings of the parent device. This way, you do not have to individually enter credentials for each NetApp sensor that you add to the same device.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)⁴⁴⁸⁵.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Enabled ONTAPI access	<p>NetApp sensors require access to ONTAPI for the utilized user account. This is enabled by default. If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web> modify -vserver clusterd -name ontapi -enabled true</pre>

Add Sensor

The [Add Sensor](#)³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG performs a meta-scan before you can add this sensor and requires basic information in advance. Provide the required information in the dialog box that appears. PRTG then recognizes all items that are available for monitoring based on your input.

 Store result

Debug Options

Setting	Description
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result.

Setting	Description
	<ul style="list-style-type: none"> Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ

Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration^[4187] on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

- Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Healthy	<p>If the system is healthy</p> <ul style="list-style-type: none"> ▪ Up status ¹⁹⁷: Yes ▪ Down status: No

Channel	Description
	 This channel is the primary channel by default.
Lag	The lag transfer duration
Last Transfer Duration	The duration of the last transfer
Last Transfer Size	The size of the last transfer
Last Transfer Timestamp	The time stamp of the last transfer
Mirror State	The mirror state <ul style="list-style-type: none"> ▪ Up status: Snapmirrored ▪ Warning status: Uninitialized ▪ Down status: Broken-Off, Unknown
Relationship Type	The relationship type <ul style="list-style-type: none"> ▪ Up status: Mirror, Mirror and Vault, Vault ▪ Down status: Unknown
Resync Fails	The number of resynchronization fails per second
Transfer Status	The transfer status (relationship status returned from the API) <ul style="list-style-type: none"> ▪ Up status: Aborting, Checking, Finalizing, Idle, Preparing, Queued, Quiesced, Quiescing, Transferring ▪ Warning status: Breaking, Unknown
Update Fails	The number of update fails per second

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.102 NetApp System Health Sensor

The NetApp System Health sensor monitors the health of a NetApp cDOT or ONTAP storage system accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

NetApp System Health Sensor

Sensor in Other Languages

- Dutch: NetApp Systeem Gesteldheid
- French: État du système NetApp
- German: NetApp Systemzustand
- Japanese: NetApp システム正常性
- Portuguese: NetApp Funcionamento do sistema
- Russian: NetApp
- Simplified Chinese: NetApp 系统健康状况
- Spanish: Estado del sistema de NetApp

Remarks

- This sensor requires .NET 4.7.2 or later on the probe system.
- The ONTAPI user account that you use with this sensor requires [access](#)¹⁷⁹⁴ to the DATA ONTAP API (ONTAPI) so that the sensor can request data from it. The access is enabled by default.
- This sensor requires administrator rights for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster | ClusterX | Configuration | Security | Users
- This sensor supersedes the deprecated NetApp cDOT System Health (SOAP) sensor.
- This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- As an alternative to administrator rights, you can add a specific Role Attribute and use read-only rights. For details, see section [Permissions: Alternative to Administrator Rights](#)¹⁸⁰⁶
- You can define NetApp API credentials (User Name and Password) in the [credentials for Windows systems](#)⁴⁵² settings of the parent device. This way, you do not have to individually enter credentials for each NetApp sensor that you add to the same device.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)⁴⁴⁸⁵.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Enabled ONTAPI access	<p>NetApp sensors require access to ONTAPI for the utilized user account. This is enabled by default. If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web> modify -vserver clusterd -name ontapi -enabled true</pre>

Add Sensor

The [Add Sensor](#)³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG performs a meta-scan before you can add this sensor and requires basic information in advance. Provide the required information in the dialog box that appears. PRTG then recognizes all items that are available for monitoring based on your input.

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration^[4187] on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Permissions: Alternative to Administrator Rights

If you do not want to provide administrator rights for the ONTAPI user account that you use with the NetApp System Health sensor, you can add a new command to the selected role of the user that makes read-only rights sufficient.

- Edit the Role of this user in the console under Cluster | ClusterX | Configuration | Security | Users.
- Add the command storage aggregate check_spare_low with access control list (ACL) all to the Role Attributes.

With this role attribute, read-only rights are sufficient for the NetApp System Health sensor.

Channel List

- ⓘ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
CPU	<p>The CPU load in percent</p> <p>i This channel is the primary channel by default.</p>
Downtime	<p>In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.</p>
Failed Fans	<p>The number of failed fans</p>
Failed PSU	<p>The number of failed power supplies</p>
Memory	<p>The memory usage</p>
Node Health	<p>The node health</p> <ul style="list-style-type: none"> Up status¹⁹⁷: OK Down status: Error

Sensor Settings Overview

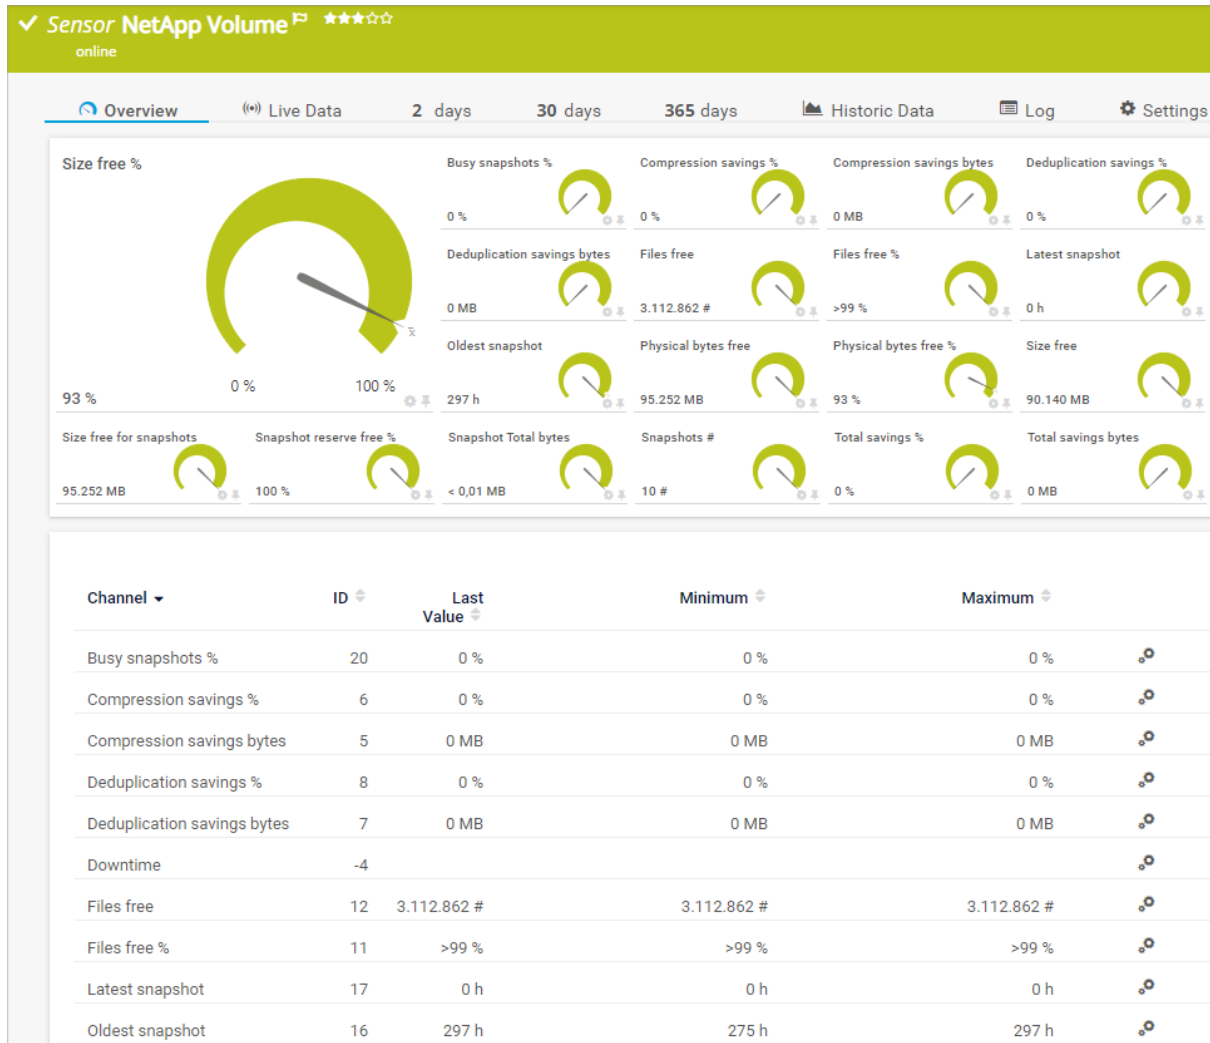

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.103 NetApp Volume Sensor

The NetApp Volume sensor monitors volumes on a NetApp cDOT or ONTAP storage system accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

NetApp Volume Sensor

Sensor in Other Languages

- Dutch: NetApp Volume
- French: Volume NetApp
- German: NetApp Volume
- Japanese: NetApp ボリューム
- Portuguese: NetApp Volume
- Russian: NetApp
- Simplified Chinese: NetApp 卷

- Spanish: Volumen de NetApp

Remarks

- This sensor requires .NET 4.7.2 or later on the probe system.
- The ONTAPI user account that you use with this sensor requires [access](#) to DATA ONTAP API (ONTAPI) so that the sensor can request data from it. The access is enabled by default.
- For this sensor, read-only user rights are sufficient for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster | ClusterX | Configuration | Security | Users
- This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- You can define NetApp API credentials (User Name and Password) in the [credentials for Windows systems](#) settings of the parent device. This way, you do not have to individually enter credentials for each NetApp sensor that you add to the same device.

Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Enabled ONTAPI access	<p>NetApp sensors require access to ONTAPI for the utilized user account. This is enabled by default. If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web> modify -vserver clusterd -name ontapi -enabled true</pre>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

PRTG performs a meta-scan before you can add this sensor and requires basic information in advance. Provide the required information in the dialog box that appears. PRTG then recognizes all items that are available for monitoring based on your input.

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Busy Snapshots %	The number of busy snapshots in percent
Compression Savings %	The compression savings in percent
Compression Savings Bytes	The compression savings in bytes
Deduplication Savings %	The deduplication savings in percent
Deduplication Savings Bytes	The deduplication savings in bytes
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Files Free	The free files in total

Channel	Description
Files Free %	The free files in percent
Latest Snapshot	The age of the last snapshot
Oldest Snapshot	The age of the oldest snapshot
Physical Bytes Free	The free physical bytes in total
Physical Bytes Free %	The free physical bytes in percent
Size Free	The free size in total
Size Free %	The free size in percent  This channel is the primary channel by default.
Size Free For Snapshots	The free size for snapshots
Snapshot Reserve Free %	The free snapshot reserve in percent
Snapshots #	The number of snapshots
Total Savings %	The total savings in percent
Total Savings Bytes	The total savings in bytes

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977

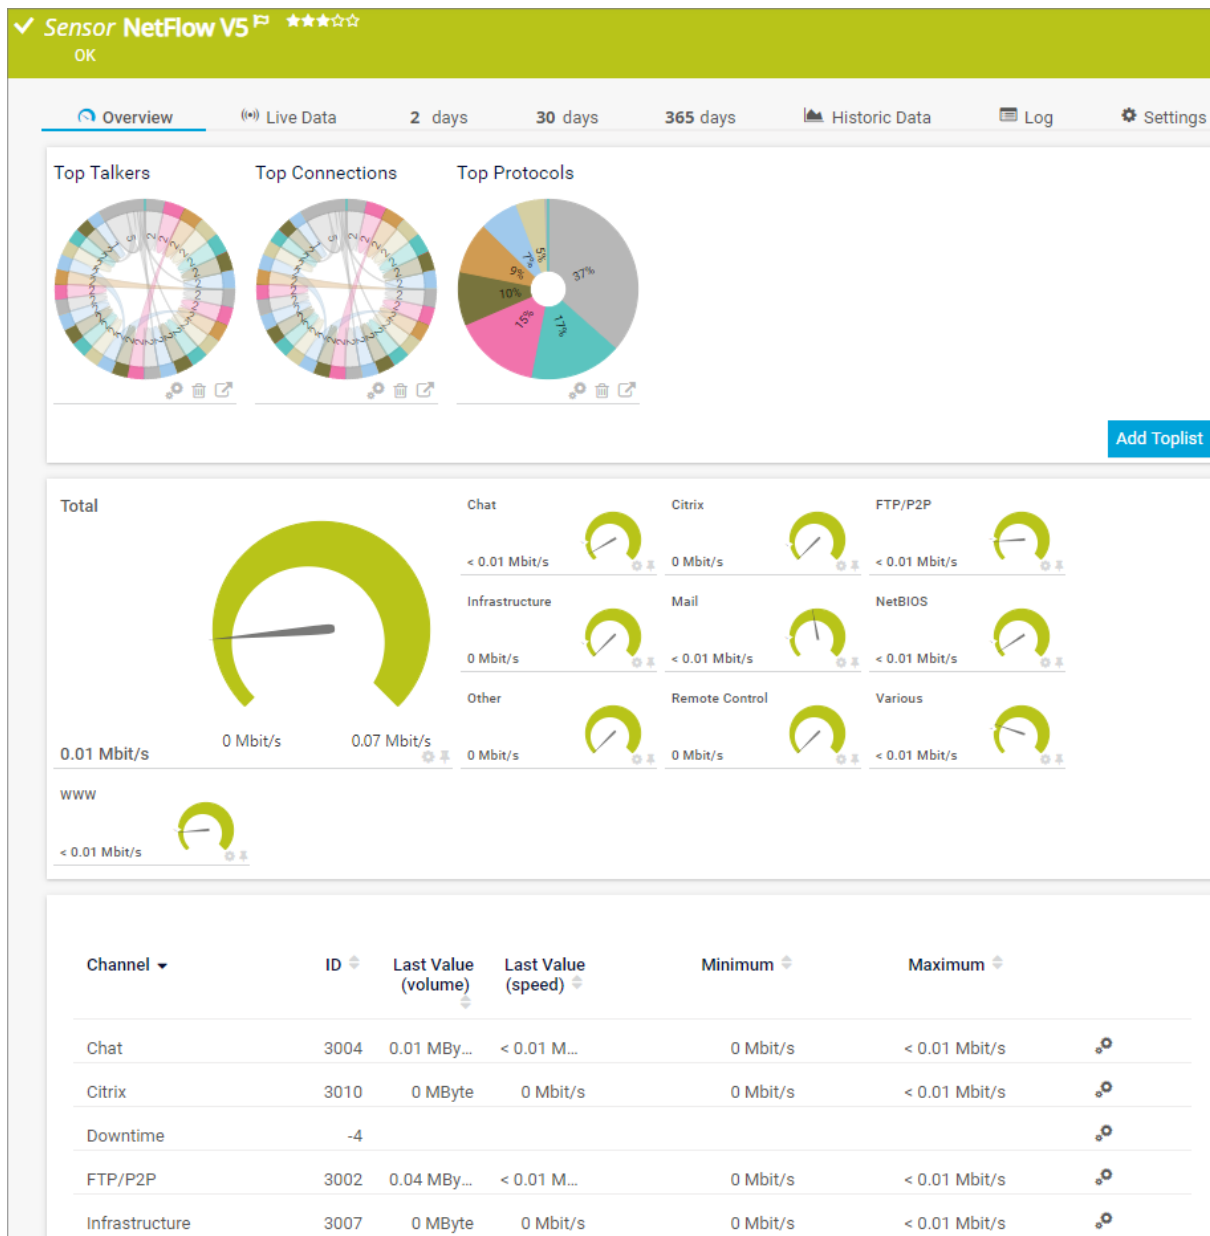

- [Notification Triggers Settings](#) 

7.8.104 NetFlow v5 Sensor

The NetFlow v5 sensor receives traffic data from a NetFlow v5-compatible device and shows the traffic by type. This sensor has several filter options to divide traffic into different channels.

i Make sure that the sensor matches the NetFlow version that your device exports.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

NetFlow v5 Sensor

Sensor in Other Languages

- Dutch: NetFlow v5
- French: NetFlow v5

- German: NetFlow v5
- Japanese: NetFlow v5
- Portuguese: NetFlow v5
- Russian: NetFlow v5
- Simplified Chinese: NetFlow v5
- Spanish: NetFlow v5

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
 - You must enable NetFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the probe system.
 - For cloning this sensor, the following rules apply. If you add the clone to the **same** probe, PRTG keeps the selected IP addresses on which it listens for xFlow (NetFlow, jFlow, sFlow, IPFIX) packets. If you add the clone to a **different** probe, PRTG selects **all** available IP addresses by default. You can change the selected IP addresses in the sensor settings.
 - You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
 - See the Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)
 - See the Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)
- ☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) ³⁶⁷ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains the following fields:

- Sensor Name**: Example Name
- Tags**: exampletag (with a plus icon to add more)
- Priority**: ★★★★★ (with the first four stars filled)

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ bandwidthsensor ▪ netflowsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

NetFlow v5 Specific Settings

NetFlow v5 Specific Settings

Receive NetFlow Packets on UDP Port ⓘ	9997
Sender IP Address ⓘ	
Receive NetFlow Packets on IP Address ⓘ	<input checked="" type="checkbox"/> Probe's Local IP Addresses
	<input checked="" type="checkbox"/> 192.0.2.0
Active Flow Timeout (Minutes) ⓘ	10
Sampling Mode ⓘ	<input checked="" type="radio"/> Off <input type="radio"/> On
Stream Data Handling ⓘ	<input checked="" type="radio"/> Discard stream data (recommended) <input type="radio"/> Store stream data only for the 'Other' channel <input type="radio"/> Store all stream data

NetFlow v5 Specific Settings

Setting	Description
Receive NetFlow Packets on UDP Port	<p>Enter the User Datagram Protocol (UDP) port number on which the flow packets are received. It must match the UDP port number in the NetFlow export options of the hardware router device. Enter an integer value.</p> <p>i When you configure the export, make sure that you select the appropriate NetFlow version for this sensor.</p>
Sender IP Address	<p>Enter the IP address of the sending device that you want to receive the NetFlow from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the specified port.</p>
Receive NetFlow Packets on IP Address	<p>Select the IP addresses on which PRTG listens to NetFlow packets. The list of IP addresses is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address that you select must match the IP address in the NetFlow export options of the hardware router device.</p> <p>i When you configure the export, make sure that you select the appropriate NetFlow version for this sensor.</p> <p>i You can also select all items or cancel the selection by using the check box in the table header.</p>

Setting	Description
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which the sensor must receive new flow data. If the timeout elapses and the sensor receives no new data during this time, it shows the Unknown status^[197]. Enter an integer value. The maximum timeout is 60 minutes.</p> <ul style="list-style-type: none">  We recommend that you set the timeout one minute longer than the timeout in the hardware router device.  If you set this value too low, flow information might be lost.  For more details, see the Knowledge Base: What is the Active Flow Timeout in Flow sensors?  If the target device sends incorrect time information that results in wrong monitoring data, try to use 0 as active flow timeout. This ignores the start and stop information of a flow as provided by the device and accounts all data to the current point in time. It might result in spikes but all data is captured.
Sampling Mode	<p>Define if you want to use the sampling mode:</p> <ul style="list-style-type: none"> ▪ Off: Use the standard flow. ▪ On: Use the sampling mode and specify the Sampling Rate below. <p> This setting must match the setting in the xFlow exporter.</p>
Sampling Rate	<p>This setting is only visible if you select On above. Enter a number that matches the sampling rate in the exporting device. If the number is different, monitoring results will be incorrect. Enter an integer value.</p>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> ▪ Discard stream data (recommended): Do not store the stream and packet data. ▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the PRTG data directory^[4526] on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. ▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p> Use with caution. If you enable this setting, it can create huge data files. We recommend that you only use this setting for a short time.</p>

Channel Configuration

Channel Configuration

Note You can change the default settings for the selected channels. This way, you do not have to customize this setting each time that you add this sensor type to PRTG. For details, see [this article](#) in the Knowledge Base.

Channel Configuration

Setting	Description
Channel Selection	<p>Define the categories that the sensor accounts the traffic to:</p> <ul style="list-style-type: none"> ▪ Web: Internet web traffic. ▪ File Transfer: Traffic from FTP. ▪ Mail: Internet mail traffic. ▪ Chat: Traffic from chat and instant messaging. ▪ Remote Control: Traffic from remote control applications such as RDP, SSH, Telnet, and VNC. ▪ Infrastructure: Traffic from network services such as DHCP, DNS, Ident, ICMP, and SNMP. ▪ NetBIOS: Traffic from NetBIOS communication. ▪ Citrix: Traffic from Citrix applications. ▪ Other Protocols: Traffic from various other protocols via UDP and TCP. <p>For each group, you can select how many channels the sensor uses, that is, how detailed the sensor divides the traffic. For each group, choose from:</p> <ul style="list-style-type: none"> ▪ No (✘): Do not account traffic of this group in its own channel. The sensor accounts all traffic of this group to the default channel named Other. ▪ Yes (✔): Count all traffic of this group and summarize it in one channel.

Setting	Description
	<ul style="list-style-type: none"> ▪ Detail (🔍): Count all traffic of this group and further divide it into different channels. The traffic appears in several channels that you can see in the Content column. <ul style="list-style-type: none"> ⓘ Extensive use of this option can cause load problems on the probe system. We recommend that you set specific, well-chosen filters for the data that you really want to analyze. ■ You can change the default configuration for groups and channels. For details, see the Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?

Filtering

■ For detailed information, see section [Filter Rules](#) ¹⁸³⁷.

Filtering

Filters *To include and exclude specific traffic, you can define filter rules based on the following format guidelines:*

- field[filter]

Fields:

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

Additional IPFIX fields:

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax.
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

Sensor Display

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ^[368] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ^[142].

Scanning Interval

Click  to interrupt the [inheritance](#) ^[142].

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Toplists

For all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

 For more information, see section [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#) .

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name
Port	Any number
SourceIP	IP address or Domain Name System (DNS) name
SourcePort	Any number
DestinationIP	IP address or Domain Name System (DNS) name
DestinationPort	Any number

Field	Possible Filter Values
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to NetFlow v5 sensors only.

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel. Possible values: IP address or DNS name
SourceASI	Any number
DestinationASI	Any number

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Chat	The traffic from chat and instant messaging (Internet Relay Chat (IRC), AOL Instant Messenger (AIM)) in bytes per second
Citrix	The traffic from Citrix applications in bytes per second

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
FTP/P2P	The traffic from file transfer (File Transfer Protocol (FTP)/Peer-to-Peer (P2P)) in bytes per second
Infrastructure	The traffic from network services (Dynamic Host Configuration Protocol (DHCP), Domain Name System (DNS), Ident, Internet Control Message Protocol (ICMP), Simple Network Management Protocol (SNMP)) in bytes per second
Mail	The internet mail traffic (Internet Message Access Protocol (IMAP), Post Office Protocol version 3 (POP3), Simple Mail Transfer Protocol (SMTP)) in bytes per second
NetBIOS	The traffic from NetBIOS communication in bytes per second
Other	The traffic from various other protocols (User Datagram Protocol (UDP), Transmission Control Protocol (TCP)) in bytes per second
Remote Control	The traffic from remote control applications (Remote Desktop Protocol (RDP), Secure Shell (SSH), Telnet, Virtual Network Computing (VNC)) in bytes per second
Total	The total traffic in bytes per second  This channel is the primary channel by default.
Various	The traffic from various other sources in bytes per second
WWW	The traffic from the web (HTTP, HTTPS) in bytes per second

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3927

7.8.105 NetFlow v5 (Custom) Sensor

The NetFlow v5 (Custom) sensor receives traffic data from a NetFlow v5-compatible device and shows the traffic by type. With this sensor, you can define your own channel definitions to divide traffic into different channels.

i Make sure that the sensor matches the NetFlow version that your device exports.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

NetFlow v5 (Custom) Sensor

Sensor in Other Languages

- Dutch: NetFlow v5 (aangepast)

- French: NetFlow v5(personnalisé)
- German: NetFlow v5 (Benutzerdefiniert)
- Japanese: NetFlow v5(カスタム)
- Portuguese: NetFlow v5 (personalizado)
- Russian: NetFlow v5 ()
- Simplified Chinese: NetFlow v5 (自定义)
- Spanish: NetFlow v5 (Personalizado)

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- You must enable NetFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the probe system.
- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.
- You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
- See the Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three rows of settings:

- Sensor Name**: A text input field containing "Example Name".
- Tags**: A text input field containing "exampletag" with a blue 'x' icon to its right and a plus icon to its left.
- Priority**: A field showing five stars, with the first three stars filled and the last two empty.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[406], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ bandwidthsensor ▪ netflowsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

NetFlow v5 Specific Settings

Setting	Description
Receive NetFlow Packets on UDP Port	<p>Enter the User Datagram Protocol (UDP) port number on which the flow packets are received. It must match the UDP port number in the NetFlow export options of the hardware router device. Enter an integer value.</p> <p> ⓘ When you configure the export, make sure that you select the appropriate NetFlow version for this sensor.</p>
Sender IP Address	<p>Enter the IP address of the sending device that you want to receive the NetFlow from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the specified port.</p>
Receive NetFlow Packets on IP Address	<p>Select the IP addresses on which PRTG listens to NetFlow packets. The list of IP addresses is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address that you select must match the IP address in the NetFlow export options of the hardware router device.</p> <p> ⓘ When you configure the export, make sure that you select the appropriate NetFlow version for this sensor.</p>

Setting	Description
	<p> You can also select all items or cancel the selection by using the check box in the table header.</p>
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which the sensor must receive new flow data. If the timeout elapses and the sensor receives no new data during this time, it shows the Unknown status¹⁹⁷. Enter an integer value. The maximum timeout is 60 minutes.</p> <p> We recommend that you set the timeout one minute longer than the timeout in the hardware router device.</p> <p> If you set this value too low, flow information might be lost.</p> <p> For more details, see the Knowledge Base: What is the Active Flow Timeout in Flow sensors?</p> <p> If the target device sends incorrect time information that results in wrong monitoring data, try to use 0 as active flow timeout. This ignores the start and stop information of a flow as provided by the device and accounts all data to the current point in time. It might result in spikes but all data is captured.</p>
Sampling Mode	<p>Define if you want to use the sampling mode:</p> <ul style="list-style-type: none"> ▪ Off: Use the standard flow. ▪ On: Use the sampling mode and specify the Sampling Rate below. <p> This setting must match the setting in the xFlow exporter.</p>
Sampling Rate	<p>This setting is only visible when sampling mode is On above. Enter a number that matches the sampling rate in your device that exports the xFlows. If the number is different, monitoring results will be incorrect. Enter an integer value.</p>
Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Enter each definition in one line. The sensor accounts all traffic that you do not define a channel for to the default channel Other.</p> <p> For detailed information, see section Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors⁴⁴⁸¹.</p> <p> Extensive use of many filters can cause load problems on the probe system. We recommend that you define specific, well-chosen filters for the data that you really want to analyze. We recommend that you do not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, we recommend that you add several sensors with fewer channels each.</p>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p>

Setting	Description
	<ul style="list-style-type: none"> Discard stream data (recommended): Do not store the stream and packet data. Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>i Use with caution. If you enable this setting, it can create huge data files. We recommend that you only use this setting for a short time.</p>

Filtering

For detailed information, see section [Filter Rules](#)¹⁸⁵³.

Filtering

Filters To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

Fields:

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

Additional IPFIX fields:

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax.
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[368] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p> i You can change the available intervals in the system administration on PRTG on premises installations. </p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p> i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply. </p> <p> i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply. </p> <p> i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply. </p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Toplists

For all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

 For more information, see section [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#) .

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name
Port	Any number
SourceIP	IP address or Domain Name System (DNS) name
SourcePort	Any number
DestinationIP	IP address or Domain Name System (DNS) name
DestinationPort	Any number

Field	Possible Filter Values
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to NetFlow v5 sensors only.

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel. Possible values: IP address or DNS name
SourceASI	Any number
DestinationASI	Any number

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
[Custom]	The traffic by type according to the channel definition

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Other	All traffic for which no channel is defined in bytes per second
Total	The total traffic in bytes per second  This channel is the primary channel by default.

7.8.106 NetFlow v9 Sensor

The NetFlow v9 sensor receives traffic data from a NetFlow v9-compatible device and shows the traffic by type. This sensor has several filter options to divide traffic into different channels.

i Make sure that the sensor matches the NetFlow version that your device exports.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

NetFlow v9 Sensor

Sensor in Other Languages

- Dutch: NetFlow v9
- French: NetFlow v9

- German: NetFlow v9
- Japanese: NetFlow v9
- Portuguese: NetFlow v9
- Russian: NetFlow v9
- Simplified Chinese: NetFlow v9
- Spanish: NetFlow v9

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
 - You must enable NetFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the probe system.
 - For cloning this sensor, the following rules apply. If you add the clone to the **same** probe, PRTG keeps the selected IP addresses on which it listens for xFlow (NetFlow, jFlow, sFlow, IPFIX) packets. If you add the clone to a **different** probe, PRTG selects **all** available IP addresses by default. You can change the selected IP addresses in the sensor settings.
 - You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
 - See the Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)
 - See the Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)
- ☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Note You can change the default settings for the selected channels. This way, you do not have to customize this setting each time that you add this sensor type to PRTG. For details, see [this article](#) in the Knowledge Base.

Channel Configuration

Setting	Description
Channel Selection	<p>Define the categories that the sensor accounts the traffic to:</p> <ul style="list-style-type: none"> ▪ Web: Internet web traffic. ▪ File Transfer: Traffic from FTP. ▪ Mail: Internet mail traffic. ▪ Chat: Traffic from chat and instant messaging. ▪ Remote Control: Traffic from remote control applications such as RDP, SSH, Telnet, and VNC. ▪ Infrastructure: Traffic from network services such as DHCP, DNS, Ident, ICMP, and SNMP. ▪ NetBIOS: Traffic from NetBIOS communication. ▪ Citrix: Traffic from Citrix applications. ▪ Other Protocols: Traffic from various other protocols via UDP and TCP. <p>For each group, you can select how many channels the sensor uses, that is, how detailed the sensor divides the traffic. For each group, choose from:</p> <ul style="list-style-type: none"> ▪ No (✘): Do not account traffic of this group in its own channel. The sensor accounts all traffic of this group to the default channel named Other. ▪ Yes (✔): Count all traffic of this group and summarize it in one channel.

Setting	Description
	<ul style="list-style-type: none"> ▪ Detail (🔍): Count all traffic of this group and further divide it into different channels. The traffic appears in several channels that you can see in the Content column. <ul style="list-style-type: none"> ⓘ Extensive use of this option can cause load problems on the probe system. We recommend that you set specific, well-chosen filters for the data that you really want to analyze. ■ You can change the default configuration for groups and channels. For details, see the Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?

Filtering

■ For detailed information, see section [Filter Rules](#) ¹⁸⁶⁹.

Filtering

Filters *To include and exclude specific traffic, you can define filter rules based on the following format guidelines:*

- field[filter]

Fields:

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

Additional IPFIX fields:

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax.
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ^[368] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ^[142].

Scanning Interval

Click  to interrupt the [inheritance](#) ^[142].

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p> i You can change the available intervals in the system administration on PRTG on premises installations. </p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p> i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply. </p> <p> i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply. </p> <p> i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply. </p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Toplists

For all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

 For more information, see section [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#) .

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name
Port	Any number
SourceIP	IP address or Domain Name System (DNS) name
SourcePort	Any number
DestinationIP	IP address or Domain Name System (DNS) name
DestinationPort	Any number

Field	Possible Filter Values
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to NetFlow v9 sensors only.

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel. Possible values: IP address or DNS name
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in the form of a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in the form of a single number (number of contiguous bits).
NextHop	IP address or Domain Name System (DNS) name

Field	Possible Filter Values
VLAN	VLAN values represent a VLAN identifier (any number)
SourceVLAN	VLAN values represent a VLAN identifier (any number)
DestinationVLAN	VLAN values represent a VLAN identifier (any number)

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Chat	The traffic from chat and instant messaging (Internet Relay Chat (IRC), AOL Instant Messenger (AIM)) in bytes per second
Citrix	The traffic from Citrix applications in bytes per second
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
FTP/P2P	The traffic from file transfer (File Transfer Protocol (FTP)/Peer-to-Peer (P2P)) in bytes per second
Infrastructure	The traffic from network services (Dynamic Host Configuration Protocol (DHCP), Domain Name System (DNS), Ident, Internet Control Message Protocol (ICMP), Simple Network Management Protocol (SNMP)) in bytes per second
Mail	The internet mail traffic (Internet Message Access Protocol (IMAP), Post Office Protocol version 3 (POP3), Simple Mail Transfer Protocol (SMTP)) in bytes per second
NetBIOS	The traffic from NetBIOS communication in bytes per second
Other	The traffic from various other protocols (User Datagram Protocol (UDP), Transmission Control Protocol (TCP)) in bytes per second
Remote Control	The traffic from remote control applications (Remote Desktop Protocol (RDP), Secure Shell (SSH), Telnet, Virtual Network Computing (VNC)) in bytes per second

Channel	Description
Total	The total traffic in bytes per second  This channel is the primary channel by default.
Various	The traffic from various other sources in bytes per second
WWW	The traffic from the web (HTTP, HTTPS) in bytes per second

Sensor Settings Overview

For more information about sensor settings, see the following sections:

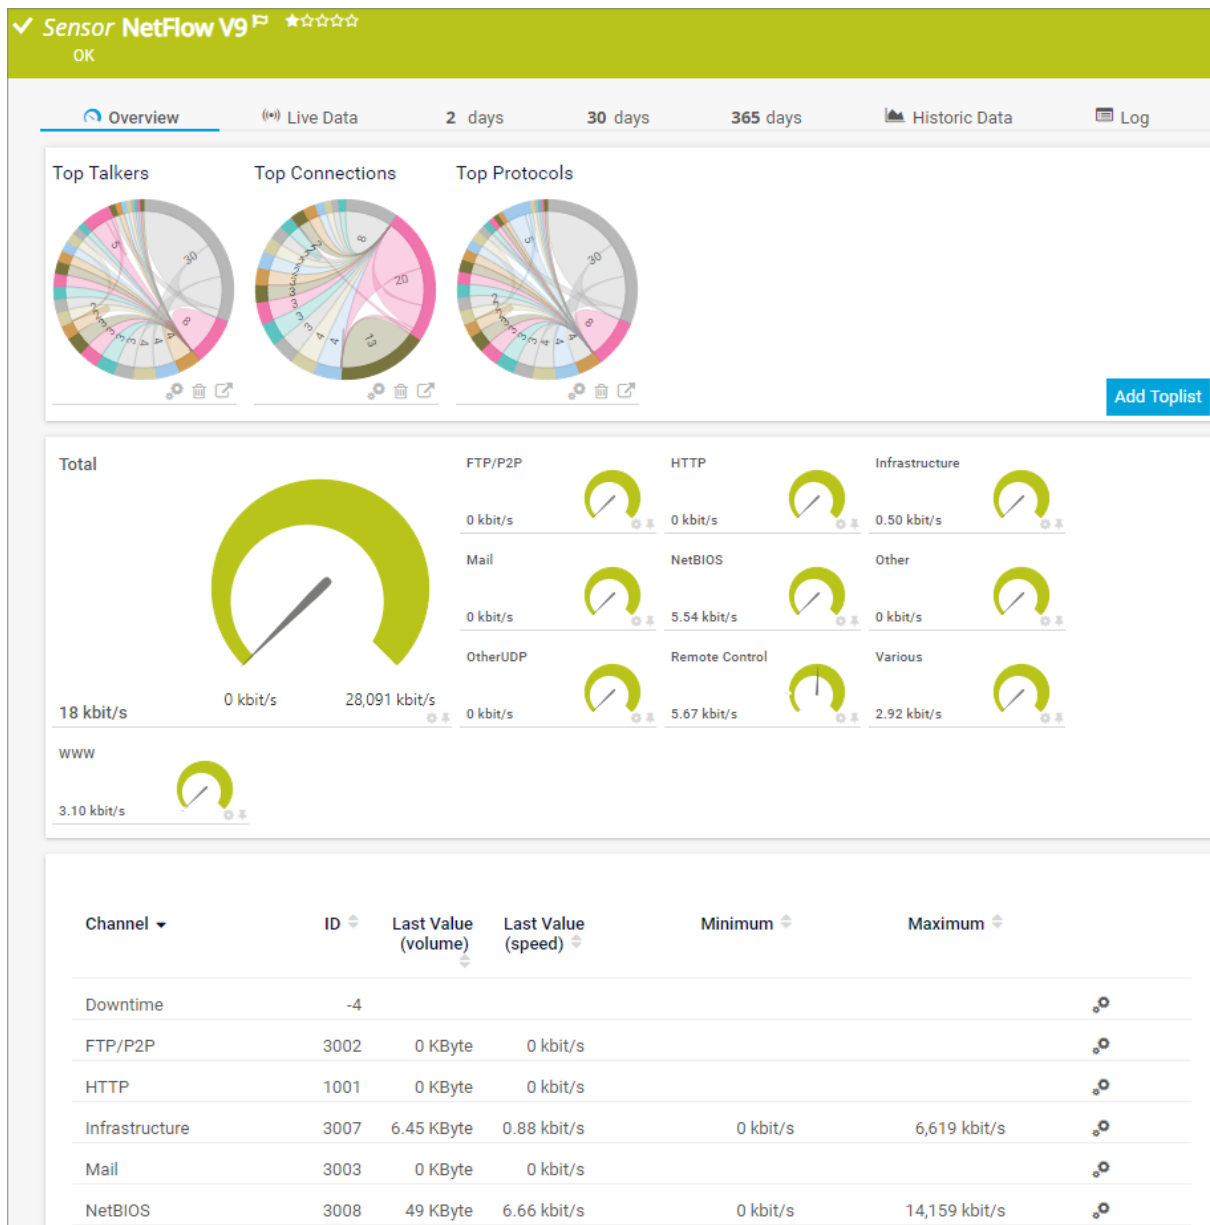

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.107 NetFlow v9 (Custom) Sensor

The NetFlow v9 (Custom) sensor receives traffic data from a NetFlow v9-compatible device and shows the traffic by type. With this sensor, you can define your own channel definitions to divide traffic into different channels.

i Make sure that the sensor matches the NetFlow version that your device exports.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

NetFlow v9 (Custom) Sensor

Sensor in Other Languages

- Dutch: NetFlow v9 (aangepast)

- French: NetFlow v9(personnalisé)
- German: NetFlow v9 (Benutzerdefiniert)
- Japanese: NetFlow v9(カスタム)
- Portuguese: NetFlow v9 (personalizado)
- Russian: NetFlow v9 ()
- Simplified Chinese: NetFlow v9 (自定义)
- Spanish: NetFlow v9 (Personalizado)

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- You must enable NetFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the probe system.
- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.
- You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
- See the Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

NetFlow v9 Specific Settings

Setting	Description
Receive NetFlow Packets on UDP Port	Enter the User Datagram Protocol (UDP) port number on which the flow packets are received. It must match the UDP port number in the NetFlow export options of the hardware router device. Enter an integer value. <p>i When you configure the export, make sure that you select the appropriate NetFlow version for this sensor.</p>
Sender IP Address	Enter the IP address of the sending device that you want to receive the NetFlow from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the specified port.
Receive NetFlow Packets on IP Address	Select the IP addresses on which PRTG listens to NetFlow packets. The list of IP addresses is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address that you select must match the IP address in the NetFlow export options of the hardware router device. <p>i When you configure the export, make sure that you select the appropriate NetFlow version for this sensor.</p>

Setting	Description
	<p> You can also select all items or cancel the selection by using the check box in the table header.</p>
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which the sensor must receive new flow data. If the timeout elapses and the sensor receives no new data during this time, it shows the Unknown status¹⁹⁷. Enter an integer value. The maximum timeout is 60 minutes.</p> <p> We recommend that you set the timeout one minute longer than the timeout in the hardware router device.</p> <p> If you set this value too low, flow information might be lost.</p> <p> For more details, see the Knowledge Base: What is the Active Flow Timeout in Flow sensors?</p> <p> If the target device sends incorrect time information that results in wrong monitoring data, try to use 0 as active flow timeout. This ignores the start and stop information of a flow as provided by the device and accounts all data to the current point in time. It might result in spikes but all data is captured.</p>
Sampling Mode	<p>Define if you want to use the sampling mode:</p> <ul style="list-style-type: none"> ▪ Off: Use the standard flow. ▪ On: Use the sampling mode and specify the Sampling Rate below. <p> This setting must match the setting in the xFlow exporter.</p>
Sampling Rate	<p>This setting is only visible when sampling mode is On above. Enter a number that matches the sampling rate in your device that exports the xFlows. If the number is different, monitoring results will be incorrect. Enter an integer value.</p>
Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Enter each definition in one line. The sensor accounts all traffic that you do not define a channel for to the default channel Other.</p> <p> For detailed information, see section Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors⁴⁴⁸¹.</p> <p> Extensive use of many filters can cause load problems on the probe system. We recommend that you define specific, well-chosen filters for the data that you really want to analyze. We recommend that you do not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, we recommend that you add several sensors with fewer channels each.</p>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p>

Setting	Description
	<ul style="list-style-type: none"> Discard stream data (recommended): Do not store the stream and packet data. Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>i Use with caution. If you enable this setting, it can create huge data files. We recommend that you only use this setting for a short time.</p>

Filtering

For detailed information, see section [Filter Rules](#)¹⁸⁸⁵.

Filtering

Filters To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

Fields:

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

Additional IPFIX fields:

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Toplists

For all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

 For more information, see section [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#) .

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name
Port	Any number
SourceIP	IP address or Domain Name System (DNS) name
SourcePort	Any number
DestinationIP	IP address or Domain Name System (DNS) name
DestinationPort	Any number

Field	Possible Filter Values
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to NetFlow v9 sensors only.

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel. Possible values: IP address or DNS name
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in the form of a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in the form of a single number (number of contiguous bits).
NextHop	IP address or Domain Name System (DNS) name

Field	Possible Filter Values
VLAN	VLAN values represent a VLAN identifier (any number)
SourceVLAN	VLAN values represent a VLAN identifier (any number)
DestinationVLAN	VLAN values represent a VLAN identifier (any number)

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
[Custom]	The traffic by type according to the channel definition
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Other	All traffic for which no channel is defined in bytes per second
Total	The total traffic in bytes per second i This channel is the primary channel by default.

Sensor Settings Overview

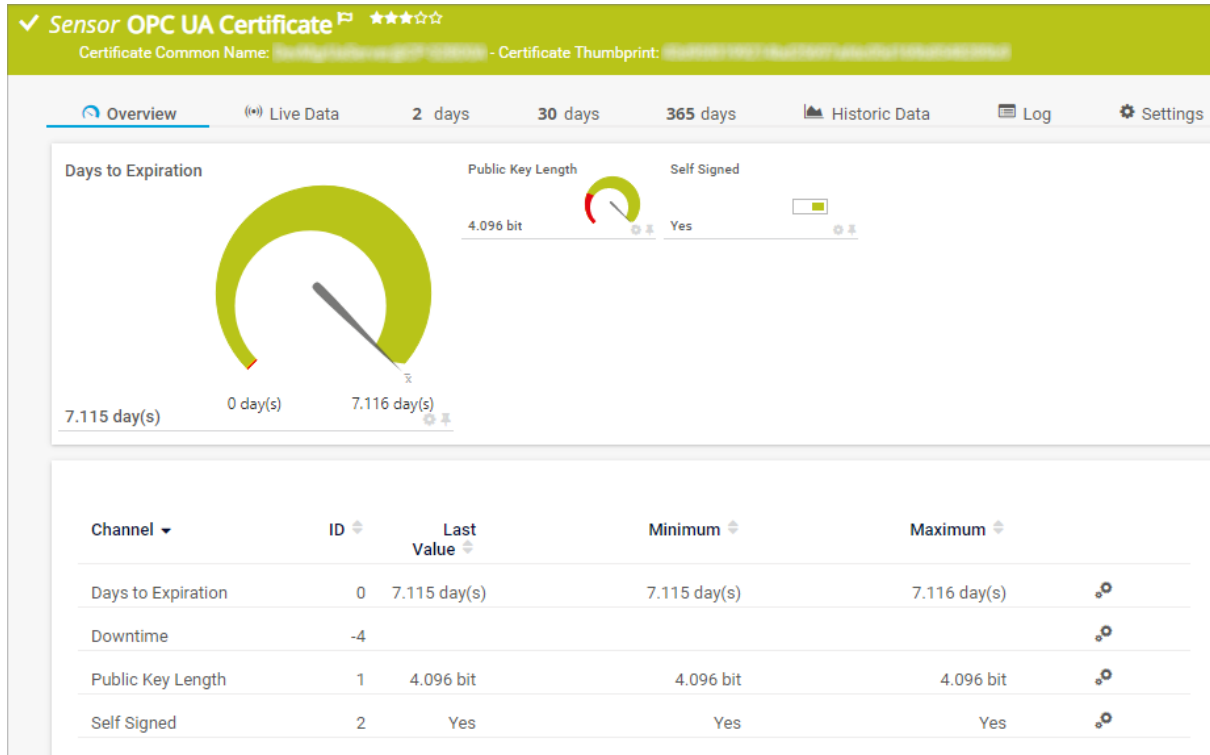

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.108 OPC UA Certificate Sensor

The OPC UA Certificate sensor monitors the certificate of an OPC Unified Architecture (OPC UA) server.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

OPC UA Certificate Sensor

Sensor in Other Languages

- Dutch: OPC UA Certificate
- French: OPC UA Certificate
- German: OPC UA Certificate
- Japanese: OPC UA Certificate
- Portuguese: OPC UA Certificate
- Russian: OPC UA Certificate
- Simplified Chinese: OPC UA Certificate
- Spanish: OPC UA Certificate

Remarks

- This sensor requires a valid port for the connection to the OPC UA server. Enter the port and, depending on the configuration, further credentials in the [Credentials for OPC UA](#) section in the settings of the parent device.
- This sensor supports the IPv6 protocol.

- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A list of tags with "exampletag" selected. There are "x" and "+" icons for removing and adding tags.
- Priority:** A star rating system showing 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ opcua ▪ opcuacertificate ▪ certificate
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking + below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Debug Options

Debug Options

Result Handling ⓘ Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory^[4526] on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window

Sensor Settings Overview

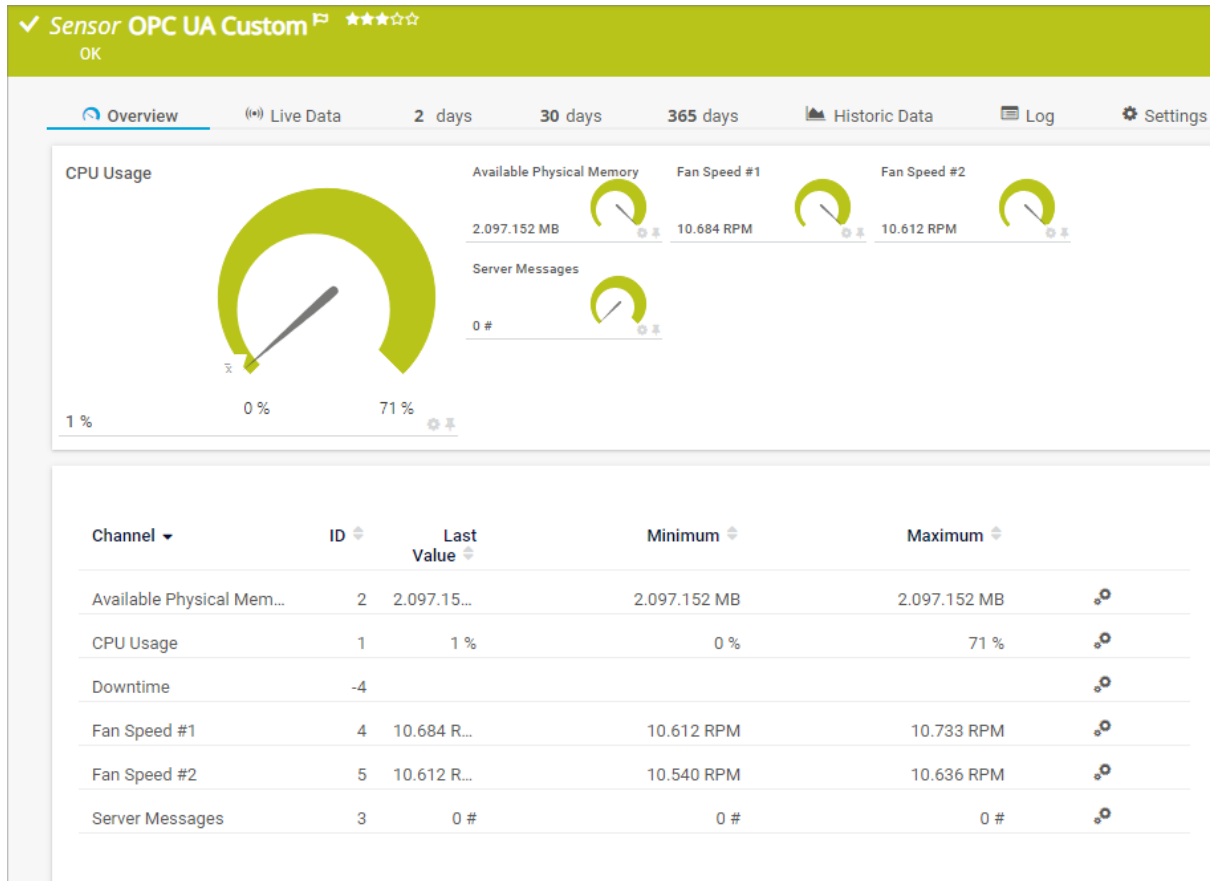

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.109 OPC UA Custom Sensor

The OPC UA Custom sensor monitors up to five numeric values returned by specific OPC Unified Architecture (OPC UA) node IDs.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

OPC UA Custom Sensor

Sensor in Other Languages

- Dutch: OPC UA Custom
- French: OPC UA Custom
- German: OPC UA Custom
- Japanese: OPC UA Custom
- Portuguese: OPC UA Custom
- Russian: OPC UA Custom
- Simplified Chinese: OPC UA Custom
- Spanish: OPC UA Custom

Remarks

- This sensor requires a valid port for the connection to the OPC UA server. Enter the port and, depending on the configuration, further credentials in the [Credentials for OPC UA](#) section in the settings of the parent device.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).
- See the Knowledge Base: [Which OPC UA data types does the OPC UA Custom sensor support?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

OPC UA Specific

Setting	Description
Channel #1 – #5 Naming Method	<p>Select the naming method for the channels of the sensor. Choose between:</p> <ul style="list-style-type: none"> ▪ Use automatic naming (default): The sensor uses the name provided by the OPC UA node. <ul style="list-style-type: none"> ⓘ You cannot use automatic naming after you created the sensor. <ul style="list-style-type: none"> ▪ Enter custom name: Enter a custom name in field Channel #1 - #5 Name. <p>Once you have created the sensor, you can change the name of the channel in the Channel Settings under Name.</p>
Channel #1 – #5 Unit	<p>Enter the unit for the numeric value that this sensor monitors.</p> <ul style="list-style-type: none"> ⓘ After sensor creation,, you can change the unit in the Channel Settings under Unit.
Channel #1 – #5 Node ID	<p>Enter the node ID from which you want to receive numeric data.</p> <ul style="list-style-type: none"> ⓘ A node ID looks like this, for example: <code>ns=1;i=1234</code> or <code>ns=2;s=test_one</code>. The sensor supports string identifiers and numeric identifiers. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Setting	Description
Channel #2 – #5	<p>You can create up to 5 different channels for this sensor. You have to define at least one data channel, so you see all available settings for Channel #1 without manually enabling it. Additionally, you can define Channel #2 up to Channel #5. To do so, choose between:</p> <ul style="list-style-type: none"> ▪ Disable (default): The sensor does not create this channel. ▪ Enable: The sensor creates this channel. Specify name, unit, and node ID for this channel below. <p>i It is not possible to enable or disable channels after sensor creation.</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a title 'Basic Sensor Settings' in blue. Below the title are three settings: 'Sensor Name' with a value of 'Example Name', 'Tags' with a value of 'exampletag' and a plus icon, and 'Priority' with a value of 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [183], as well as in alarms [228], logs [237], notifications [403], reports [406], maps [406], libraries [407], and tickets [240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags [145] that the sensor inherits [145] from its parent device [140], parent group [139], and parent probe [139].</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <ul style="list-style-type: none"> ❗ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ❗ For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ opcua ▪ opcuacustom
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

OPC UA Specific

Setting	Description
Sensor Message Node ID	<p>Optionally enter the node ID from which you want to receive a string that the sensor shows as sensor message.</p> <ul style="list-style-type: none"> ❗ A node ID looks like this, for example: <code>ns=1;i=1234</code> or <code>ns=2;s=test_one</code>. The sensor supports string identifiers and numeric identifiers. ❗ The sensor only shows the received string if the sensor is in the Up status. If the sensor enters the Down status, the sensor message shows the error message instead.
Channel #x Node ID	Shows the node ID from which you receive numeric data.

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval

Scanning Interval  60 seconds

inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3967

7.8.110 OPC UA Server Status Sensor

The OPC UA Server Status sensor monitors the server status, uptime, and diagnostic information of an OPC Unified Architecture (OPC UA) server.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

OPC UA Server Status Sensor

Sensor in Other Languages

- Dutch: OPC UA Server Status
- French: OPC UA Server Status
- German: OPC UA Server Status
- Japanese: OPC UA Server Status
- Portuguese: OPC UA Server Status

- Russian: OPC UA Server Status
- Simplified Chinese: OPC UA Server Status
- Spanish: OPC UA Server Status

Remarks

- This sensor requires a valid port for the connection to the OPC UA server. Enter the port and, depending on the configuration, further credentials in the [Credentials for OPC UA](#) section in the settings of the parent device.
- This sensor [requires](#) activated diagnostic summary information settings on your OPC UA server to create all diagnostic channels.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Detailed Requirements

Requirement	Description
Activated server diagnostics on your OPC UA server	<p>This sensor requires activated diagnostic summary information settings on your OPC UA server to create all diagnostic channels. Without activated diagnostic summary information settings, the sensor can only show the server status and the uptime.</p> <p>i Note that not all vendors support diagnostic summary information.</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁹⁷

7.8.111 Oracle SQL v2 Sensor

The Oracle SQL v2 sensor monitors a database on an Oracle server and executes a query.

i The sensor can also process the data table and show the values that you define in individual channels.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Oracle SQL v2 Sensor

Sensor in Other Languages

- Dutch: Oracle SQL v2
- French: Oracle SQL v2
- German: Oracle SQL v2
- Japanese: Oracle SQL v2
- Portuguese: Oracle SQL v2
- Russian: Oracle SQL v2
- Simplified Chinese: Oracle SQL v2
- Spanish: Oracle SQL v2

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.

- You must store your Structured Query Language (SQL) query in a file on the probe system. In a cluster, copy the file to every cluster node.
- Define credentials, custom port (if required), and timeout in the [credentials for database management systems](#) settings of the parent device, or in the settings of a group or probe above.
- This sensor supports Oracle database servers version 10.2 or higher.
- This sensor supports the IPv6 protocol.
- See section [Monitoring Databases](#) for an [example](#) for channel value selection.
- See the Knowledge Base: [How to set up the SQL v2 sensors in PRTG? Is there a guide?](#)
- See the Knowledge Base: [How can I monitor strings from an SQL database and show a sensor status depending on it?](#)
- See the Knowledge Base: [How can I monitor error tables in SQL databases?](#)
- See the Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Data

Setting	Description
SQL Query File	<p>Select the SQL query file that includes a valid SQL statement that the sensor executes on the server with every scanning interval. The list contains SQL scripts from the \Custom Sensors\sql subfolder of the PRTG program directory on the probe system. Store your script there. If you use the script on a cluster probe, you must store the script on all cluster nodes.</p> <p>A correct expression in the file could be: <code>SELECT AVG(UnitPrice) FROM Products</code>. If you want to use transactions, separate the individual steps with semicolons ";".</p> <ul style="list-style-type: none"> i Note that with each request, PRTG transfers the full result set, so use filters and limits in your query. i The demo script Demo Serveruptime.sql is available by default. You can use the it to monitor the uptime of the target server. ■ See also the Knowledge Base: Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?
Data Processing	<p>Define whether the sensor processes data from the database:</p> <ul style="list-style-type: none"> ■ Only execute query: Only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed by the query (for example, created, deleted, or edited). ■ Count table rows: Execute a <code>SELECT</code> statement and monitor how many rows of the data table this statement returns. ■ Process data table: Read and analyze the data table. If you select this option, the sensor counts rows with <code>SELECT</code> statements as well.
Channel #2 – #10	<p>This setting is only visible if you select Process data table above. You can define up to 10 additional channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you automatically see all available settings for Channel #1. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> ■ Disable: Do not create this channel. ■ Enable: Create this channel. i It is not possible to enable or disable channels after sensor creation.
Channel #x Name	<p>This setting is only visible if you select Process data table above. Enter a unique name for the channel. Enter a string. PRTG dynamically generates channels with this name as the identifier.</p> <ul style="list-style-type: none"> i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?

Setting	Description
Channel #x Mode	<p>This setting is only visible if you select Process data table above. Define how to display the determined value in the channel:</p> <ul style="list-style-type: none"> ▪ Absolute (recommended): Show the value as the sensor retrieves it from the data table. ▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table. <ul style="list-style-type: none"> ❗ This mode is not compatible with the unit Lookup. ❗ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.
Channel #x Unit	<p>This setting is only visible if you select Process data table above. Define the unit of the channel value:</p> <ul style="list-style-type: none"> ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Lookup <p>■ For more information about the available units, see section Custom Sensors⁴⁴⁴².</p> <p>❗ To use lookups⁴⁴⁸⁵ with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor.</p> <p>❗ It is not possible to use the unit Lookup in combination with the Difference mode. You are not able to create the sensor in this case.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ sqlsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Database Specific

Database Specific

Identifier **i**

Identification Parameter **i**

SID (default)

SERVICE_NAME

Database Specific

Setting	Description
Identifier	<p>Enter the Oracle System ID (SID) or the SERVICE_NAME of the database that the sensor connects to. Specify the Identification Parameter below. By default, the sensor uses the SID as the connection string.</p> <p>i You can find the SID or SERVICE_NAME in the CONNECT_DATA part of the TNSNames.ora file on the Oracle server. For example, a SID can look like this: orcl</p>
Identification Parameter	<p>Define the type of identifier that you want to use to connect to the database:</p> <ul style="list-style-type: none"> ▪ SID (default): Connect to the database instance using the SID as the connection string. ▪ SERVICE_NAME: Connect to the database instance using the SERVICE_NAME as the connection string. <p>i The type of identifier that you need to use depends on the configuration of the Oracle server.</p>

Data

Data

SQL Query File ⓘ *Demo Serveruptime.sql*

Input Parameter Handling ⓘ Do not use input parameter (default)
 Use input parameter

Transaction Handling ⓘ Do not use transaction (default)
 Use transaction and always roll back
 Use transaction and commit on success

Data Processing ⓘ *Only execute query*

Result Handling ⓘ Discard result
 Store result

Data

Setting	Description
SQL Query File	Shows the SQL script file that the sensor executes on the server. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Input Parameter Handling	Define if you want to pass a parameter to the SQL query file: <ul style="list-style-type: none"> ▪ Do not use input parameter (default): Execute the SQL query file without using variables. ▪ Use input parameter: Execute an SQL query file that contains a variable. Provide the parameter that you want to use in the query below.
Input Parameter	This setting is only visible if you select Input Parameter Handling above. Enter the parameter that you want to pass to the SQL query file. This parameter replaces the variables @prtg, :prtg, or ? in the SQL query, considering the general rules for SQL variables. You can also use PRTG placeholders for custom sensors (command-line parameters) as input parameters, for example, %sensorid or %deviceid. For details, see section Custom Sensors [444]. ⓘ Provide strings as they are and do not surround them with quotation marks. PRTG automatically and correctly inserts string parameters into the query.
Transaction Handling	Define if you want to use transactions and if they affect the database content: <ul style="list-style-type: none"> ▪ Do not use transaction (default): Do not execute transactions.

Setting	Description
Data Processing	<ul style="list-style-type: none"> ▪ Use transaction and always roll back: The query does not change data in the database. In the SQL query file, separate the single steps of the transaction with semicolons. ▪ Use transaction and commit on success: The query changes data in the database. The changes only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons. <p>Shows how the sensor processes data from the database.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Handle DBNull in Channel Values as	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define the sensor behavior if the query returns DBNull:</p> <ul style="list-style-type: none"> ▪ Error: Show a Down status if the query returns DBNull. ▪ Number 0: Recognize the result DBNull as a valid value and interpret it as the number 0.
Select Channel Value by	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define how to select the desired cell in the database table:</p> <ul style="list-style-type: none"> ▪ Column number: Determine the channel value by using the value in row 0 of the column whose number you specify in Channel #x Column Number. ▪ Column name: Determine the channel value by using the value in row 0 of the column whose name you specify in Channel #x Column Name. ▪ Row number: Determine the channel value by using the value in column 0 of the row whose number you specify in Channel #x Row Number. ▪ Key value pair: Determine the channel value by searching in column 0 for the key you specify in Channel #x Key and by returning the value in column 1 of the same row where the key value was found. <p>i Defining how the desired cell in the database table is selected is necessary to configure the cells that are used in the channels.</p> <p>i The option you select here also defines the method of how to optionally determine a value for the sensor message. For details, see setting Use Data Table Value in Sensor Message.</p> <p>■ For an example for channel value selection, see section Monitoring Databases ⁴³²⁵.</p>
Channel #x	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. The setting shows if the channel is disabled.</p>

Setting	Description
	<p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Channel #x Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Enter a unique name for the channel. Enter a string. The sensor dynamically generates channels with this name as identifier.</p> <p> If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Channel #x Column Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column number for the setting Select Channel Value by. Provide the number of the column to use to determine the channel value in row 0. Enter an integer value.</p>
Channel #x Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column name for the setting Select Channel Value by. Provide the name of the column to use to determine the channel value in row 0. Enter an integer value.</p>
Channel #x Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Row number for the setting Select Channel Value by. Provide the number of the column to use to determine the channel value in row 0. Enter an integer value.</p>
Channel #x Key	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Key value pair for the setting Select Channel Value by. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found to use to determine the channel value. Enter a string.</p>
Channel #x Mode	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. The setting shows how you want to display the determined value in the channel.</p> <p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Channel #x Unit	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define the unit of the channel value:</p> <ul style="list-style-type: none">▪ BytesBandwidth▪ BytesMemory▪ BytesDisk

Setting	Description
	<ul style="list-style-type: none"> ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Lookup
Channel #x Custom Unit	This setting is only visible if you select the channel unit Custom above. Define a unit for the channel value. Enter a string.
Channel #x Lookup	This setting is only visible if you select the channel unit Lookup above. Select a lookup file that you want to use with this channel.
Use Data Table Value in Sensor Message	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define if the sensor message shows a value from the data table:</p> <ul style="list-style-type: none"> ▪ Disable: Do not use a custom sensor message. ▪ Enable: Define a custom sensor message with a defined value of the data table. Define the value selection below. <p>The method of how to determine a value for the sensor message is defined in the setting Select Channel Value by above.</p>
Sensor Message Column Number	This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column number for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the number of a column. The sensor message shows the value in row 0 of this column. Enter an integer value.
Sensor Message Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column name for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter a string.</p> <p> Columns start with index 0.</p>

Setting	Description
Sensor Message Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Row number for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter the number of a row. The sensor message shows the value in column 0 of this row. Enter an integer value.</p> <p>i Rows start with index 0.</p>
Sensor Message Key	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Key value pair for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter a key to search for in column 0 of the data table. The sensor message shows the value in column 1 of the row where the key was found. Enter a string.</p>
Sensor Message	<p>This setting is only visible if you enable Use Data Table Value in Sensor Message. Define the sensor message. Enter a string. Use the placeholder {0} at the position where you want to display the value.</p> <p>Example: The message is {0}</p> <p>i The number sign (#) is not supported in sensor messages. If a message contains a number sign, the message is clipped at this point.</p>
If Sensor Message Changes	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</p> <p>Define what the sensor does when the sensor message changes:</p> <ul style="list-style-type: none"> Ignore changes (default): Take no action on change. Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger⁴¹³⁶, you can use this mechanism to trigger a notification³³⁶⁷ whenever the sensor value changes.
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
Maintenance Window	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p> <p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Affected Rows	The number of rows that were addressed by the query (including SELECT statements if you process data tables)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Execution Time	<p>The execution time of the entire request (including connection buildup, query execution, transaction handling, disconnection) in milliseconds (msec)</p> <p>i This channel is the primary channel by default.</p>
Query Execution Time	The execution time of the specified query in msec

Sensor Settings Overview

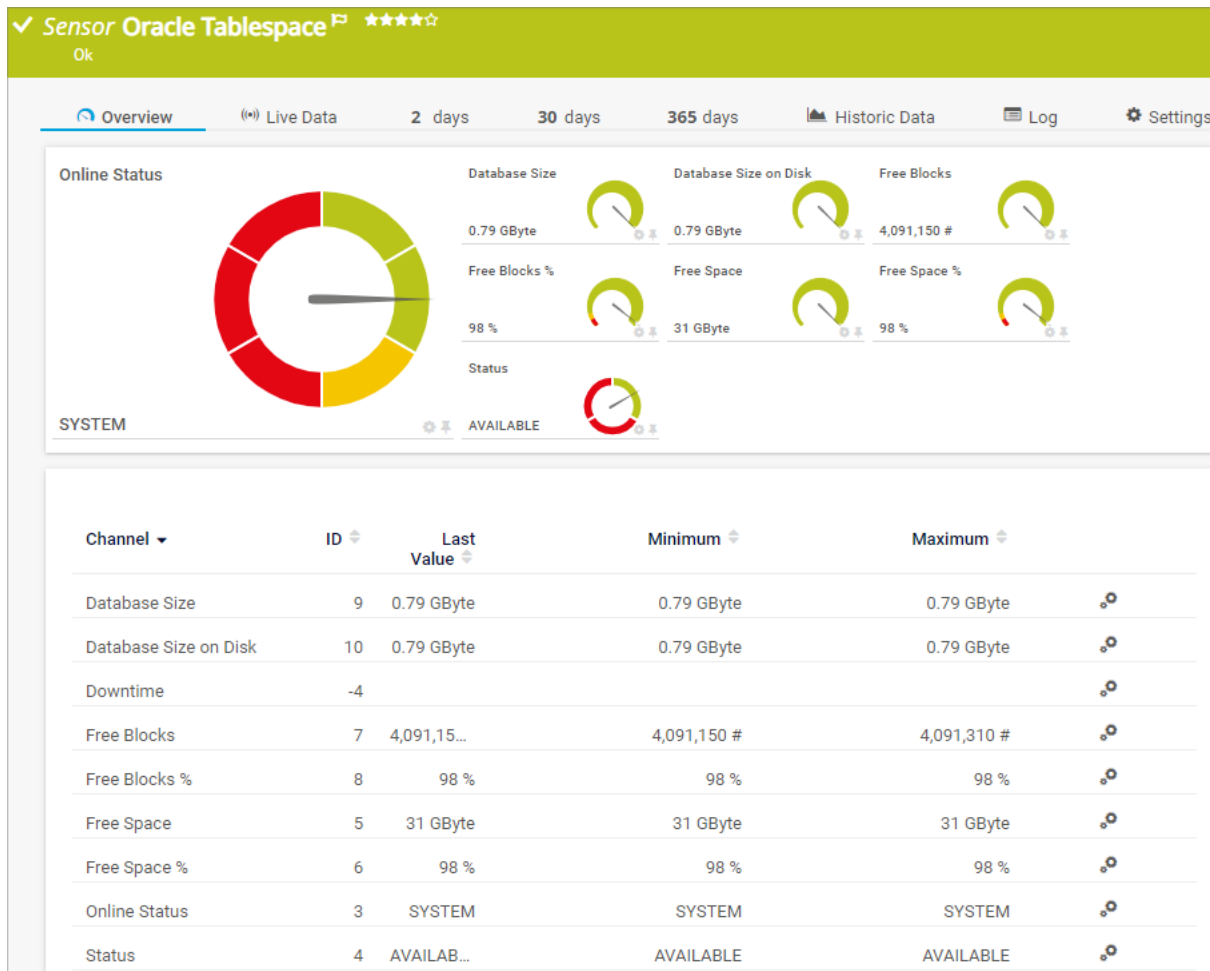

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.112 Oracle Tablespace Sensor

The Oracle Tablespace sensor monitors a tablespace on an Oracle server.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Oracle Tablespace Sensor

Sensor in Other Languages

- Dutch: Oracle Tablespace
- French: Tablespace Oracle
- German: Oracle Tablespace
- Japanese: Oracle テーブルスペース
- Portuguese: Tablespace Oracle
- Russian: Oracle
- Simplified Chinese: Oracle 表空间
- Spanish: Espacio de tablas de Oracle

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor [requires](#)¹⁹⁴³ sufficient privileges for the account that you use for the connection. We recommend that you use the **SYSTEM** account.
- This sensor does not support overprovisioning.
- This sensor supports Oracle database servers version 10.2 or higher.
- This sensor supports the IPv6 protocol.
- Define credentials, custom port (if required), and timeout in the [credentials for database management systems](#)⁴⁵⁷ settings of the parent device, or in the settings of a group or probe above.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)⁴⁴⁸⁵.
- See the Knowledge Base: [Why is my Oracle Tablespace sensor showing negative values?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Sufficient account privileges	<p>Use an account for the connection that has the privileges to see all (or specific) views. We recommend that you use the SYSTEM account if possible, otherwise grant your database administrator the SELECT_CATALOG_ROLE to the account that you use. Without sufficient privileges, you might see the error message ORA-00942: table or view does not exist.</p>

Add Sensor

The [Add Sensor](#)³⁶⁷ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

In the appearing dialog box in the Add Sensor dialog, enter an identifier to access the tablespace selection and click OK.

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ⓘ).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click to interrupt the [inheritance](#) ¹⁴².

Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²

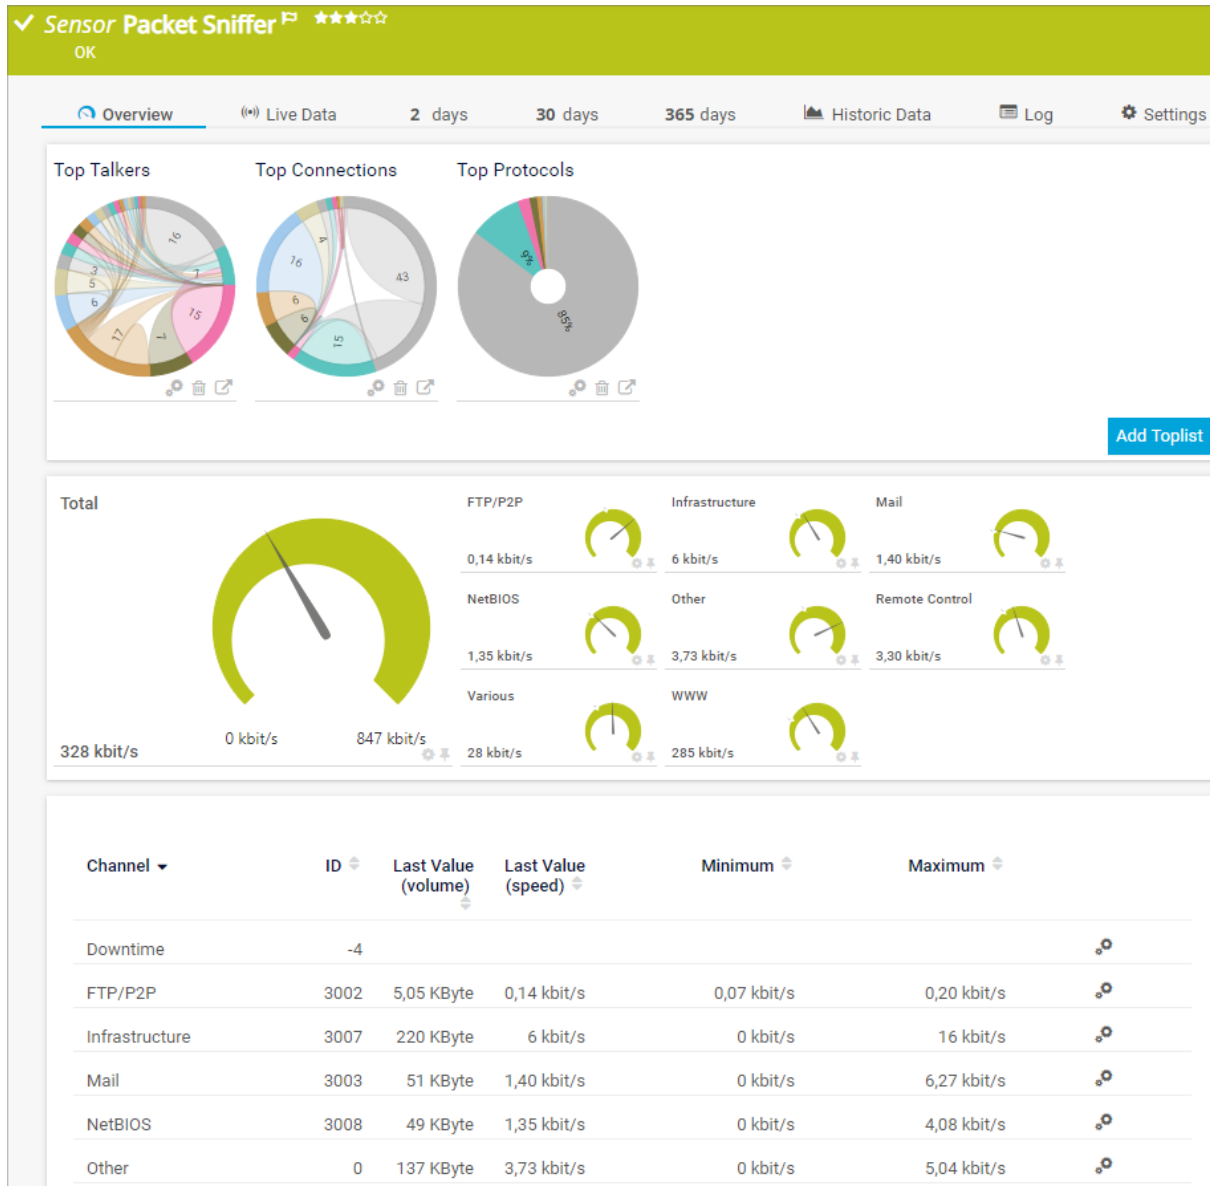

- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.113 Packet Sniffer Sensor

The Packet Sniffer sensor monitors the headers of data packets that pass a local network card using a built-in packet sniffer. You can choose from predefined channels.

i The sensor analyzes only header traffic.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Packet Sniffer Sensor

Sensor in Other Languages

- Dutch: Packet Sniffer
- French: Packet sniffing
- German: Packet Sniffer

- Japanese: パケットスニファー
- Portuguese: Sniffer de pacotes
- Russian:
- Simplified Chinese: 数据包嗅探程序
- Spanish: Examen de paquetes

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- By default, this sensor works only on a probe device.
- This sensor supports the IPv6 protocol.
- Using Network Mapper (Nmap) on the parent probe system might cause high CPU load. If you have this issue, restarting the PRTG probe service might help.
- See the Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)

i By default, you can only monitor traffic passing the probe system where the probe device with the sensor is set up. To monitor other traffic in your network, you can configure a monitoring port (if available) that the switch sends a copy of all traffic to. You can then physically connect this port to a network card of the probe system (either local probe or remote probe system). This way, PRTG can analyze the complete traffic that passes through the switch. This feature of your hardware might be called Switched Port Analyzer (SPAN), port mirroring, or port monitoring.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[406], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ bandwidthsensor ▪ sniffersensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).</p>

Sniffer Specific

 For detailed information on filters, see section [Filter Rules](#)^[196].

Sniffer Specific

Filters To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

Fields are:
IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP, or any number), ToS, DSCP

Additional Sniffer Fields:
MAC, SourceMAC, DestinationMAC, EtherType (values IPV4, ARP, RARP, APPLE, AARP, IPV6, IPXold, IPX, or any number)

Include Filter

Exclude Filter

Network Adapters

<input checked="" type="checkbox"/>	Network Adapter
<input checked="" type="checkbox"/>	NdisWan Adapter ()
<input checked="" type="checkbox"/>	Intel(R) Ethernet Connection I2...
<input checked="" type="checkbox"/>	Adapter for loopback traffic ca...

Stream Data Handling Discard stream data (recommended)
 Store stream data only for the 'Other' channel
 Store all stream data

Sniffer Specific

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax.
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.
Network Adapters	<p>Select the network adapters that this sensor monitors. You see a list of all adapters that are available on the probe system. To select an adapter, enable the check box in front of the respective name.</p> <p>i You can also select all items or cancel the selection by using the check box in the table header.</p> <p>i You cannot change this setting if the probe is not connected.</p>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> ▪ Discard stream data (recommended): Do not store the stream and packet data.

Setting	Description
	<ul style="list-style-type: none"> Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the PRTG data directory on the probe system. The file name is <code>Streams Sensor [ID] (1).csv</code>. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>i Use with caution. If you enable this setting, it can create huge data files. We recommend that you only use this setting for a short time.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Channel Configuration

Channel Configuration

Channel Selection	Group	✕	✓	🔍	Content
<input type="radio"/>	Web	<input checked="" type="radio"/>	<input type="radio"/>	...	WWW Traffic: HTTP, HTTPS
<input type="radio"/>	File Transfer	<input checked="" type="radio"/>	<input type="radio"/>	...	File Transfer: FTP (Control)
<input type="radio"/>	Mail	<input checked="" type="radio"/>	<input type="radio"/>	...	Mail Traffic: IMAP, POP3, SMTP

Scanning Interval Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Toplists

For all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

 For more information, see section [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#) .

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name
Port	Any number
SourceIP	IP address or Domain Name System (DNS) name
SourcePort	Any number
DestinationIP	IP address or Domain Name System (DNS) name
DestinationPort	Any number

Field	Possible Filter Values
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to Packet Sniffer sensors only.

Field	Possible Filter Values
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
EtherType	IPV4, ARP, RARP, APPLE, AARP, IPV6, IPXold, IPX, any number
VlanPCP	IEEE 802.1Q VLAN Priority Code Point
VlanID	IEEE 802.1Q VLAN Identifier
TrafficClass	IPv6 Traffic Class: corresponds to TOS used with IPv4
FlowLabel	IPv6 Flow Label

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Chat	The traffic from chat and instant messaging (Internet Relay Chat (IRC), AOL Instant Messenger (AIM)) in bytes per second
Citrix	The traffic from Citrix applications in bytes per second

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
FTP/P2P	The traffic from file transfer (File Transfer Protocol (FTP)/Peer-to-Peer (P2P)) in bytes per second
Infrastructure	The traffic from network services (Dynamic Host Configuration Protocol (DHCP), Domain Name System (DNS), Ident, Internet Control Message Protocol (ICMP), Simple Network Management Protocol (SNMP)) in bytes per second
Mail	The internet mail traffic (Internet Message Access Protocol (IMAP), Post Office Protocol version 3 (POP3), Simple Mail Transfer Protocol (SMTP)) in bytes per second
NetBIOS	The traffic from NetBIOS communication in bytes per second
Other	The traffic from various other protocols (User Datagram Protocol (UDP), Transmission Control Protocol (TCP)) in bytes per second
Remote Control	The traffic from remote control applications (Remote Desktop Protocol (RDP), Secure Shell (SSH), Telnet, Virtual Network Computing (VNC)) in bytes per second
Total	The total traffic in bytes per second  This channel is the primary channel by default.
Various	The traffic from various other sources in bytes per second
WWW	The traffic from the web (HTTP, HTTPS) in bytes per second

Sensor Settings Overview

For more information about sensor settings, see the following sections:

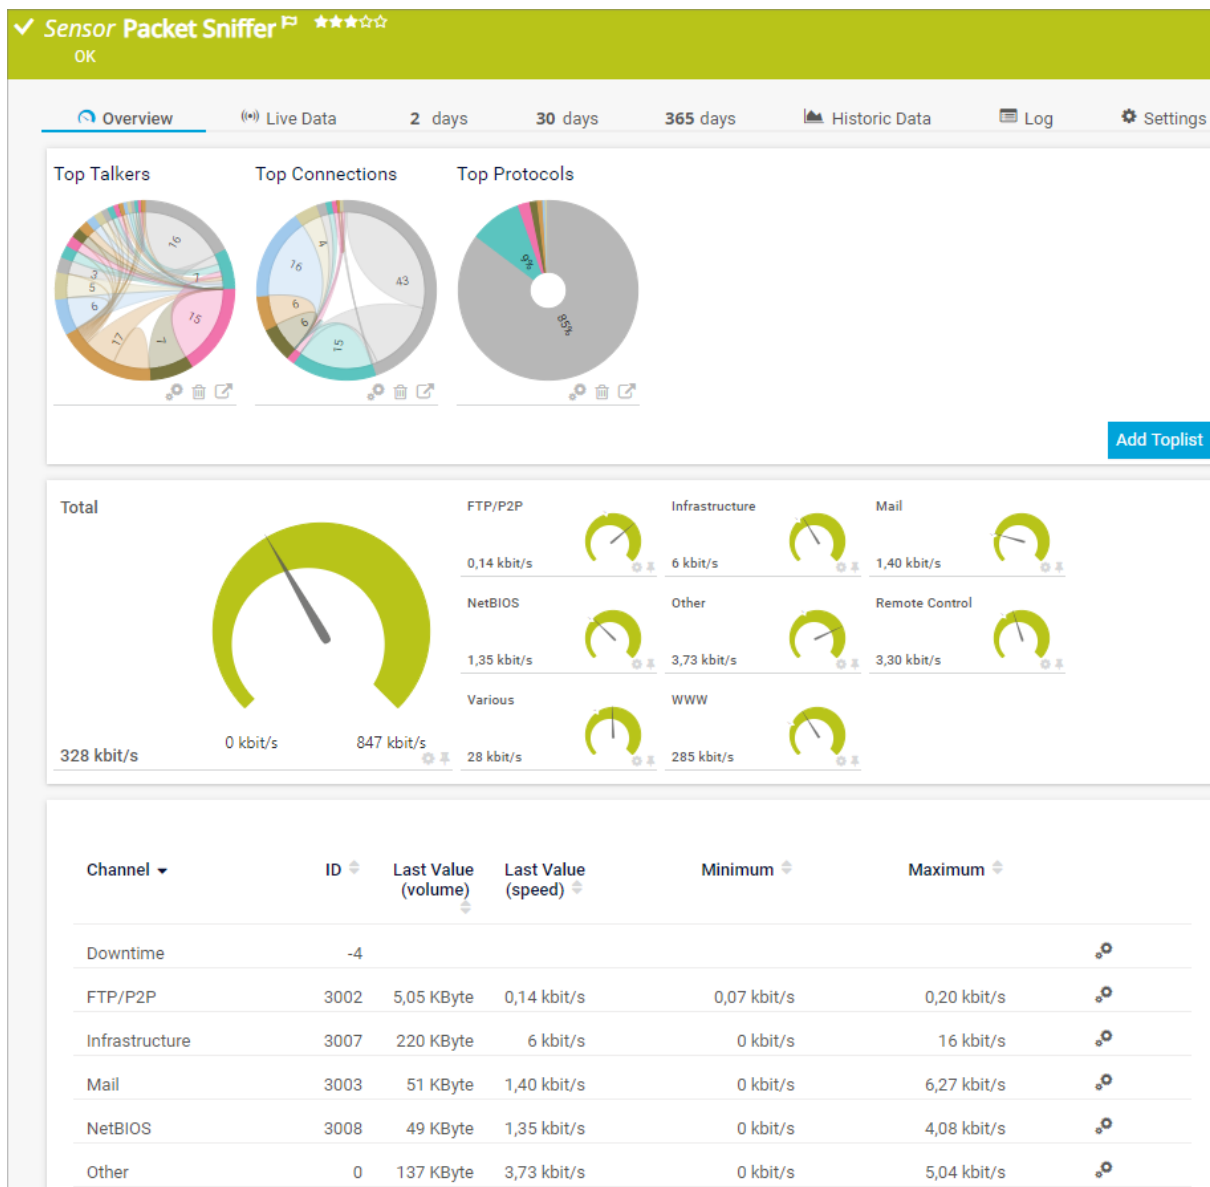

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.114 Packet Sniffer (Custom) Sensor

The Packet Sniffer (Custom) sensor monitors the headers of data packets that pass a local network card using a built-in packet sniffer. With this sensor, you can define your own channel definitions to divide traffic into different channels.

- ❗ The sensor analyzes only header traffic.
- ❗ This sensor does not have any predefined channels.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Packet Sniffer (Custom) Sensor

Sensor in Other Languages

- Dutch: Packet Sniffer (Aangepast)

- French: Packet Sniffer (personnalisé)
- German: Packet Sniffer (Benutzerdef.)
- Japanese: パケットスニフアー(カスタム)
- Portuguese: Sniffer de pacotes (Customizado)
- Russian: ()
- Simplified Chinese: 数据包嗅探程序 (自定义)
- Spanish: Examen de paquetes (personalizado)

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- By default, this sensor works only on a probe device.
- This sensor supports the IPv6 protocol.
- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.

 By default, you can only monitor traffic passing the probe system where the probe device with the sensor is set up. To monitor other traffic in your network, you can configure a monitoring port (if available) that the switch sends a copy of all traffic to. You can then physically connect this port to a network card of the probe system (either local probe or remote probe system). This way, PRTG can analyze the complete traffic that passes through the switch. This feature of your hardware might be called Switched Port Analyzer (SPAN), port mirroring, or port monitoring.

 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

- Intel(R) Ethernet Connection I2...
- Adapter for loopback traffic ca...

Stream Data Handling Discard stream data (recommended)
 Store stream data only for the 'Other' channel
 Store all stream data

Sniffer Specific

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax.
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.
Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Enter each definition in one line. The sensor accounts all traffic that you do not define a channel for to the default channel Other.</p> <p>■ For detailed information, see section Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors.</p> <p>i Extensive use of many filters can cause load problems on the probe system. We recommend that you define specific, well-chosen filters for the data that you really want to analyze. We recommend that you do not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, we recommend that you add several sensors with fewer channels each.</p>

Setting	Description
Network Adapters	<p>Select the network adapters that this sensor monitors. You see a list of all adapters that are available on the probe system. To select an adapter, enable the check box in front of the respective name.</p> <ul style="list-style-type: none">  You can also select all items or cancel the selection by using the check box in the table header.  You cannot change this setting if the probe is not connected.
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> ▪ Discard stream data (recommended): Do not store the stream and packet data. ▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the PRTG data directory on the probe system. The file name is <code>Streams Sensor [ID] (1).csv</code>. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. ▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <ul style="list-style-type: none">  Use with caution. If you enable this setting, it can create huge data files. We recommend that you only use this setting for a short time.  In a cluster, PRTG stores the result in the PRTG data directory of the master node.

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type  Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <ul style="list-style-type: none">  You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.

Setting	Description
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Primary Toplist

Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Toplists

For all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

 For more information, see section [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#) .

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name
Port	Any number
SourceIP	IP address or Domain Name System (DNS) name
SourcePort	Any number
DestinationIP	IP address or Domain Name System (DNS) name
DestinationPort	Any number

Field	Possible Filter Values
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to Packet Sniffer sensors only.

Field	Possible Filter Values
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
EtherType	IPV4, ARP, RARP, APPLE, AARP, IPV6, IPXold, IPX, any number
VlanPCP	IEEE 802.1Q VLAN Priority Code Point
VlanID	IEEE 802.1Q VLAN Identifier
TrafficClass	IPv6 Traffic Class: corresponds to TOS used with IPv4
FlowLabel	IPv6 Flow Label

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
[Custom]	The traffic by type according to the channel definition
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.

Channel	Description
Other	All traffic for which no channel is defined in bytes per second
Total	The total traffic in bytes per second  This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

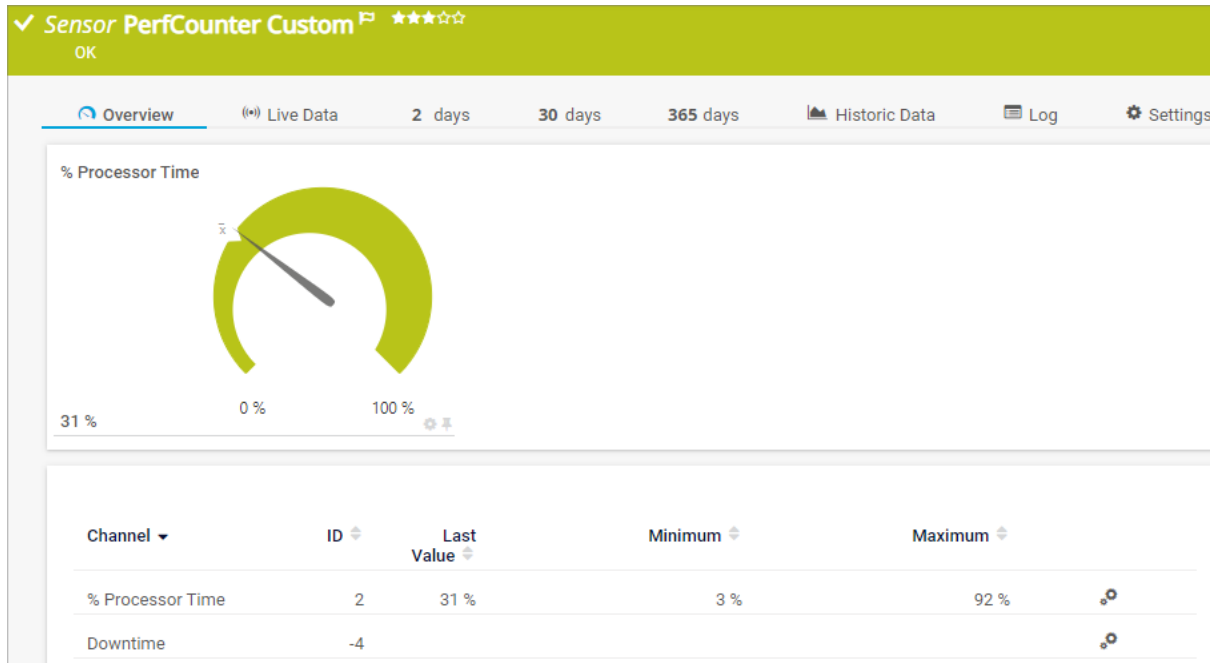

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.115 PerfCounter Custom Sensor

The PerfCounter Custom sensor monitors a configured set of Windows performance counters. You can define your own channels.

i This sensor does not have any predefined channels.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

PerfCounter Custom Sensor

Sensor in Other Languages

- Dutch: Prestatie Meters Klantspecifiek
- French: PerfCounter personnalisé
- German: Leistungsindikator (benutzerdef.)
- Japanese: パフォーマンスカウンターカスタム
- Portuguese: PerfCounter (Customizado)
- Russian: PerfCounter
- Simplified Chinese: 性能计数器自定义
- Spanish: PerfCounter Personalizado

Remarks

- This sensor requires [credentials for Windows systems](#) in the settings of the parent device.
- This sensor requires that the Remote Registry Windows service runs on the target computer.
- This sensor requires Windows Server 2008 R2 or later on the probe system.
- You cannot add different performance counters with the same name to one sensor.

- If a performance counter contains angle brackets (< or >), do not edit the channel settings because this might cause an error.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- See the Knowledge Base: [How can I find out the names of available performance counters?](#)
- See the Knowledge Base: [My performance counter sensor does not work. What can I do?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <ul style="list-style-type: none"> ❗ If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. ❗ The user account has to be a member of the Performance Monitor Users user group on the target system.
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 R2 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p>
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Performance Counter Settings

Setting	Description
List of Counters	<p>Enter the performance counters that you want to query. Enter each counter in one line. PRTG creates one channel for each performance counter that you select. Use the following syntax: the name of the counter, followed by two colons (::), and the unit.</p> <p>Example: \Processor(_Total)\% Processor Time::%</p> <p>i You cannot monitor different performance counters with the same name in one sensor. The sensor uses the performance counter as the channel name, so this would create duplicate channels, which PRTG does not support. If you want to monitor different performance counters with the same name, add one sensor for each counter. You can also create a custom sensor³⁹⁷². For example, you can write a PowerShell query that connects to the target device, retrieves the desired counters with the Get-Counter cmdlet, and reports them to PRTG as individual channels.</p> <p>i If a custom performance counter includes angle brackets (< or >), do not edit the channel settings³⁹⁷⁷ (for example, limits) after sensor creation. This might lead to a malfunctioning sensor.</p>
Mode	<p>Determine if the sensor displays the returned value as an absolute value or if it displays the difference between the last and the current value:</p> <ul style="list-style-type: none"> Absolute (recommended): Display the returned value as an absolute value. Difference: Display the difference between last and current value. <p>i Make sure that all performance counters that you monitor are capable of this mode.</p>

Basic Sensor Settings

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor. ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how different channels are shown for this sensor: <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ⓘ).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule None ▼

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

- Simplified Chinese: 性能计数器 IIS 应用程序池
- Spanish: Grupo de aplicaciones PerfCounter IIS

Remarks

- This sensor [requires](#) ¹⁹⁹⁹ Microsoft IIS version 7.5 or later on the target system.
- This sensor requires [credentials for Windows systems](#) ⁴⁵² in the settings of the parent device.
- This sensor requires that the Remote Registry Windows service runs on the target computer.
- This sensor requires Windows Server 2008 R2 or later on the probe system.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#) ⁴⁴⁸⁵.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Microsoft IIS version 7.5	To monitor IIS application pools, this sensor needs IIS version 7.5 or later to be installed on the target system.
Windows credentials	<p>This sensor requires credentials for Windows systems ⁴⁵² in the settings of the parent device. Preferably, use Windows domain credentials.</p> <ul style="list-style-type: none"> ❗ If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. ❗ The user account has to be a member of the Performance Monitor Users user group on the target system.
Windows version	For this sensor to work with Windows performance counters, make sure that a Windows version 2008 R2 or later is installed on the probe system (on every cluster node, if on a cluster probe).
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

IIS Application Pool Specific

Setting	Description
Application Pools	<p>Select the application pools that you want to monitor. PRTG creates one sensor for each application pool that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with three stars selected.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited. ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ performancecounter ▪ pciisappool
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

Sensor Settings Overview

For more information about sensor settings, see the following sections:

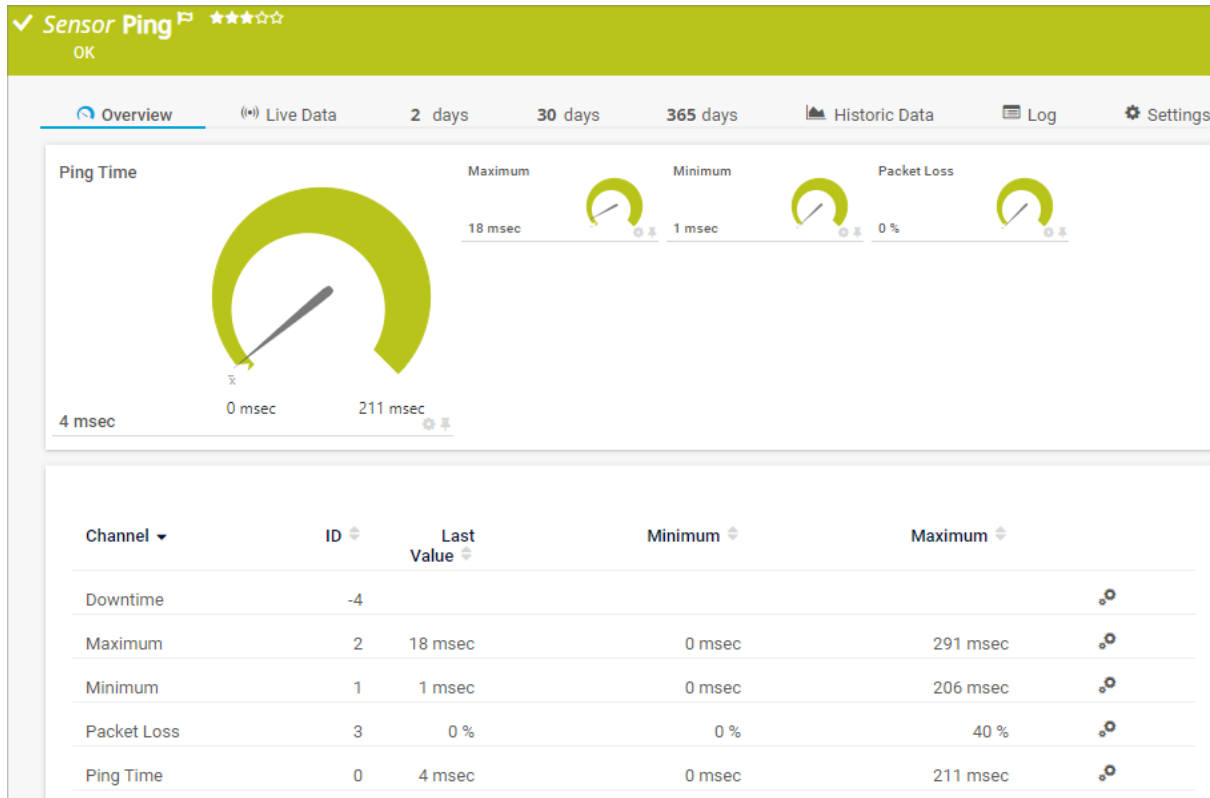

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.117 Ping Sensor

The Ping sensor sends an Internet Control Message Protocol (ICMP) echo request ("Ping") from the probe system to the parent device to monitor its availability.

i The default number of Pings per scanning interval is **5**.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Ping Sensor

Sensor in Other Languages

- Dutch: Ping
- French: Ping
- German: Ping
- Japanese: Ping
- Portuguese: Ping
- Russian:
- Simplified Chinese: Ping
- Spanish: Ping

Remarks

- This sensor supports the IPv6 protocol.

- This sensor has a very low performance impact.
- See the Knowledge Base: [How to create/customize statistical Ping sensor?](#)
- See the Knowledge Base: [Can I create an inverse Ping sensor?](#)

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ pingsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Ping Settings

Ping Settings

Timeout (Sec.) **i**

Packet Size (Bytes) **i**

Ping Method **i** Send one single Ping
 Send multiple Ping requests

Ping Count **i**

Packet Delay (ms) **i**

Acknowledge Automatically **i** Show down status on error (default)
 Show down (acknowledged) status on error

Ping Settings

Setting	Description
Timeout (Sec.)	Enter a timeout in seconds for the Ping. If the reply takes longer than this value, PRTG cancels the request and shows an error message. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).
Packet Size (Bytes)	Enter the packet size for the Ping in bytes. You can enter any value between 1 and 10000 . Enter an integer value. i We recommend that you use the default value.

Setting	Description
Ping Method	<p>Define the kind of Ping check that the sensor performs with each scanning interval:</p> <ul style="list-style-type: none"> ▪ Send one single Ping: Send a single Ping only. The sensor then shows the Ping time only. <ul style="list-style-type: none"> ❗ This setting is useful for monitoring availability. ▪ Send multiple Ping requests: Send multiple Pings in a row. The sensor then also shows the minimum and the maximum Ping time as well as the packet loss (in percent). This setting is default. <ul style="list-style-type: none"> ❗ This setting is useful if you want to create reports about average Ping times out of a series of ping requests. ❗ If you select this setting, all of the Ping requests must be lost for the sensor to show the Down status^[197]. For example, if only one Ping request is answered in a series of five, the sensor still shows the Up status.
Ping Count	<p>This setting is only visible if you select Send multiple Ping requests above. Enter the number of Pings that the sensor sends in a row in one scanning interval. Enter an integer value. The default value is 5.</p>
Ping Delay (ms)	<p>This setting is only visible if you select Send multiple Ping requests above. Enter the time in milliseconds (ms) that the sensor waits between two Ping requests. Enter an integer value. The default value is 5.</p> <p>❗ Increase the value if the target device drops Ping packets because of denial of service (DoS) suspicion.</p>
Acknowledge Automatically	<p>Define if you want to automatically acknowledge^[229] the Down status of the sensor:</p> <ul style="list-style-type: none"> ▪ Show down status on error (default): Do not automatically acknowledge an alarm if this sensor changes to the Down status. ▪ Show down (acknowledged) status on error: Automatically acknowledge an alarm. If this sensor changes to the Down status, it automatically shows the Down (Acknowledged) status instead.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

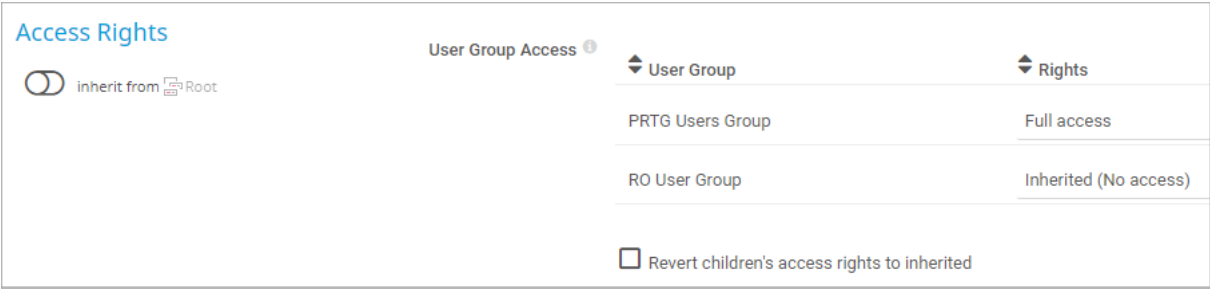

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Maximum	The maximum Ping time when using more than one Ping per interval
Minimum	The minimum Ping time when using more than one Ping per interval
Packet Loss	The packet loss in percent when using more than one Ping per interval
Ping Time	The Ping time in milliseconds (msec) i This channel is the primary channel by default.

Sensor Settings Overview

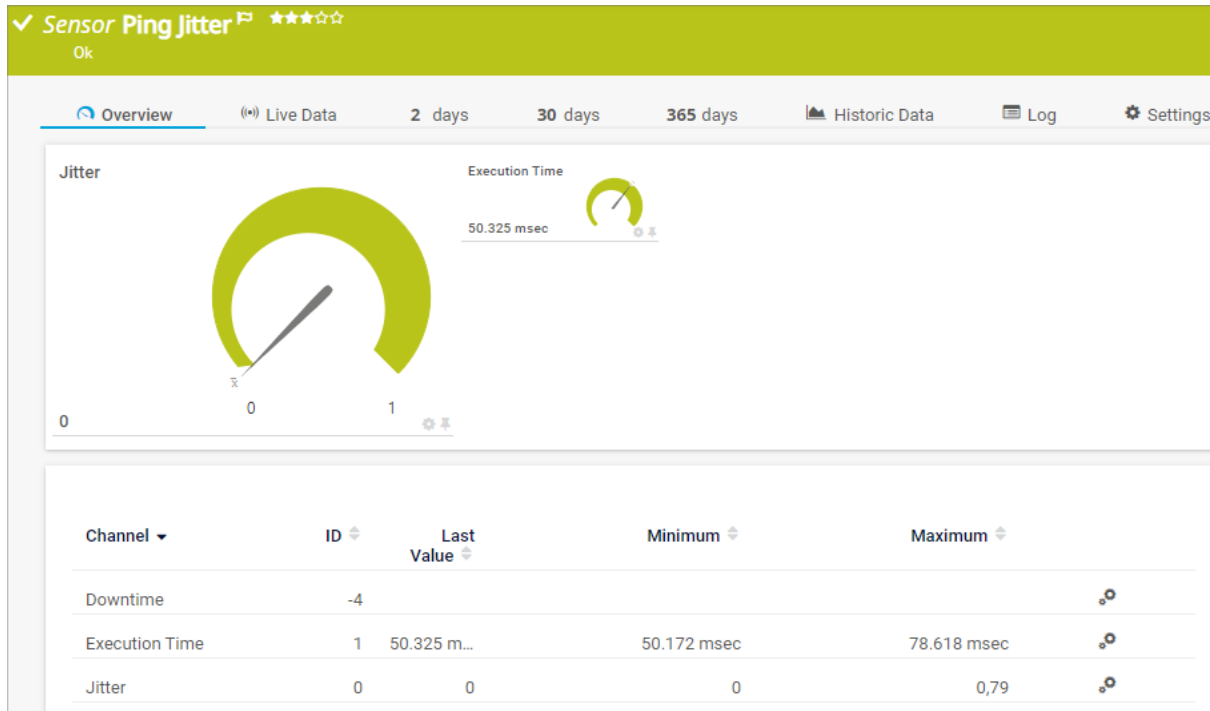

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.118 Ping Jitter Sensor

The Ping Jitter sensor sends a series of Internet Control Message Protocol (ICMP) echo requests ("Pings") to a URI to determine the statistical jitter.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Ping Jitter Sensor

Sensor in Other Languages

- Dutch: Ping Jitter
- French: Gigue du ping
- German: Ping Jitter
- Japanese: Ping ジッター監視
- Portuguese: Ping Jitter
- Russian:
- Simplified Chinese: Ping 抖动
- Spanish: Jitter de Ping

Remarks

- This sensor requires .NET 4.7.2 or later on the probe system. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor supports the IPv6 protocol.

- This sensor has a medium performance impact.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A list box containing 'exampletag' with a close button (X) and an add button (+).
- Priority**: A star rating system showing 3 stars selected out of 5.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p> If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p>

Setting	Description
	<p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ ptfsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

- [Notification Triggers Settings](#)  3987

7.8.119 POP3 Sensor

The POP3 sensor monitors an email server via the Post Office Protocol version 3 (POP3).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

POP3 Sensor

Sensor in Other Languages

- Dutch: POP3
- French: POP3
- German: POP3
- Japanese: POP3
- Portuguese: POP3
- Russian: POP3
- Simplified Chinese: POP3
- Spanish: POP3

Remarks

- This sensor does not support Secure Remote Password (SRP) ciphers.
- This sensor has a low performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A list of tags with 'exampletag' selected, and a plus sign to add more.
- Priority:** A star rating system showing 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p>

Setting	Description
	<ul style="list-style-type: none"> pop3sensor mailsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

POP3 Specific

POP3 Specific

Timeout (Sec.) **i**

Port **i**

POP3 Specific

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
Port	<p>Specify the port that the sensor uses for the POP3 connection. The default port for unsecure connections is 110 and the default port for secure connections is 995. The actual setting depends on the server you connect to. Enter an integer value.</p> <p>i We recommend that you use the default value.</p> <p>i If the connection is unsuccessful, try a different port number.</p>

Connection Security

Connection Security

Transport-Level Security **i**

Use transport-level security if available using StartTLS (default)

Use transport-level security if available

Enforce transport-level security using StartTLS

Enforce transport-level security

Connection Security

Setting	Description
Transport-Level Security	<p>Define how the sensor handles the security of the connection:</p> <ul style="list-style-type: none"> Use transport-level security if available using StartTLS (default): Try to connect to the server via a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection and StartTLS. If the server does not support this, the sensor tries to connect without connection security. Use transport-level security if available: Try to connect to the server via an SSL/TLS-secured connection. If the server does not support this, the sensor tries to connect without connection security. Enforce transport-level security using StartTLS: Try to connect to the server via an SSL/TLS-secured connection and StartTLS. If the server does not support this, the sensor shows the Down status¹⁹⁷. Enforce transport-level security: Try to connect to the server via an SSL/TLS-secured connection. If the server does not support this, the sensor shows the Down status. <p>i If the sensor connects to a server via StartTLS, the connection is first established without connection security. After the connection has been established, the sensor sends a certain command (StartTLS) over the unsecured connection to negotiate a secure connection via SSL/TLS.</p> <p>i If the sensor does not use StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If no secure connection is possible, no communication takes place.</p>

POP3 Authentication

POP3 Authentication

Setting	Description
POP3 Authentication Method	<p>Select the authentication method for the POP3 connection:</p> <ul style="list-style-type: none"> Without login: Only monitor the connection to the POP3 server. User name and password: Log in to the POP3 server with user name and password. <ul style="list-style-type: none"> i This is a simple login. It is not secure. 128-bit MD5 hash value (APOP): Send the password in an encrypted form using APOP. <ul style="list-style-type: none"> i The POP3 server that you connect to must support this option.
User Name	<p>This setting is only visible if you select User name and password or 128-bit has value (APOP) above. Enter a user name for POP3 authentication. Enter a string.</p>
Password	<p>This setting is only visible if you select User name and password or 128-bit has value (APOP) above. Enter a user name for POP3 authentication. Enter a string.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <ul style="list-style-type: none"> ☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance. i In a cluster, PRTG stores the result in the PRTG data directory of the master node.

Sensor Display

Sensor Display

Primary Channel **ⓘ** Downtime

Graph Type **ⓘ**
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval **i** 60 seconds

 inherit from  Root

If a Sensor Query Fails **i** Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Goal	<p>Define how the sensor reports on the port:</p> <ul style="list-style-type: none"> Open: Show the Up status^[197] if the port is open, and the Down status if the port is closed. Closed: Show the Up status if the port is closed, and the Down status if the port is open.
Command Handling	<p>This setting is only visible if you select Open above. Define whether the sensor sends a command after it opens the port:</p> <ul style="list-style-type: none"> Do not send a command: Only check if a connection to the port is possible. Send a command: Open a Telnet session to the respective port and send a command. ⓘ You cannot use this option if the target device is a web server.

Setting	Description
Command	<p>This setting is only visible if you select Send a command above. Enter the command that the sensor sends to the respective port in a Telnet session. Enter a string.</p> <p>i You cannot use line breaks. You can only use a simple Telnet command in a single line.</p>
Response	<p>Define if the sensor further processes the response:</p> <ul style="list-style-type: none"> ▪ Ignore response: Do not check the response. ▪ Check response code (integer): Check if the response matches a defined response code. Define the response code below. ▪ Check response text: Check if the response matches a defined response text. Define the response text below.
Allowed Response Code	<p>This setting is only visible if you select Check response code (integer) above. Enter the code that the target device must return. If the target device does not return this code, the sensor shows the Down status. Enter an integer value.</p>
Check for Keywords (positive)	<p>This setting is only visible if you select Check response text above. Check if the response contains a specific keyword. If the response does not contain the keyword, the sensor shows the Down status.</p> <ul style="list-style-type: none"> ▪ Disable: Do not check for positive keywords. ▪ Enable keyword check (positive): Check if a specific keyword exists in the received value. Define the keyword below.
Response Must Include (Down Status if Not Included)	<p>This setting is only visible if you select Enable keyword check (positive) above. Define the search string that the response must contain. You can enter a simple string in plain text or a regular expression (regex)⁴⁴⁹⁷.</p> <p>i The search string must be case sensitive.</p> <p>i If the data does not include the search pattern, the sensor shows the Down status.</p>
Search Method	<p>Define the method with which you want to provide the search string:</p> <ul style="list-style-type: none"> ▪ Simple string search: Search for a simple string in plain text. <p>i The characters * and ? work as placeholders. * stands for no number or any number of characters and ? stands for exactly one character. You cannot change this behavior. The literal search for these characters is only possible with a regex.</p> <ul style="list-style-type: none"> ▪ Regular expression: Search with a regex. <p>i PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section Regular Expressions⁴⁴⁹⁷.</p>

Setting	Description
Check for Keywords (negative)	<p>This setting is only visible if you select Simple string search above. Check if the response does not contain a specific keyword. If the response does contain the keyword, the sensor shows the Down status.</p> <ul style="list-style-type: none"> ▪ Disable: Do not check for negative keywords. ▪ Enable keyword check (negative): Check if a specific keyword does not exist in the received value. Define the keyword below.
Response Must Not Include (Down Status if Included)	<p>This setting is only visible if you select Enable keyword check (negative) above. Define the search string that the response must not contain. You can enter a simple string in plain text or a regex.</p> <ul style="list-style-type: none"> ❗ The search string must be case sensitive. ❗ If the data does include the search pattern, the sensor shows the Down status.
Search Method	<p>Define the method with which you want to provide the search string:</p> <ul style="list-style-type: none"> ▪ Simple string search: Search for a simple string in plain text. ❗ The characters * and ? work as placeholders. * stands for no number or any number of characters and ? stands for exactly one character. You cannot change this behavior. The literal search for these characters is only possible with a regex. ▪ Regular expression: Search with a regex. ❗ PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section Regular Expressions⁴⁴⁹⁷.
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ❗ In a cluster, PRTG stores the result in the PRTG data directory of the master node.

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
 inherit from  Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Sensor Settings Overview

For more information about sensor settings, see the following sections:

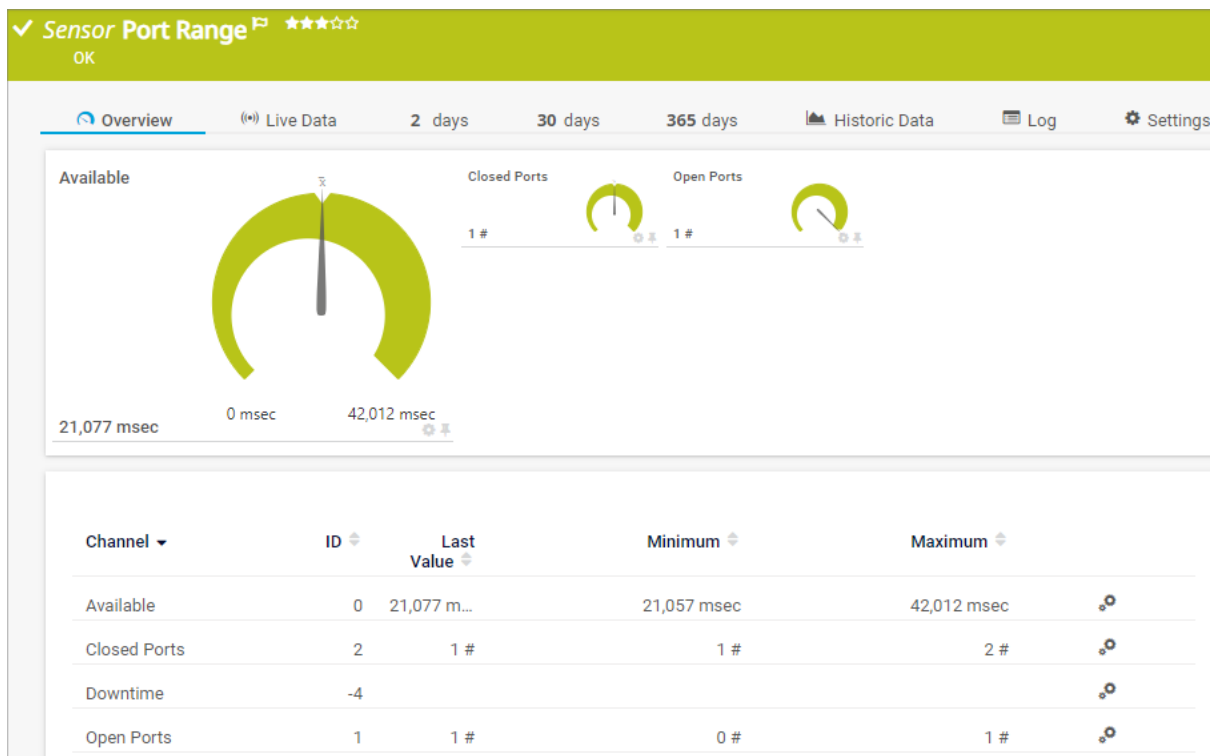

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.121 Port Range Sensor

The Port Range sensor monitors a network service by connecting to various TCP/IP ports. It tries to connect to the specified TCP/IP port numbers of a device in succession and waits for the device to accept each request.

Optionally, you can set limits in the [channel settings](#). This way, you can get alerts about open and closed ports.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Port Range Sensor

Sensor in Other Languages

- Dutch: Poortbereik
- French: Plage de port
- German: Portbereich
- Japanese: ポート範囲
- Portuguese: Intervalo de portas
- Russian:
- Simplified Chinese: 端口范围
- Spanish: Rango de puerto

Remarks

- This sensor does not support Secure Remote Password (SRP) ciphers.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A text input field containing "exampletag" with a blue 'x' icon to the right and a plus icon to the left of the input area.
- Priority:** A section with five star icons, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <ul style="list-style-type: none"> ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ portrangesensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

7.8.122 PostgreSQL Sensor

The PostgreSQL sensor monitors a database on a PostgreSQL server and executes a query.

i The sensor can also process the data table and show the values that you define in individual channels.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

PostgreSQL Sensor

Sensor in Other Languages

- Dutch: PostgreSQL
- French: PostgreSQL
- German: PostgreSQL
- Japanese: PostgreSQL
- Portuguese: PostgreSQL
- Russian: PostgreSQL
- Simplified Chinese: PostgreSQL
- Spanish: PostgreSQL

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.

- This sensor requires .NET 4.7.2 or later on the probe system.
- You must store your Structured Query Language (SQL) query in a file on the probe system. In a cluster, copy the file to every cluster node.
- Save the SQL script with the query in the \Custom Sensors\sql\postgresql subfolder of the [PRTG program directory](#) ⁴⁵²⁶.
- Define credentials, custom port (if required), and timeout in the [credentials for database management systems](#) ⁴⁵⁷¹ settings of the parent device, or in the settings of a group or probe above.
- This sensor supports PostgreSQL 7.x or later.
- This sensor supports the IPv6 protocol.
- See section [Monitoring Databases](#) ⁴³²⁴ for an [example](#) ⁴³²⁵ for channel value selection.
- See the Knowledge Base: [How can I monitor strings from an SQL database and show a sensor status depending on it?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Data

Setting	Description
SQL Query File	<p>Select the SQL query file that includes a valid SQL statement that the sensor executes on the server with every scanning interval. The list contains SQL scripts from the \Custom Sensors\sql subfolder of the PRTG program directory ⁴⁵²⁶ on the probe system. Store your script there. If you use the script on a cluster probe, you must store the script on all cluster nodes.</p>

Setting	Description
	<p>A correct expression in the file could be: SELECT AVG(UnitPrice) FROM Products. If you want to use transactions, separate the individual steps with semicolons ";".</p> <ul style="list-style-type: none"> i Note that with each request, PRTG transfers the full result set, so use filters and limits in your query. i The demo script Demo Serveruptime.sql is available by default. You can use the it to monitor the uptime of the target server. ■ See also the Knowledge Base: Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?
Data Processing	<p>Define whether the sensor processes data from the database:</p> <ul style="list-style-type: none"> ▪ Only execute query: Only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed by the query (for example, created, deleted, or edited). ▪ Count table rows: Execute a SELECT statement and monitor how many rows of the data table this statement returns. ▪ Process data table: Read and analyze the data table. If you select this option, the sensor counts rows with SELECT statements as well.
Channel #2 – #10	<p>This setting is only visible if you select Process data table above. You can define up to 10 additional channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you automatically see all available settings for Channel #1. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> ▪ Disable: Do not create this channel. ▪ Enable: Create this channel. <p>i It is not possible to enable or disable channels after sensor creation.</p>
Channel #x Name	<p>This setting is only visible if you select Process data table above. Enter a unique name for the channel. Enter a string. PRTG dynamically generates channels with this name as the identifier.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), PRTG dynamically generates channels with this name as the identifier. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Channel #x Mode	<p>This setting is only visible if you select Process data table above. Define how to display the determined value in the channel:</p> <ul style="list-style-type: none"> ▪ Absolute (recommended): Show the value as the sensor retrieves it from the data table.

Setting	Description
Channel #x Unit	<ul style="list-style-type: none"> ▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table. <ul style="list-style-type: none"> ❗ This mode is not compatible with the unit Lookup. ❗ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values. <p>This setting is only visible if you select Process data table above. Define the unit of the channel value:</p> <ul style="list-style-type: none"> ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Lookup <p>■ For more information about the available units, see section Custom Sensors⁴⁴⁴².</p> <ul style="list-style-type: none"> ❗ To use lookups⁴⁴⁸⁵ with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor. ❗ It is not possible to use the unit Lookup in combination with the Difference mode. You are not able to create the sensor in this case.

Data

SQL Query File ⓘ *Demo Serveruptime.sql*

Input Parameter Handling ⓘ Do not use input parameter (default)
 Use input parameter

Transaction Handling ⓘ Do not use transaction (default)
 Use transaction and always roll back
 Use transaction and commit on success

Data Processing ⓘ *Only execute query*

Result Handling ⓘ Discard result
 Store result

Data

Setting	Description
SQL Query File	Shows the SQL script file that the sensor executes on the server. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Input Parameter Handling	Define if you want to pass a parameter to the SQL query file: <ul style="list-style-type: none"> ▪ Do not use input parameter (default): Execute the SQL query file without using variables. ▪ Use input parameter: Execute an SQL query file that contains a variable. Provide the parameter that you want to use in the query below.
Input Parameter	This setting is only visible if you select Input Parameter Handling above. Enter the parameter that you want to pass to the SQL query file. This parameter replaces the variables @prtg, :prtg, or ? in the SQL query, considering the general rules for SQL variables. You can also use PRTG placeholders for custom sensors (command-line parameters) as input parameters, for example, %sensorid or %deviceid. For details, see section Custom Sensors [444]. ⓘ Provide strings as they are and do not surround them with quotation marks. PRTG automatically and correctly inserts string parameters into the query.
Transaction Handling	Define if you want to use transactions and if they affect the database content: <ul style="list-style-type: none"> ▪ Do not use transaction (default): Do not execute transactions.

Setting	Description
	<ul style="list-style-type: none"> Use transaction and always roll back: The query does not change data in the database. In the SQL query file, separate the single steps of the transaction with semicolons. Use transaction and commit on success: The query changes data in the database. The changes only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons.
Data Processing	<p>Shows how the sensor processes data from the database.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Handle DBNull in Channel Values as	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define the sensor behavior if the query returns DBNull:</p> <ul style="list-style-type: none"> Error: Show a Down status if the query returns DBNull. Number 0: Recognize the result DBNull as a valid value and interpret it as the number 0.
Select Channel Value by	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define how to select the desired cell in the database table:</p> <ul style="list-style-type: none"> Column number: Determine the channel value by using the value in row 0 of the column whose number you specify in Channel #x Column Number. Column name: Determine the channel value by using the value in row 0 of the column whose name you specify in Channel #x Column Name. Row number: Determine the channel value by using the value in column 0 of the row whose number you specify in Channel #x Row Number. Key value pair: Determine the channel value by searching in column 0 for the key you specify in Channel #x Key and by returning the value in column 1 of the same row where the key value was found. <p>i Defining how the desired cell in the database table is selected is necessary to configure the cells that are used in the channels.</p> <p>i The option you select here also defines the method of how to optionally determine a value for the sensor message. For details, see setting Use Data Table Value in Sensor Message.</p> <p>■ For an example for channel value selection, see section Monitoring Databases ⁴³²⁵.</p>
Channel #x	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. The setting shows if the channel is disabled.</p>

Setting	Description
	<p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Channel #x Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Enter a unique name for the channel. Enter a string. The sensor dynamically generates channels with this name as identifier.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Channel #x Column Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column number for the setting Select Channel Value by. Provide the number of the column to use to determine the channel value in row 0. Enter an integer value.</p>
Channel #x Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column name for the setting Select Channel Value by. Provide the name of the column to use to determine the channel value in row 0. Enter an integer value.</p>
Channel #x Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Row number for the setting Select Channel Value by. Provide the number of the column to use to determine the channel value in row 0. Enter an integer value.</p>
Channel #x Mode	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. The setting shows how you want to display the determined value in the channel.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Channel #x Unit	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define the unit of the channel value:</p> <ul style="list-style-type: none"> ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours

Setting	Description
	<ul style="list-style-type: none"> ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Lookup
Channel #x Custom Unit	This setting is only visible if you select the channel unit Custom above. Define a unit for the channel value. Enter a string.
Channel #x Lookup	This setting is only visible if you select the channel unit Lookup above. Select a lookup file that you want to use with this channel.
Use Data Table Value in Sensor Message	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation. Define if the sensor message shows a value from the data table:</p> <ul style="list-style-type: none"> ▪ Disable: Do not use a custom sensor message. ▪ Enable: Define a custom sensor message with a defined value of the data table. Define the value selection below. <p>The method of how to determine a value for the sensor message is defined in the setting Select Channel Value by above.</p>
Sensor Message Column Number	This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column number for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the number of a column. The sensor message shows the value in row 0 of this column. Enter an integer value.
Sensor Message Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column name for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter a string.</p> <p>i Columns start with index 0.</p>
Sensor Message Row Number	This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Row number for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter the number of a row. The sensor message shows the value in column 0 of this row. Enter an integer value.

Setting	Description
	<p>i Rows start with index 0.</p>
Sensor Message Key	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Key value pair for the setting Select Channel Value by, and if you enable Use Data Table Value in Sensor Message. Enter a key to search for in column 0 of the data table. The sensor message shows the value in column 1 of the row where the key was found. Enter a string.</p>
Sensor Message	<p>This setting is only visible if you enable Use Data Table Value in Sensor Message. Define the sensor message. Enter a string. Use the placeholder <code>{0}</code> at the position where you want to display the value.</p> <p>Example: The message is <code>{0}</code></p> <p>i The number sign (<code>#</code>) is not supported in sensor messages. If a message contains a number sign, the message is clipped at this point.</p>
If Sensor Message Changes	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</p> <p>Define what the sensor does when the sensor message changes:</p> <ul style="list-style-type: none"> Ignore changes (default): Take no action on change. Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger⁴¹³⁸, you can use this mechanism to trigger a notification³⁹⁸⁷ whenever the sensor value changes.
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the <code>\Logs\sensors</code> subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups^[4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management^[155].</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#)^[142].

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB ▼
	kbit ▼
	/ ▼
	sec... ▼
Bytes (Memory)	MB ▼
Bytes (Disk)	MB ▼
Bytes (File)	Byte ▼

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Affected Rows	The number of rows that were addressed by the query (including SELECT statements if you process data tables)
Execution Time	<p>The execution time of the entire request (including connection buildup, query execution, transaction handling, disconnection) in milliseconds (msec)</p> <p>i This channel is the primary channel by default.</p>
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Query Execution Time	The execution time of the specified query in msec

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.123 Probe Health Sensor

The Probe Health sensor monitors internal PRTG parameters. It shows the status of the probe system and checks various parameters of the probe system that can affect the quality of the monitoring results.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Probe Health Sensor

Sensor in Other Languages

- Dutch: Probe Status
- French: État de la sonde
- German: Zustand der Probe
- Japanese: プローブ正常性
- Portuguese: Funcionamento da sonda

- Russian:
- Simplified Chinese: 探针健康状况
- Spanish: Salud de sonda

Remarks

- PRTG automatically creates this sensor. You cannot delete it.
- You can only create this sensor on a probe device, either a local probe device or a remote probe device.
- This sensor has a very low performance impact.
- See the Knowledge Base: [My probe system is running out of disk space. What can I do?](#)

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes the following elements:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A list of tags with 'exampletag' selected, accompanied by a plus sign to add more.
- Priority:** A star rating system showing 3 stars out of 5.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[408], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p>

Setting	Description
	<p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> probehealthsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking + below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Bytes (Memory)	MB
Bytes (Disk)	MB
Bytes (File)	Byte

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>ⓘ Custom channel types are only available on sensor level.</p>

Channel List

ⓘ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
CPU Load	The CPU load in percent that the probe process causes. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value should usually stay below 50%.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Handles	The counter for the data structures of the operating system. It is responsible for internal resource management. Investigate obviously increasing values that occur repeatedly.
Health	<p>The sum of the probe state as a value between 100% (healthy) and 0% (failing). Investigate frequent or repeated health values below 100%.</p> <p> This channel is the primary channel by default.</p>
Interval Delay non-WMI&SNMP	The interval delay in percent for all sensors that are not of the type Simple Network Management Protocol (SNMP) or Windows Management Instrumentation (WMI). If this value is above 0%, try to increase the scanning intervals ^[379] or distribute your sensors among probes ^[4503] .
Interval Delay SNMP	The interval delay in percent for SNMP sensors. If this value is above 0%, there are probably too many SNMP v3 sensors that are very slow. In this case, try to increase the scanning intervals or distribute the sensors among probes.
Interval Delay WMI	The interval delay in percent for WMI sensors. If this value is above 0%, WMI sensors were not able to check the target device according to their interval. 100% means that WMI sensors are checked with twice their interval on average. For values above 0%, try to increase the scanning intervals or distribute the sensors among probes to keep the number of WMI sensors per probe below 120 (with a 60-second scanning interval) or 600 (with a 300-second scanning interval).
Lost Flow Packets	The number of lost xFlow (NetFlow, jFlow, sFlow, IPFIX) ^[4305] packets in percent. The higher this value, the less xFlow packages PRTG can handle. Usually, this value should be 0%. Investigate increasing values.
Memory Usage	The amount of memory that is used by the PRTG probe service as reported by the memory manager. Investigate obviously increasing values that occur repeatedly. If the value is constantly above 2 GB, this indicates that PRTG runs at its limits. In this case, you should distribute some sensors among remote probes ^[4503] .
Message Queue	The number of monitoring results that have not been processed by the core yet. This value should usually stay below 1/10 of the sensor count.
Open Requests	The number of active monitoring requests. This value should stay below the maximum of 500 open requests.

Channel	Description
Syslog Buffer	The number of buffered syslog packages. Usually, this value should be 0 (or very low). Investigate increasing values.
Syslog Drop	The number of dropped syslog packages
Threads	The number of program parts that are running simultaneously. This value can increase with heavy load. Usually, the number should not exceed 100.
Toplist Memory	The amount of RAM that the Toplists ⁴⁰⁰² on this probe are using. Stay below 1 GB memory usage (depending on the available memory on the probe system). If necessary, reduce the number of Toplists or distribute them among probes.
Trap Buffer	The number of buffered SNMP traps. Usually, this value should be 0 (or very low). Investigate increasing values.

More

■ KNOWLEDGE BASE

My probe system is running out of disk space. What can I do?

- <https://kb.paessler.com/en/topic/64628>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

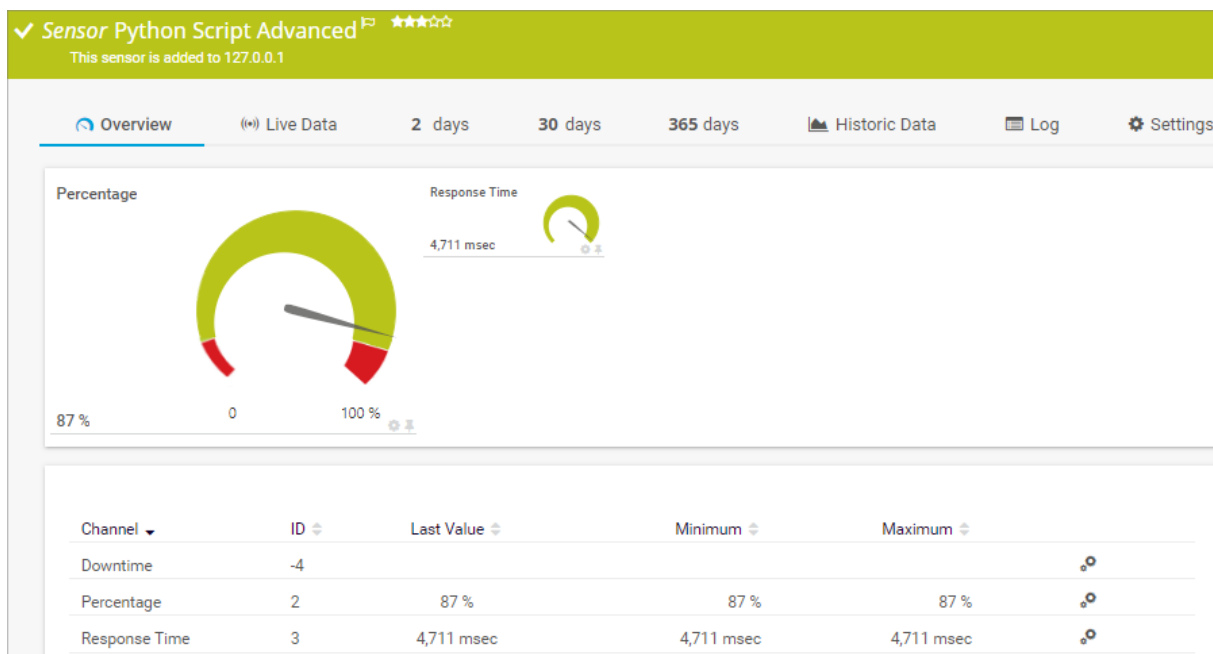

- [List of Available Sensor Types](#)⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁸⁷

7.8.124 Python Script Advanced Sensor

The Python Script Advanced sensor executes a Python script on the probe system. This option is available as part of the PRTG API.

i The return value of this sensor must be valid JavaScript Object Notation (JSON) or Extensible Markup Language (XML).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Python Script Advanced Sensor

Sensor in Other Languages

- Dutch: Python Script Geavanceerd
- French: Script Python avancé
- German: Python-Skript (Erweitert)
- Japanese: Python スクリプト(上級)
- Portuguese: Script Python Avançado
- Russian: Python ()
- Simplified Chinese: Python 脚本高级
- Spanish: Secuencia de comandos Python avanzada

Remarks

- You must store the script file on the probe system. In a cluster, copy the file to every cluster node.
- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.

- PRTG uses its own Python environment. This is located in the \python subfolder of the PRTG program directory. To avoid issues, we recommend that you do not have other Python environments running on a probe system. We also recommend that you do not uninstall the prtg Python package.
- Print commands in the Python script are not supported and lead to an invalid JSON result.
- Exceptions in the script are not supported.
- Channel values greater than 2^62 are not supported.
- The timeout of the sensor is its [scanning interval](#) ^[2098] minus 1 second. Make sure that your Python script does not run longer than this.
- For best sensor usage, we recommend that the return value is JSON encoded.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor has a medium performance impact.
- See the Knowledge Base: [What is the Mutex Name in the EXE/Script Sensor settings?](#)
- See the Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)
- See the Knowledge Base: [After updating to PRTG 20.1.55, my Python Script Advanced sensors are down](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) ^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Sensor Settings

Setting	Description
Python Script	<p>Select a Python script from the list. The sensor executes it with every scanning interval ^[2098].</p> <p>This list shows all Python script files that are available in the \Custom Sensors\python subfolder of the PRTG program directory ^[4526] on the probe system. For the files to appear in this list, store the files in this subfolder with the extension .py.</p> <ul style="list-style-type: none"> ❗ To show the expected values and sensor status, your files must return the expected XML or JSON format to standard output. The values and message must be embedded in the XML or JSON. We recommend JSON-encoded return values. ■ For detailed information on how to create custom sensors and for the return format, see section Custom Sensors ^[4440]. ❗ If you use custom sensors on the cluster probe ^[4560], copy your files to every cluster node.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ pythonxml ▪ python ▪ xml ▪ json

Setting	Description
	<ul style="list-style-type: none"> ▪ script
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Settings

Sensor Settings

Important: The Python script file must be stored on the parent probe system of the sensor.

Python Script **i** `sensor_example.py`

Security Context **i**
 Use security context of PRTG probe service
 Use Windows credentials of parent device

Device Credentials **i**
 Do not transmit device credentials
 Transmit Windows credentials
 Transmit Linux credentials
 Transmit SNMP credentials
 Transmit all device credentials

Additional Parameters **i** _____

Mutex Name **i** _____

Sensor Settings

Setting	Description
Python Script	Shows the Python script file that the sensor executes with each scanning interval. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Security Context	Define the Windows user account that the sensor uses to run the Python interpreter: <ul style="list-style-type: none"> ▪ Use security context of PRTG probe service: Run the Python script file under the same Windows user account that the probe runs under. By default, this is the Windows system user account. ▪ Use Windows credentials of parent device: Use the Windows user account from the settings of the parent device^[446].

Setting	Description
Device Credentials	<p>Define if you want to transmit device credentials to the Python script. PRTG adds the device credentials to the JSON object that is passed to the script as a command-line parameter. Choose between:</p> <ul style="list-style-type: none"> Do not transmit device credentials: Transmit no device credentials to the script. Transmit Windows credentials: Transmit Windows credentials to the script. Transmit Linux credentials: Transmit Linux credentials to the script. Transmit SNMP credentials: Transmit SNMP credentials to the script. Transmit all device credentials: Transmit Windows, Linux, and Simple Network Management Protocol (SNMP) credentials to the script. <p>i The sensor transmits all parameters in plain text.</p>
Additional Parameters	<p>Define additional parameters to add to the JSON object that is passed to the script as a command-line parameter. Enter a string or leave the field empty.</p> <p>i The sensor transmits all parameters in plain text.</p>
Mutex Name	<p>Define a mutual exclusion (mutex) name for the process. Enter a string or leave the field empty.</p> <p>i PRTG executes all Python Script Advanced sensors that have the same mutex serially, not simultaneously. This is useful if you use a lot of sensors and want to avoid high resource usage because of simultaneously running processes.</p> <p>■ See the Knowledge Base: What is the Mutex Name in the PRTG EXE/Script settings?</p>

Debug Options

Debug Options

Result Handling **i** Discard result
 Store result

Debug Options

Setting	Description
Result Handling	Define what PRTG does with the sensor result:

Setting	Description
	<ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].Data.txt and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>i You can use Store result to inspect the passed JSON object that contains all parameters (PRTG on premises only). This way, you can find out which key you can access when you script.</p> <p>i PRTG masks transmitted passwords in the logfile.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **ⓘ** Downtime

Graph Type **ⓘ** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p> i You can change the available intervals in the system administration on PRTG on premises installations. </p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p> i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply. </p> <p> i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply. </p> <p> i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply. </p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

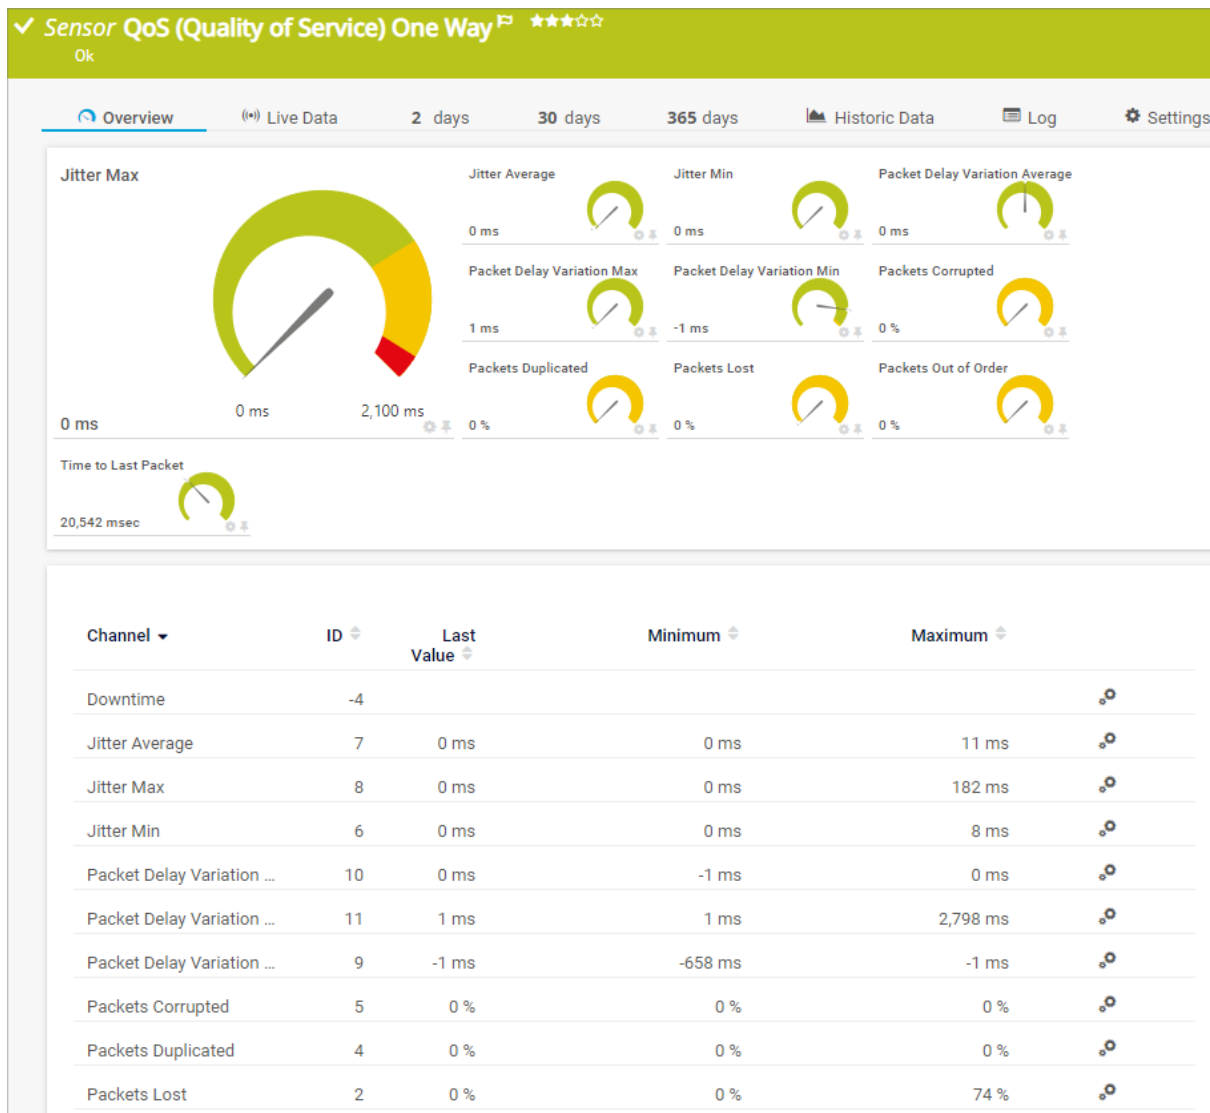

- [List of Available Sensor Types](#) 
- [Additional Sensor Types \(Custom Sensors\)](#) 
- [Channel Settings](#) 
- [Notification Triggers Settings](#) 

7.8.125 QoS (Quality of Service) One Way Sensor

The QoS (Quality of Service) One Way sensor monitors parameters regarding the quality of a network connection between two probes.

i The sensor sends a series of User Datagram Protocol (UDP) packets from the source probe to a target probe and measures several parameters.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

QoS (Quality of Service) One Way Sensor

Sensor in Other Languages

- Dutch: QoS (Quality of Service) Eén Richting
- French: QoS (Quality of Service) à sens unique
- German: QoS (Quality of Service) Unidirektional
- Japanese: 一方向 QoS(Quality of Service)

- Portuguese: QoS (Qualidade de serviço) Unidirecional
- Russian:
- Simplified Chinese: QoS (服务质量) 单向
- Spanish: QoS (Quality of Service) unidireccional

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- You must configure at least one [remote probe](#) in your PRTG on premises setup for this sensor to work, and at least two remote probes in PRTG Hosted Monitor.
- You can create this sensor on the probe device of a local probe or a remote probe.

 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p> If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags [145] that the sensor inherits [145] from its parent device [140], parent group [139], and parent probe [139]. <p>i This setting is for your information only. You cannot change it.</p>
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited [145]. <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ qossensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Quality of Service Measurement

Quality of Service Measurement

Timeout (Sec.) **i** 60

Target Probe **i** HQ (Local Probe) (127.0.0.1) ▼

Target Host/IP Address **i** 127.0.0.1

Port **i** 50000

Number of Packets **i** 1000

Packet Size (Bytes) **i** 172

Packet Delay (ms) **i** 20

Please use "Windows Policy-based Quality of Service" if you need to apply QoS parameters to the test packets of this sensor (for example, DSCP parameters). These parameters cannot be set from inside PRTG. See <http://technet.microsoft.com/en-us/library/hh831689.aspx> and <http://msdn.microsoft.com/library/aa374094.aspx> for details.

Quality of Service Measurement

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
Target Probe	<p>Define the target probe that receives the UDP packets. The dropdown list shows all local probes and remote probes in your setup.</p> <p>If you want to run the sensor on the local probe, select a remote probe as the Target Probe. If no remote probe is available, install and connect a remote probe first.</p> <p>If you want to run the sensor on a remote probe, select either a different remote probe or the local probe as the target. The sensor measures values for the network track between the parent probe and the target probe.</p> <p>i You must ensure that firewalls or network address translation (NAT) rules allow UDP packets to reach the target probe. The probe automatically opens the Windows firewall on the target system.</p> <p>☁ In PRTG Hosted Monitor, you can only select a different remote probe as the target probe. QoS measurements for connections to the hosted probe are not possible.</p>
Target Host/IP Address	<p>Define the IP address of the target probe.</p> <p>i If you do not use NAT rules, this is usually the IP address in parentheses next to the probe name under Target Probe.</p>
Port	<p>Define the source and target port for the UDP packets. Both the source probe and the target probe use this port. Enter an integer value between 1024 and 65536.</p> <p>i Use a different port for each QoS (Quality of Service) One Way sensor to make sure that packets can be assigned correctly.</p> <p>i The port must be available on both the source system and the target system.</p>
Number of Packets	<p>Define the number of packets that the sensor sends with each scanning interval. Enter an integer value. The default value is 1000.</p> <p>i We recommend that you use the default value.</p>
Packet Size (Bytes)	<p>Define the size of the packets in bytes that the sensor sends. Enter an integer value. The default value is 172.</p> <p>i We recommend that you use the default value.</p>

Setting	Description
Packet Delay (ms)	<p>Define the time in milliseconds (ms) that the sensor waits between two packets. Enter an integer value. The default value is 20.</p> <p>i We recommend that you use the default value.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
<input type="radio"/> inherit from  Root	Scanning Interval ⓘ 60 seconds
	If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays

Setting	Description
	<ul style="list-style-type: none"> ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency.

Setting	Description
	<ul style="list-style-type: none"> Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies [4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector [257] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

inherit from  Root

User Group Access 	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>For more details on access rights, see section Access Rights Management.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Jitter Average	The average jitter in milliseconds (ms)
Jitter Max	The maximum jitter in ms i This channel is the primary channel by default.
Jitter Min	The minimum jitter in ms
Packet Delay Variation Average	The average packet delay variation in ms
Packet Delay Variation Max	The maximum packet delay variation in ms

Channel	Description
Packet Delay Variation Min	The minimum packet delay variation in ms
Packets Corrupted	The corrupted packets in percent
Packets Duplicated	The duplicated packets in percent
Packets Lost	The lost packets in percent
Packets Out Of Order	The out of order packets in percent
Time To Last Packet	The time to the last packet in msec

Sensor Settings Overview

For more information about sensor settings, see the following sections:

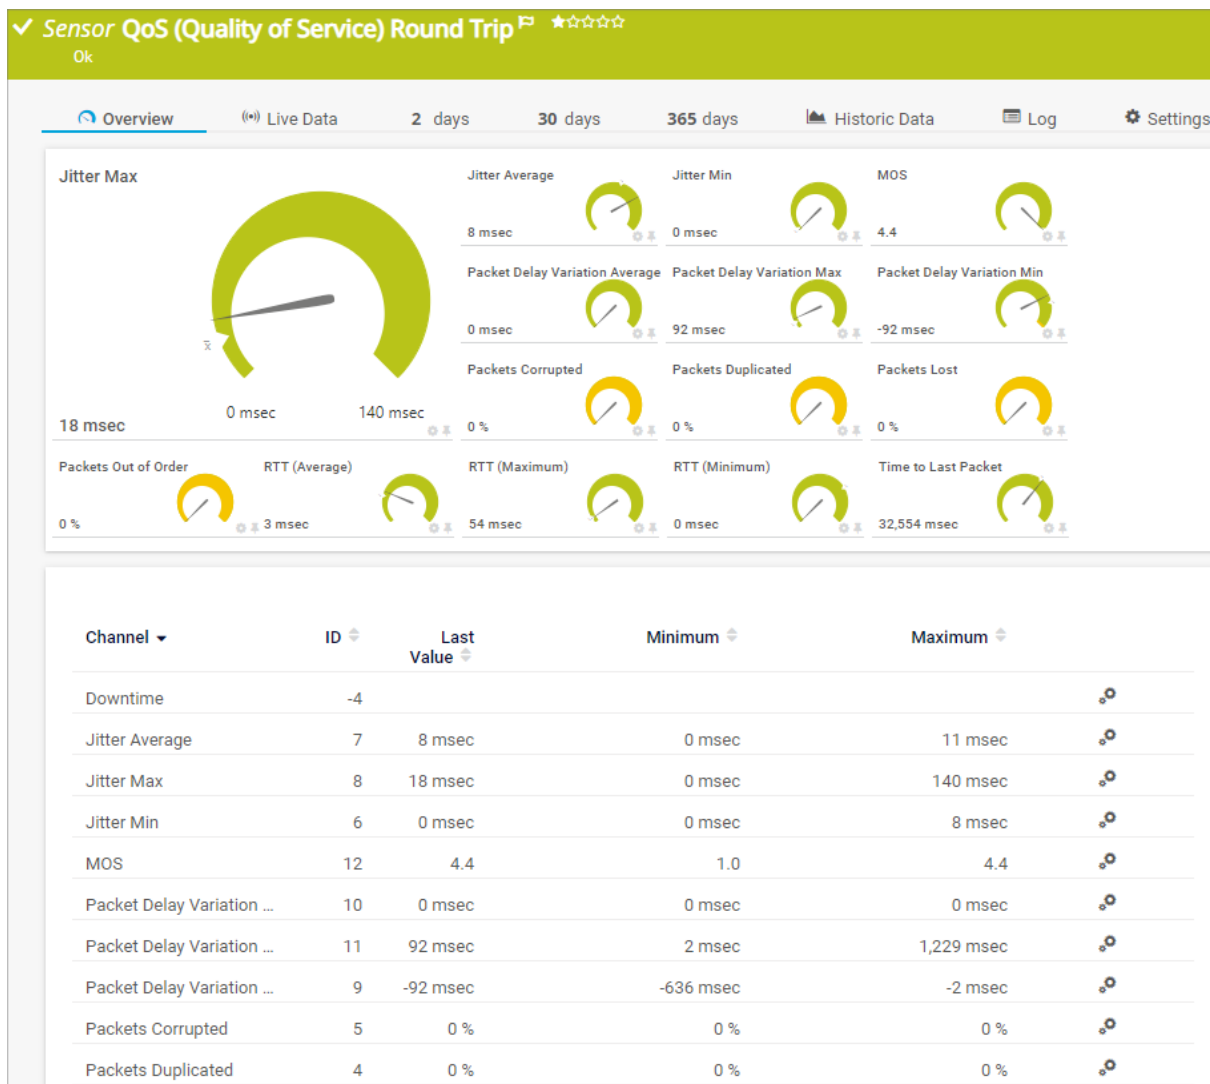

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.126 QoS (Quality of Service) Round Trip Sensor

The QoS (Quality of Service) Round Trip sensor monitors parameters regarding the quality of a network connection between two probes.

i The sensor sends a series of User Datagram Protocol (UDP) packets from the source probe to a target probe at the end of the connection line. Then, the target probe sends the packets back to the source probe.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

QoS (Quality of Service) Round Trip Sensor

Sensor in Other Languages

- Dutch: QoS (Quality of Service) Heen en weer
- French: Aller-retour du QoS (Quality of Service)
- German: QoS (Quality of Service) Round Trip
- Japanese: ラウンドトリップ QoS(Quality of Service)

- Portuguese: Percurso de ida e volta QoS (Qualidade de serviço)
- Russian:
- Simplified Chinese: QoS (服务质量) 往返
- Spanish: Ida y vuelta QoS (Calidad de servicio)

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- You must configure at least one [remote probe](#) in your PRTG on premises setup and at least two remote probes in PRTG Hosted Monitor, or you need to set up the [PRTG QoS Reflector](#) tool on the target machine at the endpoint of the connection that you want to monitor.
- You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
- See the Knowledge Base: [How can I monitor QoS round trips without using remote probes?](#)
- See the Knowledge Base: [How does PRTG calculate the MOS score for QoS sensors?](#)
- See the Knowledge Base: [What connection settings are necessary for the QoS \(Quality of Service\) Round Trip sensor?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A text input field containing "exampletag" with a blue 'X' icon to the right and a plus sign icon to the left of the input field.
- Priority:** A star rating system showing 3 out of 5 stars filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ qossensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

Target Probe

Target Host/IP Address

Port

Number of Packets

Packet Size (Bytes)

Packet Delay (ms)

Use "Windows Policy-based Quality of Service" if you need to apply QoS parameters to the test packets of this sensor (for example, DSCP parameters). These parameters cannot be set from inside PRTG. See <https://technet.microsoft.com/en-us/library/hh831689.aspx> and <https://msdn.microsoft.com/library/aa374094.aspx> for details.

Quality of Service Measurement

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
QoS Target	<p>Define the type of target that receives the UDP packets:</p> <ul style="list-style-type: none"> ▪ PRTG probe (recommended): Use a probe as the connection endpoint. ▪ Custom target: Use the PRTG QoS Reflector as the connection endpoint. <p>■ For more information about the QoS Reflector, see the Knowledge Base: How can I monitor QoS round trips without using remote probes?</p>
Target Probe	<p>This setting is only visible if you select PRTG probe above. Define the target probe that receives the UDP packets. The dropdown list shows all local probes and remote probes in your setup.</p> <p>If you want to run the sensor on the local probe, select a remote probe as the Target Probe. If no remote probe is available, install and connect a remote probe first. Alternatively, you can use the PRTG QoS Reflector.</p> <p>If you want to run the sensor on a remote probe, select either a different remote probe or the local probe as the target. The sensor measures values for the network track between the parent probe and the target probe.</p>

Setting	Description
	<p> You must ensure that firewalls or network address translation (NAT) rules allow UDP packets to reach the target probe. The probe automatically opens the Windows firewall on the target system. For details, see the Knowledge Base: What connection settings are necessary for the QoS (Quality of Service) Round Trip Sensor?</p> <p> In PRTG Hosted Monitor, you can only select a different remote probe as the target probe. QoS measurements for connections to the hosted probe are not possible.</p>
Target Host/IP Address	<p>Define the IP address of the QoS target:</p> <ul style="list-style-type: none"> ▪ If you use the QoS Reflector, enter the address of the system on which the reflector script runs. ▪ If you use a probe, enter the address of the probe to which the source probe connects. <p> If you do not use NAT rules, this is usually the IP address in parentheses next to the probe name under Target Probe.</p>
Port	<p>Define the source and target port for the UDP packets. Both the source probe and the target probe use this port. Enter an integer value between 1024 and 65536.</p> <p> Use a different port for each QoS (Quality of Service) Round Trip sensor to make sure that packets can be assigned correctly.</p> <p> The port must be available on both the source system and the target system.</p>
Number of Packets	<p>Define the number of packets that the sensor sends with each scanning interval. Enter an integer value. The default value is 1000.</p> <p> We recommend that you use the default value.</p>
Packet Size (Bytes)	<p>Define the size of the packets in bytes that the sensor sends. Enter an integer value. The default value is 172.</p> <p> We recommend that you use the default value.</p>
Packet Delay (ms)	<p>Define the time in milliseconds (ms) that the sensor waits between two packets. Enter an integer value. The default value is 20.</p> <p> We recommend that you use the default value.</p>

Click ⓘ to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
	Scanning Interval ⓘ 60 seconds
	If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Jitter Average	The average jitter in in milliseconds (msec)
Jitter Max	The maximum jitter in msec  This channel is the primary channel by default.
Jitter Min	The minimum jitter in msec
MOS	The mean opinion score (MOS)
Packet Delay Variation Average	The average packet delay variation in msec

Channel	Description
Packet Delay Variation Max	The maximum packet delay variation in msec
Packet Delay Variation Min	The minimum packet delay variation in msec
Packets Corrupted	The corrupted packets in percent
Packets Duplicated	The duplicated packets in percent
Packets Lost	The lost packets in percent
Packets Out Of Order	The out of order packets in percent
RTT (Average)	The average round-trip time (RTT) in msec
RTT (Maximum)	The maximum RTT in msec
RTT (Minimum)	The minimum RTT in msec
Time To Last Packet	The time to the last packet in msec

Sensor Settings Overview

For more information about sensor settings, see the following sections:

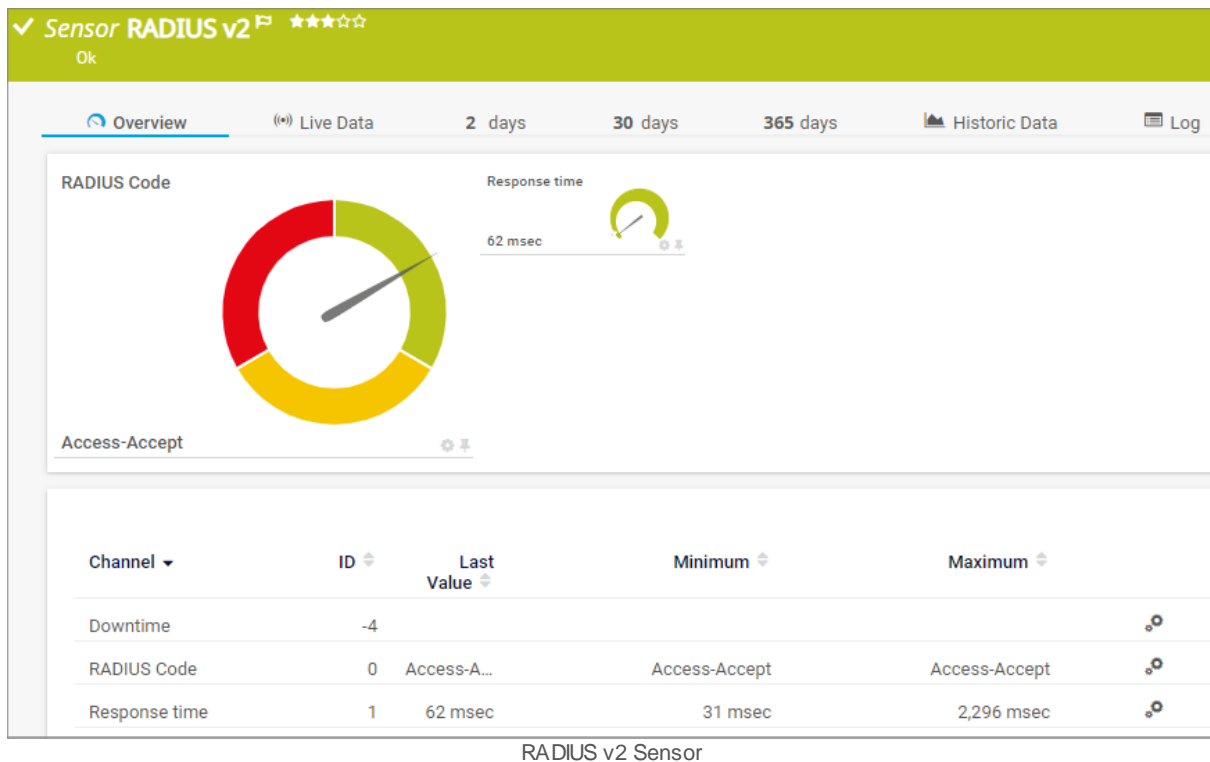

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.127 RADIUS v2 Sensor

The RADIUS v2 sensor monitors a Remote Authentication Dial-In User Service (RADIUS) server according to [RFC 2865](#).

i The sensor tries to authenticate itself against the server. If authentication fails, the sensor shows the Down [status](#)¹⁹⁷.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)²¹³⁹.

Sensor in Other Languages

- Dutch: RADIUS v2
- French: RADIUS v2
- German: RADIUS v2
- Japanese: RADIUS V2
- Portuguese: RADIUS v2
- Russian: RADIUS v2
- Simplified Chinese: RADIUS v2
- Spanish: RADIUS v2

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.

- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor only supports plain text authentication (Password Authentication Protocol (PAP)).
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority:** A section with five stars, where the first three are filled, indicating a priority of 3.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ radiussensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

RADIUS Specific

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
User Name	<p>Enter the user name for the authentication against the RADIUS server. Enter a string.</p>
Password	<p>Enter the password for the authentication between the client (the probe system) and the RADIUS server. Enter a string.</p>
Secret	<p>Enter the shared secret for the authentication between the authenticator (the probe system) and the RADIUS server. Enter a string.</p>
Port	<p>Enter the number of the port for the connection to the RADIUS server. The default value is 1812. Enter an integer value.</p>
NAS Identification	<p>Define how to identify the network access server (NAS):</p> <ul style="list-style-type: none"> ▪ Use NAS IP address: Enter the NAS IP Address for identification below. ▪ Use NAS identifier: Enter the NAS Identifier below.
NAS IP Address	<p>This setting is only visible if you select Use NAS IP address above. Enter a valid IP address for the NAS that originates the access request.</p>
NAS Identifier	<p>This setting is only visible if you select Use NAS identifier above. Enter an identifier for the NAS that originates the access request.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

7.8.128 RDP (Remote Desktop) Sensor

The RDP (Remote Desktop) sensor monitors remote desktop services such as Remote Desktop Protocol (RDP) or Terminal Services Client.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

RDP (Remote Desktop) Sensor

Sensor in Other Languages

- Dutch: RDP (Remote Desktop)
- French: RDP (Bureau à distance)
- German: RDP (Remotedesktop)
- Japanese: RDP(リモートデスクトップ)
- Portuguese: RDP (desktop remoto)
- Russian: RDP ()
- Simplified Chinese: RDP (远程桌面)
- Spanish: RDP (Escritorio remoto)

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has a title bar 'Basic Sensor Settings'. Below the title bar, there are three rows of settings:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A text input field containing 'exampletag' with a blue 'x' icon to the right and a plus sign icon to the far right.
- Priority**: A star rating system showing three filled stars and two empty stars.

Basic Sensor Settings

Setting	Description

By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

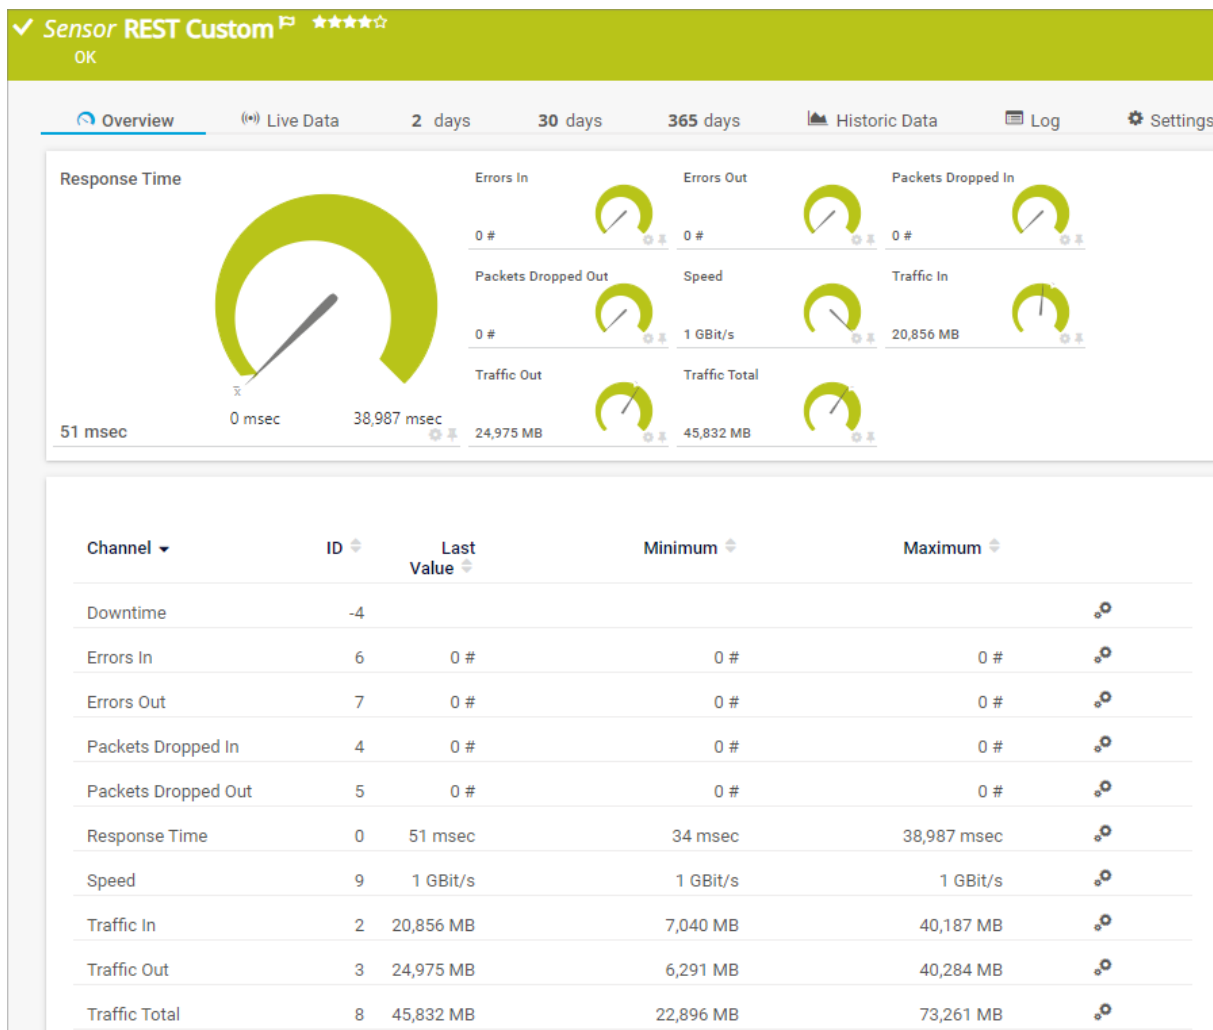

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.129 REST Custom Sensor

The REST Custom sensor queries a Representational State Transfer (REST) application programming interface (API) endpoint and maps the JavaScript Object Notation (JSON) or Extensible Markup Language (XML) result to sensor values.

i The mapping rule must be available as a REST configuration file in JSON template (*.template) format according to the PRTG API definition for custom sensors.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

REST Custom Sensor

Sensor in Other Languages

- Dutch: REST Aangepast
- French: REST personnalisé
- German: REST (Benutzerdef.)
- Japanese: REST カスタム
- Portuguese: REST (Customizado)

- Russian: REST
- Simplified Chinese: REST 自定义
- Spanish: REST personalizado

Remarks

- You must store the REST configuration file that contains the mapping rules on the probe system. In a cluster, copy the file to every cluster node.
 - This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance. If you have more than 50 channel mappings in your REST configuration file, the sensor shows an error.
 - This sensor supports the IPv6 protocol.
 - This sensor has a medium performance impact.
 - In a cluster, status changes triggered by limits only work on the master node.
- ☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

REST Specific

Setting	Description
REST Configuration	<p>Select a REST configuration file from the list. The sensor uses it to map the JSON or XML result from the REST query to sensor values.</p> <p>The default REST configuration file is channelDiscovery. If you select this file, the sensor parses the returned JSON or XML and automatically creates channels based on available values: one channel for each number and boolean for strings if they are convertible into numbers.</p> <p>This list shows all REST configuration files that are available in the \Custom Sensors\rest subfolder of the PRTG program directory on the probe system. For the files to appear in this list, store the files as JSON template (*.template) in this subfolder.</p> <p>☁ To use custom REST configurations in PRTG Hosted Monitor, contact the Paessler support team, or add this sensor to a remote probe instead and save the file on the remote probe system.</p> <p>ⓘ To show the expected values and sensor status, your files must return the expected JSON format. Channels, values, and messages must be embedded in valid JSON using JSONPath. For details, see section Define Channels and Select Channel Values.</p>

Setting	Description
	<ul style="list-style-type: none"> For detailed information on how to create custom sensors and for the return format, see section Custom Sensors. If you use custom sensors on the cluster probe, copy your files to every cluster node.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag', and a 'Priority' field with five stars, three of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <ul style="list-style-type: none"> i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). i For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ restcustomsensor ▪ restsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

REST Specific

Setting	Description
Request Method	<p>Select an HTTP request method to determine how the sensor requests the REST API.</p> <ul style="list-style-type: none"> ▪ GET (default): Use the GET method to request the REST API. ▪ POST: Use the POST method to request the REST API. <p>i If you use the POST method, use the content type, for example application/x-www-form-urlencoded, as HTTP header. In section HTTP Headers, select Use custom HTTP headers and enter the content type in the Custom HTTP Headers field.</p>
Postdata	<p>This setting is only visible if you select POST above. Enter the data part for the POST request.</p> <p>i If you use the POST method, use the content type, for example application/x-www-form-urlencoded, as HTTP header. In section HTTP Headers, select Use custom HTTP headers and enter the content type in the Custom HTTP Headers field.</p>
Request Protocol	<p>Define the security protocol of the HTTP request:</p> <ul style="list-style-type: none"> ▪ HTTP (default): Send the REST query via HTTP (not secure). ▪ HTTPS: Send the REST query via secure HTTPS.
Certificate Acceptance	<p>This setting is only visible if you select HTTPS above. Select the kind of certificates that you want the sensor to accept for the connection:</p> <ul style="list-style-type: none"> ▪ Accept trusted certificates only (default): Accept only trusted certificates issued by a certificate authority (CA). ▪ Accept all certificates: Accept all certificates, including self-signed certificates.
Authentication Method	<p>Select the authentication method for access to the REST API:</p> <ul style="list-style-type: none"> ▪ No authentication (default): Do not use any authentication for the request. ▪ Basic authentication: Use a user name and password for authentication. ▪ Basic authentication with Windows credentials from parent device: Use the Windows credentials from the parent device. <ul style="list-style-type: none"> ■ For more information, see section Inheritance of Settings ¹⁴². ▪ Token: Use a JSON Web Token (JWT) or OAuth2 Bearer Token for authentication.
User Name	<p>This setting is only visible if you select Basic authentication above. Enter a user name for the REST API. Enter a string.</p>

Setting	Description
Password	This setting is only visible if you select Basic authentication above. Enter a password for the REST API. Enter a string.
Token	This setting is only visible if you select Token above. Enter a JWT or OAuth2 Bearer Token that the REST API requires for authentication.
HTTP Headers	Define if you want to send custom HTTP headers to the target URL: <ul style="list-style-type: none"> Do not send custom HTTP headers Send custom HTTP headers
Custom HTTP Headers	<p>This setting is only visible if you select Use custom HTTP headers above. Enter a list of custom HTTP headers with their respective values that you want to transmit to the target URL, each pair in one line. The syntax of a header-value pair is <code>header1:value1</code>.</p> <p>i If you enter more than one header-value pair, you must separate them with delimiters. The syntax is <code>header1:value1 header2:value2 header3:value3</code></p> <p>i The sensor does not support the header field names <code>user-agent</code>, <code>content-length</code>, <code>host</code>.</p> <p>i Make sure that the HTTP header statement is valid. Otherwise, the sensor request cannot be successful.</p> <p>i If you select the POST Request Method setting above, enter the content type, for example <code>application/x-www-form-urlencoded</code>, as the custom HTTP header.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
REST Query	<p>Shows the REST query that this sensor executes. To change it, enter a valid query for the target REST API. The syntax is: <code>[:port]/path[?var1=val1&...]</code></p> <p>i The sensor always inherits the first part of the address from the address of the parent device. Only enter the path to the REST endpoint of the parent device. You can override the port if necessary.</p> <p>For example, if you add the sensor to a probe device, a query to the REST API of your PRTG installation that returns the number of sensors on the probe could look like this:</p> <pre style="border: 1px solid gray; padding: 5px;">/api/table.json? id=1&passhash=<passhash>&username=<username>&content=sensorxr ef&noraw=1&filter_basetype=probe&columns=totalsens=extraw</pre>

Setting	Description
REST Configuration	<p>Shows the REST configuration file that the sensor uses to map the returned JSON or XML into sensor values.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

Debug Options

Debug Options

Result Handling **i**

Discard result

Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i**

Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Proxy Settings for HTTP Sensors

Click  to interrupt the [inheritance](#)¹⁴².

The proxy settings determine how a sensor connects to a URL. You can enter data for an HTTP proxy server that sensors use when they connect via HTTP or HTTPS.

 This setting only applies to HTTP sensors and how they monitor. To change the proxy settings for the PRTG core server, see section [Core & Probes](#)⁴²⁰³.

Proxy Settings for HTTP Sensors

IP Address/DNS Name ⓘ	192.0.2.0
Port ⓘ	8080

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Define Channels and Select Channel Values

In your REST configuration file, you have to define which values of the returned JSON or XML are mapped to which channels.

- A channel is defined by the channel key in your REST configuration. See the JSON Return Format: Minimum Example in section [Custom Sensors](#) ⁴⁴⁰.

- A channel value is defined by an expression that retrieves and processes the value from the JSON source. The expression can contain [JSONPath](#) ²¹⁶⁶, [gval operators](#) ²¹⁷⁰, and [functions](#) ²¹⁷².

Example

For this example, we take PRTG as REST endpoint and query the sensor status statistics for the local probe. The REST query that we enter in the sensor settings looks like this:

```
/api/table.json?id=1&passhash=<passhash>&username=<username>&content=sensorxref&
noraw=1&filter_basetype=probe&columns=totalsens=extraw,upsens=extraw,
downsens=extraw,partialdownsens=extraw,warnsens=extraw,pausedsens=extraw,
unusualsens=extraw,undefinedsens=extraw,downacksens=extraw
```

This REST query returns some JSON, for example:

```
{
  "prtg-version": "17.3.33.2517",
  "treesize": 1,
  "state": "ok",
  "sensorxref": [
    {
      "totalsens": 28,
      "upsens": 18,
      "downsens": 0,
      "partialdownsens": 0,
      "warnsens": 0,
      "pausedsens": 9,
      "unusualsens": 1,
      "undefinedsens": 0,
      "downacksens": 0
    }
  ]
}
```

Your REST configuration has to translate this JSON for the sensor. It has to be available as JSON template (*template) in the \Custom Sensors\rest subfolder of the [PRTG program directory](#) ⁴⁵²⁶ on the probe system. See section [Custom Sensors](#) ⁴⁴⁴⁰ for details about the JSON return format.

The following example returns two channels from the JSON resource that are added to the sensor in PRTG, Total (total sensor count) and Alarms (sensors in the Down status), each selected by their keys in the returned JSON.

```
{
  "prtg": {
    "result": [
      {
        "channel": "Total" ,
        "value": $.sensorxref[0].totalsens
      },
      {
        "channel": "Alarms" ,
        "value": $.sensorxref[0].downsens
      }
    ]
  }
}
```

The channel values are the values of the corresponding properties of the REST result defined in JSONPath notation, `$.sensorxref[0].totalsens` (28) and `$.sensorxref[0].downsens` (0).

Each value's property (destination) and the text property is set to the appropriate transformation rules from source to destination. This is the JSON path of the source. The sensor replaces each path with the value from the source.

- ⓘ Several REST configuration files are available in the `\Custom Sensors\rest` subfolder by default. They are ready for use. You can also analyze them to see how to write your own REST configuration.

JSONPath

The REST Custom sensor uses [JSONPath](#) to assign values from the returned JSON to channels. With JSONPath, you provide the path to the value in the JSON source that you want to monitor in a channel.

- ⓘ The JSONPath implementation that PRTG uses for the REST Custom sensor might differ from other JSONPath implementations. You can [test and debug your definitions](#)^[2174] using the command line. To test simple JSONPath expressions and calculations, you can also use [JSONPath Online Evaluator](#)^[2176], for example. Note that this tool might not work properly with complex JSONPath expressions that PRTG supports.

Example

To demonstrate the practical usage of JSONPath, we use this JSON example that a REST query might have returned as reference in this section.

```
{
  "devices": [
    {
      "firmware": {
        "id": "0.7",
        "date": "2017-05-18T17:11:43.7049944Z",
        "channel": "beta"
      },
      "networks": {
        "a": {
          "rx_bytes": 35985021,
          "rx_packets": 176791,
          "rx_errors": 0,
          "rx_dropped": 476,
          "tx_bytes": 7229493,
          "tx_packets": 35518,
          "tx_errors": 0,
          "tx_dropped": 1
        },
        "b": {
          "rx_bytes": 40085321,
          "tx_bytes": 55294975
        }
      }
    },
    {
      "networks": {
        "a": {
          "rx_bytes": 63685865,
          "tx_bytes": 7229472
        }
      }
    }
  ]
}
```

REST Custom Sensor: JSONPath

Root The dollar sign (\$) matches the root element of the JSON data.

Child You can match a child with .<key> or [<key>]

REST Custom Sensor: JSONPath

- `.<key>` must only contain letters, numbers, and underscore (`_`). Hyphens (`-`) are not supported.
- `[<key>]` must only contain a number or a quoted string.

Example

This expression matches 35985021 in the example above:

```
$.devices.0.networks.a.rx_bytes
```

You get the same result with this expression:

```
$["devices"][0]["networks"]["a"]["rx_bytes"]
```

If an element contains a hyphen (`-`), the `.<key>` notation does not work. Use the `[<key>]` notation in this case:

```
$["data"][0]["system-stats"]["temps"]["Board (CPU)"]
```

Wildcard

To match multiple values, you can use the asterisk symbol (`*`).

- `*`
- `[*]`

Example

This expression matches 35985021 and 40085321 in the example above:

```
$.devices[0].networks.*.rx_bytes
```

Recursive Descent

You can match all subitems of a node with two dots (`..`).

Example

This expression matches 7229493 and 55294975 and 7229472 in the example above:

```
$..tx_bytes
```

Union

You can match multiple children with `[<key1>,<key2>,<...>]`.

Example

This expression matches 35985021 and 7229493 in the example above:

```
$.devices.0.networks.a["rx_bytes","tx_bytes"]
```

Slice

You can match multiple children of an array with `[<begin>:<end>]` or `[<begin>:<end>:<step>]`.

- By default, **begin**, **end**, and **step** are either integers or empty.
- The default approach is to go step by step from the first array element to the last element.

REST Custom Sensor: JSONPath

- **Step** can also be a negative integer to go through the array in reversed order.

 Example

This expression matches 63685865 in the example above:

```
$.devices[-1:].networks.a.rx_bytes
```

Current

The @ symbol matches the current element.

 Example

This expression matches 40.085321 and 55.294975 in the example above and can be used to receive a percentage value:

```
$.devices[1].networks.a["rx_bytes","tx_bytes"]
(@/100000000*100)
```

Filter

You can filter matches with [?<expression>].

 Example

This expression matches 35985021 in the example above because the first device is the only one with a beta channel:

```
$.devices[?@.firmware.channel=="beta"].networks.a.rx_bytes
```

Script

You can modify matches with (<expression>) and keys with [<expression>].

 Example

This expression matches true and false in the example above because only the first device has a beta channel:

```
$.devices[*](@.firmware.channel=="beta")
```

Placeholder

Placeholders give access to values of wildcards in a match. A placeholder #n (where n is a natural number) represents the value of the nth wildcard. You can use this in the keys of JSON arrays.

 Example

This expression creates a JSON map from ids to the corresponding firmware channel and matches {"0.7":"beta"} in the example above:

```
{$.devices[#0].id:$.devices[*].channel}
```

 This is an extension of the official JSONPath.

Constant

- Numeric constants as 64-bit floating point: 12345.678
- String constants with double quotes: "switch"

REST Custom Sensor: JSONPath

- Boolean constants: true and false
- Operator
 - Parentheses control the order of evaluation: (<expression>)
 - Arrays with brackets: [<expression>, <expression>, ...]
 - Objects: {<expression>:<expression>, <expression>:<expression>, ...}
 - Conditionals: <condition> ? <expression> : <expression>

Calculating Channel Values and Functions

You can perform calculations with the values of the source JSON or XML. The sensor uses the Paessler [gval](#) package for the calculations. For details, refer to the [gval documentation](#)^[2170].

The following operators and functions are available to calculate channel values.

REST Custom Sensor: Operators

	Operator	Description	Operand Type	Output Type
Infix Modifiers	+	plus	number	number
	-	minus	number	number
	*	times	number	number
	**	power of	number	number
	%	modulo	number	number
	/	divide	number	number
	&	bitwise and	number	number
		bitwise or	number	number
	^	bitwise xor	number	number
	<<	shift left	number	number
>>	shift right	number	number	

REST Custom Sensor: Operators

Logical Infix Operators	>	greater than	number/string	bool
	>=	equal or greater than	number/string	bool
	<	less than	number/string	bool
	<=	equal or less than	number/string	bool
	==	equal	any	bool
	!=	not equal	any	bool
	=~	match regular expression	string	bool
	!~	mismatch regular expression	string	bool
	in	contains element	any, array	bool
	&&	and	and	bool
		or	or	bool
??	coalescence	any	any	
Prefix Operators	-	negative	number	number
	~	bitwise not	number	number
	!	not	bool	bool

REST Custom Sensor: Functions

duration(start,end)

- Calculates the nanoseconds between start and end.
- Both parameters must be RFC3339 date time strings.

 Example

```
duration($.devices[0].firmware.date, "017-05-18T17:11:43.7049944Z")
```

now()

- Returns the current date time in RFC3339.

 Example

```
duration($.devices[0].firmware.date, now())
```

number(string, [base])

- Converts a string to a floating point number.
- If the base is not set, it is detected via the prefix of the string.
 - "0": base = 8
 - "0X": base = 16
 - otherwise: base = 10
 - Decimals are only supported at base 10.

 Examples

```
number("10.5")
number("a", 16)
```

len(object/array/string)

- Returns the length of an array or string and counts the number of properties in a JSON object.

 Example

```
len($.(number(@)))
```

This expression counts every number or string that can be converted into a number. It returns 13 in the example above.

sum(array-/object-of-numbers)

- Returns the sum of an array of numbers.

 Example

```
sum([1,2,3])
```

This expression returns 6.

mean(array-/object-of-numbers)

- Returns the average value of an array of numbers.

 Example

REST Custom Sensor: Functions

```
mean([1,2,3])
```

This expression returns 2.

lookup(string, string,
string, ...)

- Returns the index of the specified string in a string list, or -1 if the string is not found.

 Example

```
lookup($.device[0].firmware.channel, "stable", "beta",  
"alpha")
```

This expression returns 1 because \$.device[0].firmware.channel resolves to beta.

implode(array-/object-of-
string, string)

- Returns the concatenation of each string in the array, separated by the specified string.

 Example

```
implode($.tx_bytes, ",")
```

This expression returns 7229493,7229472.

Generic Channels

You can create a template in your REST configuration that defines generic channels. Generic channels are created based on the data that the REST endpoint returns. When the returned value is an array or object, the sensor creates a channel for each element and concatenates the corresponding key to the channel name.

 Example

Imagine that you want to have a total byte channel for each network card that is defined in the JSON example above. You can do this by creating a dynamic channel like in the following example.

```
{
  "prtg": {
    "result": [
      {
        "value": {
          "Total bytes on device" + #0 + " in network " + #1: $.devices.*.networks[*]
          (@.rx_bytes + @.tx_bytes)
        },
        "CustomUnit": "Bytes"
      }
    ]
  }
}
```

i Every channel must have a unique name. You cannot remove channels once they have been added and they keep their last received value. You can add new channels.

XML Sources

If the REST source returns XML instead of JSON, the sensor transforms the XML result to JSON before replacing the value paths with source values. Because of this, you do not know the structure of the source JSON to correctly provide the paths.

In this case, manually execute the sensor executable rest.exe from the \Sensor System subfolder of the [PRTG program directory](#) on the probe system. Execute rest.exe with the address of the XML endpoint and the parameter passthrough. The rest executable returns the converted XML to a JSON result that you can use to define the desired paths.

```
rest.exe <xml-endpoint-url> passthrough
```

Usage and Debugging

To create a suitable REST configuration for the sensor, you might want to check the returned JSON or XML and see what happens when your mapping rules apply.

The REST Custom sensor is an EXE sensor, so you can test and debug your configuration by executing rest.exe with several parameters. The rest.exe file is located in the \Sensor System subfolder of the PRTG program directory.

The command syntax is as follows:

```
rest.exe url template|passthrough|channelDiscovery [flags]
```

rest.exe: Parameters

- url
 - Address of the REST API endpoint that returns JSON or XML
- template
 - Fully qualified path and file name of your REST configuration file used to map the JSON result to the sensor

rest.exe: Parameters

- | | |
|------------------|---|
| passthrough | <ul style="list-style-type: none">▪ No mapping, only returning the queried JSON or XML▪ Useful to analyze XML that has been converted to JSON |
| channelDiscovery | <ul style="list-style-type: none">▪ Creates a channel for every number or boolean in the returned JSON or XML▪ If possible, it converts string values to number or boolean values. |

rest.exe: Flags

- | | |
|-------------------------|---|
| -authtoken <string> | <ul style="list-style-type: none">▪ JWT or OAuth2 Bearer Token to send with the request in authorization header as Bearer |
| -authusername <string> | <ul style="list-style-type: none">▪ User name for basic authentication |
| -authuserpwd <string> | <ul style="list-style-type: none">▪ User password for basic authentication |
| -post <string> | <ul style="list-style-type: none">▪ {1 0}▪ Default: 0▪ 0 results in a GET request.▪ 1 results in a POST request. |
| -proxy <string> | <ul style="list-style-type: none">▪ Proxy server connection |
| -proxyusername <string> | <ul style="list-style-type: none">▪ Proxy user name with basic authentication |
| -proxyuserpwd <string> | <ul style="list-style-type: none">▪ Proxy user password with basic authentication |
| -tlsignore <string> | <ul style="list-style-type: none">▪ {1 0}▪ Default: 0▪ 1 accepts self-signed certificates on HTTPS connections |
| -customheaders <string> | <ul style="list-style-type: none">▪ key1:val1 key2:val2 ... |
| -template | <ul style="list-style-type: none">▪ Returns the discovered template if you use channelDiscovery. |
| -timeout <integer> | <ul style="list-style-type: none">▪ Sensor timeout in seconds▪ Default: 10 |

Channel List

- Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Response Time	The response time in milliseconds (msec) <ul style="list-style-type: none"> This channel is the primary channel by default.
[Value]	The values that a REST API returns in several channels <ul style="list-style-type: none"> For details about the return value format, see section Custom Sensors.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

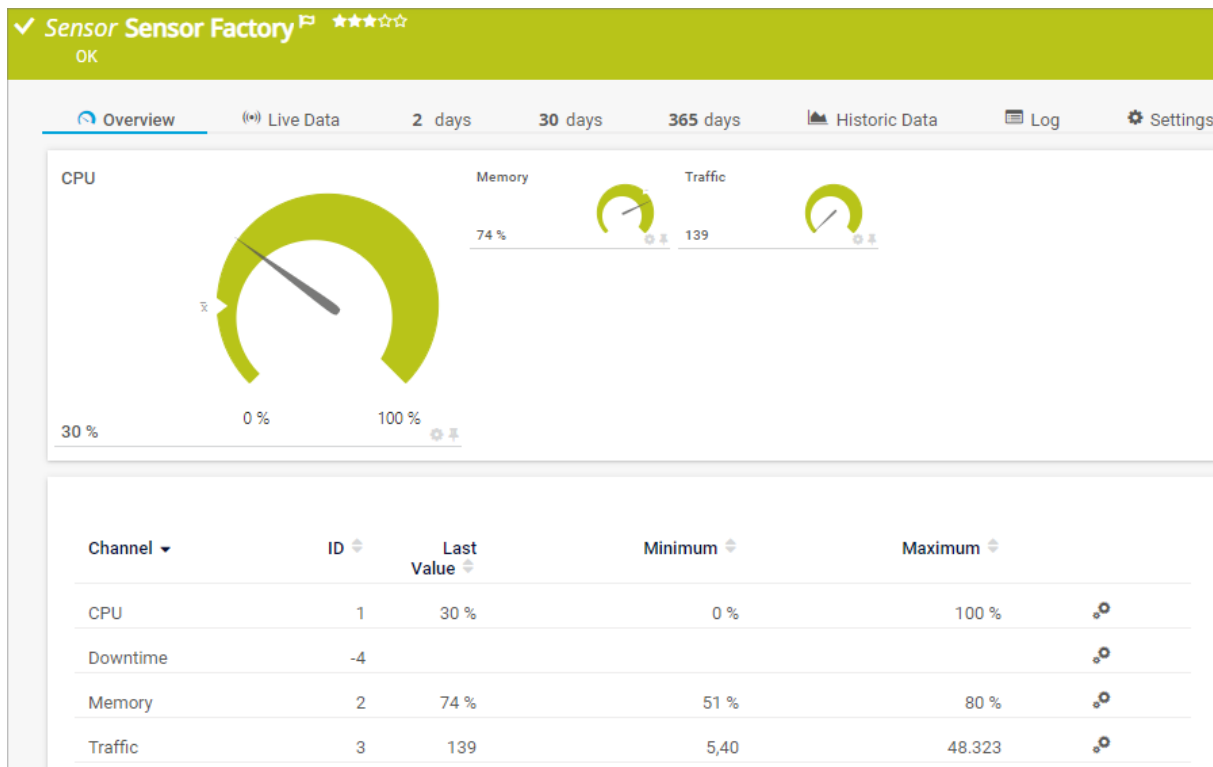

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.130 Sensor Factory Sensor

The Sensor Factory sensor monitors entire business processes that involve several components. You can create a customized sensor with channels based on data from other sensors ("source sensors").

i If you want to create only a cumulated sensor status based on specific source sensors, we recommend that you use the [Business Process sensor](#) instead.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Sensor Factory Sensor

Sensor in Other Languages

- Dutch: Sensor Fabriek
- French: Capteur combiné
- German: Formelsensor
- Japanese: センサーファクトリ
- Portuguese: Sensor de fórmula
- Russian:
- Simplified Chinese: 传感器出厂
- Spanish: Sensor Factory

Remarks

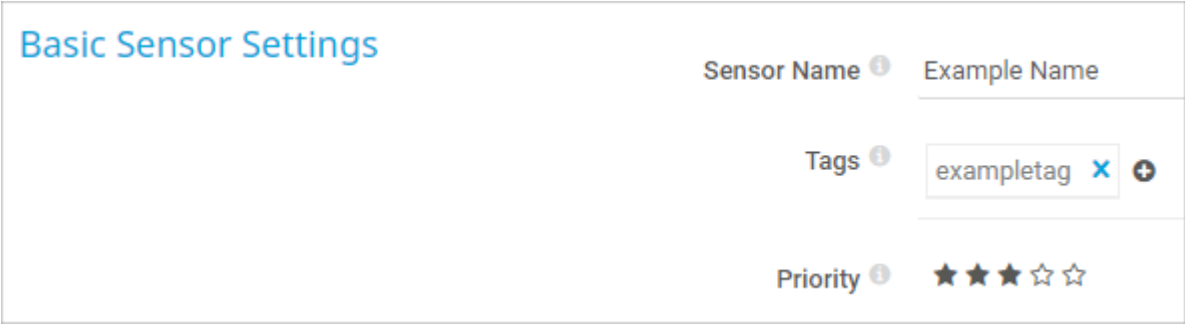

- This sensor can have a very high impact on the performance of the PRTG core server system. We recommend that you use no more than 50 Sensor Factory sensors per PRTG core server.
- Make sure that the [scanning interval](#) [2183] of this sensor is equal to or greater than the scanning interval of the source sensors to avoid incorrect sensor behavior. For example, "no data" messages or erratic changes of the sensor status can be a result of an invalid scanning interval.
- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.
- The Sensor Factory sensor might not work with [xFlow sensors](#) [4305]. Sensors that use [active flow timeout](#), for example [NetFlow and jFlow sensors](#) [4600], are not supported by the Sensor Factory sensor.
- Uptime or downtime data for this sensor is not available in [reports](#) [208].
- See the Knowledge Base: [How can I monitor the overall status of the business process "email"?](#)

Add Sensor

The [Add Sensor](#) [361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [183], as well as in alarms [228], logs [237], notifications [4031], reports [4069], maps [4085], libraries [4047], and tickets [240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited. ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ factorysensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

Sensor Factory Specific Settings

Sensor Factory Specific Settings

Channel Definition ⓘ #1:CPU Channel(128630,0)

If a Source Sensor Has No Data ⓘ Do not calculate the channels that use the sensor
 Calculate the channels and use zero as source value

Sensor Factory Specific Settings

Setting	Description
Channel Definition	Enter a channel definition for the Sensor Factory sensor. Using a specific syntax, you can refer to data from channels of other sensors. You can also calculate values. Enter one channel definition for each new channel that you want to add to the Sensor Factory sensor.

Setting	Description
Status Handling	<p data-bbox="483 371 1166 405">■ For more information, see section Define Channels ²¹⁸⁷.</p> <p data-bbox="483 472 1310 595">Define the behavior of the Sensor Factory sensor if one of the source sensors is in the Down status ¹⁹⁷. In this case, you can set the Sensor Factory sensor either to the Down status or to the Warning status. Choose from:</p> <ul data-bbox="483 618 1342 1290" style="list-style-type: none"> <li data-bbox="483 618 1342 931">■ Show down status when one or more source sensors are in down status: If at least one source sensor that you use in a channel definition is in the Down status, the Sensor Factory sensor shows the Down status as well until all referred sensors leave this status. While the Sensor Factory sensor is in the Down status, it still shows data of all available channels. <ul data-bbox="507 801 1342 931" style="list-style-type: none"> <li data-bbox="507 801 1342 931">① If a lookup definition ⁴⁴⁸⁵ or an error limit ³⁹⁷⁶ triggers the Down status of the source sensor, the Sensor Factory does not show the Down status. This is because the Sensor Factory should only show this status if it cannot calculate values. <li data-bbox="483 954 1342 1200">■ Show warning status when one or more source sensors are in down status: If at least one source sensor that you use in a channel definition is in the Down status, the Sensor Factory sensor shows the Warning status until all referred sensors leave the Down status. <ul data-bbox="507 1077 1342 1200" style="list-style-type: none"> <li data-bbox="507 1077 1342 1200">① If a lookup definition or an error limit triggers the Down status of the source sensor, the Sensor Factory does not show the Warning status. This is because the Sensor Factory sensor should only show this status if it cannot calculate values. <li data-bbox="483 1223 1342 1290">■ Use custom formula: Define the status of the Sensor Factory sensor by adding a Status Definition below.
Status Definition	<p data-bbox="483 1339 1342 1462">This setting is only visible if you select Use custom formula above. Define when the sensor switches to the Down status. You can use the status() function in combination with Boolean operations. For advanced users, it is also possible to calculate a status value.</p> <p data-bbox="483 1485 1225 1514">■ For more information, see section Define Sensor Status ²¹⁹³.</p>
If a Source Sensor Has No Data	<p data-bbox="483 1585 1342 1675">Choose how this Sensor Factory sensor reacts if a source sensor referred to in the channel definition does not provide any data (for example, because it is set to the Paused status or does not exist):</p> <ul data-bbox="483 1697 1342 1910" style="list-style-type: none"> <li data-bbox="483 1697 1342 1765">■ Do not calculate the channels that use the sensor: For defined channels that use one or more sensors that deliver no data, no data is shown. <li data-bbox="483 1787 1342 1910">■ Calculate the channels and use zero as source value: If a source sensor that you use in a channel definition does not deliver any data, zero values are filled in instead. The Sensor Factory sensor calculates the channel value and shows it using these zero values.

Setting	Description
	<p> If a sensor in the channel of a Sensor Factory sensor has no data, the Sensor Factory sensor always shows the Warning status, no matter which of the above options you select.</p>

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type  Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays

Setting	Description
	<ul style="list-style-type: none"> ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency.

Setting	Description
	<ul style="list-style-type: none"> Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies [4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector [257] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Define Channels

The channels of a Sensor Factory sensor are controlled by the Channel Definition text field. Using a special syntax, you can refer to other sensors' channels, calculate values, and add horizontal lines. You can define Sensor Factory channels using data from any other sensor's channels on your PRTG core server.

Example

You see a definition of two Sensor Factory sensor channels. Both use the [channel\(\)](#) function that collects data from the channels of other sensors in your monitoring and displays them:

```
#1:Local Probe Health
channel(1001,0)
#2:Local Traffic Out[kbit]
channel(1004,1)
```

The first channel of the Sensor Factory sensor (**#1**) collects data from the Health channel (ID 0) of the Probe Health sensor (ID 1001) running on the probe device. The second channel (**#2**) collects data from the Traffic out channel (ID 1) of a traffic sensor (ID 1004) measuring the system's local network card. Both channels are shown together in the Sensor Factory sensor's data tables and graphs.

The basic syntax for a Sensor Factory sensor channel definition looks like this:

```
#<id>:<name>[<unit>]
<formula>
```

For each channel, one section is used. A section begins with the number sign (#). Function names in formulas are not case sensitive.

The parameters are:

- `<id>` is the ID of the Sensor Factory sensor's channel. It must be a unique number that is greater than 0.
- `<name>` is the name of the Sensor Factory sensor's channel (displayed in graphs and tables).
- `[<unit>]` is an optional unit description for the Sensor Factory sensor's channel (for example, bytes). If you do not provide a unit, the Sensor Factory sensor automatically selects a suitable unit string (recommended).
- `<formula>` contains the formula to calculate the Sensor Factory sensor's channel. For the formula, you can use the following functions: `channel()`, `min()`, `max()`, `avg()`, or `percent()`.

Define Channels: Formula Calculations

Within a formula, the following elements are allowed to perform calculations with the values that are returned by one or more functions.

- Basic operations: + (add), - (subtract), * (multiply), / (divide)
Example: `3 + 5 * 2`
- Parentheses: ()
Example: `3 * (2 + 6)`
- Compare: = (equal), <> (not equal), > (greater), < (less), >= (greater or equal), <= (less or equal)
If the comparison resolves to true, the value is **10,000**. If false, the value is **0**. For delta sensors, the speed is compared.

Example

You see a Sensor Factory sensor channel definition with calculation.

```
#1:Traffic Total x Minus Traffic Out y
( channel(2001,-1) - channel(1004,1) ) * 2
```

This full channel definition results in a Sensor Factory sensor that shows a calculation with values from two channels (channel IDs **-1** and **1**) of two traffic sensors (sensor IDs **2001** and **1004**). The returned values are subtracted and then multiplied by two.

Channels can be gauge values (for example, ping **ms**) or delta values (for example, traffic **kbit/s**). Not all combinations are allowed in a formula.

- ⓘ When performing percentage calculation, use the `percent()` Function to make sure you obtain the expected values.

There are calculations you **cannot** do:

- You cannot add or subtract a delta from a gauge channel (and vice versa).
- You cannot multiply two delta channels.
- You cannot compare a delta with a gauge channel.

- You cannot use a channel of (another) Sensor Factory sensor channel in the formula.

Define Channels: channel() Function

The channel() function allows the Sensor Factory sensor to read the data from a channel of a source sensor. The syntax is:

```
channel(<sensorId>,<channelId>)
```

The parameters are:

- <sensorId> is the ID of the source sensor. It is displayed on the sensor's Overview tab.
- <channelId> is the ID of the channel of the source sensor. It is displayed in the respective field of the [channel settings](#) ³⁹⁷⁸.

Example

```
channel(2001,2)
```

This function reads the data from channel ID 2 of the source sensor with the ID 2001.

```
#1:Sample
channel(2001,2)
```

This full channel definition reads the data from channel ID 2 of the source sensor with the ID 2001 and displays it in the first Sensor Factory sensor channel (#1), without any additional calculations.

Define Channels: min() and max() Functions

The min() and max() functions return the minimum or maximum of two values. The syntax is:

```
min(<a>,<b>)
max(<a>,<b>)
```

Values for <a> and are either numbers or [channel\(\)](#) ²¹⁸⁹ functions.

Examples

```
min(10,5)
```

This function returns 5, because this is the smaller value out of 10 and 5.

```
min(channel(2001,1),channel(2002,1) )
```

This function returns the minimum of the values of channel 1 of the source sensor with ID 2001 and channel 1 of the source sensor with ID 2002.

Define Channels: avg() Function

The avg() function returns the average of the two values. This equals: $(a+b) / 2$. The syntax is:

```
avg (<a> , <b> )
```

Values for <a> and are either numbers or [channel\(\)](#) functions.

Examples

```
avg ( 20 , 10 )
```

This function returns **15**: $(20+10) / 2 = 15$.

```
avg ( channel ( 2001 , 1 ) , channel ( 2002 , 1 ) )
```

This function returns the average of channel **1** of the source sensor with ID **2001** and channel **1** of the source sensor with ID **2002**.

Define Channels: percent() Function

The percent() function calculates the percent value of two specified values, for example, a channel and a fixed value. The syntax is:

```
percent (<source> , <maximum> , <unit> )
```

The parameters are:

- <source> is the value the percent is calculated for. This is usually a [channel\(\)](#) function.
- <maximum> is the limit value used for the percent calculation.
- <unit> is an optional unit the maximum is provided in. You can use constants with this function (see [Constants](#) section below for a list). This can be used for absolute values (for example, [Ping sensors](#)) or calculated delta values (for example, traffic sensors). If no unit is provided, **1** is used.
 The sensor adds the unit string **%** automatically.

PRTG calculates: $\langle \text{source} \rangle / \langle \text{maximum} \rangle * \langle \text{unit} \rangle * 100$

 Examples

```
#1:Usage Traffic In
percent(channel(2001,0),100,kilobit)
#2:Usage Traffic Out
percent(channel(2001,1),100,kilobit)
```

This full channel definition results in a Sensor Factory sensor that shows two channels of a traffic sensor (sensor ID [2001](#)): Traffic in (channel ID [0](#)) and traffic out (channel ID [1](#)). The Sensor Factory sensor displays the values % of maximum bandwidth (100 kilobit/second).

```
#1:Ping %
percent(channel(2002,0),200)
```

This full channel definition results in a Sensor Factory sensor that shows the Ping Time channel (channel ID [0](#)) of a Ping sensor (sensor ID [2002](#)). The sensor displays the values as a percentage of 200 ms.

Define Channels: Horizontal Lines

You can add lines to the graph using a formula without the channel() function. Use a fixed value instead. The syntax is:

```
#<id>:<name>[<unit>]
<value>
```

The parameters are:

- `<id>` is the ID of the Sensor Factory sensor's channel and must be a unique number greater than 1. Although the Sensor Factory sensor does not show a horizontal line as a channel, the ID has to be unique.
- `<name>` is the name of the Sensor Factory sensor's channel. PRTG does not display this name in graphs and tables, but you can use it as a comment to describe the nature of the line.
- `[<unit>]` is an optional unit description (for example, [kbit/s](#)). If you do not provide a unit, PRTG automatically applies the line to the scale of the first Sensor Factory sensor's channel. If your Sensor Factory sensor uses different units, provide a unit to make sure the line is added for the right scale. Enter the unit exactly as shown in your graph's legend. If you enter a unit that does not yet exist in your graph, a new scale is added automatically.
- `<value>` contains a number defining where the line is shown in the graph.

 Examples

```
#5:Line at 100ms [ms]
100
```

This channel definition results in a graph that shows a horizontal line at the value of 100 on the ms scale.

```
#6:Line at 2 Mbit/s [kbit/s]
2000
```

This channel definition results in a graph that shows a horizontal line at the value of 2000 on the kbit/s scale.

```
#1:Ping Time
channel(2002,0)
#2:Line at 120ms [ms]
120
```

This full channel definition results in a Sensor Factory sensor that shows the Ping Time channel (channel ID 0) of a Ping sensor (sensor ID 2002). Additionally, the sensor graphs show a horizontal line at 120 ms.

Define Channels: Constants

The following constants are defined and can be used in calculations:

- one = 1
- kilo = 1000
- mega = 1000 * kilo
- giga = 1000 * mega
- tera = 1000 * giga
- byte = 1
- kilobyte = 1024
- megabyte = 1024 * kilobyte
- gigabyte = 1024 * megabyte
- terabyte = 1024 * gigabyte
- bit = 1/8
- kilobit = kilo / 8
- megabit = mega / 8
- gigabit = giga / 8
- terabit = tera / 8

Define Sensor Status: status() Function

You can control the status of a Sensor Factory sensor via the Status Definition text field if you enable the custom formula option in the [sensor settings](#)²¹⁷⁹. Using a special syntax, you can define when the Sensor Factory sensor changes to the Down status. In all other cases, the sensor is in the Up status. The syntax is:

```
status(sensorID) <boolean> status(sensorID)
```

The parameters are:

- <sensorid> is the ID of the source sensor that you want to check the status of. It is displayed on the sensor's Overview tab.
- <boolean> is one of the Boolean operators AND, OR, or NOT. If the resulting expression is **true**, the Sensor Factory sensor changes to the Down status.

Examples

```
status(2031) AND status(2044)
```

This changes the Sensor Factory sensor to the Down status if both source sensors, with IDs **2031** and **2044**, are in the Down status. Otherwise the Sensor Factory sensor shows the Up status.

```
status(2031) OR status(2044)
```

This changes the Sensor Factory sensor to the Down status if at least one of the source sensors with ID **2031** or ID **2044** is in the Down status. Otherwise the Sensor Factory sensor shows the Up status.

```
status(2031) AND NOT status(2044)
```

This changes the Sensor Factory sensor to the Down status if the source sensor with ID **2031** is in the Down status, but the source sensor with ID **2044** is **not** in the Down status. Otherwise the Sensor Factory sensor shows the Up status.

i A status() function with NOT has to be connected with AND or OR if it is combined with other status() functions:

```
status(sensorID) AND NOT status(sensorID)
```

```
status(sensorID) OR NOT status(sensorID)
```

```
( status(2031) AND status(2044) ) OR status(2051)
```

This changes the Sensor Factory sensor to the Down status if both the source sensor with ID **2031** and the source sensor with ID **2044** are in the Down status, or if the source sensor with ID **2051** is in the Down status. Otherwise the Sensor Factory sensor shows the Up status.

Additionally, the following elements are allowed to perform calculations and comparisons with the values that are returned by the status functions:

- Basic operations: + (add), - (subtract), * (multiply), / (divide)
Example: **3 + 5 * 2**

- Parentheses: ()
Example: $3 * (2 + 6)$
- Compare: = (equal), <> (not equal), > (greater), < (less), >= (greater or equal), <= (less or equal)
If the comparison resolves to true, the value is 10,000. If false, the value is 0. For delta sensors, the speed is compared.

Internally, the status() function returns the downtime channel of the source sensor in hundreds of percent (10,000 = 100%).

- true corresponds to a value of 10,000, which is the Down status.
- false corresponds to a value of 0, which is the Up status.

If you understand this, you can use more complex formulas.

Example

```
( status(1031) + status(1032) + status(1033) + status(1034) ) >= 20000
```

This changes the Sensor Factory sensor to the Down status if at least any two of the source sensors with IDs 1031, 1032, 1033, or 1034 are in the Downstatus. Otherwise the Sensor Factory sensor shows the Up status.

i You can also use the status() function in [channel definitions](#)^[2187]. Using this functionality, it is possible, for example, to display the numeric status value of source sensors in a Sensor Factory sensor channel.

Using Sensor Factory Sensors in a Cluster

If you run PRTG in a [cluster](#)^[135], note the following:

- If you add a Sensor Factory sensor underneath the [cluster probe](#), and in the Sensor Factory formula you refer to a channel of a source sensor running on the cluster probe as well, the Sensor Factory sensor shows the data of all cluster nodes for this channel.
- If you add a Sensor Factory sensor underneath the [local probe](#), and in the Sensor Factory formula you refer to a channel of a sensor running on the cluster probe, the Sensor Factory sensor only shows data of the primary master node for this channel.

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
[Custom]	The monitoring results from other sensors or devices. Samples for usage are: <ul style="list-style-type: none"> ▪ Show single channels of one or more sensors in one graph.

Channel	Description
	<ul style="list-style-type: none"> Use the data from single channels of one or more sensors to calculate new values (for example, you can subtract, multiply, and divide). Create graphs with data from other sensors' channels and add horizontal lines at specific vertical positions.
Downtime	<p>In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.</p> <p>i The Sensor Factory sensor does not show values in the Downtime channel because they cannot be calculated for this sensor.</p>

7.8.131 sFlow Sensor

The sFlow sensor receives traffic data from an sFlow v5-compatible device and shows the traffic by type. This sensor has several filter options to divide traffic into different channels.

- i The sensor analyzes only header traffic.
- i Make sure that the target device supports sFlow v5.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

sFlow Sensor

Sensor in Other Languages

- Dutch: sFlow
- French: sFlow
- German: sFlow
- Japanese: sFlow
- Portuguese: sFlow
- Russian: sFlow
- Simplified Chinese: sFlow
- Spanish: sFlow

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- You must enable sFlow v5 export on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the probe system with this sensor (either a local probe or a remote probe).
- This sensor accepts RAW data only. The stream must be sent via IPv4.
- For cloning this sensor, the following rules apply. If you add the clone to the **same** probe, PRTG keeps the selected IP addresses on which it listens for xFlow (NetFlow, jFlow, sFlow, IPFIX) packets. If you add the clone to a **different** probe, PRTG selects **all** available IP addresses by default. You can change the selected IP addresses in the sensor settings.
- This sensor has several [limitations](#) ²¹⁹⁷.
- You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
- See the Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)
- See the Knowledge Base: [Where is the volume line in graphs?](#)
- See the Paessler tools: [Paessler sFlow Tester](#)

 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Limitations

There are some limitations that you should consider before you use this sensor:

- The sensor only supports sFlow v5 datagrams.
- The sensor only supports IPv4 flows.
- The sensor only supports the "raw packet header" format.
- The sensor only supports the "Flow sample" and "Extended flow" formats. It cannot process "Counter" formats.

- The sensor only processes samples where the source ID matches the ifIndex of the input interface (avoiding double-counted traffic) and ascending sequence numbers.
- The sensor only supports sample packets of the Ethernet type "IP" (with optional VLAN tag)
- The sensor only supports sampled packets of the types TCP and UDP.

✂ We recommend that you use [sFlow Tester](#) for debugging.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a 'Basic Sensor Settings' dialog box. It has three main sections: 'Sensor Name' with an information icon and the text 'Example Name'; 'Tags' with an information icon and a text input field containing 'exampletag' and a plus sign; and 'Priority' with an information icon and five star icons, the last one being filled.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets . ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited .

Setting	Description
	<p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ bandwidthsensor ▪ sflowsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

sFlow v5 Specific Settings

Setting	Description
Receive sFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the UDP port number in the sFlow export options of the hardware router device. The default value is 6343. Enter an integer value.
Sender IP Address	Enter the IP address of the sending device that you want to receive the sFlow from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the specified port.

Setting	Description
Receive sFlow Packets on IP Address	<p>Select the IP addresses on which PRTG listens to sFlow packets. The list of IP addresses is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address that you select must match the IP address in the sFlow export options of the hardware router device.</p> <ul style="list-style-type: none">  When you configure the export, make sure that you select the appropriate sFlow v5 for this sensor  You can also select all items or cancel the selection by using the check box in the table header.
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> ▪ Discard stream data (recommended): Do not store the stream and packet data. ▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the PRTG data directory on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. ▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <ul style="list-style-type: none">  Use with caution. If you enable this setting, it can create huge data files. We recommend that you only use this setting for a short time.

Note You can change the default settings for the selected channels. This way, you do not have to customize this setting each time that you add this sensor type to PRTG. For details, see [this article](#) in the Knowledge Base.

Channel Configuration

Setting	Description
Channel Selection	<p>Define the categories that the sensor accounts the traffic to:</p> <ul style="list-style-type: none"> ▪ Web: Internet web traffic. ▪ File Transfer: Traffic from FTP. ▪ Mail: Internet mail traffic. ▪ Chat: Traffic from chat and instant messaging. ▪ Remote Control: Traffic from remote control applications such as RDP, SSH, Telnet, and VNC. ▪ Infrastructure: Traffic from network services such as DHCP, DNS, Ident, ICMP, and SNMP. ▪ NetBIOS: Traffic from NetBIOS communication. ▪ Citrix: Traffic from Citrix applications. ▪ Other Protocols: Traffic from various other protocols via UDP and TCP. <p>For each group, you can select how many channels the sensor uses, that is, how detailed the sensor divides the traffic. For each group, choose from:</p> <ul style="list-style-type: none"> ▪ No (✘): Do not account traffic of this group in its own channel. The sensor accounts all traffic of this group to the default channel named Other. ▪ Yes (✔): Count all traffic of this group and summarize it in one channel. ▪ Detail (🔍): Count all traffic of this group and further divide it into different channels. The traffic appears in several channels that you can see in the Content column. <ul style="list-style-type: none"> ⓘ Extensive use of this option can cause load problems on the probe system. We recommend that you set specific, well-chosen filters for the data that you really want to analyze. <p>■ You can change the default configuration for groups and channels. For details, see the Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?</p>

Filtering

■ For detailed information, see section [Filter Rules](#) .

Filtering

Filters To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

Fields:

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

Additional IPFIX fields:

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter 

Exclude Filter 

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax.
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type  Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.  You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.
Graph Type	Define how different channels are shown for this sensor: <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel.

Setting	Description
	<ul style="list-style-type: none"> Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Primary Toplist

Primary Toplist

Primary Toplist 
Top Connections

Primary Toplist

Setting	Description
Primary Toplist	<p>Define which Toplist is the primary Toplist of the sensor:</p> <ul style="list-style-type: none"> Top Talkers Top Connections Top Protocols [Any custom Toplists you add] <p> PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Toplists

For all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

 For more information, see section [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#) .

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name
Port	Any number
SourceIP	IP address or Domain Name System (DNS) name
SourcePort	Any number
DestinationIP	IP address or Domain Name System (DNS) name
DestinationPort	Any number

Field	Possible Filter Values
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to sFlow sensors only.

Field	Possible Filter Values
Interface	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel. Possible values: IP address or DNS name
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Chat	The traffic from chat and instant messaging (Internet Relay Chat (IRC), AOL Instant Messenger (AIM)) in bytes per second
Citrix	The traffic from Citrix applications in bytes per second

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
FTP/P2P	The traffic from file transfer (File Transfer Protocol (FTP)/Peer-to-Peer (P2P)) in bytes per second
Infrastructure	The traffic from network services (Dynamic Host Configuration Protocol (DHCP), Domain Name System (DNS), Ident, Internet Control Message Protocol (ICMP), Simple Network Management Protocol (SNMP)) in bytes per second
Mail	The internet mail traffic (Internet Message Access Protocol (IMAP), Post Office Protocol version 3 (POP3), Simple Mail Transfer Protocol (SMTP)) in bytes per second
NetBIOS	The traffic from NetBIOS communication in bytes per second
Other	The traffic from various other protocols (User Datagram Protocol (UDP), Transmission Control Protocol (TCP)) in bytes per second
Remote Control	The traffic from remote control applications (Remote Desktop Protocol (RDP), Secure Shell (SSH), Telnet, Virtual Network Computing (VNC)) in bytes per second
Total	The total traffic in bytes per second  This channel is the primary channel by default.
Various	The traffic from various other sources in bytes per second
WWW	The traffic from the web (HTTP, HTTPS) in bytes per second

PAESSLER TOOLS

sFlow Tester

- <https://www.paessler.com/tools/sflowtester>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

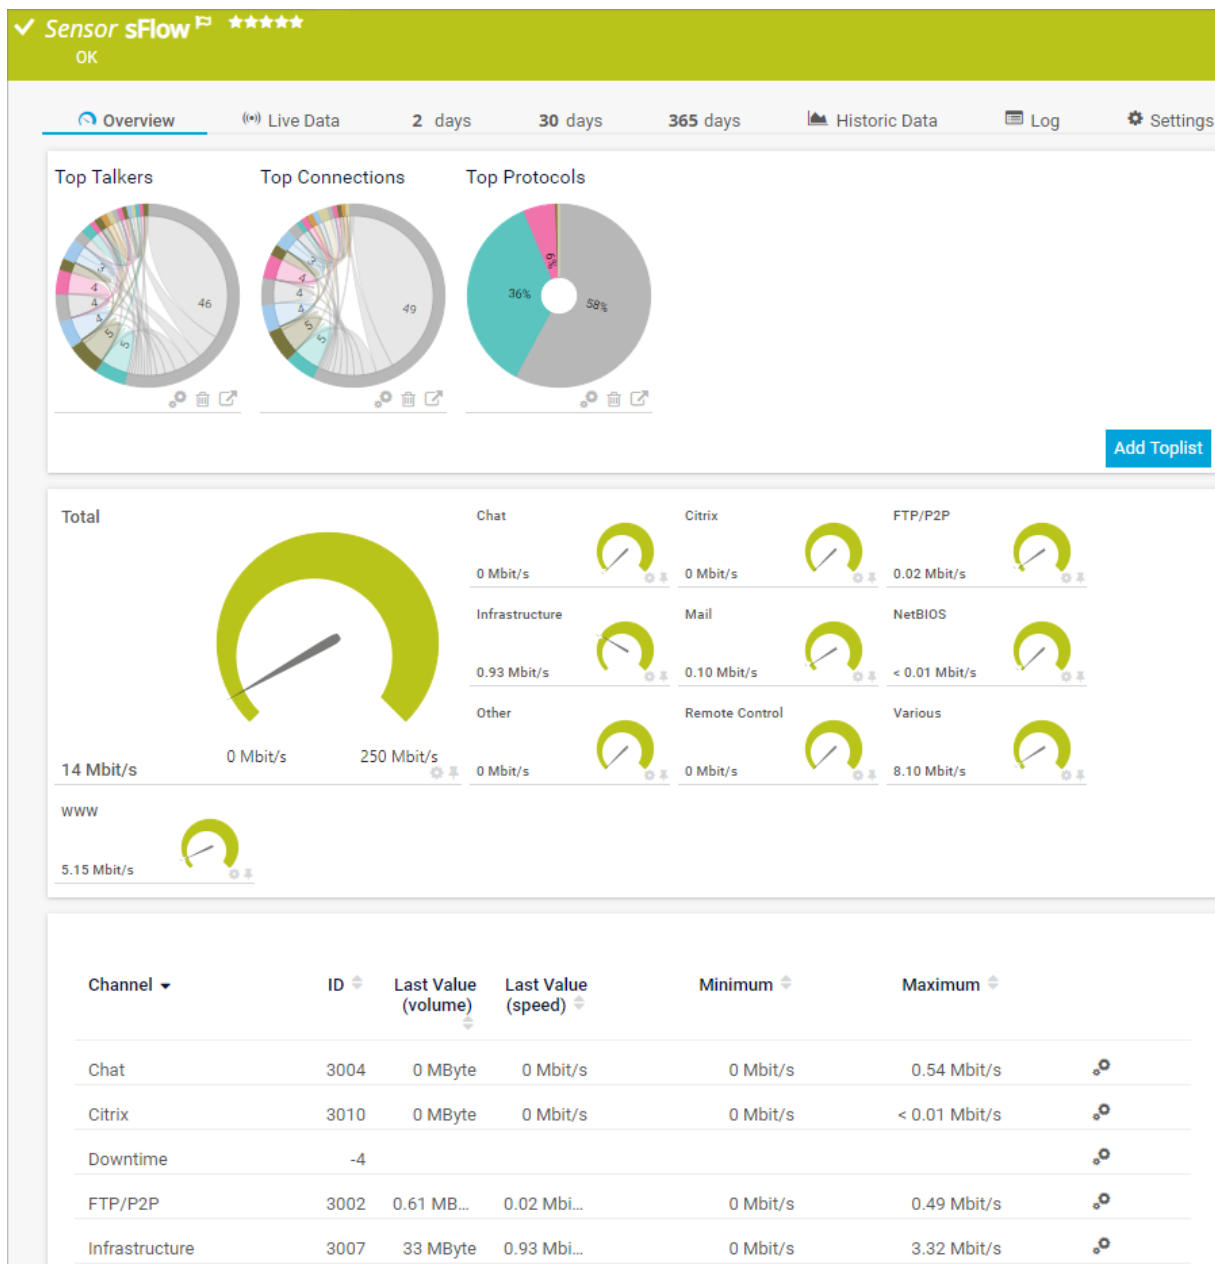

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.132 sFlow (Custom) Sensor

The sFlow (Custom) sensor receives traffic data from an sFlow v5-compatible device and shows the traffic by type. With this sensor, you can define your own channel definitions to divide traffic into different channels.

- i The sensor analyzes only header traffic.
- i Make sure that the target device supports sFlow v5.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

sFlow (Custom) Sensor

Sensor in Other Languages

- Dutch: sFlow (Custom)
- French: sFlow (personnalisé)
- German: sFlow (Benutzerdef.)
- Japanese: sFlow(カスタム)
- Portuguese: sFlow (customizado)
- Russian: sFlow ()
- Simplified Chinese: sFlow (自定义)
- Spanish: sFlow (Personalizado)

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- You must enable sFlow v5 export on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the probe system with this sensor (either a local probe or a remote probe).
- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.
- This sensor has several [limitations](#) ²²¹⁴.
- This sensor accepts RAW data.
- You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
- See the Knowledge Base: [Where is the volume line in graphs?](#)
- See the Paessler tools: [Paessler sFlow Tester](#)

 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Limitations

There are some limitations that you should consider before you use this sensor:

- The sensor only supports sFlow v5 datagrams.
- The sensor only supports IPv4 flows.
- The sensor only supports the "raw packet header" format.
- The sensor only supports the "Flow sample" and "Extended flow" formats. It cannot process "Counter" formats.
- The sensor only processes samples where the source ID matches the ifIndex of the input interface (avoiding double-counted traffic) and ascending sequence numbers.
- The sensor only supports sample packets of the Ethernet type "IP" (with optional VLAN tag)

- The sensor only supports sampled packets of the types TCP and UDP.

✂ We recommend that you use [sFlow Tester](#) for debugging.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ bandwidthsensor ▪ sflowsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

 Store stream data only for the 'Other' channel
 Store all stream data

sFlow v5 Specific Settings

Setting	Description
Receive sFlow Packets on UDP Port	<p>Enter the UDP port number on which the flow packets are received. It must match the UDP port number in the sFlow export options of the hardware router device. The default value is 6343. Enter an integer value.</p> <p>i When you configure the export, make sure that you select the appropriate sFlow v5 for this sensor</p>

Setting	Description
Sender IP Address	<p>Enter the IP address of the sending device that you want to receive the sFlow from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the specified port.</p>
Receive sFlow Packets on IP Address	<p>Select the IP addresses on which PRTG listens to sFlow packets. The list of IP addresses is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address that you select must match the IP address in the sFlow export options of the hardware router device.</p> <ul style="list-style-type: none">  When you configure the export, make sure that you select the appropriate sFlow v5 for this sensor  You can also select all items or cancel the selection by using the check box in the table header.
Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Enter each definition in one line. The sensor accounts all traffic that you do not define a channel for to the default channel Other.</p> <p> For detailed information, see section Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors.</p> <ul style="list-style-type: none">  Extensive use of many filters can cause load problems on the probe system. We recommend that you define specific, well-chosen filters for the data that you really want to analyze. We recommend that you do not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, we recommend that you add several sensors with fewer channels each.
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> ▪ Discard stream data (recommended): Do not store the stream and packet data. ▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the PRTG data directory on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. ▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <ul style="list-style-type: none">  Use with caution. If you enable this setting, it can create huge data files. We recommend that you only use this setting for a short time.

Filtering

For detailed information, see section [Filter Rules](#) ²²²⁵.

Filtering

Filters To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

Fields:

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

Additional IPFIX fields:

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Scanning Interval	
 inherit from  Root	Scanning Interval ⓘ 60 seconds
	If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays

Setting	Description
	<ul style="list-style-type: none"> ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency.

Setting	Description
	<ul style="list-style-type: none"> Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies [4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector [257] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Toplists

For all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#)⁴⁰⁰².

Filter Rules

The following filter rules apply to all xFlow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name
Port	Any number
SourceIP	IP address or Domain Name System (DNS) name
SourcePort	Any number
DestinationIP	IP address or Domain Name System (DNS) name
DestinationPort	Any number
Protocol	Transmission Control Protocol (TCP) , User Datagram Protocol (UDP) , Internet Control Message Protocol (ICMP) , Open Shortest Path First (OSPF) , any number

Field	Possible Filter Values
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to sFlow sensors only.

Field	Possible Filter Values
Interface	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel. Possible values: IP address or DNS name
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
[Custom]	The traffic by type according to the channel definition
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Other	All traffic for which no channel is defined in bytes per second

Channel	Description
Total	The total traffic in bytes per second  This channel is the primary channel by default.

Remarks

- This sensor requires [credentials for Linux/Solaris/macOS \(SSH/WBEM\) systems](#) in the settings of the parent device.
- This sensor cannot support all Linux/Unix and macOS distributions.
- This sensor has a medium performance impact.
- See the Knowledge Base: [SSH and SFTP sensors in Unknown status](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p>

Setting	Description
	<ul style="list-style-type: none"> sftpsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

SSH Specific

SSH Specific

Connection Timeout (Sec.) ⁱ 60

Shell Timeout (Sec.) ⁱ 10

SSH Port ⁱ Inherit port number from parent device (default)
 Enter custom port number

SSH Engine ⁱ Inherit from parent device (default)
 Default
 Compatibility Mode (deprecated)

Result Handling ⁱ Discard result
 Store result
 Store result in case of error

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i Ensure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after k has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Enter an integer value.</p>

Setting	Description
	<p>i Ensure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.</p>
SSH Port	<p>Define which port this sensor uses for the SSH connection:</p> <ul style="list-style-type: none"> ▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems^[452] section of the parent device settings. ▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings.
Use Port Number	<p>This setting is only visible if you select Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer value.</p>
SSH Engine	<p>Select the method that you want to use to access data with this SSH sensor^[430]. We strongly recommend that you use the default engine. You can still use the legacy mode for some time to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the object hierarchy^[138]. If you have not changed the SSH engine, this is the recommended default engine. ▪ Default: This is the default monitoring method for SSH sensors. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option. ▪ Compatibility mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors running with the default SSH engine. <p>i The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory^[452] on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. ▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status.

Setting	Description
	<p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type  Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#) ¹⁴².

- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.134 Share Disk Free Sensor

The Share Disk Free sensor monitors free disk space of a share (Windows/Samba) using server message block (SMB).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Share Disk Free Sensor

Sensor in Other Languages

- Dutch: Share Disk Ruimte
- French: Espace disque libre partagé
- German: Freigaben-Speicherplatz
- Japanese: 共有ディスク空き容量
- Portuguese: Disco livre para compartilhamento
- Russian:
- Simplified Chinese: 共享的磁盘可用空间
- Spanish: Disco libre share

Remarks

- This sensor requires that the LanmanServer service runs on the target computer.
- This sensor only works if no quotas are enabled on the target share. If there are quotas enabled for the user account that this sensor uses to connect to the share, the absolute value is okay, but the percentage variable shows incorrect values.

- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- See the Knowledge Base: [What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
LanmanServer service	<p>To monitor shares on Windows machines, make sure that the LanmanServer service runs on the target computer.</p> <p>i The display name of the service is Server.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

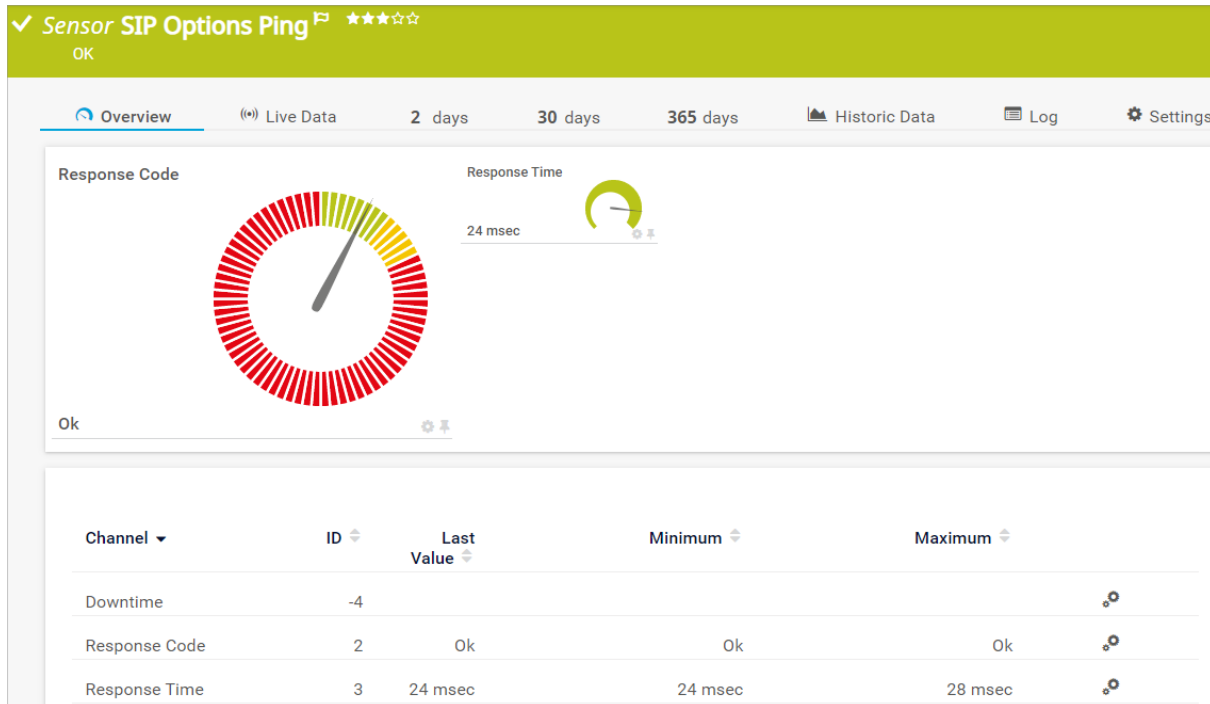

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3957

7.8.135 SIP Options Ping Sensor

The SIP Options Ping sensor monitors the connectivity to a Session Initiation Protocol (SIP) server using SIP options "Ping". The sensor sends **auth** and **options** requests to the SIP server.

i You can use this sensor to monitor Voice over IP (VoIP) services.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SIP Options Ping Sensor

Sensor in Other Languages

- Dutch: SIP Opties Ping
- French: Ping SIP Options
- German: SIP Options Ping
- Japanese: SIP オプション Ping
- Portuguese: SIP Options Ping
- Russian: SIP
- Simplified Chinese: SIP 选项 Ping
- Spanish: Opciones Ping SIP

Remarks

- This sensor requires .NET 4.7.2 or later on the probe system.
- An SIP server might return the error '**480 Service temporarily unavailable**' until at least one reachable SIP client is connected to the server.

- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

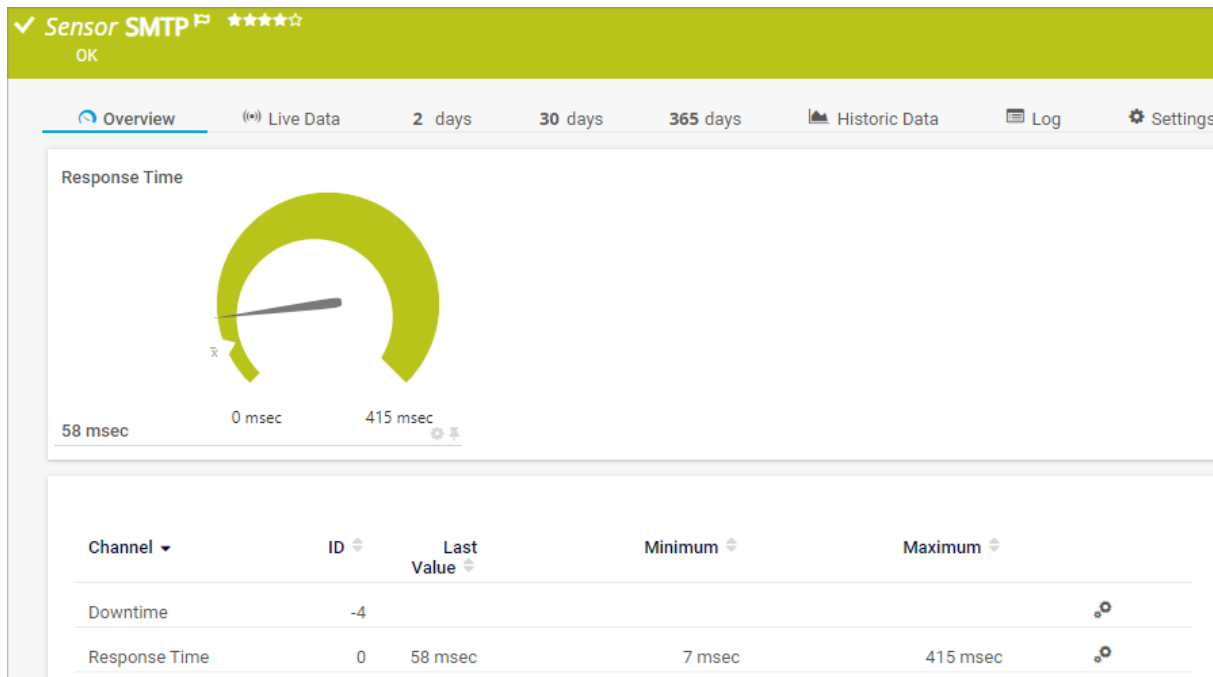

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.136 SMTP Sensor

The SMTP sensor monitors a mail server using the Simple Mail Transfer Protocol (SMTP).

i The sensor can optionally send a test email with every check.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SMTP Sensor

Sensor in Other Languages

- Dutch: SMTP
- French: SMTP
- German: SMTP
- Japanese: SMTP
- Portuguese: SMTP
- Russian: SMTP
- Simplified Chinese: SMTP
- Spanish: SMTP

Remarks

- This sensor does not support Secure Remote Password (SRP) ciphers.
- This sensor has a low performance impact.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections: 'Sensor Name' with a text input field containing 'Example Name'; 'Tags' with a text input field containing 'exampletag' and a plus sign button; and 'Priority' with a star rating of five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>ⓘ This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ smtpsensor ▪ mailsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

SMTP Specific

SMTP Specific	
Timeout (Sec.) i	60
Port i	25

SMTP Specific

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
Port	<p>Enter the number of the port that the sensor uses to send an email via SMTP. The default port for unsecure connections is 25 and the default ports for secure connections are 465 or 587. The actual setting depends on the server that you connect to. Enter an integer value.</p> <p>i We recommend that you use the default value.</p> <p>i If the connection is unsuccessful, try a different port number.</p>

Authentication

Authentication

SMTP Authentication Method ⓘ

None

User name and password

HELO Ident ⓘ

Authentication

Setting	Description
SMTP Authentication Method	Define if you want to use authentication for the SMTP connection: <ul style="list-style-type: none"> ▪ None: Do not use any authentication method. ▪ User name and password: Authenticate against the SMTP server via user name and password.
User Name	This setting is only visible if you select User name and password above. Enter a user name for SMTP authentication. Enter a string.
Password	This setting is only visible if you select User name and password above. Enter a password for SMTP authentication. Enter a string.
HELO Ident	Enter a server name for the HELO part of the email protocol. If you leave this field empty, the value defaults to the computer name. ⓘ For some mail servers, the HELO identifier must be the valid principal host domain name for the client host. See SMTP RFC 2821 . ⓘ Only ASCII characters are allowed.

Connection Security

Connection Security

Transport-Level Security ⓘ

Use transport-level security if available using StartTLS (default)

Use transport-level security if available

Enforce transport-level security using StartTLS

 Send an email

Result Handling **i** Discard result
 Store result

Monitoring

Setting	Description
Email Handling	<p>Define the monitoring approach when connecting to the SMTP server:</p> <ul style="list-style-type: none"> ▪ Do not send an email: Do not send an email, only connect to the SMTP server. ▪ Send an email: Send an email through the SMTP server. If there is an error when sending the email, this triggers an error message and the sensor changes to the Down status.

Setting	Description
From	This setting is only visible if you select Send email above. Specify the address of the sender of the email. Enter a valid email address.
To	This setting is only visible if you select Send email above. Specify the address that PRTG sends the email to. Enter a valid email address. ⓘ If you define more than one recipient, separate the individual email addresses with commas.
Topic	This setting is only visible if you select Send email above. Specify the subject that the email contains. Enter a string or leave the field empty.
Content	This setting is only visible if you select Send email above. Specify the body that the email contains. Enter a string or leave the field empty.
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor. ⓘ You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.

Setting	Description
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ¹⁴².

Access Rights

inherit from  Root

User Group Access ¹	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵³.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.

Channel	Description
Response Time	The response time in milliseconds (msec)  This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

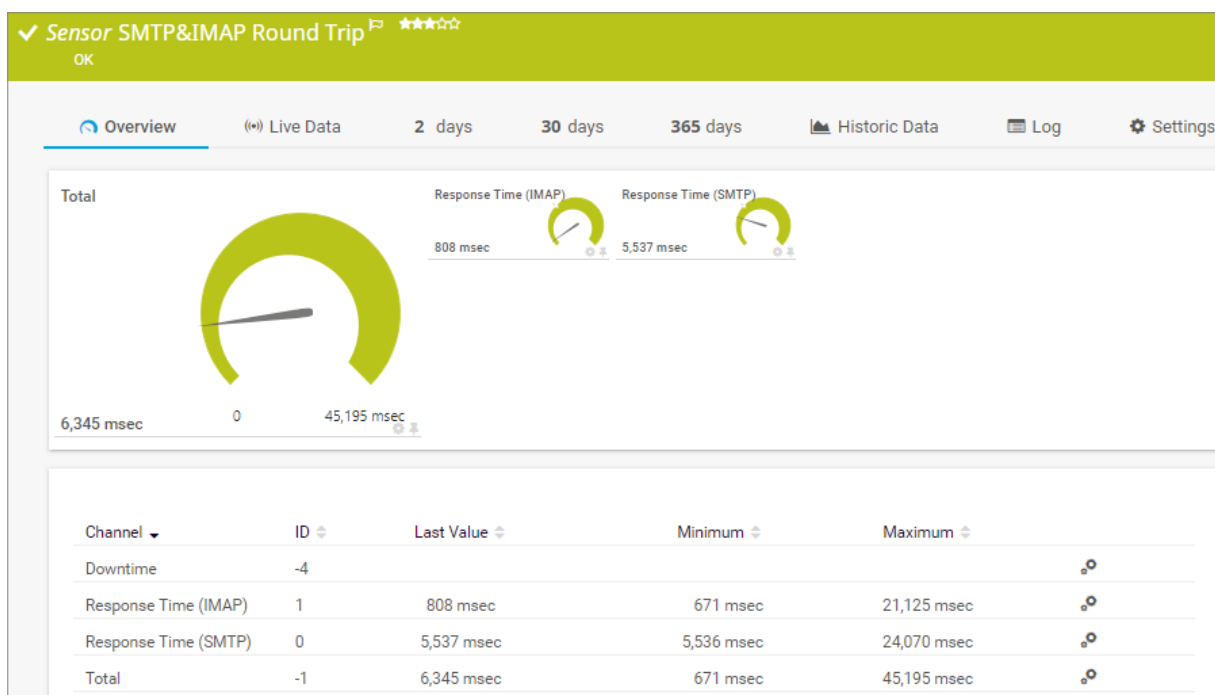

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.137 SMTP&IMAP Round Trip Sensor

The SMTP&IMAP Round Trip sensor monitors the time it takes for an email to reach an Internet Message Access Protocol (IMAP) mailbox using the Simple Mail Transfer Protocol (SMTP). It sends an email via the parent device (an SMTP server) and then scans a dedicated IMAP mailbox until the email arrives.

i The SMTP&IMAP Round Trip sensor automatically deletes these emails from the mailbox as soon as PRTG retrieves them. The emails only remain in the mailbox if a timeout or a restart of the PRTG core server occurs during sensor runtime.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SMTP&IMAP Round Trip Sensor

Sensor in Other Languages

- Dutch: SMTP & IMAP Round Trip
- French: Durée de boucle SMTP&IMAP
- German: SMTP&IMAP-Übermittlung
- Japanese: SMTP & IMAP ラウンドトリップ
- Portuguese: Percurso de ida e volta SMTP&IMAP
- Russian: SMTP&IMAP
- Simplified Chinese: SMTP 和 IMAP 往返
- Spanish: Ida y vuelta SMTP&IMAP

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- The parent device must be an SMTP server.
- This sensor does not support Secure Remote Password (SRP) ciphers.
- Use dedicated email accounts with this sensor. If you use more sensors of this type, make sure that each sensor uses its own email accounts.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ¹⁴⁵.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ imapsensor ▪ roundtrip ▪ mailsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).</p>

Email Settings

Setting	Description
From	Specify the email address of the email's sender. Enter a valid email address.
To	<p>Specify the address that PRTG sends the emails to. Enter a valid email address.</p> <p>i You can only enter one email address.</p>

Setting	Description
HELO Ident	Enter a server name for the HELO part of the mail protocol. For some mail servers, the HELO identifier must be the valid principal host domain name for the client host. For more information, see SMTP RFC 2821 .

Step 1: Send Email Using Parent Device (SMTP Server)

i In this step, you configure how the sensor sends the emails. The sensor uses the IP Address/DNS Name of the parent device (an SMTP server).

Step 1: Send Email Using Parent Device (SMTP Server)

Port <small>i</small>	25
Timeout for SMTP Connection (Sec.) <small>i</small>	300
SMTP Authentication Method <small>i</small>	<input checked="" type="radio"/> None <input type="radio"/> User name and password
Additional Text for Email Subject <small>i</small>	

Step 1: Send Email Using Parent Device (SMTP Server)

Setting	Description
Port	<p>Enter the number of the port that the sensor uses to send an email via SMTP. The default port for unsecure connections is 25 and the default ports for secure connections are 465 or 587. The actual setting depends on the server that you connect to. Enter an integer value.</p> <p>i We recommend that you use the default value.</p> <p>i If the connection is unsuccessful, try a different port number.</p>
Timeout for SMTP Connection (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
SMTP Authentication Method	<p>Define if you want to use authentication for the SMTP connection:</p> <ul style="list-style-type: none"> ▪ None: Do not use any authentication method. ▪ User name and password: Authenticate against the SMTP server via user name and password.

Setting	Description
User Name	This setting is only visible if you select User name and password above. Enter a user name for SMTP authentication. Enter a string.
Password	This setting is only visible if you select User name and password above. Enter a password for SMTP authentication. Enter a string.
Additional Text for Email Subject	<p>PRTG automatically creates the subject part of the round trip email. The subject consists of the string PRTG Roundtrip Mail:, followed by a unique globally unique identifier (GUID) to correctly identify the email in the IMAP mailbox, for example, PRTG Roundtrip Mail: {5E858D9C-AC70-466A-9B2A-55630165D276}.</p> <p>Use this field to place your custom text before the automatically created text.</p>

Connection Security

- Enforce transport-level security

Connection Security

Setting	Description
Transport-Level Security	<p>Define how the sensor handles the security of the connection:</p> <ul style="list-style-type: none"> ▪ Use transport-level security if available using StartTLS (default): Try to connect to the server via a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection and StartTLS. If the server does not support this, the sensor tries to connect without connection security. ▪ Use transport-level security if available: Try to connect to the server via an SSL/TLS-secured connection. If the server does not support this, the sensor tries to connect without connection security. ▪ Enforce transport-level security using StartTLS: Try to connect to the server via an SSL/TLS-secured connection and StartTLS. If the server does not support this, the sensor shows the Down status¹⁹⁷. ▪ Enforce transport-level security: Try to connect to the server via an SSL/TLS-secured connection. If the server does not support this, the sensor shows the Down status. <p> ⓘ If the sensor connects to a server via StartTLS, the connection is first established without connection security. After the connection has been established, the sensor sends a certain command (StartTLS) over the unsecured connection to negotiate a secure connection via SSL/TLS.</p>

Setting	Description
	<p>i If the sensor does not use StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If no secure connection is possible, no communication takes place.</p>

Step 2: Check an IMAP Mailbox until Email Arrives

i In this step, you configure how to receive the emails that the sensor sends.

Step 2: Check an IMAP Mailbox until Email Arrives

IP Address/DNS Name i	mail.example.com
Mailbox i	INBOX
Port i	143
Connection Interval (Sec.) i	10
Maximum Trip Time (Sec.) i	300
User Name i	johnqpublic
Password i
Search Method i	<input checked="" type="radio"/> Search for the email directly (default) <input type="radio"/> Search through all available emails

Step 2: Check an IMAP Mailbox Until Email Arrives

Setting	Description
IP Address/DNS Name	Specify the IMAP server. Enter a valid IP address or Domain Name System (DNS) name.
Mailbox	<p>Specify the IMAP mailbox that you want to check. Enter the IMAP mailbox or folder name, for example INBOX.</p> <p>i The IMAP mailbox or folder name must not match the sender of the email in the From field. Otherwise, the sensor might incorrectly interpret unsuccessful round trips as successful.</p>
Port	Specify the port that the sensor uses for the IMAP connection. The default port for unsecure connections is 143 and the default port for secure connections is 993. The actual setting depends on the server you connect to.. Enter an integer value.

Setting	Description
	<p> We recommend that you use the default value.</p> <p> If the connection is unsuccessful, try a different port number.</p>
Connection Interval (Sec.)	Enter the number of seconds the sensor waits between two connections to the IMAP server. PRTG repeatedly checks the mailbox in this scanning interval until the email arrives. Enter an integer value.
Maximum Trip Time (Sec.)	Enter the number of seconds an email may take to arrive in the IMAP mailbox. PRTG continuously checks the mailbox in this scanning interval until the email arrives. If it does not arrive within the maximum trip time, the sensor shows an error message. Enter an integer value.
User Name	Enter a user name for IMAP authentication. Enter a string.
Password	Enter a password for IMAP authentication. Enter a string.  The password must not contain spaces, percent signs (%), or the character combination !*.
Search Method	Define how to search for the round trip email in the mailbox: <ul style="list-style-type: none"> ▪ Search for the email directly (default): Send a SEARCH command to directly find the round trip email on the IMAP server. ▪ Search through all available emails: Search through all available emails in the mailbox locally to find the round trip email. This might take some time if you have many emails in your mailbox.

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Response Time (IMAP)	The response time of the IMAP server in milliseconds (msec)
Response Time (SMTP)	The response time of the SMTP server in msec
Total	The sum of the response time of the IMAP server and the SMTP server in msec
	i This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

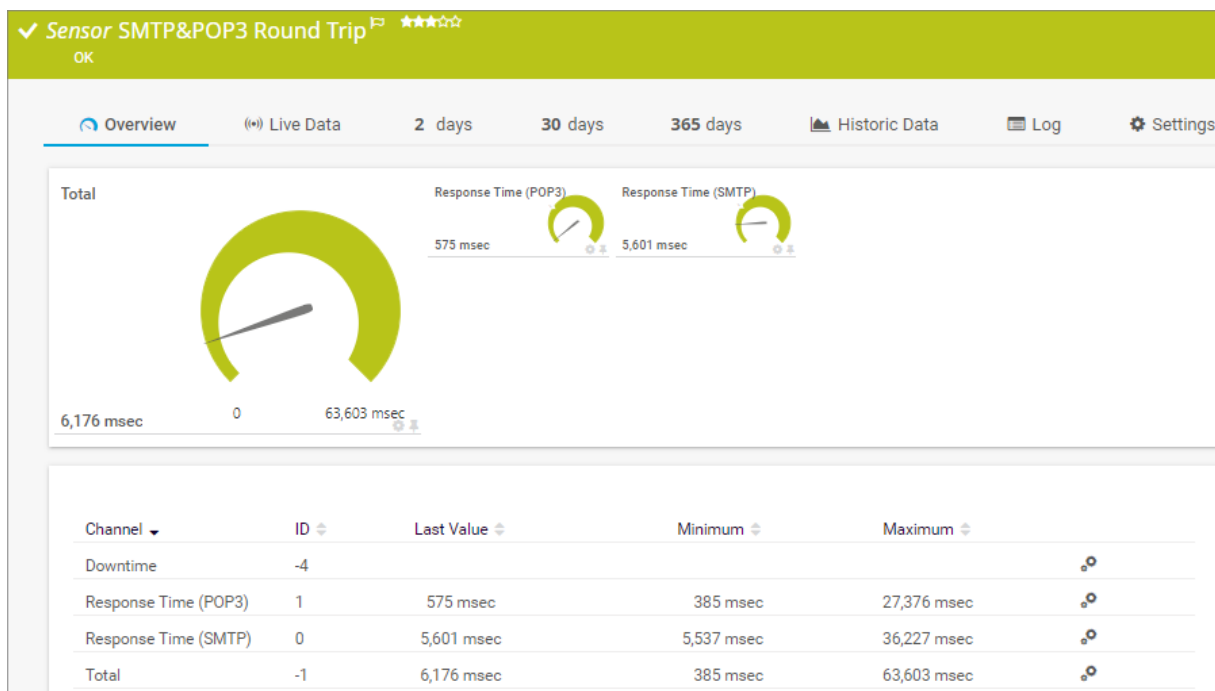

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.138 SMTP&POP3 Round Trip Sensor

The SMTP&POP3 Round Trip sensor monitors the time it takes for an email to reach a Post Office Protocol version 3 (POP3) mailbox using the Simple Mail Transfer Protocol (SMTP). It sends an email using the parent device (an SMTP server) and then scans a dedicated POP3 mailbox until the email comes in.

i The SMTP&POP3 Round Trip sensor automatically deletes these emails from the mailbox as soon as PRTG has retrieved them. Emails only remain in the mailbox if a timeout or a restart of the PRTG core server occurs during sensor runtime.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SMTP&POP3 Round Trip Sensor

Sensor in Other Languages

- Dutch: SMTP & POP3 Round Trip
- French: Durée de boucle SMTP&POP3
- German: SMTP&POP3-Übermittlung
- Japanese: SMTP&POP3 ラウンドトリップ
- Portuguese: Percurso de ida e volta SMTP&POP3
- Russian: SMTP POP3
- Simplified Chinese: SMTP 和 POP3 往返
- Spanish: Ida y vuelta SMTP&POP3

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- The parent device must be an SMTP server.
- This sensor does not support Secure Remote Password (SRP) ciphers.
- Use dedicated email accounts with this sensor. If you use more sensors of this type, make sure that each sensor uses its own email accounts.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name**: A text input field containing "Example Name".
- Tags**: A list of tags, currently showing "exampletag" with a close button (X) and a plus button (+) to add more.
- Priority**: A star rating system showing 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ¹⁴⁵.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ pop3sensor ▪ roundtrip ▪ mailsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

Email Settings

Email Settings

From ⓘ johnqpublic@example.com

To ⓘ janeqpublic@example.com

HELO Ident ⓘ mail.example.com

Email Settings

Setting	Description
From	<p>Specify the email address of the email's sender. Enter a valid email address.</p>
To	<p>Specify the address that PRTG sends the emails to. Enter a valid email address.</p> <p>i You can only enter one email address.</p>

Setting	Description
HELO Ident	Enter a server name for the HELO part of the mail protocol. For some mail servers, the HELO identifier must be the valid principal host domain name for the client host. For more information, see SMTP RFC 2821 .

Step 1: Send Email Using Parent Device (SMTP Server)

i In this step, you configure how the sensor sends the emails. The sensor uses the IP Address/DNS Name of the parent device (an SMTP server).

Step 1: Send Email Using Parent Device (SMTP Server)

Port <small>i</small>	25
Timeout for SMTP Connection (Sec.) <small>i</small>	300
SMTP Authentication Method <small>i</small>	<input checked="" type="radio"/> None <input type="radio"/> User name and password
Additional Text for Email Subject <small>i</small>	

Step 1: Send Email Using Parent Device (SMTP Server)

Setting	Description
Port	<p>Enter the number of the port that the sensor uses to send an email via SMTP. The default port for unsecure connections is 25 and the default ports for secure connections are 465 or 587. The actual setting depends on the server that you connect to. Enter an integer value.</p> <p>i We recommend that you use the default value.</p> <p>i If the connection is unsuccessful, try a different port number.</p>
Timeout for SMTP Connection (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
SMTP Authentication Method	<p>Define if you want to use authentication for the SMTP connection:</p> <ul style="list-style-type: none"> ▪ None: Do not use any authentication method. ▪ User name and password: Authenticate against the SMTP server via user name and password.

Setting	Description
User Name	This setting is only visible if you select User name and password above. Enter a user name for SMTP authentication. Enter a string.
Password	This setting is only visible if you select User name and password above. Enter a password for SMTP authentication. Enter a string.
Additional Text for Email Subject	<p>PRTG automatically creates the subject part of the round trip email. The subject consists of the string PRTG Roundtrip Mail:, followed by a unique globally unique identifier (GUID) to correctly identify the email in the IMAP mailbox, for example, PRTG Roundtrip Mail: {5E858D9C-AC70-466A-9B2A-55630165D276}.</p> <p>Use this field to place your custom text before the automatically created text.</p>

- Enforce transport-level security

Connection Security

Setting	Description
Transport-Level Security	<p>Define how the sensor handles the security of the connection:</p> <ul style="list-style-type: none"> ▪ Use transport-level security if available using StartTLS (default): Try to connect to the server via a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection and StartTLS. If the server does not support this, the sensor tries to connect without connection security. ▪ Use transport-level security if available: Try to connect to the server via an SSL/TLS-secured connection. If the server does not support this, the sensor tries to connect without connection security. ▪ Enforce transport-level security using StartTLS: Try to connect to the server via an SSL/TLS-secured connection and StartTLS. If the server does not support this, the sensor shows the Down status¹⁹⁷. ▪ Enforce transport-level security: Try to connect to the server via an SSL/TLS-secured connection. If the server does not support this, the sensor shows the Down status. <p> ⓘ If the sensor connects to a server via StartTLS, the connection is first established without connection security. After the connection has been established, the sensor sends a certain command (StartTLS) over the unsecured connection to negotiate a secure connection via SSL/TLS.</p>

Setting	Description
	<p>i If the sensor does not use StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If no secure connection is possible, no communication takes place.</p>

Step 2: Check a POP3 Mailbox until Email Arrives

i In this step, you configure how to receive the sent emails.

Step 2: Check a POP3 Mailbox until Email Arrives

IP Address/DNS Name i	mail.example.com
Port i	110
Connection Interval (Sec.) i	5
Maximum Trip Time (Sec.) i	300
POP3 Authentication Method i	<input checked="" type="radio"/> Without login <input type="radio"/> User name and password <input type="radio"/> 128-bit MD5 hash value (APOP)

Email Settings

Setting	Description
IP Address/DNS Name	Specify the POP3 server. Enter a valid IP address or Domain Name System (DNS) name.
Port	<p>Specify the port that the sensor uses for the POP3 connection. The default port for unsecure connections is 110 and the default port for secure connections is 995. The actual setting depends on the server you connect to. Enter an integer value.</p> <p>i We recommend that you use the default value.</p> <p>i If the connection is unsuccessful, try a different port number.</p>
Connection Interval (Sec.)	Enter the number of seconds the sensor waits between two connections to the POP3 server. PRTG continuously checks the mailbox in this scanning interval until the email arrives. Enter an integer value.

Setting	Description
Maximum Trip Time (Sec.)	Enter the number of seconds an email may take to arrive in the POP3 mailbox. PRTG continuously checks the mailbox in the interval that you specify above until the email arrives. If it does not arrive within the maximum trip time, the sensor triggers an error message. Enter an integer value.
POP3 Authentication Method	Select the authentication method for the POP3 connection: <ul style="list-style-type: none"> Without login: Only monitor the connection to the POP3 server. User name and password: Log in to the POP3 server with user name and password. <ul style="list-style-type: none"> i This is a simple login. It is not secure. 128-bit MD5 hash value (APOP): Send the password in an encrypted form using APOP. <ul style="list-style-type: none"> i The POP3 server that you connect to must support this option.
User Name	This setting is only visible if you select User name and password or 128-bit has value (APOP) above. Enter a user name for POP3 authentication. Enter a string.
Password	This setting is only visible if you select User name and password or 128-bit has value (APOP) above. Enter a user name for POP3 authentication. Enter a string.

Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

7.8.139 SNMP APC Hardware Sensor

The SNMP APC Hardware sensor monitors performance counters on an APC UPS device via the Simple Network Management Protocol (SNMP).

i The SNMP APC Hardware sensor does not appear as a running sensor, instead it is created as an [SNMP Custom Advanced sensor](#) ²⁴⁸⁴.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ²³¹⁴.

SNMP APC Hardware Sensor

Sensor in Other Languages

- Dutch: SNMP APC Hardware
- French: Matériels SNMP APC
- German: SNMP APC Hardware
- Japanese: SNMP APC ハードウェア
- Portuguese: Hardware SNMP APC
- Russian: SNMP APC
- Simplified Chinese: SNMP APC 硬件
- Spanish: SNMP APC Hardware

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.

- See the Knowledge Base: [How can I monitor additional counters with the SNMP APC Hardware sensor?](#)
- See the Knowledge Base: [How can I monitor an APC UPS that does not support SNMP?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

APC UPS Specific

Setting	Description
Library OIDs	<p>Select the performance counters that you want to monitor. PRTG creates one SNMP Custom Advanced sensor for each Library OID category that you select.</p> <p>i If you select more than 10 OIDs per category, PRTG creates the corresponding amount of SNMP Custom Advanced sensors.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#) 
- [Additional Sensor Types \(Custom Sensors\)](#) 

- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

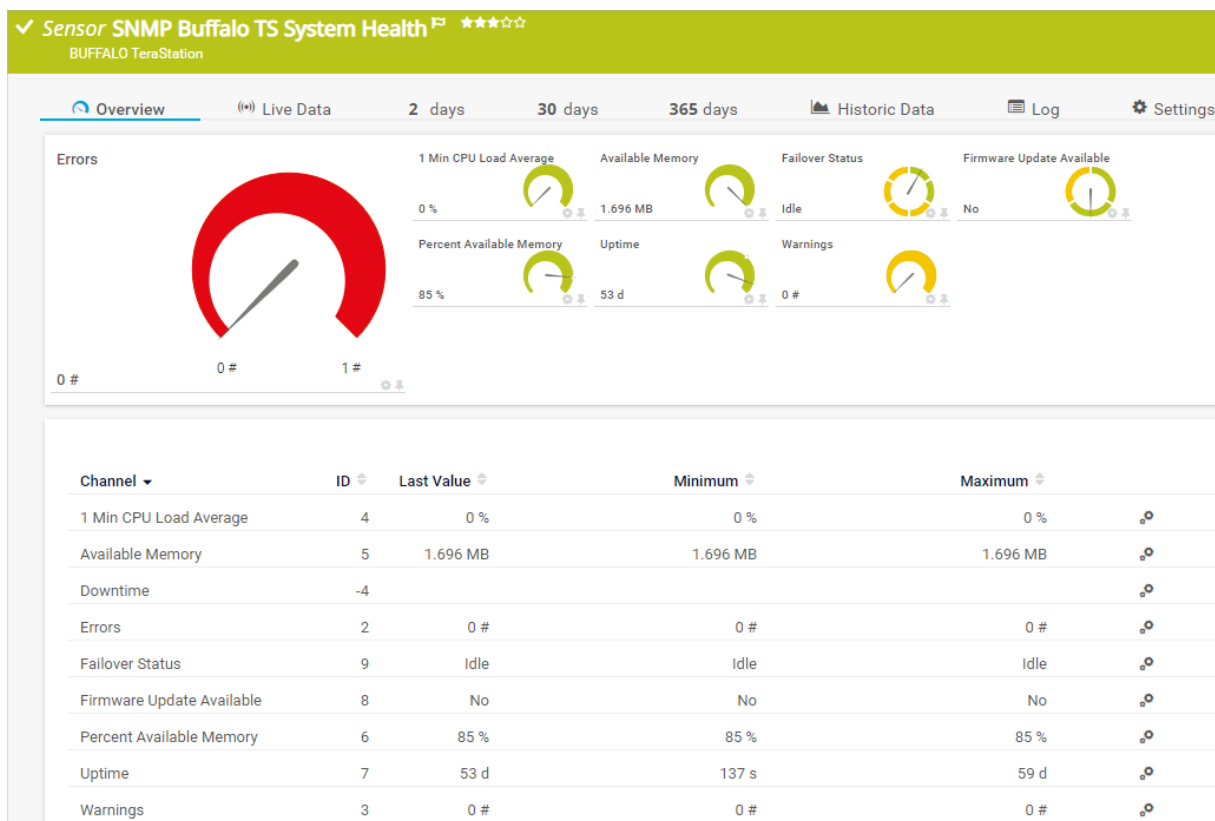

7.8.140 SNMP Buffalo TS System Health Sensor

The SNMP Buffalo TS System Health sensor monitors the system health of a Buffalo TeraStation network-attached storage (NAS) via the Simple Network Management Protocol (SNMP).

i This sensor supports the following TeraStation systems: [3000](#), [3010](#), [3020](#), [5000](#), [5010](#), [6000](#), and [7000](#) series.

i Run an [auto-discovery](#) with the device template Buffalo TeraStation NAS to automatically create [SNMP Custom Table sensors](#) with additional useful information about the TeraStation, for example, array status, disk smart status, disk status, and Internet Small Computer System Interface (iSCSI) status. This device template also creates [SNMP sensors](#) for traffic, memory, and load average on the TeraStation.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Buffalo TS System Health Sensor

Sensor in Other Languages

- Dutch: SNMP Buffalo TS System Status
- French: État du système SNMP Buffalo TS
- German: SNMP Buffalo TS System Health
- Japanese: SNMP Buffalo TS システムの正常性
- Portuguese: SNMP Buffalo TS Funcionamento do sistema

- Russian: Buffalo TS SNMP
- Simplified Chinese: SNMP Buffalo TS 系统健康状况
- Spanish: Salud del sistema NS de Buffalo TS SNMP

Remarks

- This sensor supports the TeraStation 3000, 3010, 3020, 5000, 5010, 6000, and 7000 series.
- In certain cases, this sensor might show an error message. If you encounter such an issue, open the [settings of the parent device](#)^[463], section SNMP Compatibility Options, and set the Walk Mode to Use GETNEXT requests.
- This sensor has predefined limits for several metrics. You can individually change these limits in the channel settings. For detailed information about channel limits, see section [Channel Settings](#)^[3977].
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)^[448].

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name**: A text input field containing "Example Name".
- Tags**: A list of tags with "exampletag" selected, accompanied by a plus sign to add more tags.
- Priority**: A star rating system showing three stars selected out of five.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[183] , as well as in alarms ^[228] , logs ^[237] , notifications ^[4031] , reports ^[4039] , maps ^[4035] , libraries ^[4047] , and tickets ^[240] .

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpbuffalots ▪ buffalots ▪ systemhealth
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [421] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management [158].</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
1 Min CPU Load Average	The average CPU load in percent
Available Memory	The available memory in bytes
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Errors	The number of errors i This channel is the primary channel by default.
Failover Status	The failover status <ul style="list-style-type: none"> Up status¹⁹⁷: Busy, Idle Warning status: Initializing, Starting Backup, Starting Main, Stopping
Firmware Update Available	If a firmware update is available <ul style="list-style-type: none"> Up status: No, Unknown Warning status: Yes
Percent Available Memory	The available memory in percent
Uptime	The system uptime
Warnings	The number of warnings

Sensor Settings Overview

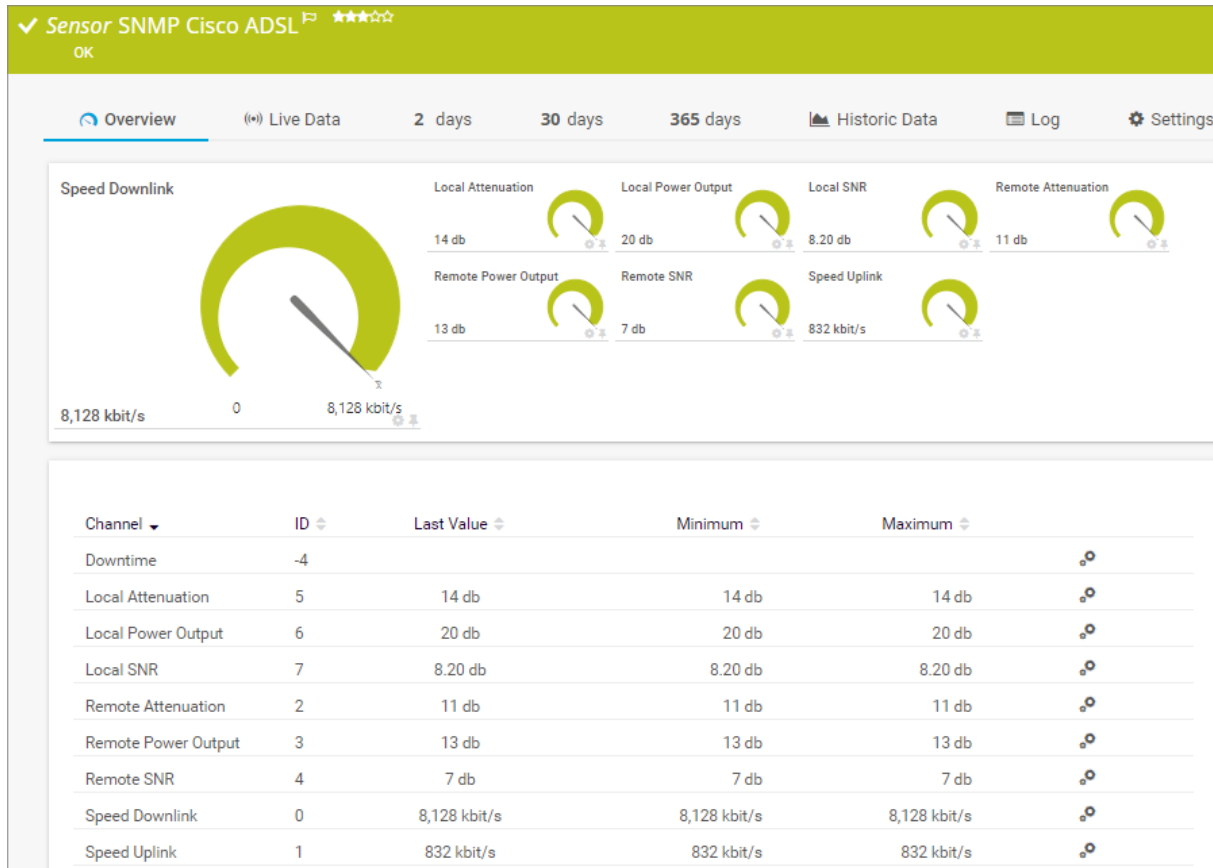

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.141 SNMP Cisco ADSL Sensor

The SNMP Cisco ADSL sensor monitors asymmetric digital subscriber line (ADSL) statistics of a Cisco router via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Cisco ADSL Sensor

Sensor in Other Languages

- Dutch: SNMP Cisco ADSL
- French: ADSL Cisco SNMP
- German: SNMP Cisco ADSL
- Japanese: SNMP Cisco ADSL
- Portuguese: SNMP Cisco ADSL
- Russian: SNMP Cisco ADSL
- Simplified Chinese: SNMP Cisco ADSL
- Spanish: SNMP Cisco ADSL

Remarks

- This sensor supports the IPv6 protocol.

- This sensor has a low performance impact.
- For a general introduction to the technology behind SNMP, see section [Monitoring via SNMP](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Cisco ADSL Settings

Setting	Description
Line Index	<p>Select the performance counters that you want to monitor. PRTG creates one sensor for each performance counter that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpcisoadsl
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>

Credentials for SNMP Devices

 inherit from  Root

SNMP Version  v1
 v2c (recommended)
 v3

Community String  public

SNMP Port  161

Timeout (Sec.)  5

Credentials for SNMP Devices

Setting	Description
SNMP Version	Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:

Setting	Description
	<ul style="list-style-type: none"> ▪ SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> ❗ SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP. ▪ SNMP v2c (recommended): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters. ▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption. <ul style="list-style-type: none"> ❗ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in Interval Delay or Open Requests with the Probe Health sensor^[2083], distribute the load over multiple probes^[4503]. SNMP v1 and SNMP v2c do not have this limitation.
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c above. Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>❗ We recommend that you use the default value.</p>
Authentication Method	<p>This setting is only visible if you select SNMP v3 above. Select the authentication method:</p> <ul style="list-style-type: none"> ▪ MD5: Use message-digest algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>❗ If you do not want to use authentication but you need SNMP v3, for example, because your device requires context, you can leave the Password field empty. In this case, PRTG uses SNMP_SEC_LEVEL_NOAUTH and it entirely deactivates authentication.</p> <p>❗ The authentication method you select must match the authentication method of your device.</p>
User Name	<p>This setting is only visible if you select SNMP v3 above. Enter the user name for access to the target SNMP device.</p> <p>❗ The user name that you enter must match the user name of your device.</p>
Password	<p>This setting is only visible if you select SNMP v3 above. Enter the password for access to the target SNMP device.</p> <p>❗ The password that you enter must match the password of your device.</p>

Setting	Description
Encryption Type	<p>This setting is only visible if you select SNMP v3 above. Select an encryption type:</p> <ul style="list-style-type: none"> ▪ DES: Use Data Encryption Standard (DES) as the encryption algorithm. ▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm. <p> Net-SNMP does not support AES-192 and AES-256. They do not have RFC specifications.</p> <p> The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above. Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above. Enter a context name only if the configuration of the device requires it. Context is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer value. The default port is 161.</p> <p> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p> <p> If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>

Scanning Interval

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none">▪ 30 seconds▪ 60 seconds▪ 5 minutes▪ 10 minutes▪ 15 minutes▪ 30 minutes▪ 1 hour▪ 4 hours▪ 6 hours▪ 12 hours▪ 24 hours <p> You can change the available intervals in the system administration <small>4187</small> on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status <small>197</small>. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none">▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails.▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails.▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails.

Setting	Description
	<p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies ⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>

Setting	Description
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Active Email Sessions	The number of active email sessions
Active IPsec Sessions	The number of active Internet Protocol Security (IPsec) sessions
Active L2L Sessions	The number of active LAN-to-LAN (L2L) sessions
Active LB Sessions	The number of active LB sessions
Active Sessions	<p>The total number of active sessions</p> <p> This channel is the primary channel by default.</p>
Active SVC Sessions	The number of active switched virtual circuit (SVC) sessions
Active Users	The number of active users

Channel	Description
Active WebVPN Sessions	The number of active WebVPN users
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Groups With Active Users	The number of groups with active users

Sensor Settings Overview

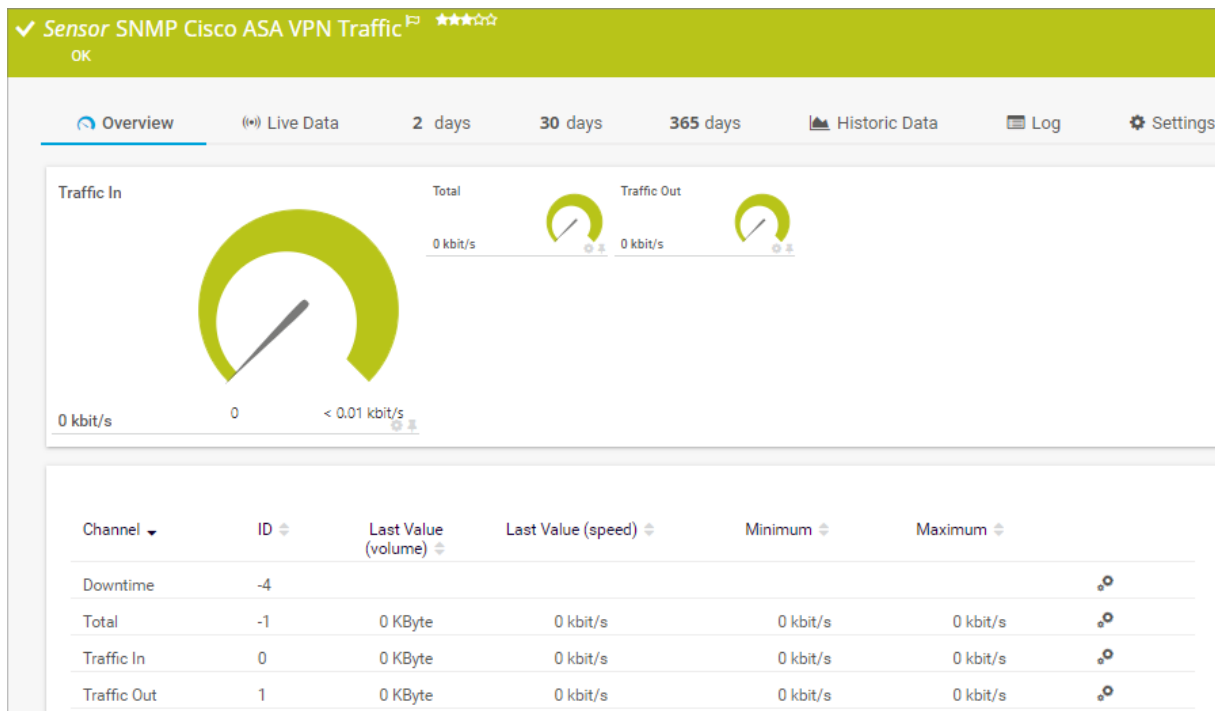

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.143 SNMP Cisco ASA VPN Traffic Sensor

The SNMP Cisco ASA VPN Traffic sensor monitors the traffic of an Internet Protocol Security (IPsec) VPN connection on a Cisco Adaptive Security Appliance via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Cisco ASA VPN Traffic Sensor

Sensor in Other Languages

- Dutch: SNMP Cisco ASA VPN Verkeer
- French: Traffic VPN ASA Cisco SNMP
- German: SNMP Cisco ASA VPN-Datenverkehr
- Japanese: SNMP Cisco ASA VPN トラフィック
- Portuguese: Tráfego VPN SNMP Cisco ASA
- Russian: SNMP Cisco ASA VPN
- Simplified Chinese: SNMP Cisco ASA VPN 流量
- Spanish: Tráfico SNMP Cisco ASA VPN

Remarks

- This sensor can monitor IPsec connections only.
- This sensor is intended to monitor permanent connections. It shows an error if a connection is interrupted.
- This sensor supports the IPv6 protocol.

- This sensor has a low performance impact.
- See the Knowledge Base: [I get the error PE123 when using the SNMP Cisco ASA VPN Traffic sensor. What can I do?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ❗ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

ASA VPN Specific

Setting	Description
Connections	<p>Select the IPsec VPN connections that you want to monitor. PRTG creates one sensor for each IPsec VPN connection that you select.</p> <ul style="list-style-type: none"> ❗ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. ❗ This sensor can only monitor VPN connections based on IPsec. This means, for example, that connections that use Cisco AnyConnect do not appear in this list.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

SNMP Port ⓘ

Timeout (Sec.) ⓘ

Credentials for SNMP Devices

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> ▪ SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> ⓘ SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP. ▪ SNMP v2c (recommended): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters. ▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption. <ul style="list-style-type: none"> ⓘ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in Interval Delay or Open Requests with the Probe Health sensor^[2083], distribute the load over multiple probes^[4503]. SNMP v1 and SNMP v2c do not have this limitation.
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c above. Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p> ⓘ We recommend that you use the default value.</p>
Authentication Method	<p>This setting is only visible if you select SNMP v3 above. Select the authentication method:</p> <ul style="list-style-type: none"> ▪ MD5: Use message-digest algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication.

Setting	Description
	<p>i If you do not want to use authentication but you need SNMP v3, for example, because your device requires context, you can leave the Password field empty. In this case, PRTG uses SNMP_SEC_LEVEL_NOAUTH and it entirely deactivates authentication.</p> <p>i The authentication method you select must match the authentication method of your device.</p>
User Name	<p>This setting is only visible if you select SNMP v3 above. Enter the user name for access to the target SNMP device.</p> <p>i The user name that you enter must match the user name of your device.</p>
Password	<p>This setting is only visible if you select SNMP v3 above. Enter the password for access to the target SNMP device.</p> <p>i The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above. Select an encryption type:</p> <ul style="list-style-type: none"> ▪ DES: Use Data Encryption Standard (DES) as the encryption algorithm. ▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm. <p>i Net-SNMP does not support AES-192 and AES-256. They do not have RFC specifications.</p> <p>i The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above. Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p>i The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above. Enter a context name only if the configuration of the device requires it. Context is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer value. The default port is 161.</p> <p>i We recommend that you use the default value.</p>

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

inherit from  Root

Scanning Interval **i** 60 seconds

If a Sensor Query Fails **i** Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration⁴¹⁸⁷ on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. 7.8.144 SNMP Cisco ASA VPN Users Sensor

The SNMP Cisco ASA VPN Users sensor monitors account connections to a VPN on a Cisco Adaptive Security Appliance via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Cisco ASA VPN Users Sensor

Sensor in Other Languages

- Dutch: SNMP Cisco ASA VPN Gebruikers
- French: Utilisateurs Cisco ASA VPN SNMP
- German: SNMP Cisco ASA VPN-Benutzer
- Japanese: SNMP Cisco ASA VPN ユーザー数
- Portuguese: Usuários VPN SNMP Cisco ASA
- Russian: SNMP Cisco ASA VPN
- Simplified Chinese: SNMP Cisco ASA VPN 用户
- Spanish: Usuarios de SNMP Cisco ASA VPN

Remarks

- Do not use this sensor to monitor more than 50 VPN users, especially if they are all connected simultaneously. For more information, see the Knowledge Base: [My SNMP Cisco ASA VPN Users sensor shows a user limit error. Why? What can I do?](#)
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog box. It has a title bar 'Basic Sensor Settings' in blue. Below the title bar, there are three sections: 'Sensor Name' with an information icon and the text 'Example Name'; 'Tags' with an information icon and a text input field containing 'exampletag' and a plus sign; and 'Priority' with an information icon and five star icons, three of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p>

Setting	Description
	<ul style="list-style-type: none"> snmpciscoasavpnsensor snmpciscoasavpntrafficsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Sensor Display

Primary Channel **ⓘ** Downtime

Graph Type **ⓘ** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Credentials for SNMP Devices

Click  to interrupt the [inheritance](#).

Credentials for SNMP Devices

 inherit from  Root

SNMP Version 

v1

v2c (recommended)

v3

Community String  public

SNMP Port  161

Timeout (Sec.)  5

Credentials for SNMP Devices

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> ▪ SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none">  SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP. ▪ SNMP v2c (recommended): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters.

Setting	Description
	<ul style="list-style-type: none"> ▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption. <ul style="list-style-type: none"> ⓘ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in Interval Delay or Open Requests with the Probe Health sensor²⁰⁸³, distribute the load over multiple probes⁴⁵⁰³. SNMP v1 and SNMP v2c do not have this limitation.
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c above. Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>ⓘ We recommend that you use the default value.</p>
Authentication Method	<p>This setting is only visible if you select SNMP v3 above. Select the authentication method:</p> <ul style="list-style-type: none"> ▪ MD5: Use message-digest algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>ⓘ If you do not want to use authentication but you need SNMP v3, for example, because your device requires context, you can leave the Password field empty. In this case, PRTG uses SNMP_SEC_LEVEL_NOAUTH and it entirely deactivates authentication.</p> <p>ⓘ The authentication method you select must match the authentication method of your device.</p>
User Name	<p>This setting is only visible if you select SNMP v3 above. Enter the user name for access to the target SNMP device.</p> <p>ⓘ The user name that you enter must match the user name of your device.</p>
Password	<p>This setting is only visible if you select SNMP v3 above. Enter the password for access to the target SNMP device.</p> <p>ⓘ The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above. Select an encryption type:</p> <ul style="list-style-type: none"> ▪ DES: Use Data Encryption Standard (DES) as the encryption algorithm. ▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm.

Setting	Description
	<p> Net-SNMP does not support AES-192 and AES-256. They do not have RFC specifications.</p> <p> The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above. Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above. Enter a context name only if the configuration of the device requires it. Context is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer value. The default port is 161.</p> <p> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p> <p> If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds

Setting	Description
	<ul style="list-style-type: none"> ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

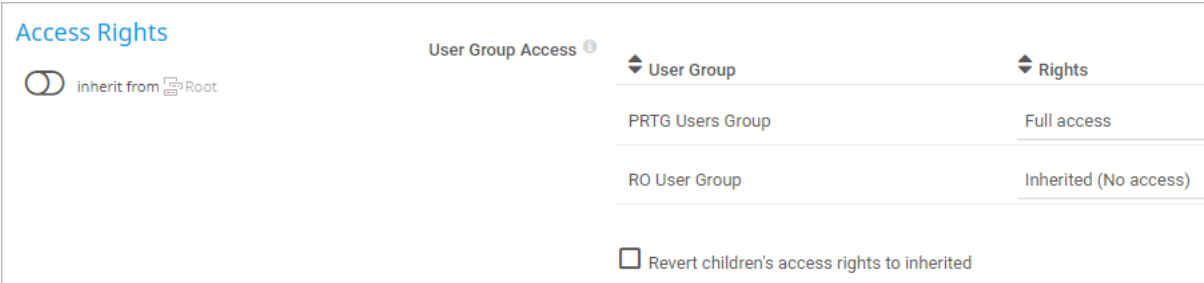

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups^[4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management^[158].</p>

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
[Account]	The account status <ul style="list-style-type: none"> Up status¹⁹⁷; Offline, Online
Connected Accounts	The number of connected accounts <ul style="list-style-type: none"> i This channel is the primary channel by default.
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

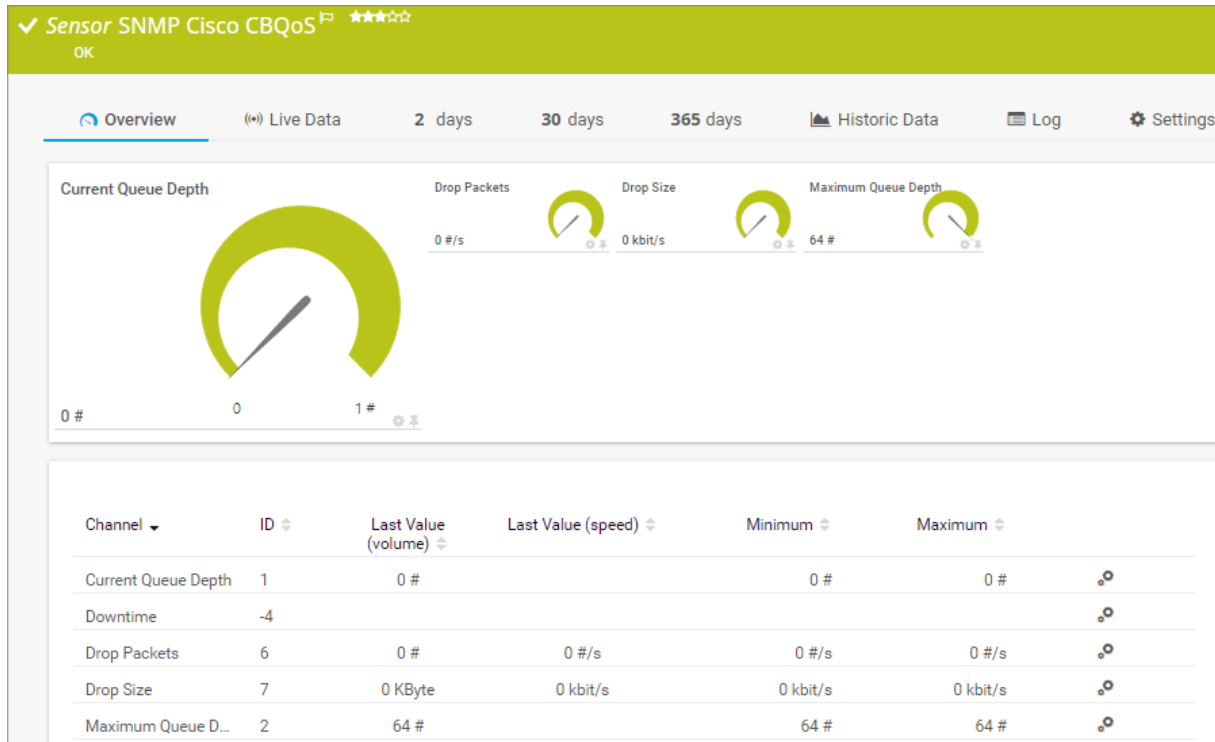

- [List of Available Sensor Types](#)⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁸⁷

7.8.145 SNMP Cisco CBQoS Sensor

The SNMP Cisco CBQoS sensor monitors network parameters using Cisco's Class Based Quality of Service (CBQoS) via the Simple Network Management Protocol (SNMP).

i The sensor supports the classes [Class Map](#), [Match Statement](#), and [Queueing](#).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Cisco CBQoS Sensor

Sensor in Other Languages

- Dutch: SNMP Cisco CBQoS
- French: CBQoS Cisco SNMP
- German: SNMP Cisco CBQoS
- Japanese: SNMP Cisco CBQoS
- Portuguese: CBQoS Cisco de SNMP
- Russian: SNMP Cisco CBQoS
- Simplified Chinese: SNMP Cisco CBQoS
- Spanish: CBQoS de Cisco SNMP

Remarks

- This sensor has a very low performance impact.
- For a general introduction to the technology behind SNMP, see section [Monitoring via SNMP](#).

- For a general introduction to the technology behind Quality of Service (QoS) monitoring, see section [Monitoring Quality of Service](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Class Based QoS Specific

Setting	Description
Entries	<p>Select the entries that you want to monitor. PRTG creates one sensor for each entry that you select.</p> <ul style="list-style-type: none"> ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority:** A row of five stars, with the first three filled, indicating a priority of 3.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <ul style="list-style-type: none"> ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?

Setting	Description
Parent Tags	Shows tags ^[145] that the sensor inherits ^[145] from its parent device ^[140] , parent group ^[139] , and parent probe ^[139] . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145] . ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ cbqossensor

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [421] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Current Queue Depth	The current queue depth
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Drop Packets	The number of drop packets per second
Drop Size	The drop size per second
Maximum Queue Depth	The maximum queue depth
No Buffer Drop Packets	The number of drop packets without buffer per second
Post Policy Size	The post policy size per second
Pre Policy Packets	The number of pre-policy packets per second
Pre Policy Size	The pre-policy size per second

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#) ⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#) ³⁹⁷²

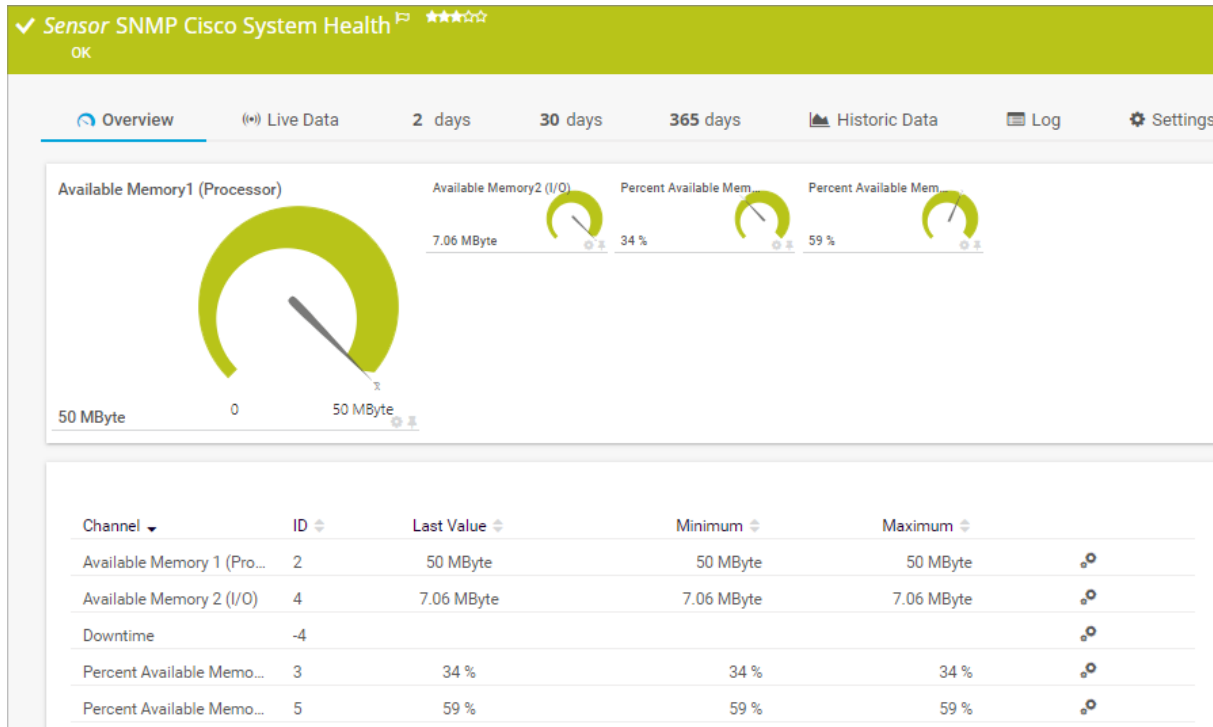

Part 7: Device and Sensor Setup | 8 Sensor Settings
145 SNMP Cisco CBQoS Sensor

- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.146 SNMP Cisco System Health Sensor

The SNMP Cisco System Health sensor monitors the system health of a Cisco device via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Cisco System Health Sensor

Sensor in Other Languages

- Dutch: SNMP Cisco System Health
- French: État du système Cisco SNMP
- German: SNMP Cisco Systemzustand
- Japanese: SNMP Cisco システムの正常性
- Portuguese: Funcionamento do sistema SNMP Cisco
- Russian: SNMP Cisco
- Simplified Chinese: SNMP Cisco 系统健康状况
- Spanish: SNMP Salud de sistema Cisco

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor has predefined limits for several metrics. You can individually change these limits in the channel settings. For detailed information about channel limits, see section [Channel Settings](#).

- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).
- SNMP Cisco System Health sensors that are created with the [Cisco Device \(Generic\)](#) device template for auto-discovery can have additional tags.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Cisco System Health Specific

Setting	Description
Measurements	<p>Select the measurements that you want to monitor. PRTG creates one sensor for each measurement that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority:** A section with five stars, where the first three are filled, indicating a priority of 3.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpciscosystemhealthsensor ▪ systemhealth
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Cisco System Health Specific

Cisco System Health Specific
Measurements **i** 1

Cisco System Health Specific

Setting	Description
Measurements	Shows the ID of the measurement that this sensor monitors.

Setting	Description
	<p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

Debug Options

Debug Options

Result Handling **i**

Discard result

Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i**

Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels</p>

Setting	Description
	<p>are available for this sensor.</p> <p>i You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval **i** 60 seconds

 inherit from  Root

If a Sensor Query Fails **i** Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds

Setting	Description
	<ul style="list-style-type: none"> ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies , select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector  to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

inherit from  Root

User Group Access ⓘ

Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[402], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[25] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[44] or in its parent group settings ^[41].</p>

Access Rights

Click  to interrupt the [inheritance](#) ¹⁴².

Access Rights

inherit from  Root

User Group Access ¹	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵³.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

Channel Unit Types ⓘ

inherit from Root

Channel Type	Unit
Bytes (Bandwidth)	KB
	kbit
	/
	sec...
Bytes (Memory)	MB
Bytes (Disk)	MB
Bytes (File)	Byte

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Channel List

Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Oper State	The oper state

Channel	Description
	<ul style="list-style-type: none"> Up status¹⁹⁷: Config, Diagnostics, Disabled, Discovery, Ok, Pending Reassociation, Pending Reboot, Test, Unconfig Warning status: Bios Restore, CMOS Reset, Decommissioning, Degraded, Maintenance, Power Problem, Restart, Thermal Problem, Voltage Problem Down status: Compute Failed, Compute Mismatch, Config Failure, Diagnostics Failed, Discovery Failed, Inaccessible, Indeterminate, Inoperable, Maintenance Failed, Power Off, Removed, Test Failed, Unassociated, Unconfig Failed
Operability	<p>The operability state</p> <ul style="list-style-type: none"> Up status: Auto Upgrade, Operable Warning status: Degraded, Unknown Down status: Accessibility Problem, Bios Post Timeout, Chassis Limit Exceeded, Config, Decommissioning, Disabled, Equipment Problem, Discovery, Discovery Failed, Fabric Connection Problem, Fabric Unsupported Connection, Identify, Identity Unestablishable, Inoperable, Link Activate Blocked, Malformed Fru, Not Supported, Peer Comm Problem, Performance Problem, Post Failure, Power Problem, Powered Off, Removed, Thermal Problem, Upgrade Problem, Voltage Problem <p> This channel is the primary channel by default.</p>
Power State	<p>The power state</p> <ul style="list-style-type: none"> Up status: Off Duty, Ok, On, Online, Power Save, Test Warning status: Degraded, Not Supported, Unknown Down status: Error, Failed, Off, Offline

Sensor Settings Overview

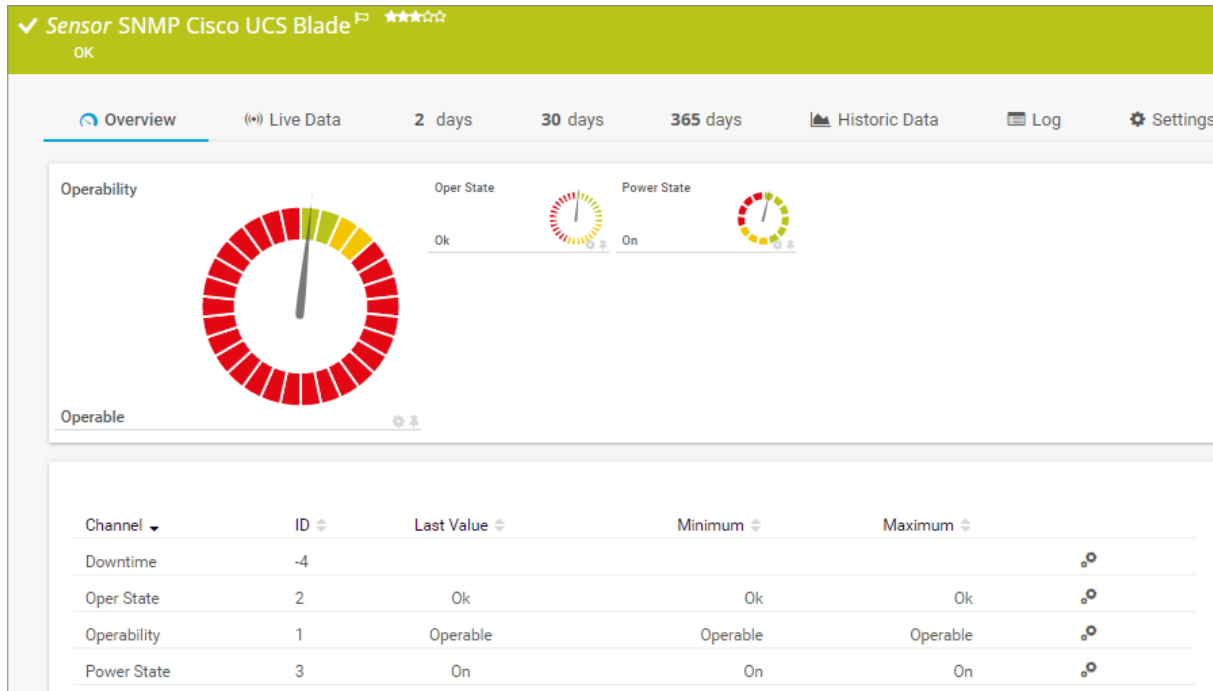

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.148 SNMP Cisco UCS Chassis Sensor

The SNMP Cisco UCS Chassis sensor monitors the health status of the chassis of a Cisco Unified Computing System (UCS) device via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Cisco UCS Chassis Sensor

Sensor in Other Languages

- Dutch: SNMP Cisco UCS Chassis
- French: Châssis SNMP Cisco UCS
- German: SNMP Cisco UCS Chassis
- Japanese: SNMP Cisco UCS シャーシ
- Portuguese: Chassi UCS Cisco SNMP
- Russian: SNMP Cisco UCS
- Simplified Chinese: SNMP Cisco UCS 机箱
- Spanish: Carcasa del Cisco UCS del SNMP

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Settings

Setting	Description
Chassis	<p>Select the chassis that you want to monitor. PRTG creates one sensor for each chassis that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It includes the following elements:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' to remove the tag and a '+' to add more.
- Priority:** A star rating system showing 3 stars selected out of 5.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags ^[145] that the sensor inherits ^[145] from its parent device ^[140] , parent group ^[139] , and parent probe ^[139] . <i>i</i> This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145] . <i>i</i> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). <i>i</i> For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ snmpciscosystemhealthsensor ▪ systemhealth ▪ ucssystemhealth ▪ ucs ▪ chassis
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.
