Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

 User Group	 Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#)¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Sensor Settings Overview

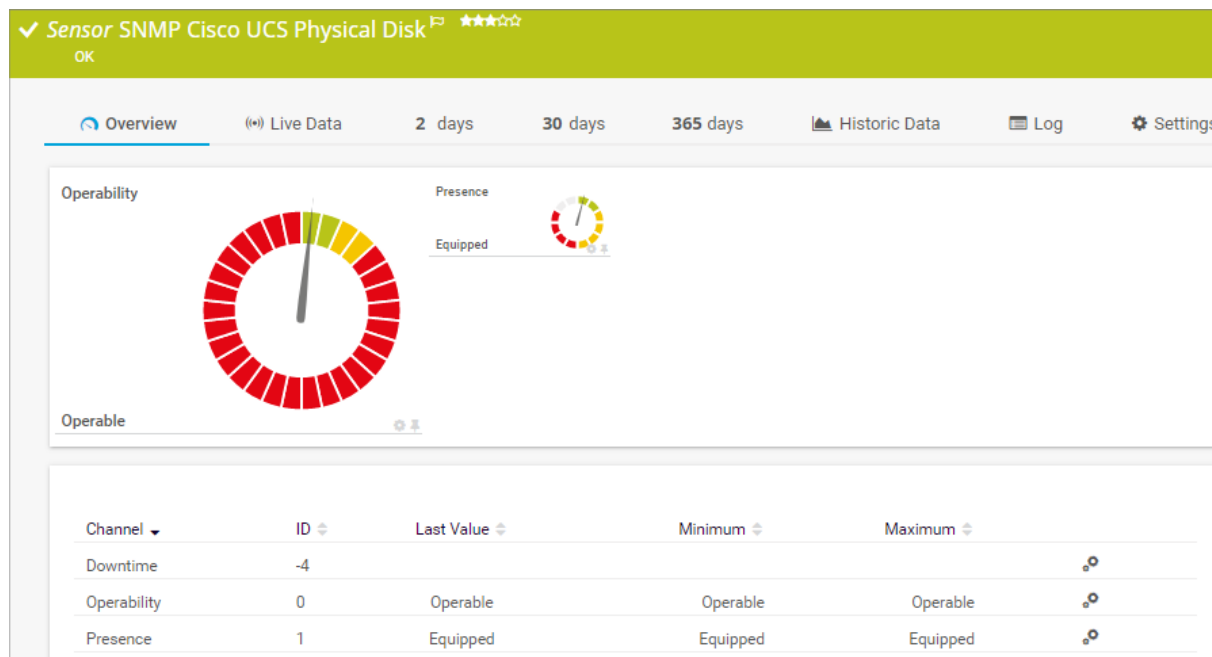

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.149 SNMP Cisco UCS Physical Disk Sensor

The SNMP Cisco UCS Physical Disk sensor monitors a physical disk of a Cisco Unified Computing System (UCS) device via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Cisco UCS Physical Disk Sensor

Sensor in Other Languages

- Dutch: SNMP-Cisco UCS fysieke schijf
- French: Disque physique UCS Cisco SNMP
- German: SNMP Cisco UCS Physikalisches Laufwerk
- Japanese: SNMP Cisco UCS 物理ディスク
- Portuguese: Disco físico de UCS Cisco de SNMP
- Russian: SNMP Cisco UCS
- Simplified Chinese: SNMP Cisco UCS 物理磁盘
- Spanish: Disco físico Cisco UCS de SNMP

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

UCS Physical Disk

Setting	Description
Disk	<p>Select the physical disks that you want to monitor. PRTG creates one sensor for each physical disk that you select.</p> <ul style="list-style-type: none"> i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. i This list only shows working disks that have the status Up or Warning.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority:** A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <ul style="list-style-type: none"> i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?

Setting	Description
Parent Tags	Shows tags [145] that the sensor inherits [145] from its parent device [140], parent group [139], and parent probe [139]. <i>i</i> This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited [145]. <i>i</i> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). <i>i</i> For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ snmpciscophysicaldisksensor ▪ ucs ▪ snmp
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

UCS Physical Disk

UCS Physical Disk

Disk *i* ip:192.168.1.1:162:snmpciscophysicaldisksensor:149:pd-1

Display Name *i* pd-1

UCS Physical Disk

Setting	Description
Disk	Shows the physical disk that this sensor monitors. <i>i</i> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Setting	Description
Display Name	Shows the display name of the physical disk that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor. ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how different channels are shown for this sensor: <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

7.8.150 SNMP Cisco UCS System Health Sensor

The SNMP Cisco UCS System Health sensor monitors the system health of a Cisco Unified Computing System (UCS) device via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Cisco UCS System Health Sensor

Sensor in Other Languages

- Dutch: SNMP Cisco UCS System Health
- French: État du système SNMP Cisco UCS
- German: SNMP Cisco UCS Systemzustand
- Japanese: SNMP Cisco UCS システムの正常性
- Portuguese: Funcionamento do sistema UCS SNMP Cisco
- Russian: SNMP Cisco UCS
- Simplified Chinese: SNMP Cisco UCS 系统健康状况
- Spanish: Estado del sistema Cisco UCS del SNMP

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field with the value "Example Name".
- Tags:** A text input field with the value "exampletag" and a plus sign icon to the right.
- Priority:** A section with five star icons, all of which are filled, indicating a priority of 5.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets . ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited .

Setting	Description
	<p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> snmpciscosystemhealthsensor systemhealth ucssystemhealth ucs
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel.

Setting	Description
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p> <ul style="list-style-type: none"> Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷).

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁸ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes 30 minutes

Setting	Description
	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None ▼

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Sensor Settings Overview

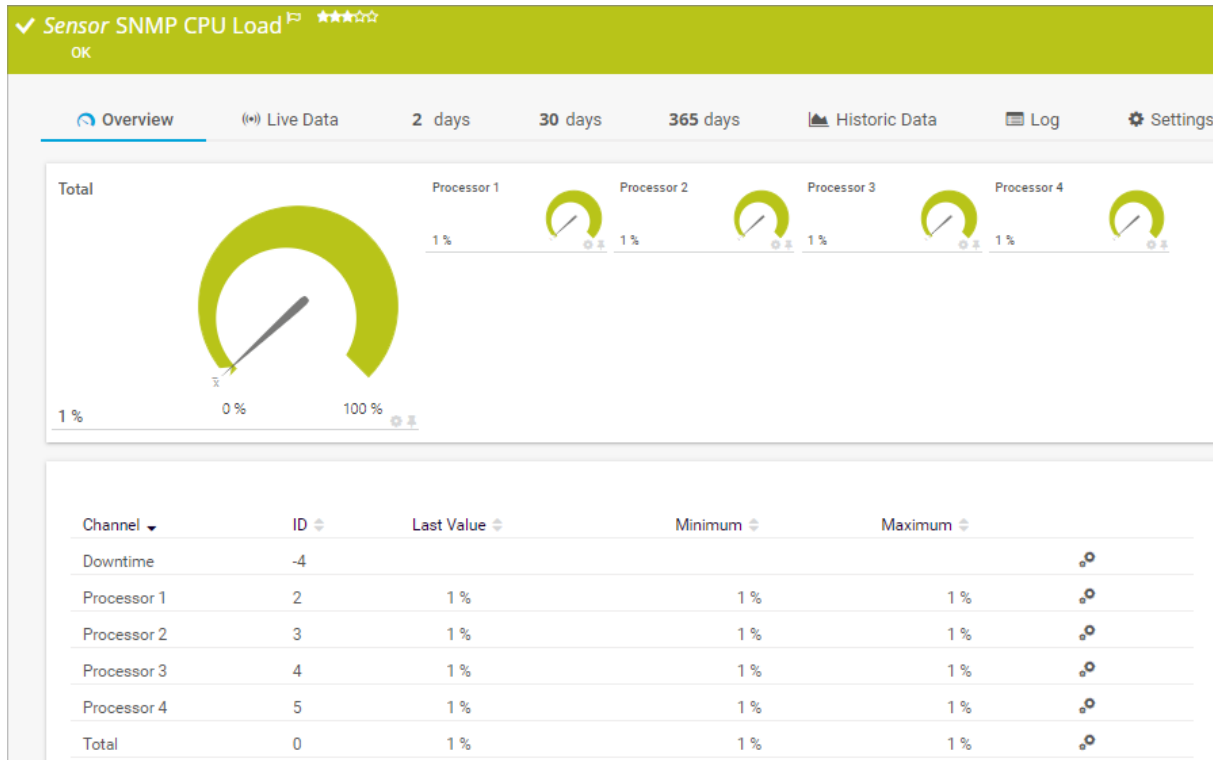

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.151 SNMP CPU Load Sensor

The SNMP CPU Load sensor monitors the system load via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP CPU Load Sensor

Sensor in Other Languages

- Dutch: SNMP CPU Load
- French: Charge CPU SNMP
- German: SNMP Prozessorlast
- Japanese: SNMP CPU の負荷
- Portuguese: Carga da SNMP CPU
- Russian: SNMP
- Simplified Chinese: SNMP CPU 负载
- Spanish: SNMP Carga de CPU

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `:::1`). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmp ▪ cpu ▪ cpuloadsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Debug Options

Debug Options

Result Handling **i**

Discard result

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** ▼
None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

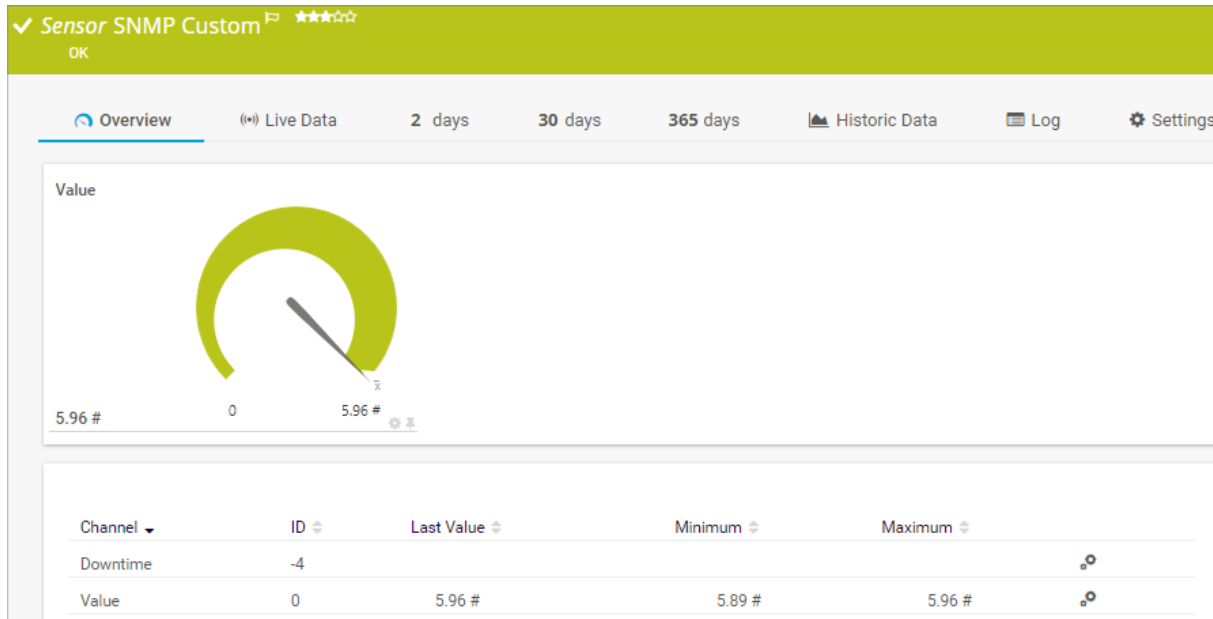

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.152 SNMP Custom Sensor

The SNMP Custom sensor monitors a single parameter that is returned by a specific object identifier (OID) via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Custom Sensor

Sensor in Other Languages

- Dutch: SNMP (Klant specifiek)
- French: SNMP (personnalisé)
- German: SNMP (Benutzerdef.)
- Japanese: SNMP カスタム
- Portuguese: SNMP customizado
- Russian: SNMP
- Simplified Chinese: SNMP 自定义
- Spanish: SNMP personalizado

Remarks

- It might not work to query data from a probe device via SNMP (querying [localhost](#), [127.0.0.1](#), or [::1](#)). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- See the Knowledge Base: [How do I find out which OID I need for an SNMP Custom sensor?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

OID Settings

Setting	Description
Channel Name	<p>Enter a name for the channel in which the sensor shows the results for the OID. Enter a string.</p> <p>i You can change this value later in the channel settings of this sensor.</p>
Value Type	<p>Select the expected numeric type of the results at the OID:</p> <ul style="list-style-type: none"> ▪ Absolute (unsigned integer): Integer values without an operational sign, such as 10 or 120. ▪ Absolute (signed integer): Integer values with an operational sign, such as -12 or 120. ▪ Absolute (float): Float values, such as -5.80 or 8.23. ▪ Delta (counter): Counter values. PRTG calculates the difference between the last and the current value. PRTG additionally divides the delta value by a time period to indicate a speed value. <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Unit String	<p>Enter the unit for the values that this sensor returns. Enter a string. PRTG uses the unit string for display purposes and shows it in graphs, data tables, and gauges.</p> <p>i If you want to change the unit after sensor creation, you can change it in the sensor's channel settings.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Multiplication ⓘ 1

Division ⓘ 1

If Value Changes ⓘ Ignore changes
 Trigger 'change' notification

OID Settings

Setting	Description
OID	<p>Enter the OID of the SNMP object that you want to receive numeric data from.</p> <p> ⓘ Most OIDs begin with 1.3.6.1. However, OIDs that start with 1.0, or 1.1, or 1.2 are also allowed. If you want to entirely disable the validation of your entry, add the string norfccheck: to the beginning of the OID, for example, norfccheck:2.0.0.0.1.</p>
Value Type	<p>Shows the value type of the numeric data that this sensor receives from the OID.</p> <p> ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Multiplication	<p>If you want to multiply the received data with a certain value, enter the multiplier. Use the default value 1 to not change the received value. Enter an integer value.</p>
Division	<p>If you want to divide the received data by a certain value, enter the divisor. Use the default value 1 to not change the received value. Enter an integer value.</p>
If Value Changes	<p>Define what the sensor does when the sensor value changes:</p> <ul style="list-style-type: none"> ▪ Ignore changes (default): Take no action on change. ▪ Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger⁴¹³⁶, you can use this mechanism to trigger a notification³⁹⁸⁷ whenever the sensor value changes.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[402], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management.</p>

Channel List

❗ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
[Value]	<p>The single numeric value (int64) for a specified OID</p> <p>❗ This channel is the primary channel by default.</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

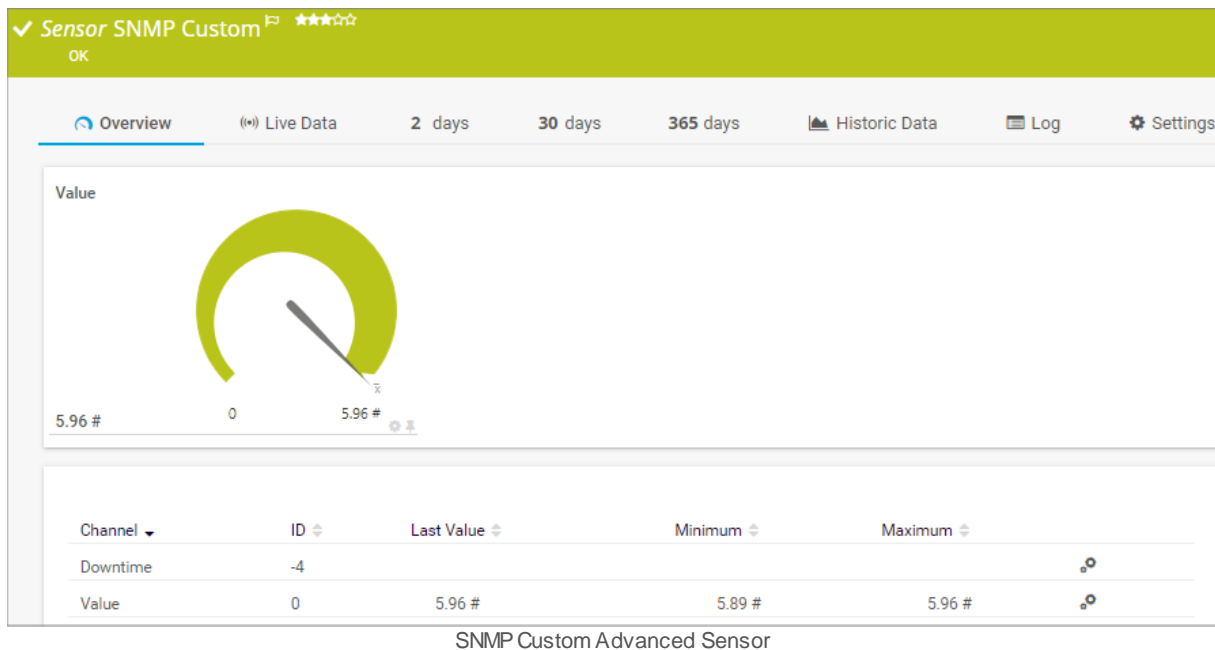

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.153 SNMP Custom Advanced Sensor

The SNMP Custom Advanced sensor monitors numeric values returned for object identifiers (OID) via the Simple Network Management Protocol (SNMP).

i The [SNMP Library sensor](#)²⁷⁹⁷ automatically creates SNMP Custom Advanced sensors when the Management Information Base (MIB) file that you import contains single values.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)²⁴⁷⁴.

Sensor in Other Languages

- Dutch: SNMP Aanpasbaar Geavanceerd
- French: SNMP personnalisé avancé
- German: SNMP (Benutzerdef. erweitert)
- Japanese: SNMP カスタムアドバンスト
- Portuguese: SNMP customizado avançado
- Russian: SNMP
- Simplified Chinese: SNMP 自定义高级
- Spanish: SNMP personalizado avanzado

Remarks

- It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). [Add this device to PRTG](#)³⁴⁰ with the IP address that it has in your network and create the SNMP sensor on this device instead.
- This sensor supports the IPv6 protocol.

- This sensor has a low performance impact.
- See the Knowledge Base: [How do I find out which OID I need for an SNMP Custom sensor?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

OID Settings

Setting	Description
Value Type	<p>Select the expected numeric type of the results at the OID:</p> <ul style="list-style-type: none"> ▪ Absolute (unsigned integer): Integer values without an operational sign, such as 10 or 120. ▪ Absolute (signed integer): Integer values with an operational sign, such as -12 or 120. ▪ Absolute (float): Float values, such as -5.80 or 8.23. ▪ Delta (counter): Counter values. PRTG calculates the difference between the last and the current value. PRTG additionally divides the delta value by a time period to indicate a speed value. <p>i Absolute (float) and Delta (Counter) are not compatible with the unit Lookup.</p>
Channel #2 – #10	<p>You can create up to 10 different channels for this sensor. You have to define at least one data channel, so you already see all available settings for Channel #1. Additionally, you can define Channel #2 up to Channel #10. To do so, choose between:</p> <ul style="list-style-type: none"> ▪ Disable: Do not create this channel. ▪ Enable: Create this channel. Define further settings below. <p>i It is not possible to enable or disable channels after sensor creation.</p>

Scanning Interval

Scanning Interval **i** 60 seconds

 inherit from  Root

If a Sensor Query Fails **i** Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies , select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector  to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

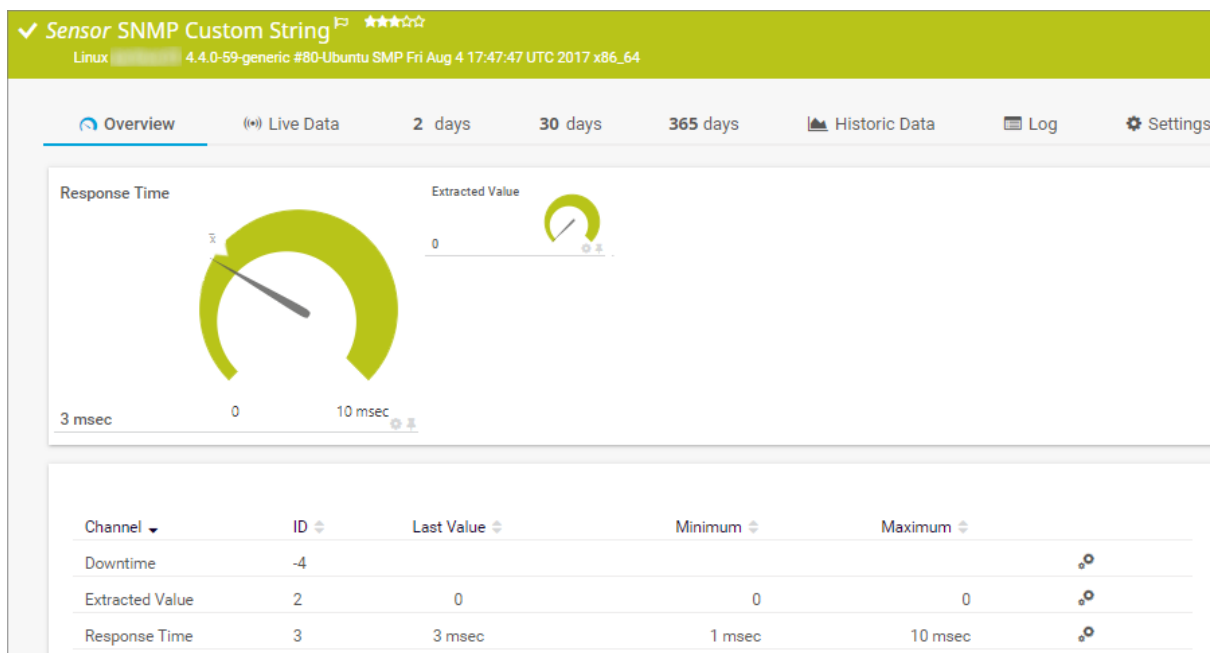

7.8.154 SNMP Custom String Sensor

The SNMP Custom String sensor monitors a string returned by a specific object identifier (OID) via the Simple Network Management Protocol (SNMP). It can check for keywords. If you want to set limits to the channel value, you can also extract a numeric value contained in the string.

i In the sensor message, the sensor shows the string that you [search](#)²⁴⁷⁸ for and the reason for the Warning or Down [status](#)¹⁹⁷¹.

i The [SNMP Library sensor](#)²⁷⁹⁷ automatically creates SNMP Custom String sensors when the Management Information Base (MIB) file that you import contains string values.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)²⁴⁸⁸.

SNMP Custom String Sensor

Sensor in Other Languages

- Dutch: SNMP Aangepaste Tekenreeks
- French: Chaîne personnalisée SNMP
- German: SNMP-Zeichenfolge
- Japanese: SNMP カスタム文字列
- Portuguese: Sequência de caracteres customizada SNMP
- Russian: SNMP:
- Simplified Chinese: SNMP 自定义字符串
- Spanish: Cadena personalizada de SNMP

Remarks

- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `:::1`). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- For an example, see section [Number Extraction with Regular Expression](#).
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- See the Knowledge Base: [How do I find out which OID I need for an SNMP Custom sensor?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <ul style="list-style-type: none"> i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). i For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpcustomstringsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

OID Settings

OID Settings

OID ⓘ 1.3.6.1.2.1.1.3.0

Maximum Length of String ⓘ

If Value Changes ⓘ

Ignore changes
 Trigger 'change' notification

OID Settings

Setting	Description
OID	<p>Enter the OID of the SNMP object that you want to receive a string from.</p> <ul style="list-style-type: none"> i Most OIDs begin with 1.3.6.1. However, OIDs that start with 1.0, or 1.1, or 1.2 are also allowed. If you want to entirely disable the validation of your entry, add the string norfccheck: to the beginning of the OID, for example, norfccheck:2.0.0.0.1.

Setting	Description
Maximum Length of String	Define the maximum length of the string that PRTG receives from the SNMP object at the OID. If the string is longer than this value, the sensor shows the Down status. Enter an integer value or leave the field empty.
If Value Changes	Define what the sensor does when the sensor value changes: <ul style="list-style-type: none"> Ignore changes (default): Take no action on change. Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger⁴¹³⁸, you can use this mechanism to trigger a notification³⁹⁸⁷ whenever the sensor value changes.

Extended Processing

Extended Processing

Interpret Result As **i**

String (default)

Bytes in hexadecimal notation

Bytes in decimal notation

Numeric Value Extraction **i**

Do not use extraction

Use a regular expression for extraction

Extended Processing

Setting	Description
Interpret Result As	<p>Define the type of the received string:</p> <ul style="list-style-type: none"> ▪ String (default): Handle the result as a common string. ▪ Bytes in hexadecimal notation: Handle the result as bytes in hexadecimal notation. For example, select this option if you monitor MAC addresses. ▪ Bytes in decimal notation: Handle the result as bytes in decimal notation. For example, select this option if you monitor IP addresses.
Numeric Value Extraction	<p>Define if you want to filter out a numeric value from the received string:</p> <ul style="list-style-type: none"> ▪ Do not use extraction: Do not extract a float value. Use the result as a string value. ▪ Use a regular expression for extraction: Use a regular expression (regex) to identify a numeric value in the string and to convert it to a float value to use it, for example, with channel limits. Define below. See also the example²⁴⁸⁷. ■ For more information, see section Channel Settings³⁹⁷⁷.
Regular Expression	<p>This setting is only visible if you select Use a regular expression for extraction above. Enter a regular expression to identify the numeric value that you want to extract from the string returned by the SNMP object at the specified OID. You can use capturing groups.</p> <ul style="list-style-type: none"> i Make sure that the expression only returns numbers, including the decimal and thousands separators. i PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section Regular Expressions⁴⁴⁹⁷.
Index of Capturing Group	<p>This setting is only visible if you select Use a regular expression for extraction above. If your regex uses capturing groups, specify which one captures the number. Enter an integer value or leave the field empty.</p>
Decimal Separator	<p>This setting is only visible if you select Use a regular expression for extraction above. Define the character for the decimal separator of the number. Enter a string or leave the field empty.</p>
Thousands Separator	<p>This setting is only visible if you select Use a regular expression for extraction above. Define the character for the thousands separator of the number. Enter a string or leave the field empty.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
Maintenance Window	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p> <p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>For more details on access rights, see section Access Rights Management.</p>

Example: Number Extraction with Regular Expression

If you want to extract a number in the response string via a regex, note that the index for captures in this sensor is based on 1 (not on 0). Furthermore, capturing groups are not automatically created. The example below illustrates this issue.

Consider the following string as returned by a request for CPU usage:

```
5 Sec (3.49%), 1 Min (3.555%), 5 Min (3.90%)
```

Assuming you would like to filter for the number 3.555, this is the percentage in the second parentheses. Enter the following regex in the Regular Expression field:

```
(\d+\.\d+).*?(\d+\.\d+).*?(\d+\.\d+)
```

As Index of Capturing Group, enter 3. This extracts the desired number 3.555.

The index must be 3 in this case because the capturing groups here are the following:

- Group 1 contains 3.49%, 1 Min (3.555), 5 Min (3.90)
- Group 2 contains 3.49
- Group 3 contains 3.555
- Group 4 contains 3.90

Keep this note about index and capturing groups in mind when using number extraction.

It is not possible to match an empty string with the PRTG regex sensor search.

 PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more details, see section [Regular Expressions](#)  ⁴⁴⁹⁷.

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Extracted Value	The value extracted from the string (optional)
Response Time	The response time in milliseconds (msec)  This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

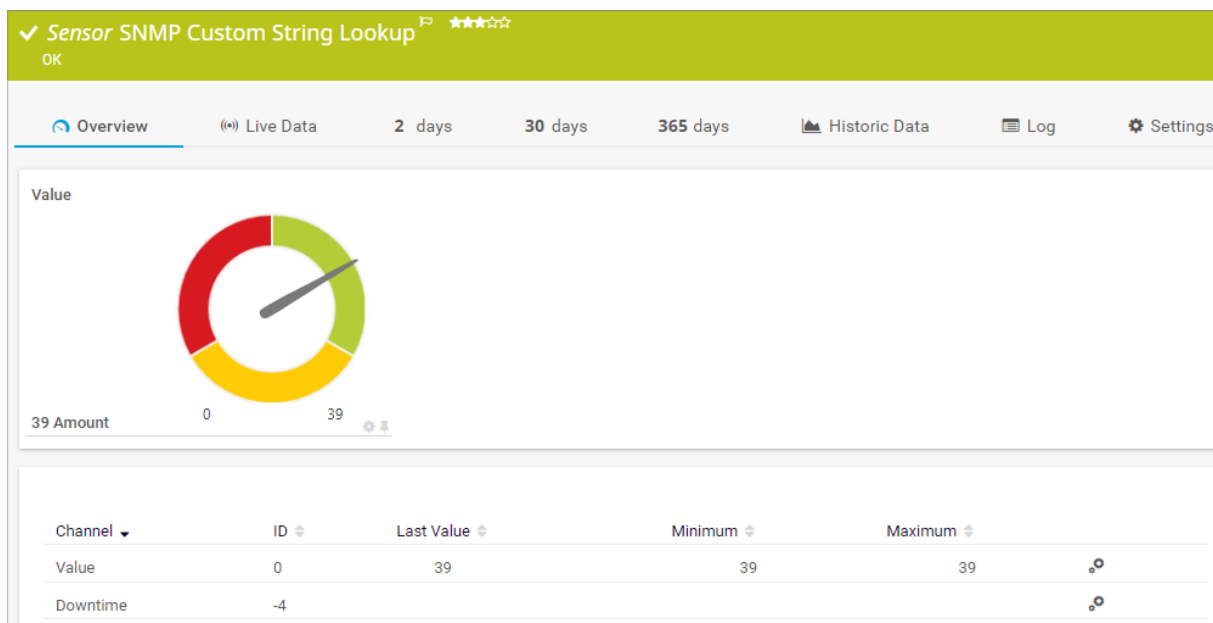

- [List of Available Sensor Types](#)  ⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)  ³⁹⁷²
- [Channel Settings](#)  ³⁹⁷⁷
- [Notification Triggers Settings](#)  ³⁹⁸⁷

7.8.155 SNMP Custom String Lookup Sensor

The SNMP Custom String Lookup sensor monitors a string that a specific object identifier (OID) returns via the Simple Network Management Protocol (SNMP). It can map the string directly to a [sensor status](#) [197] by using a [defined lookup file](#) [4485].

Basically, this sensor does a "reverse lookup". You have to define all potential return strings in the lookup file as text values, each in one lookup entry. Graphs and data tables show the value to which the string is mapped, usually an integer ([lookup type](#) [4493] SingleInt). For more information, see section [Example](#) [2498].

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) [2499].

SNMP Custom String Lookup Sensor

Sensor in Other Languages

- Dutch: SNMP Aangepaste Tekst Lookup
- French: Requête de chaîne personnalisée SNMP
- German: SNMP-Zeichenfolge mit Lookup
- Japanese: SNMP カスタム文字列のルックアップ
- Portuguese: Pesquisa da sequência de caracteres customizada SNMP
- Russian: SNMP
- Simplified Chinese: SNMP 自定义字符串查询
- Spanish: Búsqueda de cadena personalizada de SNMP

Remarks

- It might not work to query data from a probe device via SNMP (querying [localhost](#), [127.0.0.1](#), or [::1](#)). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).
- See section [Example](#) for a sample lookup definition for this sensor.
- See the Knowledge Base: [How do I find out which OID I need for an SNMP Custom sensor?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

OID Settings

Setting	Description
Channel Name	<p>Enter a name for the channel in which the sensor shows the results for the OID. Enter a string.</p> <p>i You can change this value later in the channel settings of this sensor.</p>
Lookup	<p>Select a lookup file that is available in the \lookups\custom subfolder of the PRTG program directory on the probe system.</p> <p>i The lookup file must contain all potential strings that the OID can return.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Example

 You have to provide all possible return strings for this sensor in one lookup file. For example, consider an OID that can return one of the three strings **Good**, **Deficient**, or **Bad**. Then you have to [define a lookup file](#)⁴⁴⁸⁵ for this sensor that contains all these possible string values as text, each text value in one lookup entry:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="mylookupfile" desiredValue="0"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="PaeValueLookup.xsd">
  <Lookups>
    <SingleInt state="Ok" value="0">
      Good
    </SingleInt>
    <SingleInt state="Warning" value="1">
      Deficient
    </SingleInt>
    <SingleInt state="Error" value="2">
      Bad
    </SingleInt>
  </Lookups>
</ValueLookup>
```

If a retrieved string matches one of the text values, the sensor maps it into the defined integer value ("reverse lookup") that is shown, for example, in data graphs. Depending on the integer, the sensor shows the respective status and converts the integer back to the original string to show it as a channel value. If the OID returns a string that the lookup definition does not contain, the sensor shows the [Down status](#)¹⁹⁷ with a corresponding error message.

For example, you create an SNMP Custom String Lookup sensor, apply the example lookup definition from above (store it into the \lookups\custom subfolder of the PRTG program directory), and the specified OID returns the string **Good**. Then the sensor maps the string **Good** to the integer value **0** that is shown in the live graph of the sensor, for example. According to the status definition `state="Ok"`, the sensor status is Up in this case. The integer **0** is converted back to the string **Good**, which is shown as the channel value.

 The string match is not case sensitive.

 Use the lookup type SingleInt for this sensor. BitFields and ranges are not supported.

 If you [imported an SNMP library](#)²⁸⁰⁷ (this is an `.oidlib` file) that contains [lookups](#)⁴⁴⁸⁵ (you can see this in section Lookup in the MIB Importer), you can define your own sensor states for returning values. Use the lookupname of the imported SNMP library as id parameter in a custom lookup definition. This overrides the lookups that an `.oidlib` file might contain with your own status definitions. See section [Define Lookups](#)⁴⁴⁸¹ for details about this mechanism.

Channel List

- ❗ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
[Value]	The retrieved string value and its status, as defined in the corresponding lookup file ❗ This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

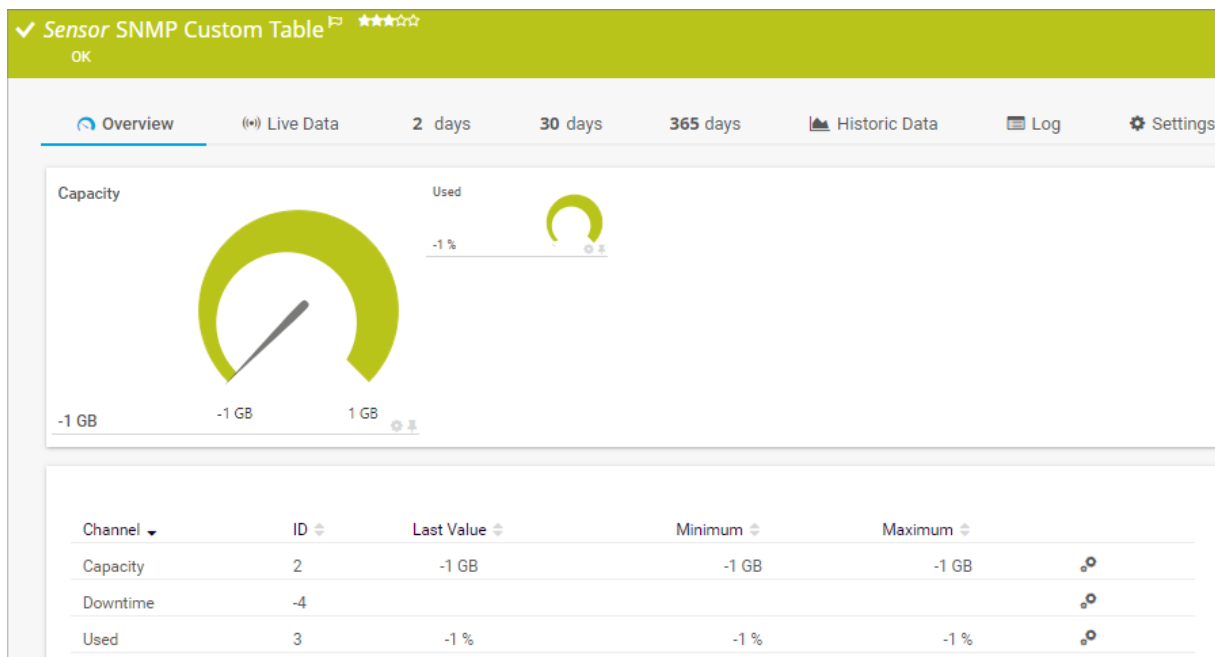

- [List of Available Sensor Types](#) 
- [Additional Sensor Types \(Custom Sensors\)](#) 
- [Channel Settings](#) 
- [Notification Triggers Settings](#) 

7.8.156 SNMP Custom Table Sensor

The SNMP Custom Table sensor monitors entries from a table that is provided via the Simple Network Management Protocol (SNMP). You can create one new sensor per table row. For each sensor, you can define up to ten channels. Each channel shows the value of one defined table column.

i The [SNMP Library sensor](#)²⁷⁹⁷ automatically creates SNMP Custom Table sensors when the Management Information Base (MIB) file that you import contains tables.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)²⁵¹².

SNMP Custom Table Sensor

Sensor in Other Languages

- Dutch: SNMP Aangepaste Tabel
- French: Table SNMP personnalisée
- German: SNMP (Benutzerdef. Tabelle)
- Japanese: SNMP カスタムテーブル
- Portuguese: Tabela customizada do SNMP
- Russian: SNMP
- Simplified Chinese: SNMP 自定义表
- Spanish: Tabla de SNMP personalizado

Remarks

- It might not work to query data from a probe device via SNMP (querying [localhost](#), [127.0.0.1](#), or [::1](#)). [Add this device to PRTG](#)³⁴⁰ with the IP address that it has in your network and create the SNMP sensor on this device instead.

- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- See the Knowledge Base: [How do I find out which OID I need for an SNMP Custom sensor?](#)
- See the Knowledge Base: [What can I monitor with the SNMP Custom Table Sensor?](#)

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

SNMP Table

Setting	Description
Table OID	<p>Enter the object identifier (OID) of the SNMP table that you want to monitor. The OID must directly point to an object that represents an SNMP table. PRTG creates one SNMP Custom Table sensor for each table row that you select.</p> <p>i If you do not enter an OID, you cannot proceed with channel creation.</p>

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. You can use the placeholders [tablename] and [rowidentifier]. PRTG replaces them with the name of the table and the identifying value of the chosen row respectively. You can select the column that provides the row identifier in the Identification Column option below.</p> <p>You can also enter a valid OID that is part of a different SNMP table, for example, [1.3.6.1.2.1.2.2.1.2], to query information that the current table does not contain. PRTG adds the same index as in the original table to the OID.</p>

Table Specific

Setting	Description
Table	<p>The sensor shows you the table that the OID returns. Select the table rows that contain the data that you want to monitor. PRTG creates one sensor for each table row that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>
Identification Column	<p>Define the identification column for the sensors that you want to create. The sensors use this column to uniquely identify each table row.</p> <p>i We recommend that you use a unique identification column because it allows the sensors to keep track of changing indexes.</p> <p>i The value of the column that you select as identification column replaces the [rowidentifier] in the sensor name. This lets you distinguish sensors that you create for the same SNMP table.</p>
Channel #2 – #10	<p>You can create up to 10 different channels for this sensor. You have to define at least one data channel, so you already see all available settings for Channel #1. Additionally, you can define Channel #2 up to Channel #10. To do so, choose between:</p> <ul style="list-style-type: none"> ▪ Disable: Do not create this channel. ▪ Enable: Create this channel. Define further settings below. <p>i It is not possible to enable or disable channels after sensor creation.</p> <p>i All channels that you define during the creation of an SNMP Custom Table sensor are the same for all sensors for each table row.</p>
Value Type	<p>Select the expected type of results in this channel:</p> <p>Select the expected numeric type of the results at the OID:</p> <ul style="list-style-type: none"> ▪ Absolute (unsigned integer): Integer values without an operational sign, such as 10 or 120. ▪ Absolute (signed integer): Integer values with an operational sign, such as -12 or 120. ▪ Absolute (float): Float values, such as -5.80 or 8.23. ▪ Delta (counter): Counter values. PRTG calculates the difference between the last and the current value. PRTG additionally divides the delta value by a time period to indicate a speed value. <p>i Absolute (float) and Delta (Counter) are not compatible with the unit Lookup.</p> <p>i See below ²⁵⁰² for other channel settings that you can also change after sensor creation.</p>

Setting	Description
	<p>i This sensor monitors numeric values only. Make sure that you do not select columns that return strings because they lead to the Down status^[197]. For example, if you monitor an ifTable, we recommend that you do not select an ifDescr column because this results in an error.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a title 'Basic Sensor Settings' in blue. Below the title are three settings: 'Sensor Name' with an information icon and the value 'Example Name'; 'Tags' with an information icon and a list containing 'exampletag' with a close button and a plus sign; and 'Priority' with an information icon and five star icons.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpcustomsensor ▪ snmpcustomtable
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

SNMP Table

SNMP Table
Table OID **i** 1.3.6.1.2.1.1.3.0

SNMP Table

Setting	Description
Table OID	<p>Shows the OID of the SNMP table that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

Table Specific

Table Specific	
Identifier ⓘ	196608
Identification Column ⓘ	table_index
Channel #1 Name ⓘ	CPU Load (1 min average)
Channel #1 Column ⓘ	hrProcessorLoad
Channel #1 Value Type ⓘ	Absolute (signed integer, for example "-12", "120")
Channel #1 Unit ⓘ	Percent
Channel #2 ⓘ	Disable

Table Specific

Setting	Description
Identifier	This is the value of the column that you selected as the Identification Column during sensor creation. PRTG also displays it in the sensor name to distinguish it from other sensors you created for the same table with other table rows. You can change the identifier if you want to.
Identification Column	Shows the table column that you chose as identification column. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Channel #x Name	Enter a name for the channel in which the sensor shows the desired result. Enter a string.
Channel #x Column	Select the table column that, together with the table row, points to the value that you want to monitor in this channel. You can choose between the available columns of the table that you monitor.
Channel #x Value Type	Shows the value type of the data that this sensor receives in this channel. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Channel #x Unit	Define the unit of the data that this sensor receives in this channel: <ul style="list-style-type: none"> ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature

Setting	Description
	<ul style="list-style-type: none"> ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Lookup <p> For more information about the available units, see section Custom Sensors.</p> <p> To use lookups with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor.</p> <p> You cannot use the unit Lookup if you select the value type Delta (counter) or Absolute (float). You are not able to create the sensor in this case.</p>
Channel #x Custom Unit	This setting is only visible if you select the channel unit Custom above. Define a unit for the channel value. Enter a string.
Channel #x Lookup	This setting is only visible if you select the channel unit Lookup above. Select a lookup file that you want to use with this channel.
Channel #2 – #10	Shows if you enabled or disabled a channel. <p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type 
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Sensor Settings Overview

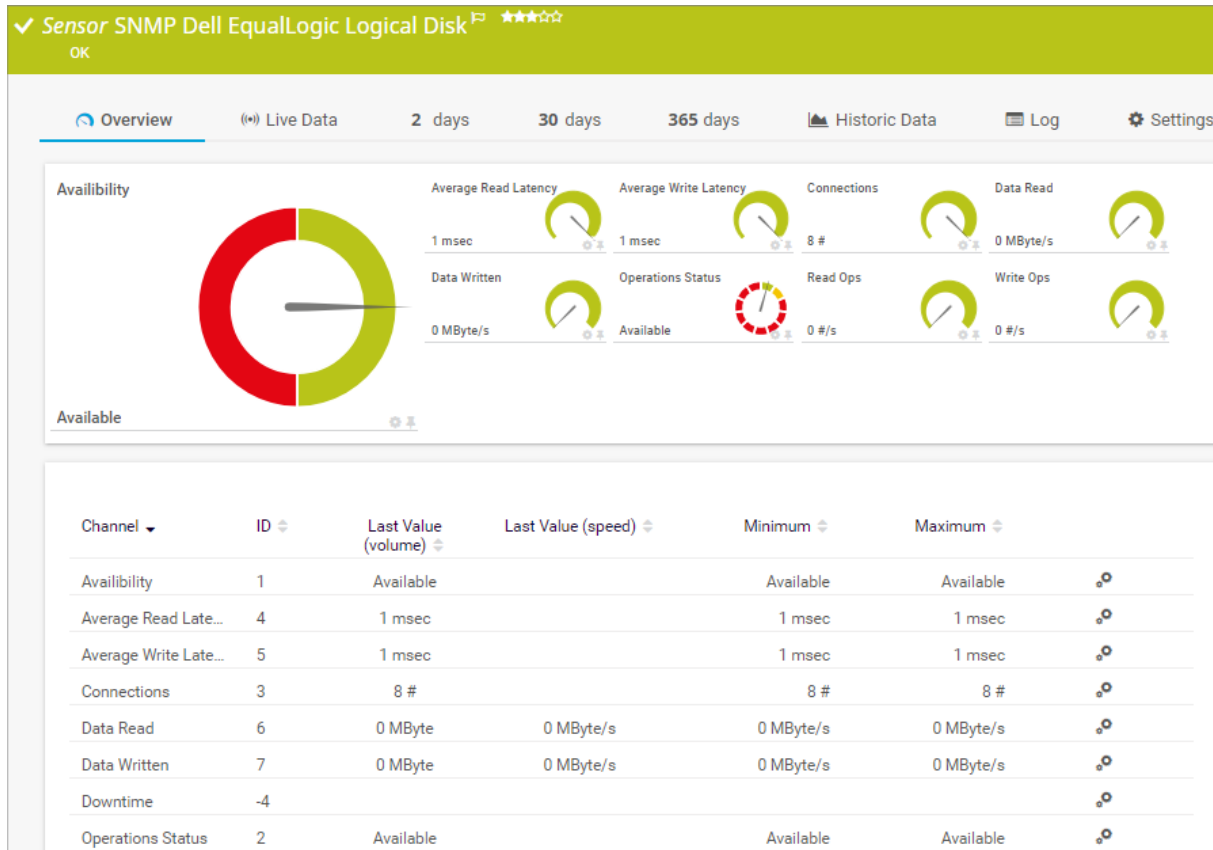

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.157 SNMP Dell EqualLogic Logical Disk Sensor

The SNMP Dell EqualLogic Logical Disk sensor monitors a volume of a Dell EqualLogic storage system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Dell EqualLogic Logical Disk Sensor

Sensor in Other Languages

- Dutch: SNMP Dell EqualLogic Logische Schijf
- French: Disque logique Dell EqualLogic SNMP
- German: SNMP Dell EqualLogic Logischer Datenträger
- Japanese: SNMP Dell EqualLogic 論理ディスク
- Portuguese: Disco lógico SNMP Dell EqualLogic
- Russian: SNMP Dell EqualLogic
- Simplified Chinese: SNMP Dell EqualLogic 逻辑磁盘
- Spanish: Disco lógico SNMP de Dell EqualLogic

Remarks

- This sensor supports the IPv6 protocol.

- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Dell EqualLogic Specific

Setting	Description
Volumes	<p>Select the volumes that you want to monitor. PRTG creates one sensor for each volume that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog with the following fields:

- Sensor Name**: Example Name
- Tags**: exampletag (with a plus sign to add more)
- Priority**: 5 stars (represented by five star icons)

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ dellequallogic ▪ snmpdell ▪ dell
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Part 7: Device and Sensor Setup | 8 Sensor Settings
157 SNMP Dell EqualLogic Logical Disk Sensor

- <https://kb.paessler.com/en/topic/46863>

Sensor Settings Overview

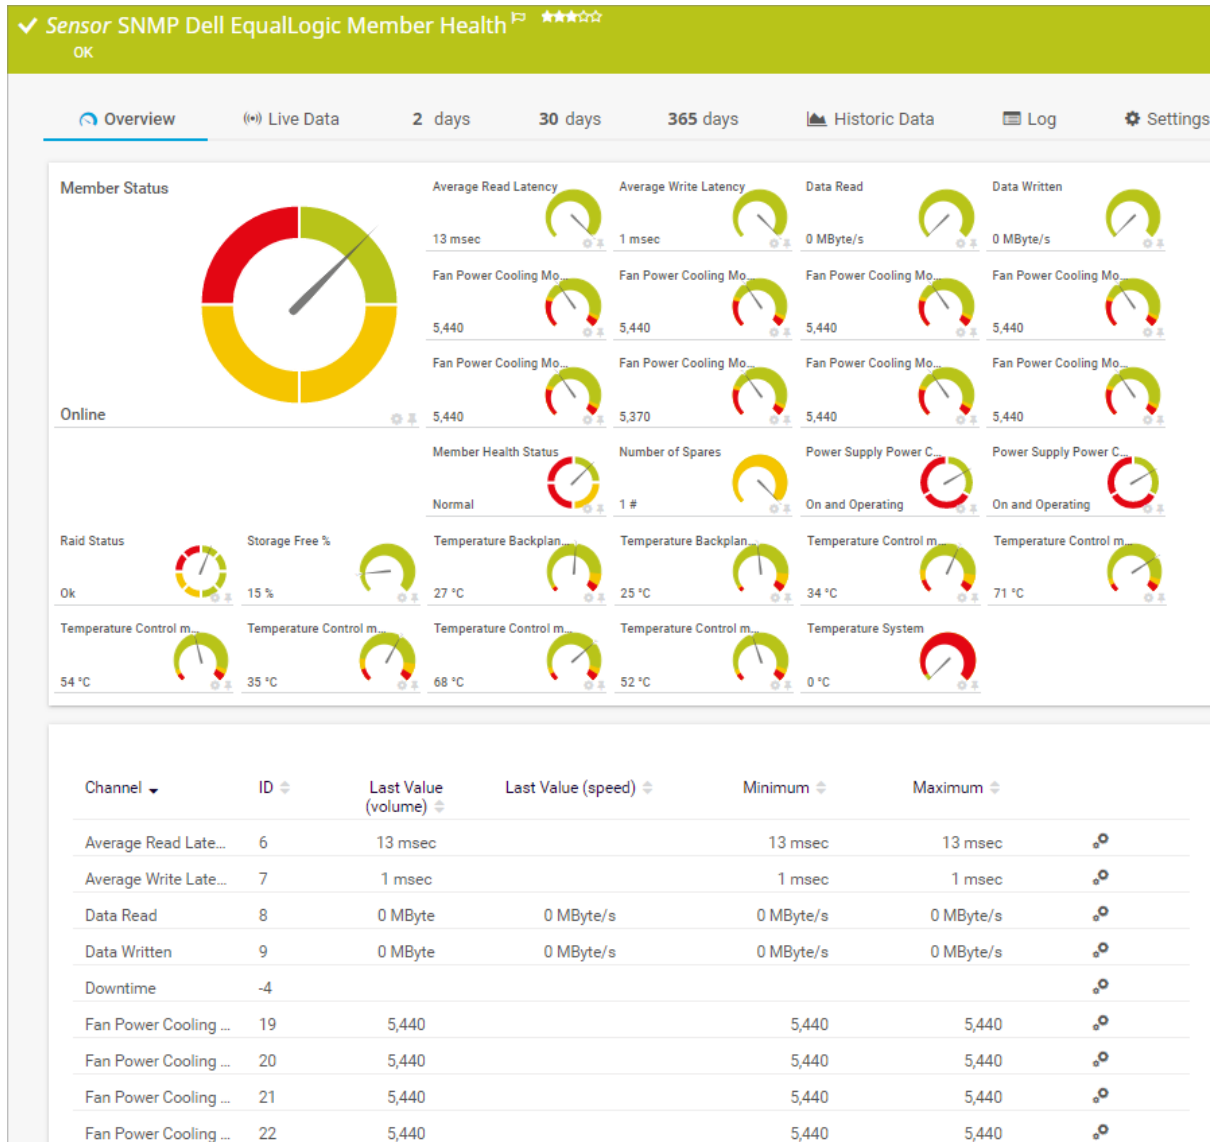

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.158 SNMP Dell EqualLogic Member Health Sensor

The SNMP Dell EqualLogic Member Health sensor monitors the health of an array member of an EqualLogic storage system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Dell EqualLogic Member Health Sensor

Sensor in Other Languages

- Dutch: SNMP Dell EqualLogic Lid Gezondheid
- French: État du membre Dell EqualLogic SNMP
- German: SNMP Dell EqualLogic Member-Zustand
- Japanese: SNMP Dell EqualLogic のメンバー 正常性
- Portuguese: Funcionamento do membro SNMP Dell EqualLogic

- Russian: Dell EqualLogic SNMP
- Simplified Chinese: SNMP Dell EqualLogic 成员健康状况
- Spanish: Salud de miembro SNMP de Dell EqualLogic

Remarks

- This sensor works with [SNMP v2c](#) and [SNMP v3](#). It does not support [SNMP v1](#). Make sure that you set the correct SNMP Version in the Credentials for SNMP Devices settings of the parent device or inherit it from objects higher in the [hierarchy](#).
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ❗ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Display

Sensor Display

Primary Channel i Downtime

Graph Type i Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.

Setting	Description
	<p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval  60 seconds

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds

Setting	Description
	<ul style="list-style-type: none"> ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p>

Setting	Description
	<p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None ▼

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p>

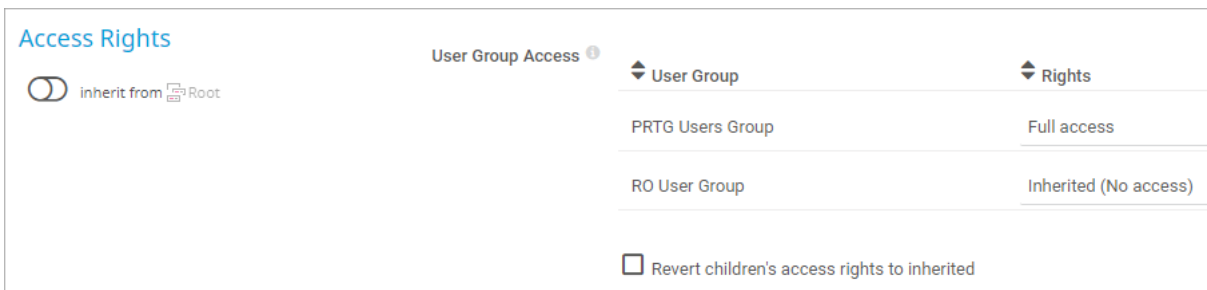

Setting	Description
	<ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ²⁵¹ to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Sensor Settings Overview

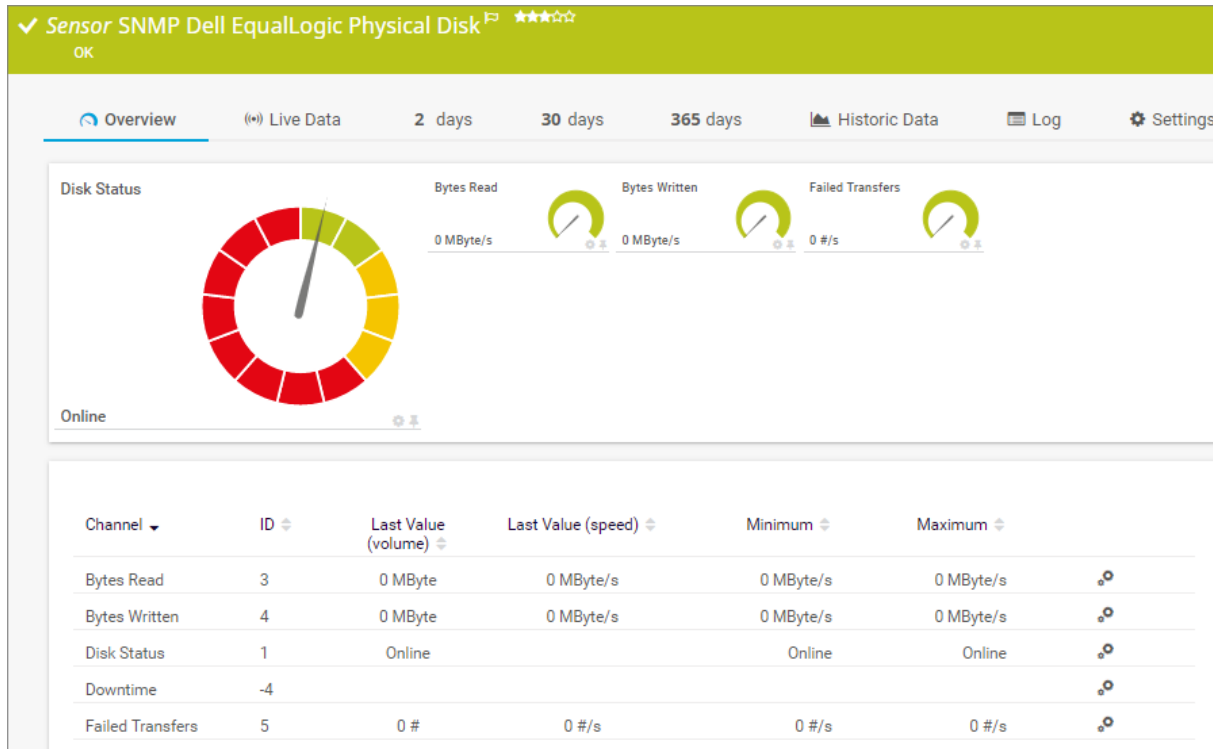

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3957

7.8.159 SNMP Dell EqualLogic Physical Disk Sensor

The SNMP Dell EqualLogic Physical Disk sensor monitors a disk in a Dell EqualLogic storage system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Dell EqualLogic Physical Disk Sensor

Sensor in Other Languages

- Dutch: SNMP Dell EqualLogic Fysieke Schijf
- French: Disque physique Dell EqualLogic SNMP
- German: SNMP Dell EqualLogic Physikalischer Datenträger
- Japanese: SNMP Dell EqualLogic 物理ディスク
- Portuguese: Disco físico SNMP Dell EqualLogic
- Russian: Dell EqualLogic SNMP
- Simplified Chinese: SNMP Dell EqualLogic 物理磁盘
- Spanish: Disco físico SNMP de Dell EqualLogic

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Dell EqualLogic Specific

Setting	Description
Disk	<p>Select the physical disks that you want to monitor. PRTG creates one sensor for each physical disk that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has a title bar 'Basic Sensor Settings'. Below the title bar, there are three rows of settings:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A text input field containing 'exampletag' with a blue 'x' icon to the right and a plus sign icon to the left of the input field.
- Priority**: A row of five star icons, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ dellequallogic ▪ snmpdell ▪ dell
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

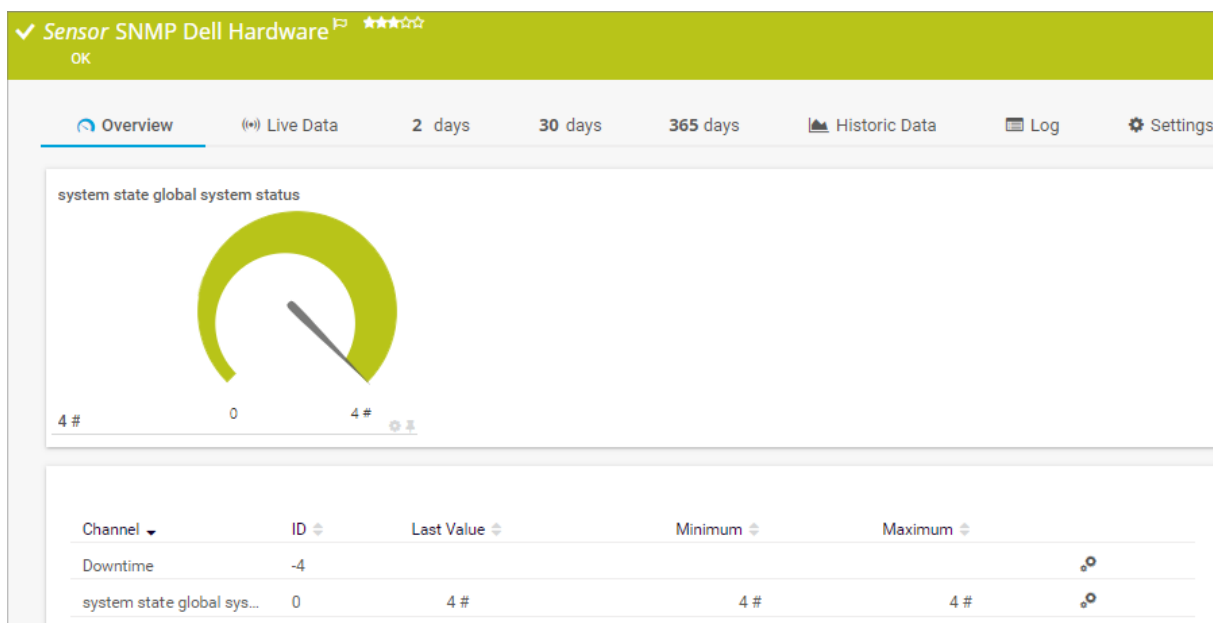

7.8.160 SNMP Dell Hardware Sensor

The SNMP Dell Hardware sensor monitors performance counters on a Dell hardware device via the Simple Network Management Protocol (SNMP).

i The data that you can monitor with this sensor depends on the available performance counters on the target system.

i The SNMP Dell Hardware sensor does not appear as a running sensor, instead it is created as an [SNMP Custom Advanced sensor](#)^[2464] or an [SNMP Custom Table sensor](#)^[2500].

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)^[2557].

SNMP Dell Hardware Sensor

Sensor in Other Languages

- Dutch: SNMP Dell Hardware
- French: Matériels SNMP Dell
- German: SNMP Dell Hardware
- Japanese: SNMP Dell ハードウェア
- Portuguese: Hardware Dell SNMP
- Russian: Dell SNMP
- Simplified Chinese: SNMP Dell 硬件
- Spanish: Hardware SNMP Dell

Remarks

- This sensor [requires](#)^[2550] that the Dell OpenManage Server Administrator is installed on the monitored Dell device.

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- See the Knowledge Base: [What do I need to monitor Dell servers?](#)

Detailed Requirements

Requirement	Description
Dell OpenManage Server Administrator	<p>This sensor needs the Dell OpenManage Server Administrator (OMSA) tool to be installed on the target device to monitor it. Make sure that you enable SNMP in the OMSA.</p> <p>■ For details, see the Knowledge Base: What do I need to monitor Dell servers?</p>

Add Sensor

The [Add Sensor](#)³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Dell Hardware Specific

Setting	Description
Library OIDs	<p>Select the performance counters that you want to monitor. PRTG creates one SNMP Custom Advanced sensor or SNMP Custom Table sensor with up to 10 channels for each library OID category that you select. If your selection results in more than 10 channels, PRTG creates the corresponding amount of SNMP Custom Advanced sensors or SNMP Custom Table sensors.</p> <p>ⓘ Select the counters that you want to monitor with caution. We recommend that you select only a few counters in this dialog. Use the search function in the table header to filter for specific counters. Selecting too many library OIDs might result in thousands of sensors or the sensor creation is canceled.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ dell
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

If Value Changes ⓘ Ignore changes
 Trigger 'change' notification

Dell Hardware Specific

Setting	Description
Interface	Shows the name of the interface (performance counter) that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Unit String	Define the unit of the numeric data that the sensor receives at the specified OID. Enter a string.
Multiplication	If you want to multiply the received data with a certain value, enter the multiplier. Enter an integer value.
Division	If you want to divide the received data by a certain value, enter the divisor. Enter an integer value.
If Value Changes	Define what the sensor does when the sensor value changes: <ul style="list-style-type: none"> Ignore changes (default): Take no action on change. Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger⁴¹³⁸, you can use this mechanism to trigger a notification³⁹⁸⁷ whenever the sensor value changes.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes

Setting	Description
	<ul style="list-style-type: none"> ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>

Setting	Description
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

- Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
[Performance Counter]	<p>The value returned by a specific Dell hardware object identifier (OID), for example</p> <ul style="list-style-type: none"> ▪ Data about the system management software ▪ Data about system status

Sensor Settings Overview

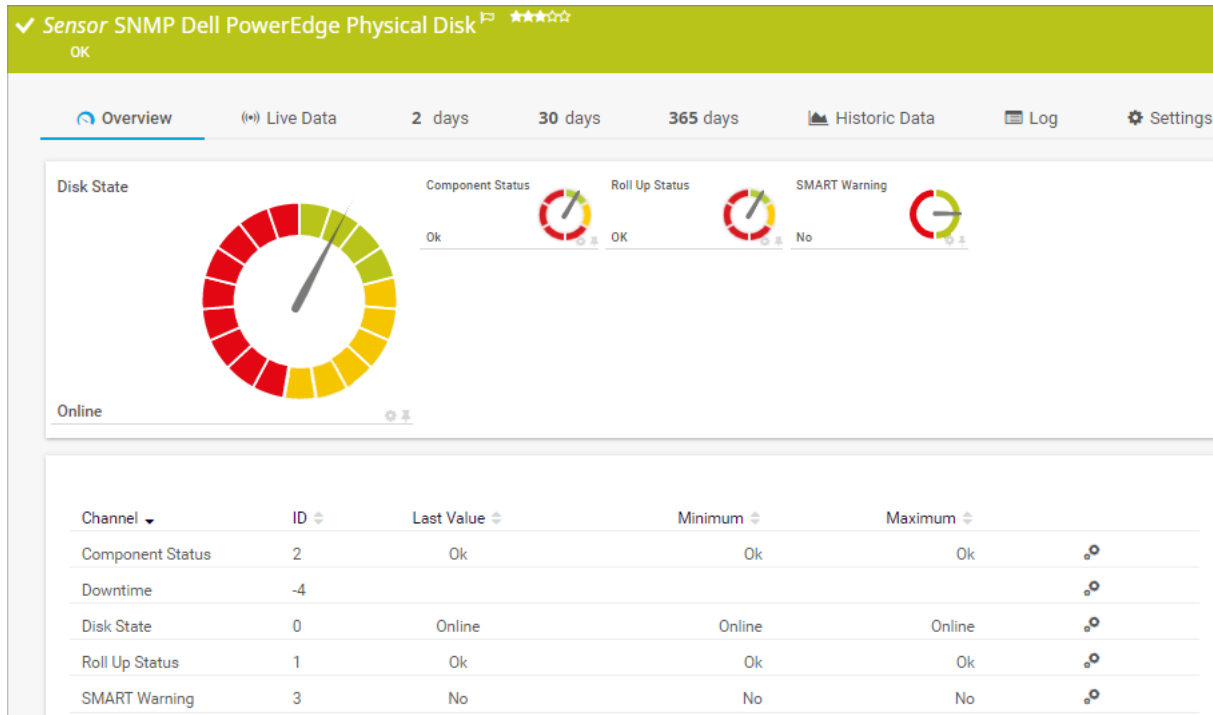

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.162 SNMP Dell PowerEdge System Health Sensor

The SNMP Dell PowerEdge System Health sensor monitors the system health of a Dell PowerEdge server via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Dell PowerEdge System Health Sensor

Sensor in Other Languages

- Dutch: SNMP Dell PowerEdge System Status
- French: État du système Dell PowerEdge SNMP
- German: SNMP Dell PowerEdge Systemzustand
- Japanese: SNMP Dell PowerEdge システムの正常性
- Portuguese: Funcionamento do sistema SNMP Dell PowerEdge
- Russian: Dell PowerEdge SNMP
- Simplified Chinese: SNMP Dell PowerEdge 系统健康状况
- Spanish: SNMP Salud de sistema Dell PowerEdge

Remarks

- This sensor [requires](#) ²⁵⁷² that Integrated Dell Remote Access Controller (iDRAC) 7 or the Dell OpenManage Server Administrator (OMSA) are installed on the monitored server.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor has predefined limits for several metrics. You can individually change these limits in the channel settings. For detailed information about channel limits, see section [Channel Settings](#) ³⁹⁷⁷.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#) ⁴⁴⁸⁵.
- See the Knowledge Base: [Why does my Dell PowerEdge System Health sensor show a power unit status error after iDRAC update?](#)
- See the Knowledge Base: [What do I need to monitor Dell servers?](#)
- See the Knowledge Base: [I can't add Dell PowerEdge sensors to PRTG. What can I do?](#)

Detailed Requirements

Requirement	Description
Dell OpenManage Server Administrator or iDRAC 7	<p>This sensor needs the Dell OpenManage Server Administrator (OMSA) tool to be installed on the target device to monitor it. Make sure that you enable SNMP in the OMSA.</p> <ul style="list-style-type: none"> ■ For details, see the Knowledge Base: What do I need to monitor Dell servers? ⓘ You can also monitor Dell PowerEdge servers with this sensor via iDRAC 7.

Add Sensor

The [Add Sensor](#) ³⁶⁷ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Dell PowerEdge System Health Specific

Setting	Description
Chassis	Select the chassis that you want to monitor. PRTG creates one sensor for each chassis that you select.

Setting	Description
	<p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a title 'Basic Sensor Settings' in blue. Below the title are three settings: 'Sensor Name' with a value of 'Example Name', 'Tags' with a value of 'exampletag' and a plus icon, and 'Priority' with a value of five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpdellssystemhealthsensor ▪ systemhealth ▪ snmpdell ▪ dell
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Data Source ⓘ iDRAC

Dell PowerEdge System Health Specific

Setting	Description
Chassis	<p>Shows the chassis that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Channel Mask	<p>Shows the channel mask that describes which channels are available.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Data Source	<p>Shows the interface that PRTG uses to get monitoring data. This is either Dell OMSA or iDRAC.</p>

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type  Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#)¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Sensor Settings Overview

For more information about sensor settings, see the following sections:

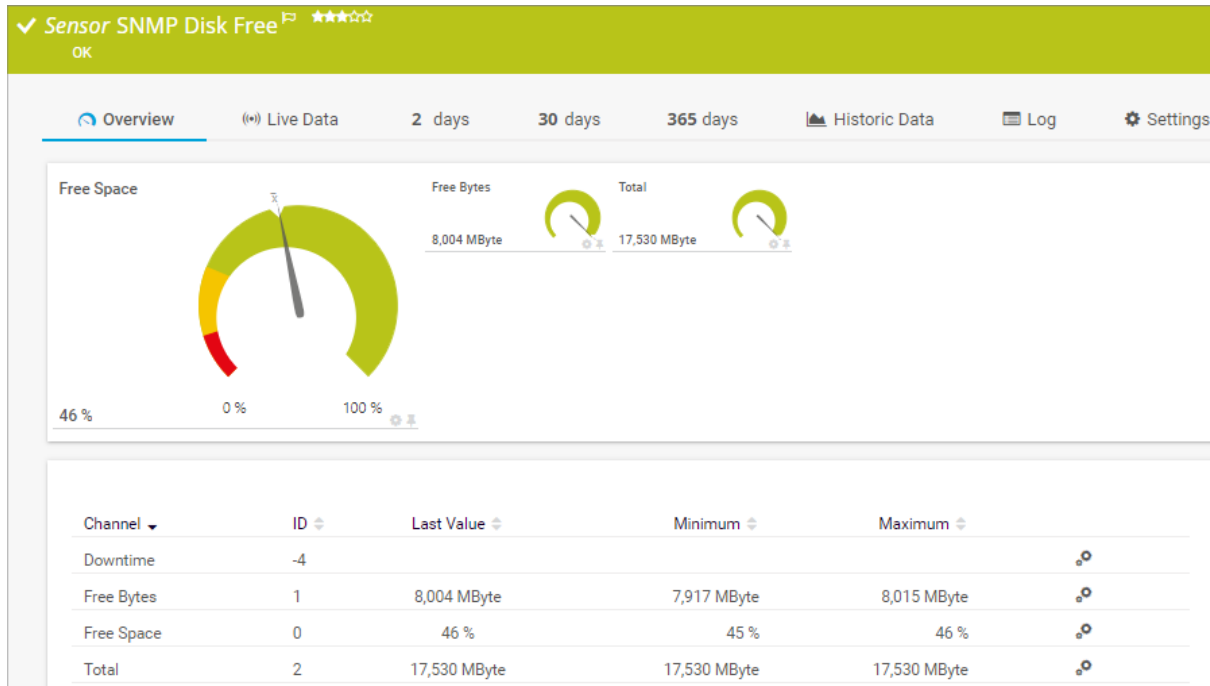

Part 7: Device and Sensor Setup | 8 Sensor Settings
162 SNMP Dell PowerEdge System Health Sensor

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.163 SNMP Disk Free Sensor

The SNMP Disk Free sensor monitors the free disk space on a logical disk via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Disk Free Sensor

Sensor in Other Languages

- Dutch: SNMP vrije schijf ruimte
- French: Espace disque disponible SNMP
- German: SNMP Datenträgerspeicher
- Japanese: SNMP ディスク空き容量
- Portuguese: Disco livre SNMP
- Russian: SNMP
- Simplified Chinese: SNMP 磁盘可用空间
- Spanish: SNMP Disco libre

Remarks

- This sensor uses more generic object identifier (OID) values compared to the [SNMP Linux Disk Free sensor](#).
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

- It might not work to query data from a probe device via SNMP (querying [localhost](#), [127.0.0.1](#), or [::1](#)). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Disk Free Settings

Setting	Description
Disk	Select the disks that you want to monitor. PRTG creates one sensor for each disk that you select.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections: 'Sensor Name' with the value 'Example Name', 'Tags' with a list containing 'exampletag', and 'Priority' set to 3 stars out of 5.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets . If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe .

Setting	Description
	<p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ¹⁴⁵.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpdiskfreesensor ▪ diskspacesensor ▪ diskfree ▪ snmp
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Disk Free Settings

Disk Free Settings Disk ⓘ C:\ Label:Windows Serial Number 16384/16384

Disk Free Settings

Setting	Description
Disk	<p>Shows the name of the disk that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. We strongly recommend that you only change it if the Paessler support team explicitly asks you to do so. Wrong usage can result in incorrect monitoring data.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click ⓘ to interrupt the [inheritance](#).

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

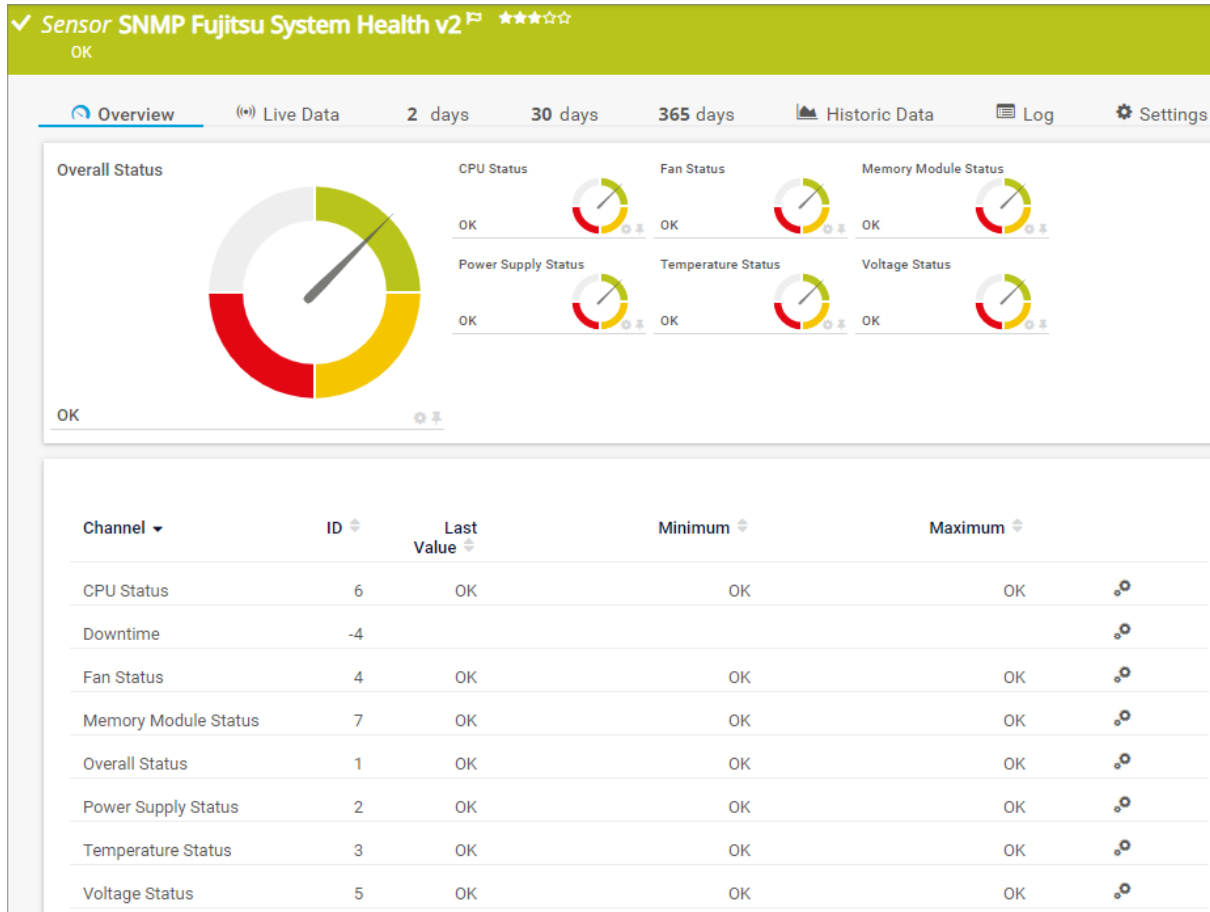

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.164 SNMP Fujitsu System Health v2 Sensor

The SNMP Fujitsu System Health v2 sensor monitors the status of a Fujitsu PRIMERGY server via the integrated Remote Management Controller (iRMC) and Simple Network Management Protocol (SNMP). The sensor might also work on other Fujitsu devices that have an iRMC available like PRIMEQUEST servers, some storage systems of the ETERNUS product line, and CELSIUS workstations in racks.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Fujitsu System Health v2 Sensor

Sensor in Other Languages

- Dutch: SNMP Fujitsu System Health v2
- French: SNMP Santé du système Fujitsu v2
- German: SNMP Fujitsu Systemzustand v2
- Japanese: SNMP Fujitsu システム正常性 v2
- Portuguese: Funcionamento do sistema Fujitsu SNMP v2
- Russian: Fujitsu SNMP, 2
- Simplified Chinese: SNMP Fujitsu 系统运行状况版本 2
- Spanish: Salud del sistema Fujitsu con SNMP v2

Remarks

- Use an iRMC interface as parent device for this sensor.
- Make sure that you enable SNMP in the iRMC via ServerView.
- This sensor does not support SNMPv1.
- As of iRMC S5, additional counters for physical disks and logical disks are supported.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor supersedes the deprecated SNMP Fujitsu System Health sensor.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

System Specific

Setting	Description
Measurements	<p>Select the measurements that you want to monitor. PRTG creates one sensor for each measurement that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Sensor Settings Overview

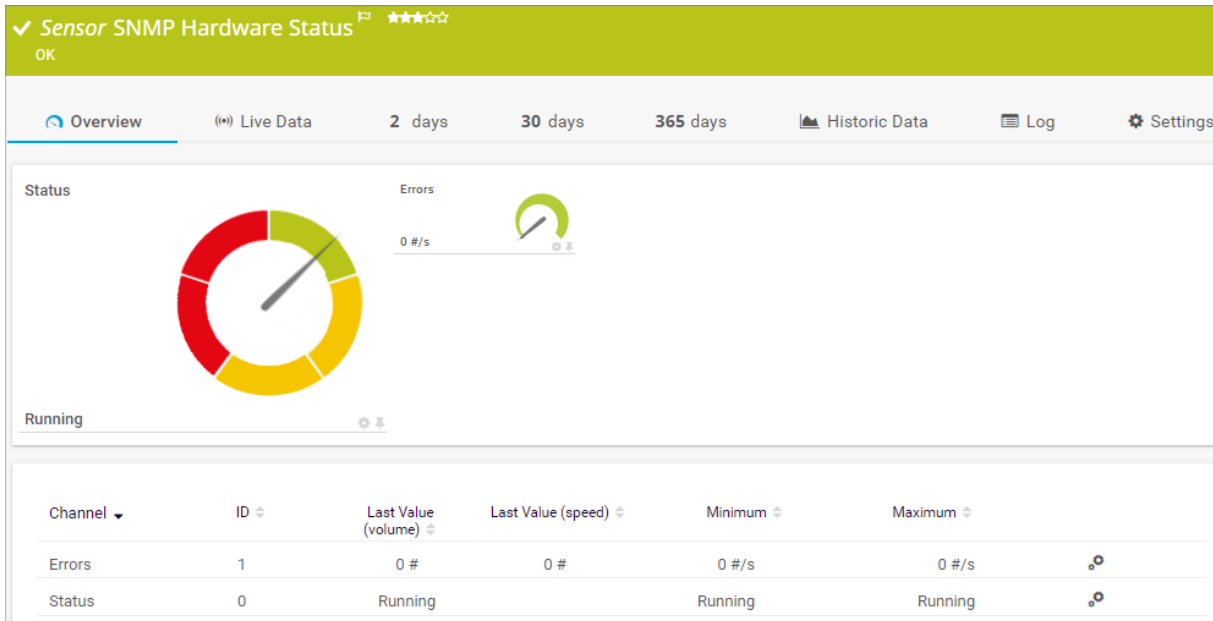

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.165 SNMP Hardware Status Sensor

The SNMP Hardware Status sensor monitors the status of a server's hardware component via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Hardware Status Sensor

Sensor in Other Languages

- Dutch: SNMP Hardware Status
- French: Statut matériel SNMP
- German: SNMP Hardwarezustand
- Japanese: SNMP ハードウェア正常性
- Portuguese: Status do hardware SNMP
- Russian: SNMP
- Simplified Chinese: SNMP 硬件状态
- Spanish: Estado del hardware de SNMP

Remarks

- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `::1`). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.

- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Hardware Specific

Setting	Description
Hardware Components	<p>Select the hardware components that you want to monitor. PRTG creates one sensor for each hardware component that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority:** A section with five stars, where the first three are filled, indicating a priority of 3.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ hardwarestatus
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Hardware Specific

Hardware Specific	
Hardware Components i	1
Product ID i	0.0

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor. ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how different channels are shown for this sensor: <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel.

Setting	Description
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p> <ul style="list-style-type: none"> Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁸ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes 30 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁵⁷

7.8.166 SNMP HP LaserJet Hardware Sensor

The SNMP HP LaserJet Hardware sensor monitors performance counters on an HP LaserJet hardware device via the Simple Network Management Protocol (SNMP).

i The SNMP HP LaserJet Hardware sensor does not appear as a running sensor, instead it is created as an [SNMP Custom Advanced sensor](#)²⁴⁶⁴.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)²⁶²⁷.

SNMP HP LaserJet Hardware Sensor

Sensor in Other Languages

- Dutch: SNMP HP LaserJet Hardware
- French: Matériels SNMP HP LaserJet
- German: SNMP HP LaserJet Hardware
- Japanese: SNMP HP LaserJet ハードウェア
- Portuguese: Hardware da HP LaserJet SNMP
- Russian: HP LaserJet SNMP
- Simplified Chinese: SNMP HP LaserJet 硬件
- Spanish: Hardware SNMP HP LaserJet

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.

- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

7.8.167 SNMP HPE BladeSystem Blade Sensor

The SNMP HPE BladeSystem Blade sensor monitors the status of an HPE BladeSystem via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP HPE BladeSystem Blade Sensor

Sensor in Other Languages

- Dutch: SNMP HPE BladeSystem Blade
- French: SNMP HPE BladeSystem Blade
- German: SNMP HPE BladeSystem Blade
- Japanese: SNMP HPE BladeSystem ブレード
- Portuguese: Blade do SNMP HPE BladeSystem
- Russian: - HPE BladeSystem SNMP
- Simplified Chinese: SNMP HPE BladeSystem 刀片
- Spanish: Blade de SNMP de HPE BladeSystem

Remarks

- Make sure that you add this sensor to a device whose IP address or Domain Name System (DNS) name points to the HPE BladeSystem Enclosure hosting the Onboard Administrator.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

HPE BladeSystem Specific

Setting	Description
Server Blades	<p>Select the blades that you want to monitor. PRTG creates one sensor for each server blade that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority:** A section with five stars, where the first three are filled, indicating a priority of 3.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmp ▪ hpe ▪ blade ▪ bladesystem
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

HPE BladeSystem Specific

HPE BladeSystem Specific
Server Blades **i**

HPE BladeSystem Specific

Setting	Description
Server Blades	Shows the server blade that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor. i You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.
Graph Type	Define how different channels are shown for this sensor: <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼

Sensor Settings Overview

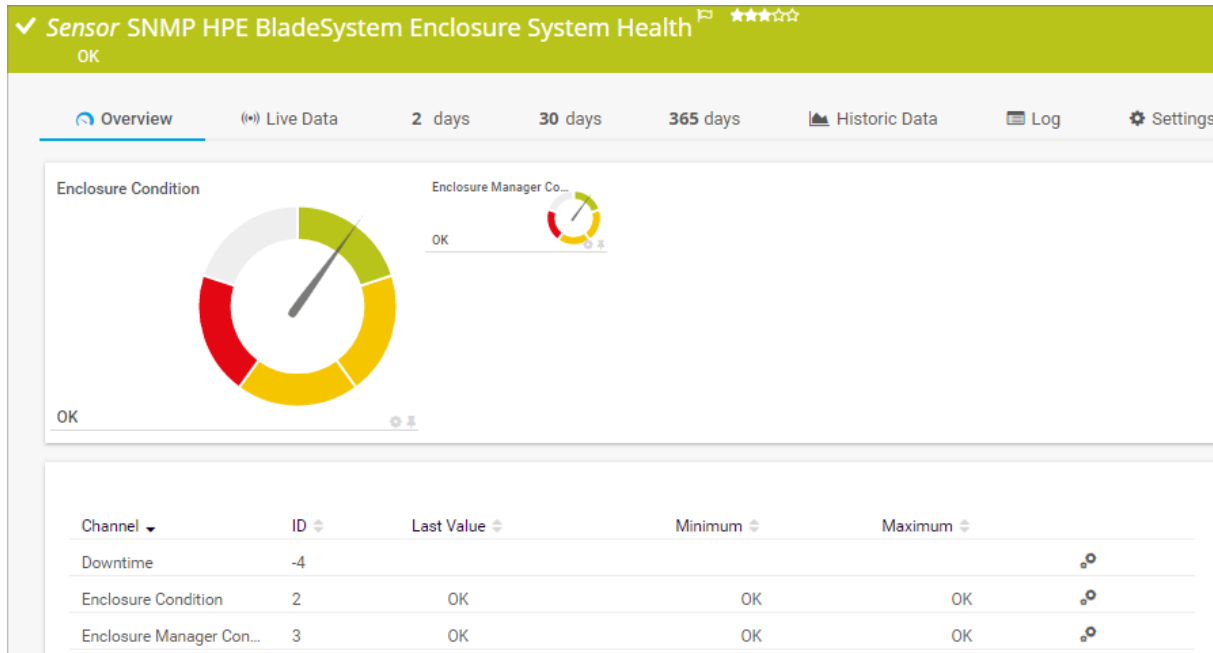

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.168 SNMP HPE BladeSystem Enclosure System Health Sensor

The SNMP HPE BladeSystem Enclosure System Health sensor monitors the system health of an HPE BladeSystem device via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP HPE BladeSystem Enclosure System Health Sensor

Sensor in Other Languages

- Dutch: SNMP HPE BladeSystem Behuizing Systeem Gesteldheid
- French: État d'un système de Enclosure HPE BladeSystem SNMP
- German: SNMP HPE BladeSystem Enclosure Systemzustand
- Japanese: SNMP HPE BladeSystem インクロージャのシステム正常性
- Portuguese: Funcionamento do sistema de gabinete de HPE BladeSystem via SNMP
- Russian: HPE BladeSystem SNMP
- Simplified Chinese: SNMP HPE BladeSystem 外壳系统运行状况
- Spanish: Salud de sistema SNMP de carcasa HPE BladeSystem

Remarks

- Make sure that you add this sensor to a device whose IP address or Domain Name System (DNS) name points to the HPE BladeSystem Enclosure hosting the Onboard Administrator.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmp ▪ hpe ▪ blade ▪ bladesystem ▪ systemhealth ▪ health
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

7.8.169 SNMP HPE ProLiant Logical Disk Sensor

The SNMP HPE ProLiant Logical Disk sensor monitors a logical disk in an HPE server via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP HPE ProLiant Logical Disk Sensor

Sensor in Other Languages

- Dutch: SNMP HPE ProLiant Logische Schijf
- French: Disque logique HPE ProLiant SNMP
- German: SNMP HPE ProLiant Logischer Datenträger
- Japanese: SNMP HPE ProLiant 論理ディスク
- Portuguese: Disco lógico SNMP HPE ProLiant
- Russian: HPE ProLiant SNMP
- Simplified Chinese: SNMP HPE ProLiant 逻辑磁盘
- Spanish: Disco lógico SNMP HPE ProLiant

Remarks

- For Gen9 servers or earlier: This sensor requires HPE Insight Management Agents and HPE Insight Management Web-based Enterprise Management (WBEM) Providers to be installed on the target device.
- For Gen10 servers: This sensor requires HPE Agentless Management and the HPE Agentless Management Service to be installed on the target device.
- For Gen10 servers: Use the HPE Integrated Lights Out (iLO) interface as the parent device for this sensor.

- This sensor supports monitoring iLO as of iLO version 3. We recommend that you use iLO 4 or later.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)⁴⁴⁸⁵.

Detailed Requirements

Requirement	Description
HPE system management tools	<p>For Gen9 servers or earlier, this sensor needs a specific HPE system management tool to be installed on the target device to report data via SNMP: HPE Insight Management Agents. To receive SNMP data from redundant array of independent disks (RAID) controllers, you additionally need HPE Insight Management WBEM Providers. For Gen10 servers, this sensor no longer requires HPE system management tools. Instead, the sensor needs the Agentless Management Service to be installed on the target device.</p> <ul style="list-style-type: none"> ■ For more details and download links, see the Knowledge Base: Monitor HP ProLiant via SNMP? ⓘ For Gen9 servers or earlier, some of the HPE object identifiers (OID) that this sensor uses are only accessible via the iLO interface. If this sensor throws an error that it cannot find "such device types", create a device that points to the address of the HPE iLO interface (if available) and add the sensor to this device. We recommend that you use the Agentless Management feature with configured SNMP. You can set this up in the iLO configuration interface under Administration Management SNMP Settings. For Gen10 servers, use the HPE iLO interface as parent device for this sensor.

Add Sensor

The [Add Sensor](#)³⁶⁷ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

HPE ProLiant Logical Disk Settings

Setting	Description
Disk	<p>Select the logical disks that you want to monitor. PRTG creates one sensor for each logical disk that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' configuration page. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign to add more, and a 'Priority' field set to 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmphpelogicaldisksensor ▪ logicaldisk ▪ snmphpe ▪ hpe
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Setting	Description
Disk	<p>Shows the name of the disk that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ
 Show channels independently (default)

 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

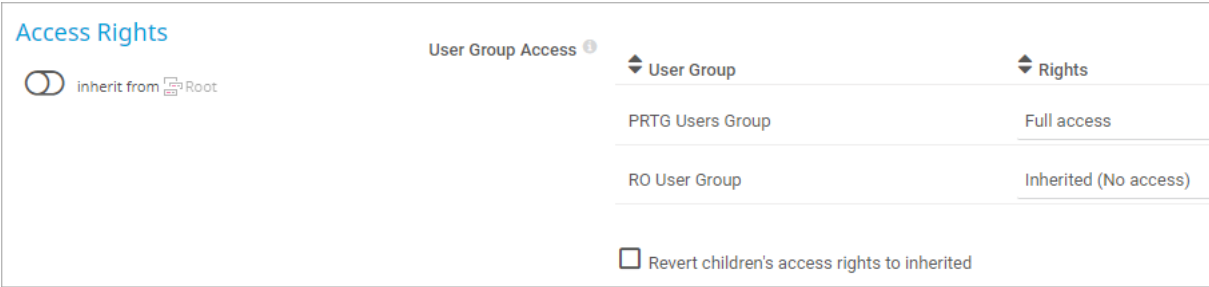

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

i Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

inherit from  Root

Channel Unit Types **i**

Channel Type	Unit

7.8.170 SNMP HPE ProLiant Memory Controller Sensor

The SNMP HPE ProLiant Memory Controller sensor monitors a memory controller in an HPE server via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP HPE ProLiant Memory Controller Sensor

Sensor in Other Languages

- Dutch: SNMP HPE ProLiant Geheugencontroller
- French: Contrôleur de mémoire HPE ProLiant SNMP
- German: SNMP HPE ProLiant Speichercontroller
- Japanese: SNMP HPE ProLiant メモリコントローラー
- Portuguese: Controlador de memória SNMP HPE ProLiant
- Russian: HPE ProLiant SNMP
- Simplified Chinese: SNMP HPE ProLiant 内存控制器
- Spanish: Controlador de memoria SNMP HPE ProLiant

Remarks

- For Gen9 servers or earlier: This sensor requires HPE Insight Management Agents and HPE Insight Management Web-based Enterprise Management (WBEM) Providers to be installed on the target device.
- For Gen10 servers: This sensor requires HPE Agentless Management and the HPE Agentless Management Service to be installed on the target device.
- For Gen10 servers: Use the HPE Integrated Lights Out (iLO) interface as the parent device for this sensor.
- If modules are inserted at a later point, you have to add this sensor anew.
- This sensor supports monitoring iLO as of iLO version 3. We recommend that you use iLO 4 or later.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)⁴⁴⁸⁵.
- See the Knowledge Base: [Which lookup values are supported by the SNMP HPE ProLiant Memory Controller sensor?](#)

Detailed Requirements

Requirement	Description
HPE system management tools	<p>For Gen9 servers or earlier, this sensor needs a specific HPE system management tool to be installed on the target device to report data via SNMP: HPE Insight Management Agents. To receive SNMP data from redundant array of independent disks (RAID) controllers, you additionally need HPE Insight Management WBEM Providers. For Gen10 servers, this sensor no longer requires HPE system management tools. Instead, the sensor needs the Agentless Management Service to be installed on the target device.</p> <ul style="list-style-type: none"> ■ For more details and download links, see the Knowledge Base: Monitor HP ProLiant via SNMP? ⓘ For Gen9 servers or earlier, some of the HPE object identifiers (OID) that this sensor uses are only accessible via the iLO interface. If this sensor throws an error that it cannot find "such device types", create a device that points to the address of the HPE iLO interface (if available) and add the sensor to this device. We recommend that you use the Agentless Management feature with configured SNMP. You can set this up in the iLO configuration interface under Administration Management SNMP Settings. For Gen10 servers, use the HPE iLO interface as parent device for this sensor.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

	<ul style="list-style-type: none"> ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#)¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3997

7.8.171 SNMP HPE ProLiant Network Interface Sensor

The SNMP HPE ProLiant Network Interface sensor monitors a network interface in an HPE server via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP HPE ProLiant Network Interface Sensor

Sensor in Other Languages

- Dutch: SNMP HPE ProLiant Netwerkinterface
- French: Interface réseau HPE ProLiant SNMP
- German: SNMP HPE ProLiant Netzwerkschnittstelle
- Japanese: SNMP HPE ProLiant ネットワークインターフェース
- Portuguese: Interface de rede SNMP HPE ProLiant
- Russian: HPE ProLiant SNMP
- Simplified Chinese: SNMP HPE ProLiant 网络接口
- Spanish: SNMP Interface de red HPE ProLiant

Remarks

- For Gen9 servers or earlier: This sensor requires HPE Insight Management Agents and HPE Insight Management Web-based Enterprise Management (WBEM) Providers to be installed on the target device.
- For Gen10 servers: This sensor requires HPE Agentless Management and the HPE Agentless Management Service to be installed on the target device.
- For Gen10 servers: Use the HPE Integrated Lights Out (iLO) interface as the parent device for this sensor.
- During sensor creation, the status of each available network interface is shown. If this status is Link Failure, it is still possible to add a sensor for the respective interface. Though, most likely the sensor for this interface does not work correctly. The error message in this case is "No Such Name (SNMP error # 2)".
- This sensor supports monitoring iLO as of iLO version 3. We recommend that you use iLO 4 or later.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

Detailed Requirements

Requirement	Description
HPE system management tools	<p>For Gen9 servers or earlier, this sensor needs a specific HPE system management tool to be installed on the target device to report data via SNMP: HPE Insight Management Agents. To receive SNMP data from redundant array of independent disks (RAID) controllers, you additionally need HPE Insight Management WBEM Providers. For Gen10 servers, this sensor no longer requires HPE system management tools. Instead, the sensor needs the Agentless Management Service to be installed on the target device.</p> <p>■ For more details and download links, see the Knowledge Base: Monitor HP ProLiant via SNMP?</p> <p>ⓘ For Gen9 servers or earlier, some of the HPE object identifiers (OID) that this sensor uses are only accessible via the iLO interface. If this sensor throws an error that it cannot find "such device types", create a device that points to the address of the HPE iLO interface (if available) and add the sensor to this device. We recommend that you use the Agentless Management feature with configured SNMP. You can set this up in the iLO configuration interface under Administration Management SNMP Settings. For Gen10 servers, use the HPE iLO interface as parent device for this sensor.</p>

Add Sensor

The [Add Sensor](#)  dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

HPE ProLiant Network Interface Settings

Setting	Description
Network Interfaces	<p>Select the network interfaces that you want to monitor. PRTG creates one sensor for each interface that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p> <p>i If this status is Link Failure, it is still possible to add a sensor for the respective interface. Though, most likely the sensor for this interface does not work correctly. The error message in this case is No Such Name (SNMP error # 2).</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog box. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A list of tags with 'exampletag' selected, and a plus sign to add more.
- Priority:** A star rating system showing 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p>

Setting	Description
	<p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmphpenetworkinterfacesensor ▪ snmphpe ▪ hpe
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

HPE ProLiant Network Interface Settings

HPE ProLiant Network Interface Settings

Network Interfaces **i**

HPE ProLiant Network Interface Settings

Setting	Description
Network Interfaces	<p>Shows the name of the network interface that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type  Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

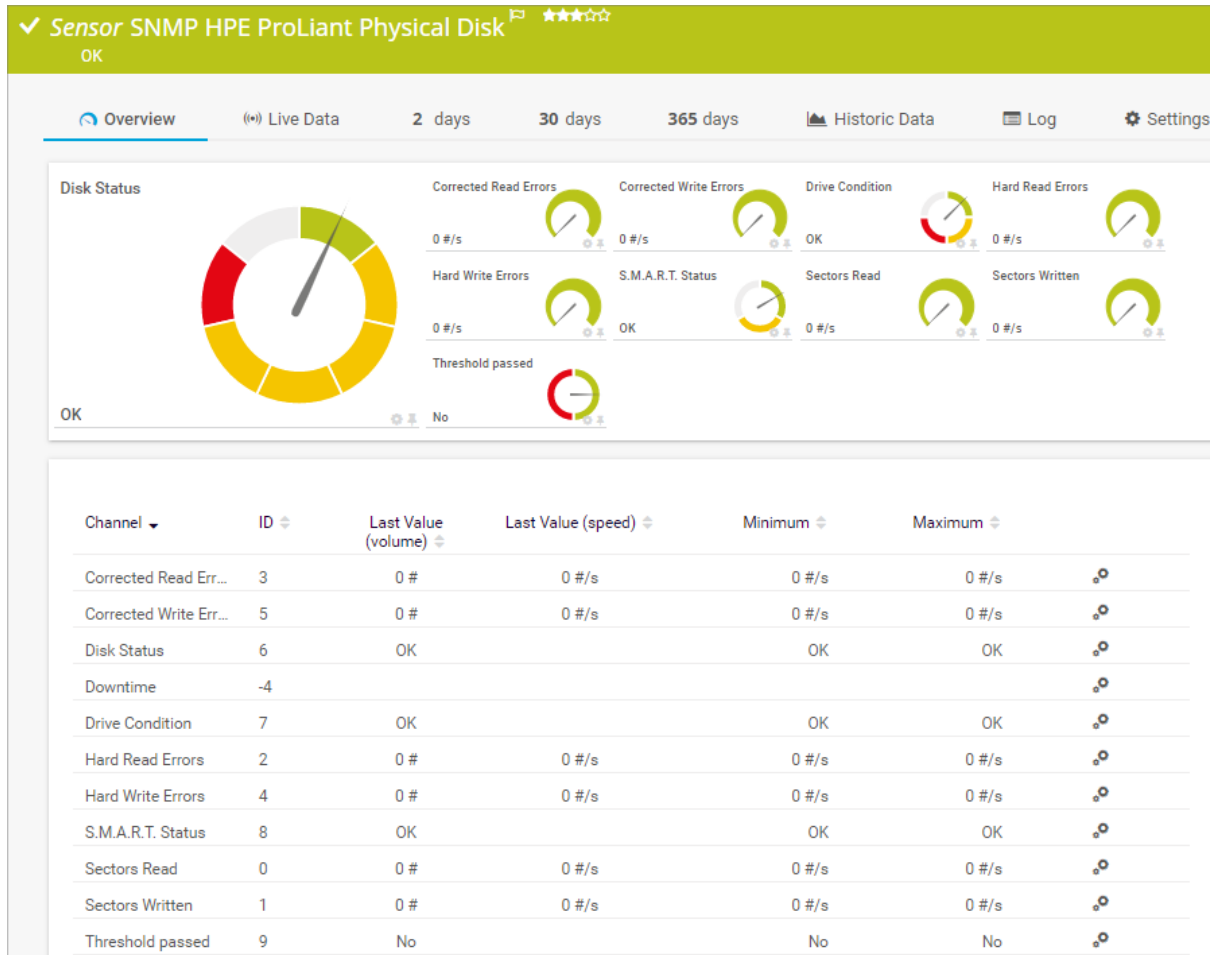

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.172 SNMP HPE ProLiant Physical Disk Sensor

The SNMP HPE ProLiant Physical Disk sensor monitors a physical disk in an HPE server via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP HPE ProLiant Physical Disk Sensor

Sensor in Other Languages

- Dutch: SNMP HPE ProLiant Fysieke Schijf
- French: Disque physique HPE ProLiant SNMP
- German: SNMP HPE ProLiant Physikalischer Datenträger
- Japanese: SNMP HPE ProLiant 物理ディスク
- Portuguese: Disco físico SNMP HPE ProLiant
- Russian: HPE ProLiant SNMP
- Simplified Chinese: SNMP HPE ProLiant 物理磁盘
- Spanish: SNMP Disco físico HPE ProLiant

Remarks

- For Gen9 servers or earlier: This sensor requires HPE Insight Management Agents and HPE Insight Management Web-based Enterprise Management (WBEM) Providers to be installed on the target device.
- For Gen10 servers: This sensor requires HPE Agentless Management and the HPE Agentless Management Service to be installed on the target device.
- For Gen10 servers: Use the HPE Integrated Lights Out (iLO) interface as the parent device for this sensor.
- The sensor only show Disk Status and no other channels if it runs in "Limited Monitoring" mode. For more information, see [SNMP HPE ProLiant Physical Disk sensor not showing all information](#).
- This sensor supports monitoring iLO as of iLO version 3. We recommend that you use iLO 4 or later.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)⁴⁴⁸⁵.

Detailed Requirements

Requirement	Description
HPE system management tools	<p>For Gen9 servers or earlier, this sensor needs a specific HPE system management tool to be installed on the target device to report data via SNMP: HPE Insight Management Agents. To receive SNMP data from redundant array of independent disks (RAID) controllers, you additionally need HPE Insight Management WBEM Providers. For Gen10 servers, this sensor no longer requires HPE system management tools. Instead, the sensor needs the Agentless Management Service to be installed on the target device.</p> <ul style="list-style-type: none"> ■ For more details and download links, see the Knowledge Base: Monitor HP ProLiant via SNMP? ⓘ For Gen9 servers or earlier, some of the HPE object identifiers (OID) that this sensor uses are only accessible via the iLO interface. If this sensor throws an error that it cannot find "such device types", create a device that points to the address of the HPE iLO interface (if available) and add the sensor to this device. We recommend that you use the Agentless Management feature with configured SNMP. You can set this up in the iLO configuration interface under Administration Management SNMP Settings. For Gen10 servers, use the HPE iLO interface as parent device for this sensor.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

HPE ProLiant Physical Disk Settings

Setting	Description
Disk	<p>Select the physical disks that you want to monitor. PRTG creates one sensor for each physical disk that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with three stars selected.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited. ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ snmphpephysicaldisksensor ▪ physicaldisk ▪ snmphpe ▪ hpe
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Disk	Shows the ID of the physical disk that this sensor monitors.

Setting	Description
	<p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking + below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

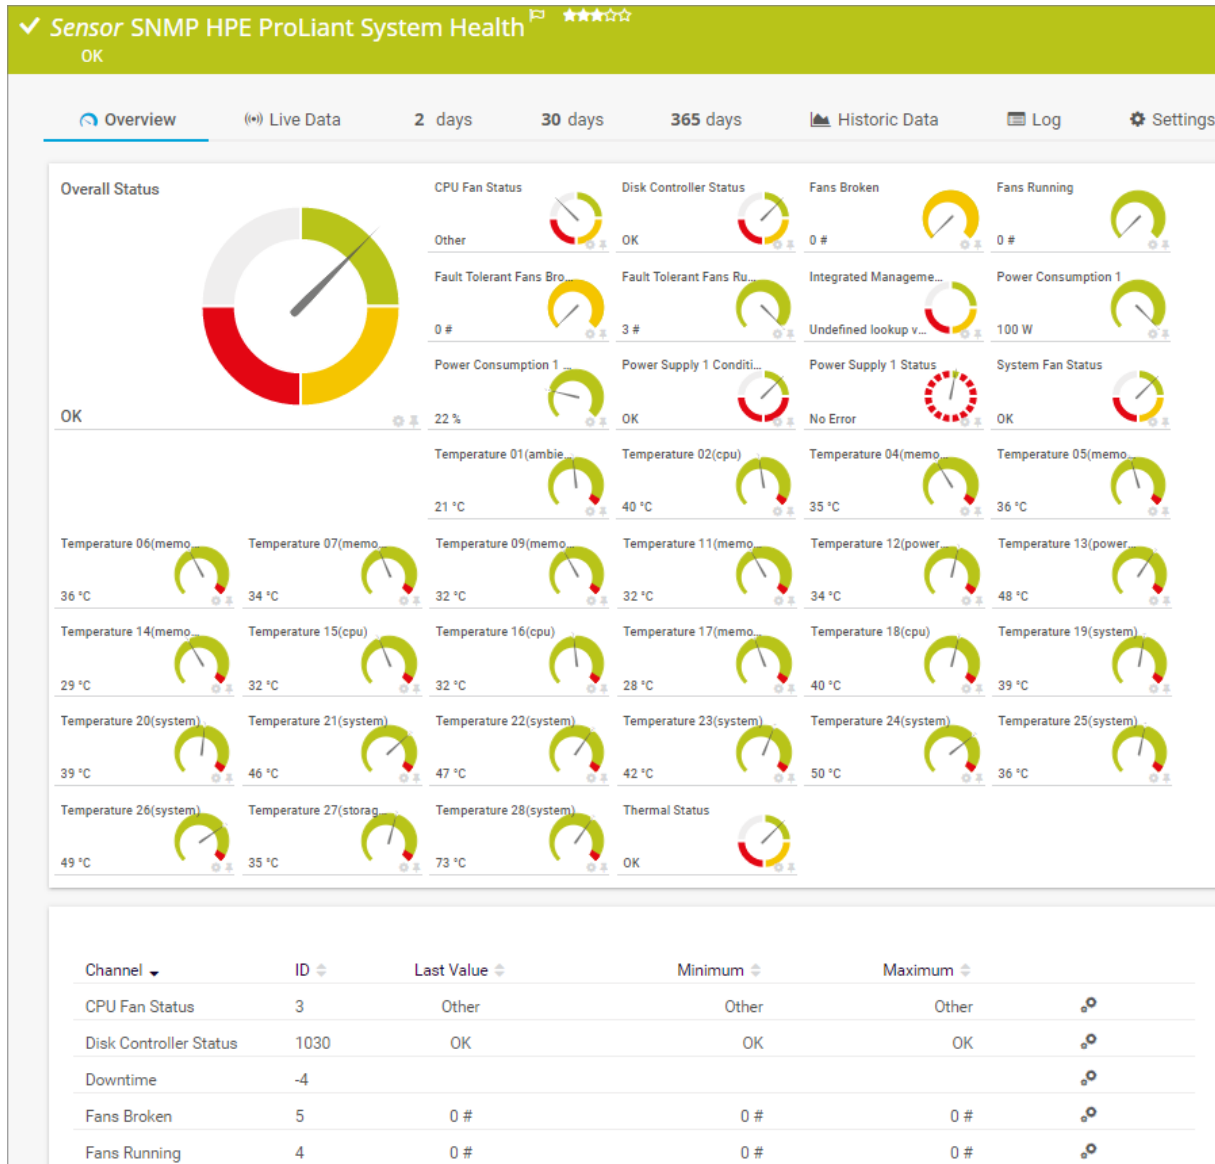

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.173 SNMP HPE ProLiant System Health Sensor

The SNMP HPE ProLiant System Health sensor monitors the system health of an HPE ProLiant server via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP HPE ProLiant System Health Sensor

Sensor in Other Languages

- Dutch: SNMP HPE ProLiant Systeemstatus
- French: État du système HPE ProLiant SNMP
- German: SNMP HPE ProLiant Systemzustand
- Japanese: SNMP HPE ProLiant システム正常性
- Portuguese: Funcionamento do sistema SNMP HPE ProLiant

- Russian: HPE ProLiant SNMP
- Simplified Chinese: SNMP HPE ProLiant 系统运行状况
- Spanish: SNMP Salud de sistema HPE ProLiant

Remarks

- For Gen9 servers or earlier: This sensor requires HPE Insight Management Agents and HPE Insight Management Web-based Enterprise Management (WBEM) Providers to be installed on the target device.
- For Gen10 servers: Use the HPE Integrated Lights Out (iLO) interface as the parent device for this sensor.
- This sensor has predefined limits for temperatures and broken frames. You can change these limits individually in the [channel settings](#) ³⁹⁷⁷.
- Redundant array of independent disks (RAID) controllers that have no hard disks assigned might cause the Down [status](#) ¹⁹⁷. In this case, deactivate the respective controllers in the HPE ProLiant BIOS to avoid sensor errors.
- This sensor supports monitoring iLO as of iLO version 3. We recommend that you use iLO 4 or later.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#) ⁴⁴⁸⁵.

Detailed Requirements

Requirement	Description
HPE system management tools	<p>For Gen9 servers or earlier, this sensor needs a specific HPE system management tool to be installed on the target device to report data via SNMP: HPE Insight Management Agents. To receive SNMP data from redundant array of independent disks (RAID) controllers, you additionally need HPE Insight Management WBEM Providers. For Gen10 servers, this sensor no longer requires HPE system management tools.</p> <p>■ For more details and download links, see the Knowledge Base: Monitor HP ProLiant via SNMP?</p> <p>i For Gen9 servers or earlier, some of the HPE object identifiers (OID) that this sensor uses are only accessible via the iLO interface. If this sensor throws an error that it cannot find "such device types", create a device that points to the address of the HPE iLO interface (if available) and add the sensor to this device. We recommend that you use the Agentless Management feature with configured SNMP. You can set this up in the iLO configuration interface under Administration Management SNMP Settings. For Gen10 servers, use the HPE iLO interface as parent device for this sensor.</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog box. It has a title bar 'Basic Sensor Settings' on the left. Below the title bar, there are three rows of settings:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A text input field containing 'exampletag' with a blue 'x' icon to the right and a plus sign icon to the left of the input field.
- Priority**: A star rating system showing five stars, with the first three stars filled and the last two empty.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ snmphpesystemhealthsensor ▪ systemhealth ▪ snmphpe ▪ hpe
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Sensor Display

Primary Channel **ⓘ** Downtime

Graph Type **ⓘ** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ^[397]).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p> i You can change the available intervals in the system administration on PRTG on premises installations. </p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p> i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply. </p> <p> i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply. </p> <p> i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply. </p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule ⓘ None

Maintenance Window ⓘ Do not set up a one-time maintenance window

Sensor Settings Overview

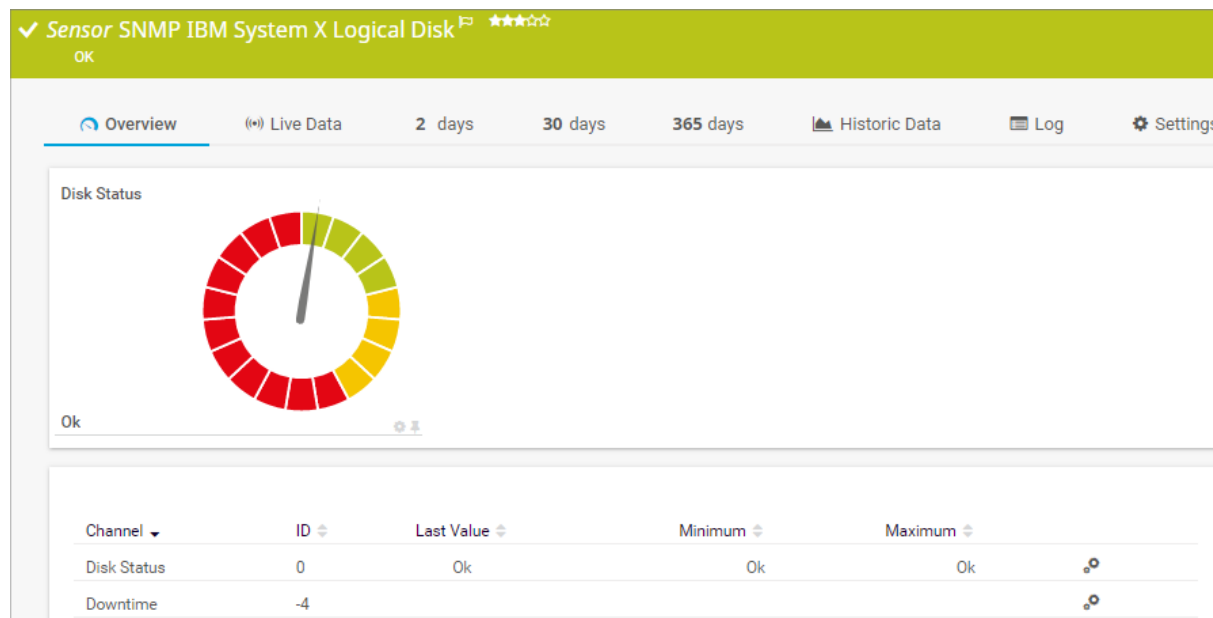

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.174 SNMP IBM System X Logical Disk Sensor

The SNMP IBM System X Logical Disk sensor monitors a logical disk in an IBM server via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)^[2720].

SNMP IBM System X Logical Disk Sensor

Sensor in Other Languages

- Dutch: SNMP IBM System X Logical Disk
- French: Disque logique IBM System X SNMP
- German: SNMP IBM System X Logischer Datenträger
- Japanese: SNMP IBM System X 論理 ディスク
- Portuguese: Disco lógico do IBM System X SNMP
- Russian: IBM System X SNMP
- Simplified Chinese: SNMP IBM 系统 X 逻辑 磁盘
- Spanish: Disco lógico de IBM System X con SNMP

Remarks

- This sensor requires the IBM Systems Director Platform to be installed on the target device.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)^[4485].

- See the Knowledge Base: [What are the requirements to monitor IBM System x?](#)
- See the Knowledge Base: [IBM System X sensors could not find any disk/data on this device \(PE187/PE188/PE194\)](#)

Detailed Requirements

Requirement	Description
IBM Systems Director Platform Agent	<p>This sensor needs the IBM Systems Director Platform Agent to be installed on the target IBM device to monitor it via SNMP.</p> <p>■ For more information, see the Knowledge Base: What are the requirements to monitor IBM System x?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

IBM System X Logical Disk Settings

Setting	Description
Disk	<p>Select the logical disks that you want to monitor. PRTG creates one sensor for each logical disk that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Sensor Display

Sensor Display
Primary Channel **i** Downtime

Graph Type **i**
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling ³⁹⁷⁷ (available in the channel settings ³⁹⁷⁷).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ

User Group	Rights
PRTG Users Group	Full access

Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Sensor Settings Overview

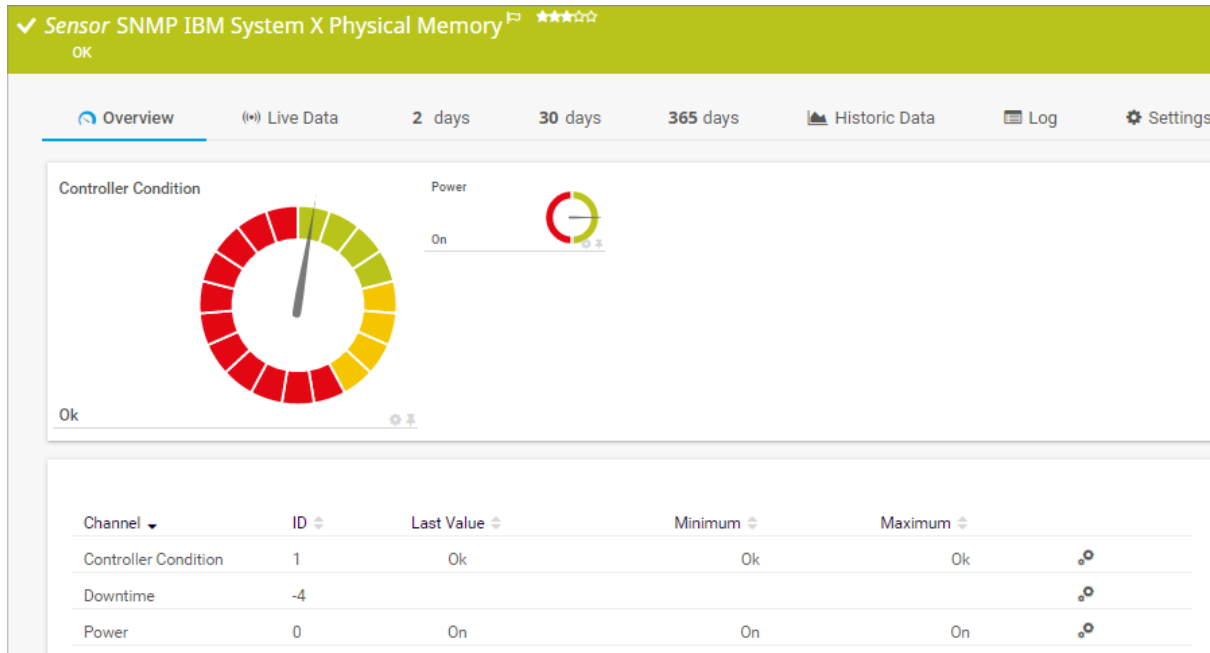

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.176 SNMP IBM System X Physical Memory Sensor

The SNMP IBM System X Physical Memory sensor monitors the memory modules in an IBM server via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP IBM System X Physical Memory Sensor

Sensor in Other Languages

- Dutch: SNMP IBM System X Physical Memory
- French: Mémoire physique SNMP IBM System X
- German: SNMP IBM System X Physikalischer Speicher
- Japanese: SNMP IBM System X 物理メモリ
- Portuguese: Memória física do IBM System X SNMP
- Russian: IBM System X SNMP
- Simplified Chinese: SNMP IBM 系统 X 物理内存
- Spanish: Memoria física de IBM System X con SNMP

Remarks

- This sensor requires the IBM Systems Director Platform to be installed on the target device.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

- See the Knowledge Base: [What are the requirements to monitor IBM System x?](#)
- See the Knowledge Base: [IBM System X sensors could not find any disk/data on this device \(PE187/PE188/PE194\)](#)

Detailed Requirements

Requirement	Description
IBM Systems Director Platform Agent	<p>This sensor needs the IBM Systems Director Platform Agent to be installed on the target IBM device to monitor it via SNMP.</p> <p>■ For more information, see the Knowledge Base: What are the requirements to monitor IBM System x?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

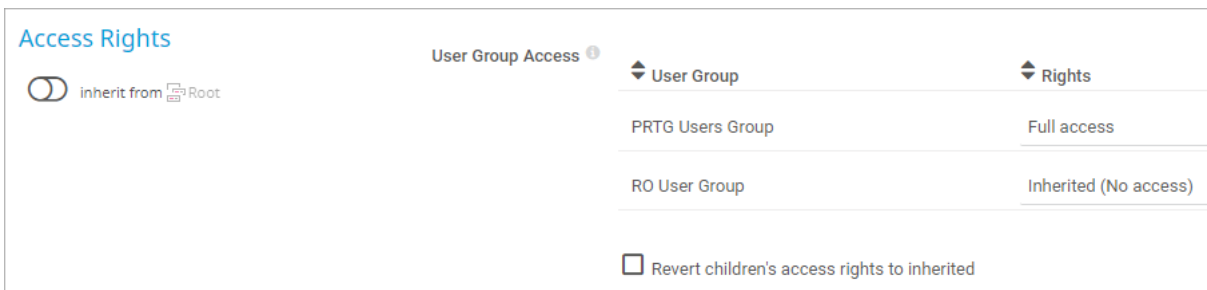

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷

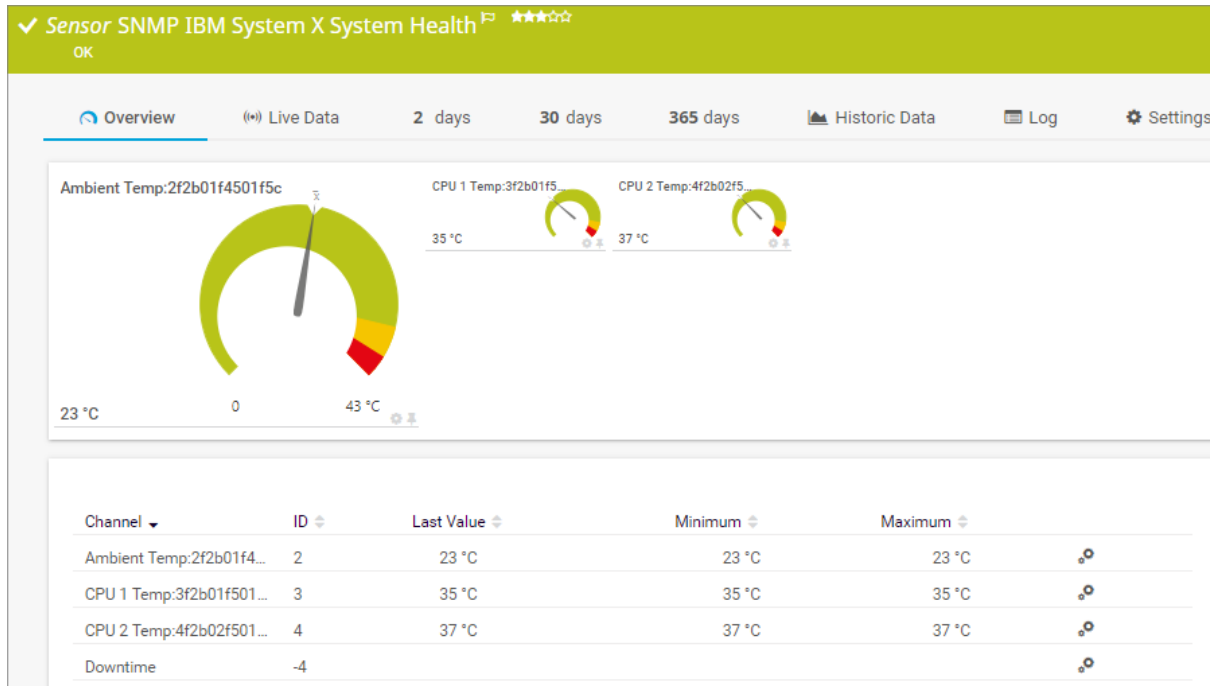

Part 7: Device and Sensor Setup | 8 Sensor Settings
176 SNMP IBM System X Physical Memory Sensor

- [Notification Triggers Settings](#) 

7.8.177 SNMP IBM System X System Health Sensor

The SNMP IBM System X System Health sensor monitors the system health of an IBM device via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP IBM System X System Health Sensor

Sensor in Other Languages

- Dutch: SNMP IBM System X System Health
- French: État du système IBM System X SNMP
- German: SNMP IBM System X Systemzustand
- Japanese: SNMP IBM System X システムの正常性
- Portuguese: Funcionamento do sistema IBM System X SNMP
- Russian: IBM System X SNMP
- Simplified Chinese: SNMP IBM 系统 X 系统健康状况
- Spanish: Salud del sistema de IBM System X con SNMP

Remarks

- This sensor requires the IBM Systems Director Platform to be installed on the target device.
- This sensor can also run directly on an Integrated Management Module (IMM) network port and can show the overall health of IMMs.

- If the IBM device returns a string in an unexpected format for the percentage of fan revolutions (for example, "offline"), this sensor shows -1% in the corresponding channel. You can define the Down status for this via [channel limits](#) ³⁹⁷⁸.
- This sensor has predefined limits for several metrics. You can individually change these limits in the channel settings. For detailed information about channel limits, see section [Channel Settings](#) ³⁹⁷⁷.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#) ⁴⁴⁸⁵.
- See the Knowledge Base: [What are the requirements to monitor IBM System x?](#)
- See the Knowledge Base: [IBM System X sensors could not find any disk/data on this device \(PE187/PE188/PE194\)](#)

Detailed Requirements

Requirement	Description
IBM Systems Director Platform Agent	<p>This sensor needs the IBM Systems Director Platform Agent to be installed on the target IBM device to monitor it via SNMP.</p> <p>■ For more information, see the Knowledge Base: What are the requirements to monitor IBM System x?</p>

i The SNMP IBM System X System Health sensor can also run directly on an IMM network port and can show the overall health of IMM's.

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

IBM System X System Health Specific

Setting	Description
Measurements	Select the measurements that you want to monitor. PRTG creates one sensor for each measurement that you select.

Setting	Description
	<p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpibmsystemhealthsensor ▪ systemhealth
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Sensor Settings Overview

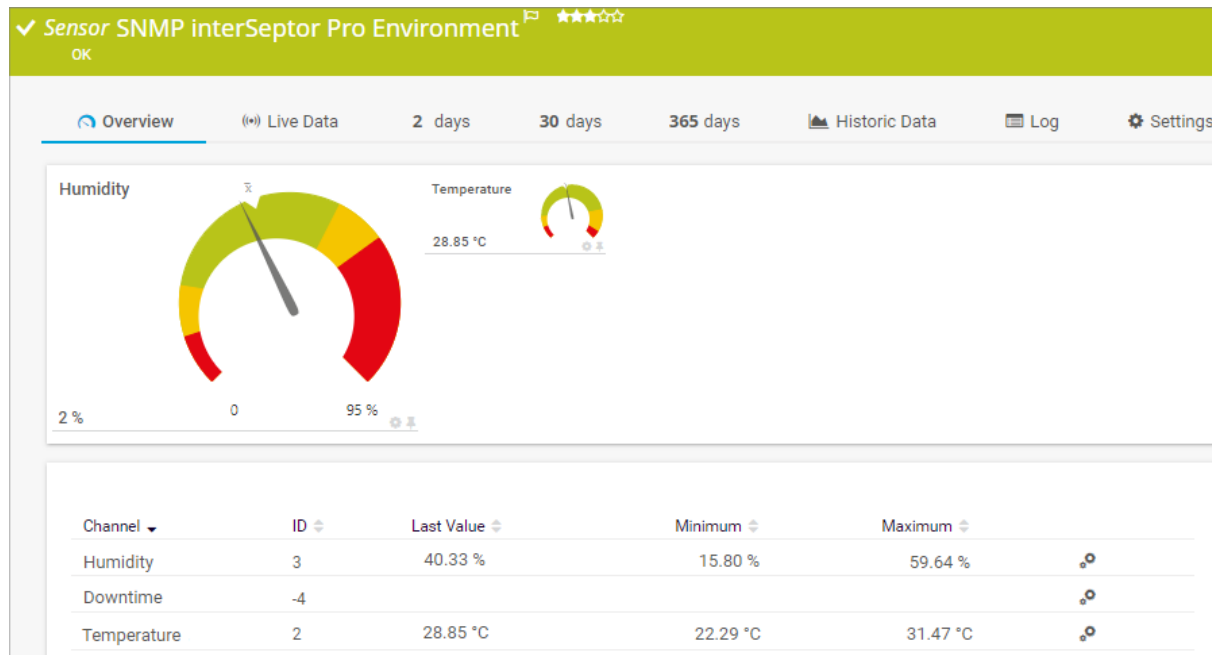

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.178 SNMP interSeptor Pro Environment Sensor

The SNMP interSeptor Pro Environment sensor queries data from a Jakarta interSeptor Pro environmental monitoring system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP interSeptor Pro Environment Sensor

Sensor in Other Languages

- Dutch: SNMP interSeptor Pro Omgeving
- French: Environnement interSeptor Pro SNMP
- German: SNMP interSeptor Pro Umgebung
- Japanese: SNMP interSeptor Pro 環境
- Portuguese: Ambiente do SNMP interSeptor Pro
- Russian: interSeptor Pro SNMP
- Simplified Chinese: SNMP interSeptor Pro 环境
- Spanish: Entorno de interSeptor Pro de SNMP

Remarks

- To monitor data of an interSeptor Pro device with this sensor, you have to add the IP address of your PRTG core server system to Access Control in the interSeptor Pro control panel. Open the interSeptor Pro web interface, select InterSeptor Pro Menu | System Configuration | Access Control, and allow access for the IP address of PRTG.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

InterSeptor Environment Specific

Setting	Description
Measuring Point	<p>Select the measuring points that you want to monitor. PRTG creates one sensor for each measuring point that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited . ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ interseptor ▪ environment
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Settings Overview

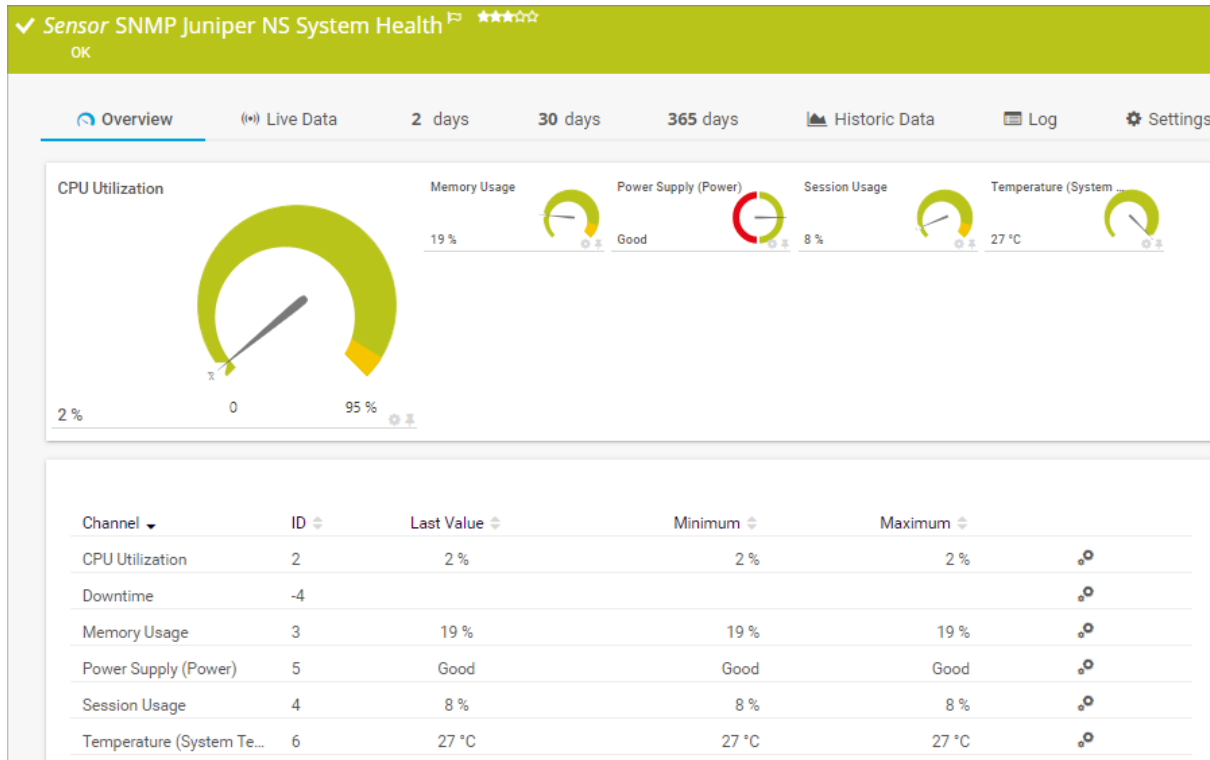

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.179 SNMP Juniper NS System Health Sensor

The SNMP Juniper NS System Health sensor monitors the system health of a Juniper NetScreen device via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Juniper NS System Health Sensor

Sensor in Other Languages

- Dutch: SNMP Juniper NS systeemstatus
- French: État du système SNMP Juniper NS
- German: SNMP Juniper NS Systemzustand
- Japanese: SNMP Juniper NS のシステム正常性
- Portuguese: Funcionamento do sistema Juniper NS SNMP
- Russian: Juniper NS SNMP
- Simplified Chinese: SNMP Juniper NS 系统健康状况
- Spanish: Salud del sistema NS de Juniper SNMP

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁸⁷

7.8.180 SNMP LenovoEMC Physical Disk Sensor

The SNMP LenovoEMC Physical Disk sensor monitors a physical disk in a LenovoEMC network-attached storage (NAS) via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP LenovoEMC Physical Disk Sensor

Sensor in Other Languages

- Dutch: SNMP LenovoEMC fysieke schijf
- French: Disque physique SNMP LenovoEMC
- German: SNMP LenovoEMC Physikalischer Datenträger
- Japanese: SNMP LenovoEMC 物理ディスク
- Portuguese: Disco físico LenovoEMC SNMP
- Russian: LenovoEMC SNMP
- Simplified Chinese: SNMP LenovoEMC 物理磁盘
- Spanish: Disco físico de LenovoEMC con SNMP

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

LenovoEMC NAS Settings

Setting	Description
Disk	<p>Select the physical disks that you want to monitor. PRTG creates one sensor for each physical disk that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited . ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ snmplenovoemc ▪ lenovoemc ▪ physicaldisk
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁸⁷

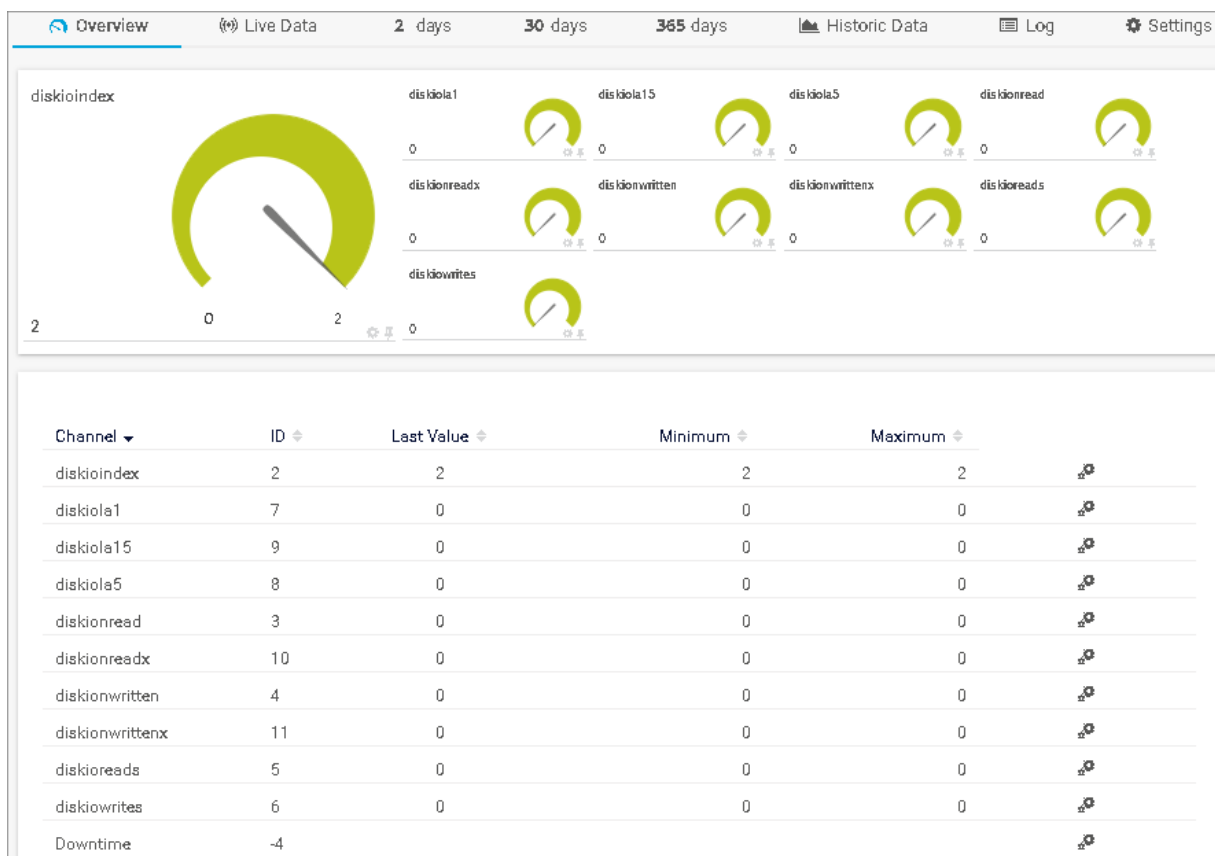

7.8.182 SNMP Library Sensor

The SNMP Library sensor uses a Management Information Base (MIB) file to create sensors that monitor a device via the Simple Network Management Protocol (SNMP).

- ❶ The content of the MIB file determines which data types are available for monitoring. When you create the sensor, it provides a list of counters that the target device returns based on every object identifier (OID) in the MIB file.
- ❷ The SNMP Library sensor does not appear as a running sensor. It uses the meta-scan facility of the probe to find or to match OIDs from the MIB file. It is useful because you do not have to manually enter OIDs.

To monitor SNMP-capable devices and to add sensors via the SNMP Library sensor, download the manufacturer's MIB files for the target device, convert the MIB files to the [OID library](#) format, and [import](#) them into PRTG. PRTG also provides [precompiled .oidlib files](#) that contain the OIDs of SNMP counters for the most common network devices.

For more information, see the Knowledge Base: [How do SNMP, MIBs and OIDs work?](#)

SNMP Custom Advanced Sensor Created by SNMP Library Sensor

Sensor in Other Languages

- Dutch: [SNMP Bibliotheek](#)
- French: [Bibliothèque SNMP](#)
- German: [SNMP-Bibliothek](#)

- Japanese: SNMP ライブラリ
- Portuguese: Biblioteca SNMP
- Russian: SNMP
- Simplified Chinese: SNMP 库
- Spanish: Biblioteca SNMP

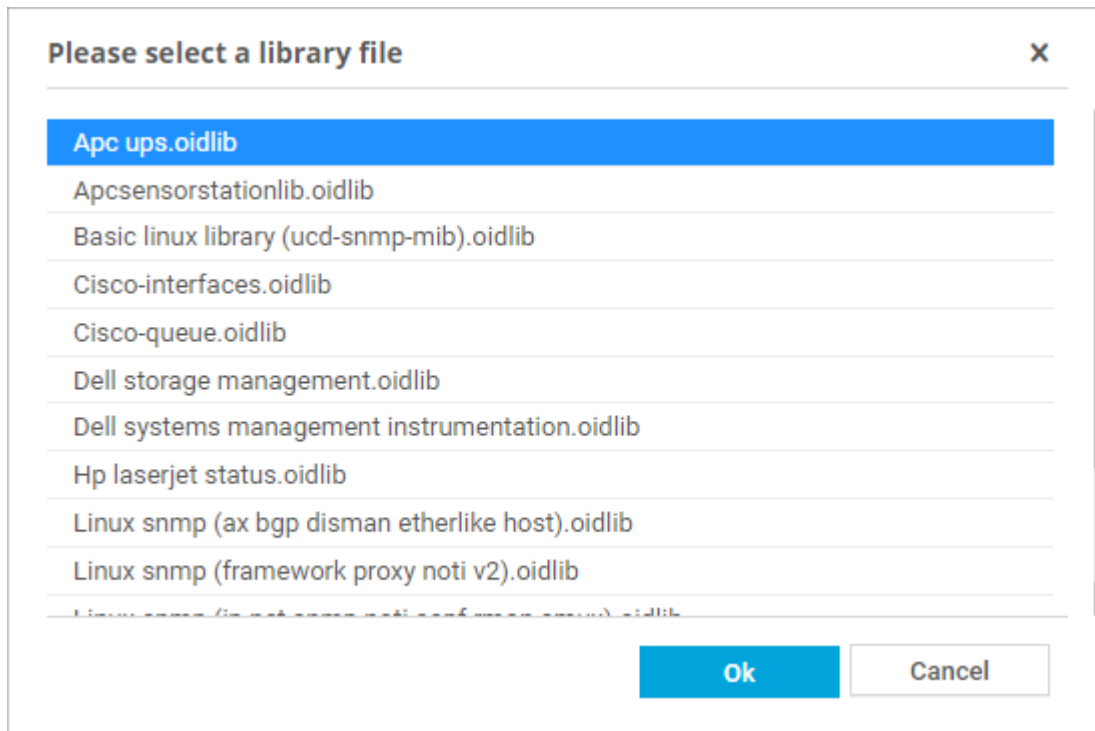

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- See the Knowledge Base: [How do SNMP, MIBs and OIDs work?](#)
- See the Knowledge Base: [How can I import my MIB files into PRTG?](#)
- See the Knowledge Base: [Can't find a sensor for my device in PRTG but I believe it supports SNMP. How to proceed?](#)

☁ To import MIB files into PRTG Hosted Monitor, [contact the Paessler support team](#) .

Add Sensor

PRTG shows a list of .oidlib files that are available on the system. This list contains all library files in the \snmplibs subfolder of the [PRTG program directory](#) . It contains both the default PRTG library files and your own library files.

List of SNMP Library Files

The library file names in the list indicate their purpose. Select a library file that is suitable for the target device (for example, choose an MIB file that you imported) and confirm via Ok.

i If the library file not suitable for the target device, this results in the error message [The scan for available monitoring items has failed on this device: No such object \(SNMP error # 222\)](#). If you see this message, click Cancel and try to add the sensor with a different library file.

The SNMP Library sensor takes a list of OIDs that you import from an MIB file into an `.oidlib` file and tests the OIDs against the target device to find the OIDs that the target device supports. This discovery process is the [meta-scan](#). If the sensor finds counters for the target device, the sensor settings open with a list of all available monitoring items.

The screenshot shows the 'SNMP Library Specific' configuration window. The library path is `C:\Program Files (x86)\PRTG Network Monitor\snmplibs\Linux SNMP (Framework Proxy Noti v2).oidlib`. Below the path is a search bar and a table of 'Library OIDs'. The table has columns for 'MIB Module', 'Category', and 'Name'. The visible rows are:

<input type="checkbox"/>	MIB Module	Category	Name
<input type="checkbox"/>	SNMP-MPD-MIB	snmpmpdstats	snmp unknown security models
<input type="checkbox"/>	SNMP-MPD-MIB	snmpmpdstats	snmp unknown pdu handlers
<input type="checkbox"/>	SNMP-MPD-MIB	snmpmpdstats	snmp invalid msgs
<input type="checkbox"/>	SNMPv2-MIB	sysor: 1	sysorup time
<input type="checkbox"/>	SNMPv2-MIB	sysor: 10	sysorup time
<input type="checkbox"/>	SNMPv2-MIB	sysor: 2	sysorup time

At the bottom, there is a red error message: **This field is required.** Below the table, there are radio buttons for 'If Value Changes': Ignore changes and Trigger 'change' notification.

List of SNMP Single Values: Sorted by MIB, Category, Name

The screenshot shows the 'SNMP Library Specific' configuration window. The library path is `C:\Program Files (x86)\PRTG Network Monitor\snmplibs\Linux SNMP (Source TCP UCD UDP).oidlib`. Below the path is a search bar and a table of 'Library OIDs'. The table has columns for 'MIB Module', 'Category', and 'Name'. The visible rows are:

<input type="checkbox"/>	MIB Module	Category	Name
<input type="checkbox"/>	UCD-DISKIO-MIB	diskio: 19	diskioindex
<input type="checkbox"/>	UCD-DISKIO-MIB	diskio: 2	diskiowrites
<input type="checkbox"/>	UCD-DISKIO-MIB	diskio: 2	diskioreads
<input type="checkbox"/>	UCD-DISKIO-MIB	diskio: 2	diskionwrittenx
<input type="checkbox"/>	UCD-DISKIO-MIB	diskio: 2	diskionwritten
<input type="checkbox"/>	UCD-DISKIO-MIB	diskio: 2	diskionwritten

At the bottom, there is a red error message: **This field is required.** Below the table, there are radio buttons for 'If Value Changes': Ignore changes and Trigger 'change' notification.

List of SNMP Table Values: Sorted by MIB, Category (Table Name/OID), Row, Name

The list of SNMP table values sequentially presents row values to help you find the values you are interested in.

- ⓘ You can also use the search function to find the desired group or category. The search matches individual strings, so if your string has a space in it, put the search string in quotes.

Select the counters that you want to monitor and click Save. PRTG creates sensors based on the OID types of the selected counters.

Add Sensor Settings

Setting	Description
Library	<p>Shows the path to the .oidlib file that this sensor uses.</p> <ul style="list-style-type: none"> ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Library OIDs	<p>Select the parameters that you want to monitor. The list is specific to your setup. The list contains all counters that are available in the .oidlib file that match the target device. Select one or more items by adding a check mark in front of the respective line.</p> <ul style="list-style-type: none"> ⓘ You can also select all items or cancel the selection by using the check box in the table header. <p>Depending on the type of the selected entries, PRTG creates the following sensors:</p> <ul style="list-style-type: none"> ▪ SNMP Custom Advanced sensor²⁴⁶⁴: For up to 10 channels for 10 OIDs each. For example, 22 selected single values result in 3 sensors: 2 sensors with 10 channels and 1 sensor with 2 channels. ▪ SNMP Custom String sensor²⁴⁷⁵: For each selected entry that returns a string value. ▪ SNMP Custom Table sensor²⁵⁰⁰: For up to 10 channels for 10 columns per row. The channels represent the values in the columns of the same row. <ul style="list-style-type: none"> ⓘ Once you create a custom SNMP sensor, you can create a device template⁴⁰¹⁹ from it and prepare it for distribution. For example, you can refine the template with better name templates.

In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

inherit from  Root

User Group Access 	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Import MIB Files

✂ Additionally, you can create your own `.oidlib` files by importing the device manufacturers' MIB files with the free [MIB Importer](#) tool. You can convert your MIB files and save the `.oidlib` file results to the `\snmplibs` subfolder of the [PRTG program directory](#) ⁴⁵²⁶.

■ For more information about the MIB Importer, see the Knowledge Base: [How can I import my MIB files into PRTG?](#)

If the `.oidlib` files that you import contain [lookups](#) ⁴⁴⁸⁵ (you can see this in section Lookup in the MIB Importer), you can define your own sensor states for the values that the lookups return. Add an SNMP Library sensor with this `.oidlib` file. PRTG then creates a lookup definition file using the lookupname of the chosen library as id parameter.

ⓘ PRTG adds the lookups without status definitions, so the sensor shows the Warning [status](#) ¹⁹⁷ by default. You have to edit the corresponding lookup files to get reliable alarms. Override the lookup definition with your own custom lookup. For more information, see section [Define Lookups](#) ⁴⁴⁹¹.

☁ To import MIB files into PRTG Hosted Monitor, [contact the Paessler support team](#) ⁴²⁶⁶.

Default .oidlib Files Overview

PRTG comes with the following `.oidlib` files.

ⓘ The `.oidlib` files might not support all devices or parameters.

.oidlib File	Description
APC UPS.oidlib	Monitors uninterruptible power supplies (UPSs) from APC American Power Conversion Corp.
APCSensorstationlib.oidlib	Monitors alarm status, communication status, humidity, and temperature as shown by an APC sensor station.
Basic Linux Library (UCD-SNMP-MIB).oidlib	Monitors basic system parameters on Linux systems, such as memory, disk and swap, CPU, and more.
cisco-interfaces.oidlib	Monitors Cisco-specific parameters, for example, the number of present network interfaces on a system, several states of an interface (admin, oper, speed, type, errors, discards, etc.), and more.
cisco-queue.oidlib	Monitors queues on a Cisco interface, for example, queue depth and its maximum, discarded messages from the queue, the number of the queue within the queue set, and more.
Dell Storage Management.oidlib	Monitors Dell storage devices. Possible parameters include disk arrays, battery and power supply, fan and temperature, virtual disk, and more.
Dell Systems Management Instrumentation.oidlib	Monitors the hardware of Dell systems. Possible parameters include ACPower and battery, alerts, base board, BIOS, Baseboard Management Controller (BMC), chassis, COO, cooling, event log, firmware, integrated development environment (IDE), keyboard, memory, port, network, processor, Small Computer System Interface (SCSI), system, temperature, USB, universally unique identifier (UUID), and more.
HP LaserJet Status.oidlib	Monitors toner, paper, and jam status of an HP LaserJet printer.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

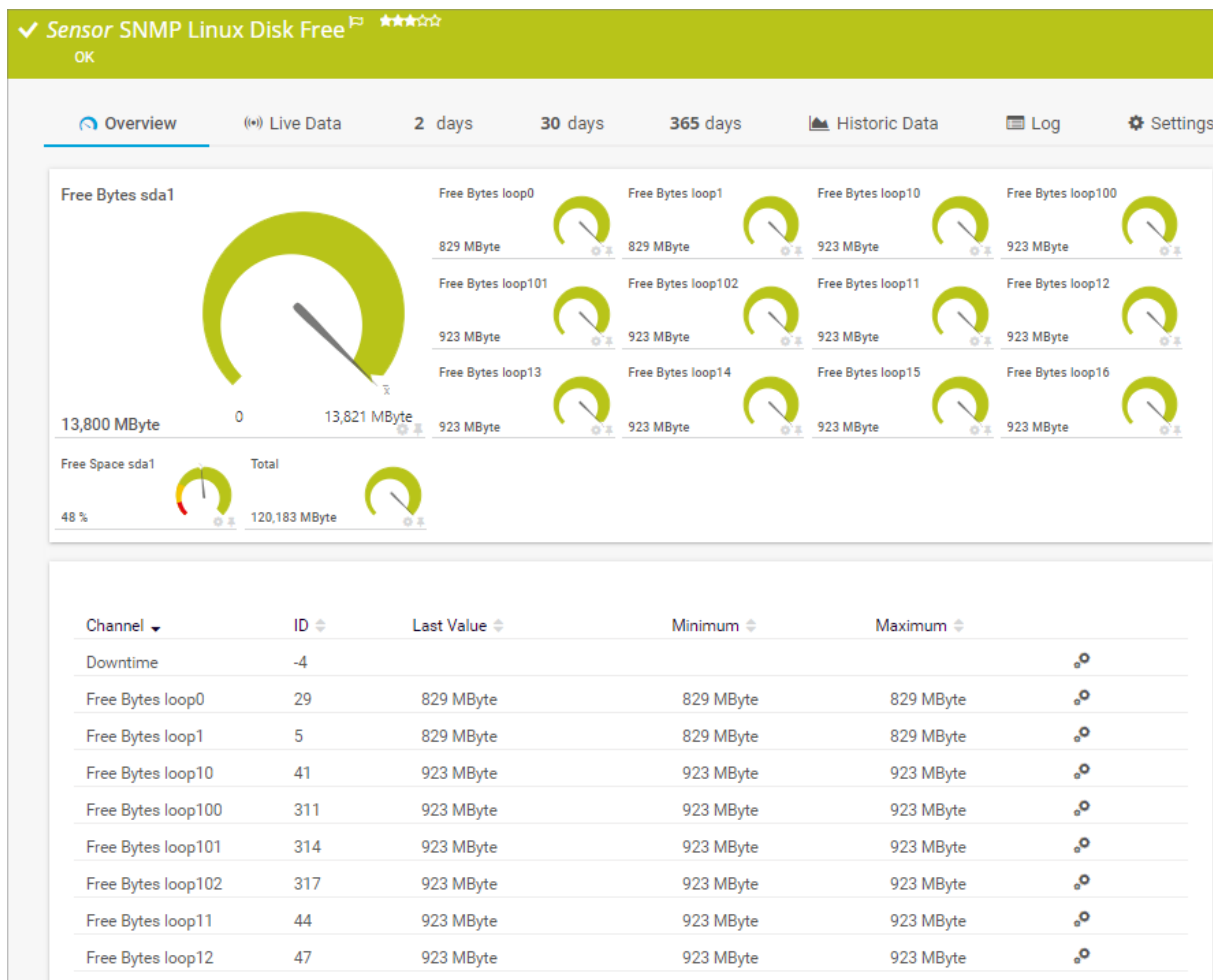

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.183 SNMP Linux Disk Free Sensor

The SNMP Linux Disk Free sensor monitors the free space on disks of a Linux/Unix system via the Simple Network Management Protocol (SNMP).

The free space that this sensor returns shows the disk space that is not yet used. Not all of this space may be available for use because a part of this space may be reserved by the system, for example, for redundancy purposes. For details, see the Knowledge Base: [Why do SSH Disk Free and SNMP Linux Disk Free show different values for my target Linux system?](#)

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Linux Disk Free Sensor

Sensor in Other Languages

- Dutch: SNMP Linux vrije schijf ruimte
- French: Espace disque libre SNMP Linux
- German: SNMP Linux-Datenträgerspeicher
- Japanese: SNMP Linux ディスクの空き容量
- Portuguese: Disco livre Linux SNMP

- Russian: Linux SNMP
- Simplified Chinese: SNMP Linux 磁盘可用空间
- Spanish: SNMP disco libre Linux

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- See the Knowledge Base: [Why do SSH Disk Free and SNMP Linux Disk Free show different values for my target Linux system?](#)
- See the Knowledge Base: [Monitoring Linux problem - SNMP port not reachable](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpdiskfreesensor ▪ diskspacesensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Set Limits Checked for ALL Disks

In this section, you can set limits that are valid for all channels and all drives. With limits, you can define when the sensor shows the Warning or Down [status](#)^[197], depending on the data provided by all drives that this sensor monitors. If you want to individually define limits for separate channels, use the limit settings in the [channel settings](#)^[397].

i All limits that you define here are valid in addition to the limits in the particular Channel settings. The limits are valid simultaneously, so the first limit that is breached applies.

Set Limits Checked For ALL Disks

Use the channel settings to set separate error limits or warning limits for each disk.

Percentage Limit Check ⓘ Only use the limits in the settings of the percentage channels
 Use the limits of both the sensor and the channel settings

Upper Error Limit ⓘ

Upper Warning Limit ⓘ

Lower Warning Limit ⓘ 25

Lower Error Limit ⓘ 10

Size Limit Check ⓘ Only use the limits in the settings of the byte size channels
 Use the limits of both the sensor and the channel settings

Alarm on Missing/Removed Disk ⓘ Deactivate alarm (default)
 Activate alarm

Set Limits Checked For ALL Disks

Setting	Description
Percentage Limit Check	<p>Enable or disable a limit check for the free space in percentage channels of all drives. By default, the sensor enables percentage limits with a lower warning limit and a lower error limit. Choose between:</p> <ul style="list-style-type: none"> Only use the limits in the settings of the percentage channels: Do not define sensor limits that are valid for all percentage channels. The sensor only uses the limits that you define in the settings of the particular "free space in percent" channels to determine the status. Use the limits of both the sensor and the channel settings: Define sensor limits that are valid for all percentage channels. Additional fields appear below. The sensor shows the Warning or the Down status when free space limits are above or below the limits.
Upper Error Limit	<p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify an upper limit in percent for the Down status. If the free disk space of one of your drives exceeds this value, the sensor changes to the Down status. Enter an integer value or leave the field empty.</p> <p>i The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Upper Warning Limit	<p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify an upper limit in percent for the Warning status. If the free disk space of one of your drives exceeds this value, the sensor changes to the Warning status. Enter an integer value or leave the field empty.</p>

Setting	Description
Lower Warning Limit	<p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p> <p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify a lower limit in percent for the Warning status. If the free disk space of one of your drives falls below this value, the sensor changes to the Warning status. Enter an integer value or leave the field empty.</p>
Lower Error Limit	<p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p> <p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify a lower limit in percent for the Down status. If the free disk space of one of your drives falls below this value, the sensor changes to the Down status. Enter an integer value or leave the field empty.</p>
Size Limit Check	<p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p> <p>Enable or disable a limit check for the free bytes channels of all drives:</p> <ul style="list-style-type: none"> ▪ Only use the limits in the settings of the byte size channels: Do not define sensor limits that are valid for all byte size channels. The sensor only uses limits that you define in the settings of the particular free space in bytes channels to determine the status. ▪ Use the limits of both the sensor and the channel settings: Define limits for the sensor that are valid for all byte size channels. Additional fields appear below. The sensor shows the Warning or Down status when free space limits are above or below the value. <p> By default, byte size limits are not enabled for drives.</p>
Upper Error Limit	<p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MB). If the free disk space of one of your drives exceeds this value, the sensor changes to the Down status. Enter an integer value or leave the field empty.</p> <p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>

Setting	Description
Upper Warning Limit	<p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MB). You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Alarm on Missing/Removed Disk	<p>If a monitored disk is removed or not found, the sensor sets the values to zero. Select the alarm approach in this case:</p> <ul style="list-style-type: none"> ▪ Deactivate alarm (default): Do not send an alert for a removed disk. ▪ Activate alarm: Send an alert if a monitored disk is removed or not found.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click ⓘ to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** ▼
None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule None ▼

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent

 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

7.8.185 SNMP Linux Meminfo Sensor

The SNMP Linux Meminfo sensor monitors the memory usage of a Linux/Unix system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Linux Meminfo Sensor

Sensor in Other Languages

- Dutch: SNMP Linux meminfo
- French: Info sur la mémoire SNMP Linux
- German: SNMP Linux Speicherinfo
- Japanese: SNMP Linux メモリ情報
- Portuguese: Linux Meminfo SNMP
- Russian: Linux Meminfo SNMP
- Simplified Chinese: SNMP Linux 内存信息
- Spanish: SNMP información de memoria Linux

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- See the Knowledge Base: [Monitoring Linux problem - SNMP port not reachable](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A list of tags with "exampletag" visible, and buttons for removing (X) and adding (+) tags.
- Priority:** A set of five star icons, all of which are filled, indicating a priority of 5.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p>

Setting	Description
	<p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpmeminfosensor ▪ memorysensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent

 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

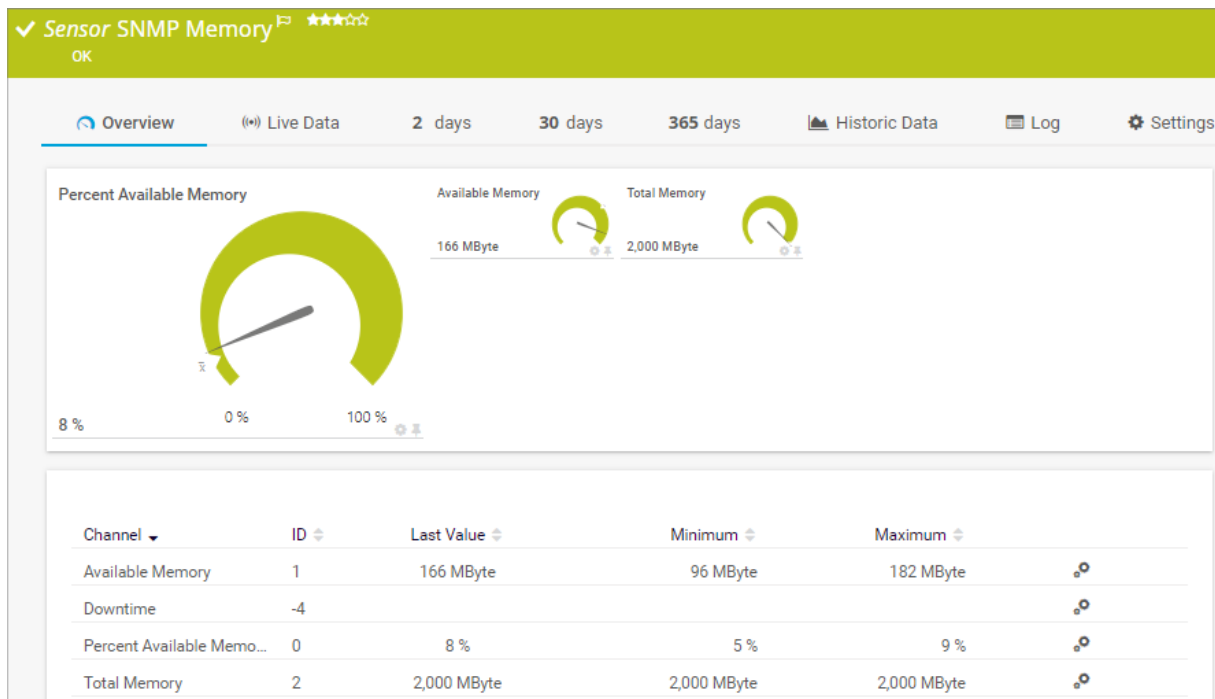

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.187 SNMP Memory Sensor

The SNMP Memory sensor monitors the memory usage of a system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

This sensor uses more generic object identifier (OID) values in comparison to the [SNMP Linux Meminfo sensor](#).

SNMP Memory Sensor

Sensor in Other Languages

- Dutch: SNMP Geheugen
- French: Mémoire SNMP
- German: SNMP Speicher
- Japanese: SNMP メモリ
- Portuguese: Memória SNMP
- Russian: SNMP
- Simplified Chinese: SNMP 内存
- Spanish: SNMP Memoria

Remarks

- It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.

- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Memory Settings

Setting	Description
Memory Type	<p>Select the memory types that you want to monitor. PRTG creates one sensor for each memory type that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority:** A section with five stars, where the first three are filled, indicating a priority of 3.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpmemoriesensor ▪ memory ▪ memoriesensor ▪ snmp
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor. ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how different channels are shown for this sensor: <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
<input type="radio"/> inherit from  Root	Scanning Interval ⓘ 60 seconds
	If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.188 SNMP NetApp Disk Free Sensor

The SNMP NetApp Disk Free sensor monitors the free space on disks of a NetApp storage system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP NetApp Disk Free Sensor

Sensor in Other Languages

- Dutch: SNMP NetApp Schijf Vrije Ruimte
- French: Espace disque libre NetApp SNMP
- German: SNMP NetApp-Datenträgerspeicher
- Japanese: SNMP NetApp 空きディスク
- Portuguese: Disco livre SNMP NetApp
- Russian: NetApp SNMP
- Simplified Chinese: SNMP NetApp 磁盘可用空间
- Spanish: SNMP Disco libre NetApp

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).
- See the Knowledge Base: [How can I monitor capacity and used disk space on a NetApp?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁸ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes 30 minutes

Setting	Description
	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules </p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

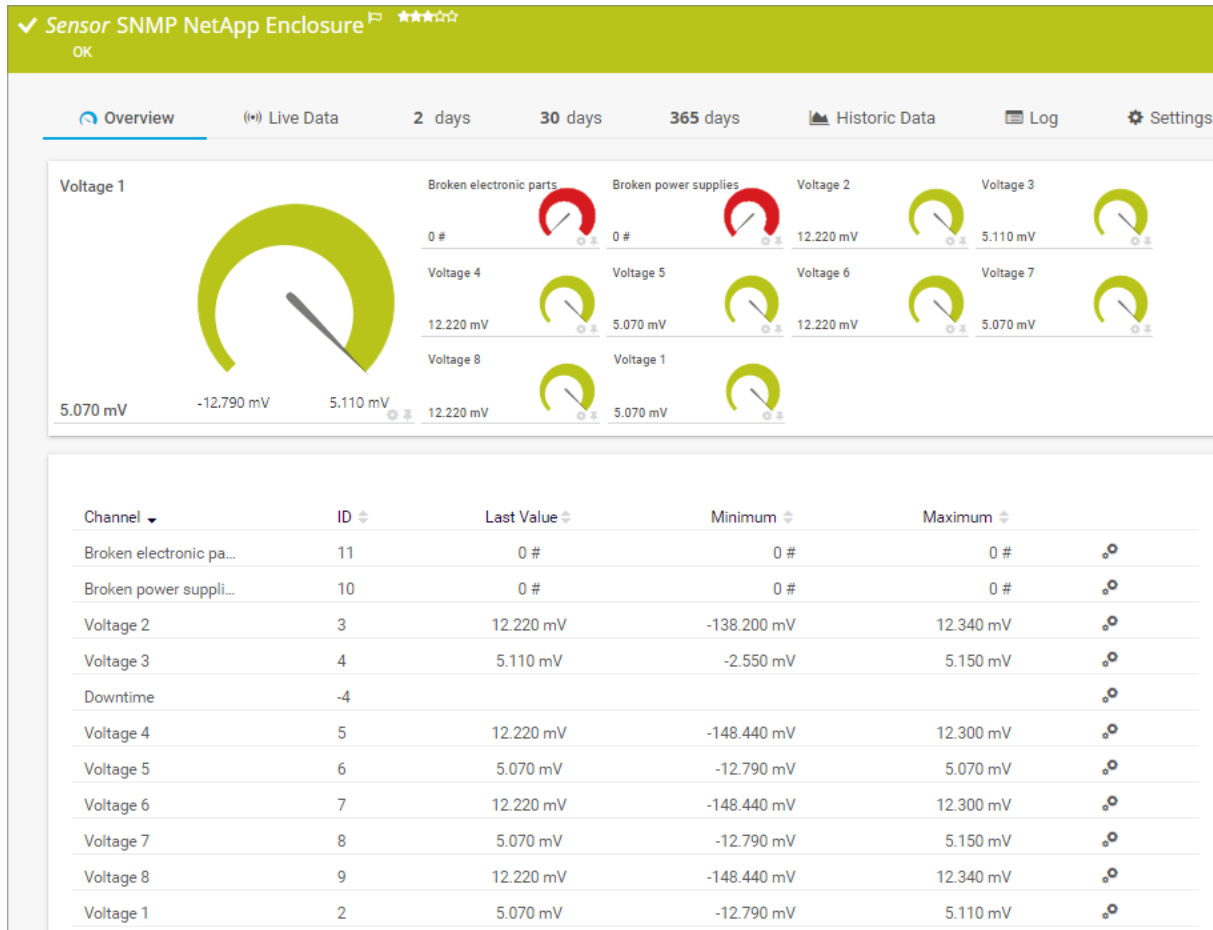

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.189 SNMP NetApp Enclosure Sensor

The SNMP NetApp Enclosure sensor monitors the power supply and cooling of an enclosure that is part of a NetApp storage system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP NetApp Enclosure Sensor

Sensor in Other Languages

- Dutch: SNMP NetApp Behuizing
- French: Boîtier NetApp SNMP
- German: SNMP NetApp Enclosure
- Japanese: SNMP NetApp エンクロージャ
- Portuguese: Gabinete NetApp via SNMP
- Russian: NetApp SNMP
- Simplified Chinese: SNMP NetApp 机箱
- Spanish: SNMP NetApp Enclosure

Remarks

- This sensor only supports NetApp versions up to 8.2.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor has predefined limits for several metrics. You can individually change these limits in the channel settings. For detailed information about channel limits, see section [Channel Settings](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

NetApp Enclosure Settings

Setting	Description
Enclosures	<p>Select the power supply and cooling measurements of the enclosures that you want to monitor. PRTG creates one sensor for each enclosure/measurement combination that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Sensor Name ⓘ Example Name

Tags ⓘ X +

Priority ⓘ ★★☆☆☆

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[406], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpnetappenclosuresensor ▪ snmpnetapp ▪ netapp
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

NetApp Enclosure Settings

NetApp Enclosure Settings

Setting	Description
Enclosure	Shows the identifier of the enclosure that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Measurement	Shows the type of measurement that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Sensor Settings Overview

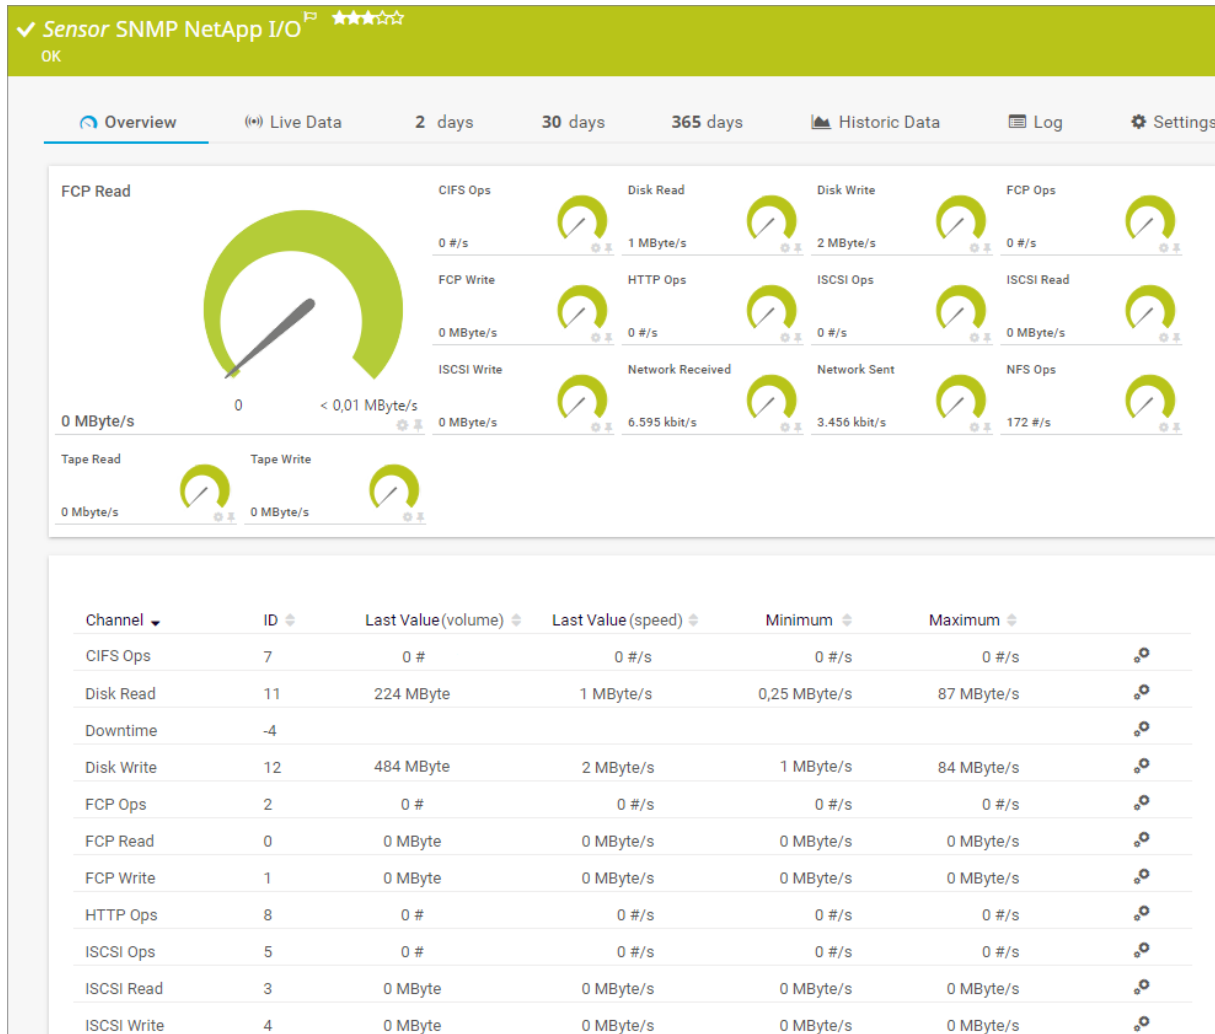

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.190 SNMP NetApp I/O Sensor

The SNMP NetApp I/O sensor monitors the input/output operations per second (IOPS) on a NetApp storage system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP NetApp I/O Sensor

Sensor in Other Languages

- Dutch: SNMP NetApp I/O
- French: NetApp SNMP E/S
- German: SNMP NetApp E/A
- Japanese: SNMP NetApp I/O
- Portuguese: E/S SNMP NetApp
- Russian: - NetApp SNMP
- Simplified Chinese: SNMP NetApp I/O

- Spanish: SNMP NetApp I/O

Remarks

- This sensor only supports NetApp versions up to 8.2.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- If you use NetApp cDOT 8.3 or NetApp ONTAP 9.0 or later, we recommend that you use the [NetApp I/O sensor](#) instead.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field with the placeholder "Example Name".
- Tags:** A list of tags with "exampletag" currently selected. There are "X" and "+" icons for removing and adding tags.
- Priority:** A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpnetappiosensor ▪ snmpnetapp ▪ netapp
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>

Setting	Description
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> i You can change the available intervals in the system administration on PRTG on premises installations. </p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p> i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply. </p> <p> i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply. </p> <p> i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply. </p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None ▼

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

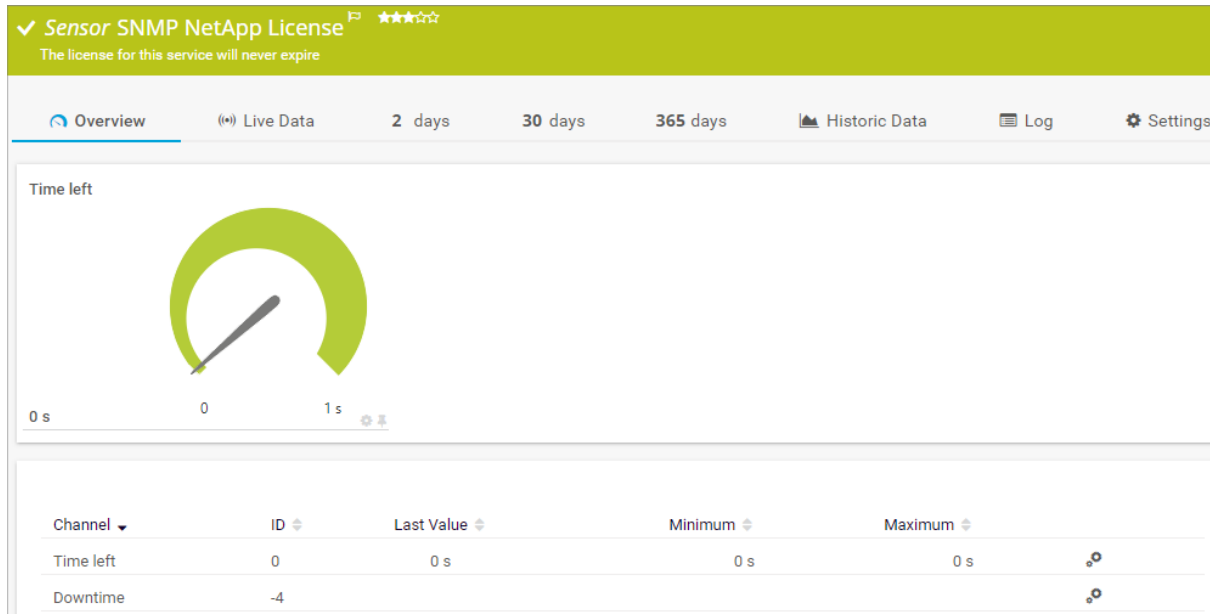

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.191 SNMP NetApp License Sensor

The SNMP NetApp License sensor monitors the licenses for the services of a NetApp storage system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP NetApp License Sensor

Sensor in Other Languages

- Dutch: SNMP NetApp licentie
- French: Licence NetApp SNMP
- German: SNMP NetApp Lizenz
- Japanese: SNMP NetApp ライセンス
- Portuguese: Licença SNMP NetApp
- Russian: NetApp SNMP
- Simplified Chinese: SNMP NetApp 许可证
- Spanish: SNMP Licencia NetApp

Remarks

- This sensor only supports NetApp versions up to 8.2.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

NetApp License Settings

Setting	Description
Licenses for Services	<p>Select the licenses for the services that you want to monitor. PRTG creates one sensor for each license that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority**: A selection of three stars out of five.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags [145] that the sensor inherits [145] from its parent device [140], parent group [139], and parent probe [139]. <p>i This setting is for your information only. You cannot change it.</p>
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited [145]. <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpnetapplicensesensor ▪ snmpnetapp ▪ netapp
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

NetApp License Settings

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.192 SNMP NetApp Logical Unit Sensor

The SNMP NetApp Logical Unit sensor monitors the input/output operations per second (IOPS) on a logical unit of a NetApp storage system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP NetApp Logical Unit Sensor

Sensor in Other Languages

- Dutch: SNMP NetApp Logical Unit
- French: Unité logique NetApp SNMP
- German: SNMP NetApp Logische Einheit
- Japanese: SNMP NetApp 論理ユニット
- Portuguese: Unidade lógica SNMP NetApp
- Russian: NetApp SNMP
- Simplified Chinese: SNMP NetApp 逻辑单元
- Spanish: Unidad lógica NetApp por SNMP

Remarks

- This sensor only supports NetApp versions up to 8.2.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- If you use NetApp cDOT 8.3 or NetApp ONTAP 9.0 or later, we recommend that you use the [NetApp LUN sensor](#) instead.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

NetApp Logical Unit Settings

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **None**

Maintenance Window **Do not set up a one-time maintenance window**
 Set up a one-time maintenance window

Dependency Type **Use parent**
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

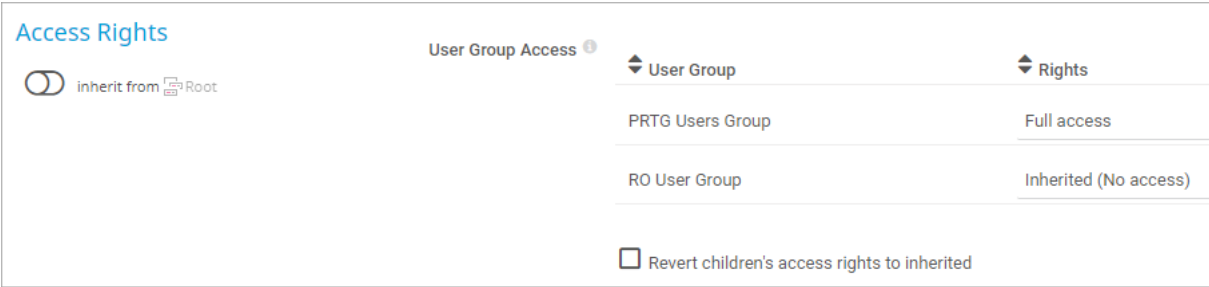

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

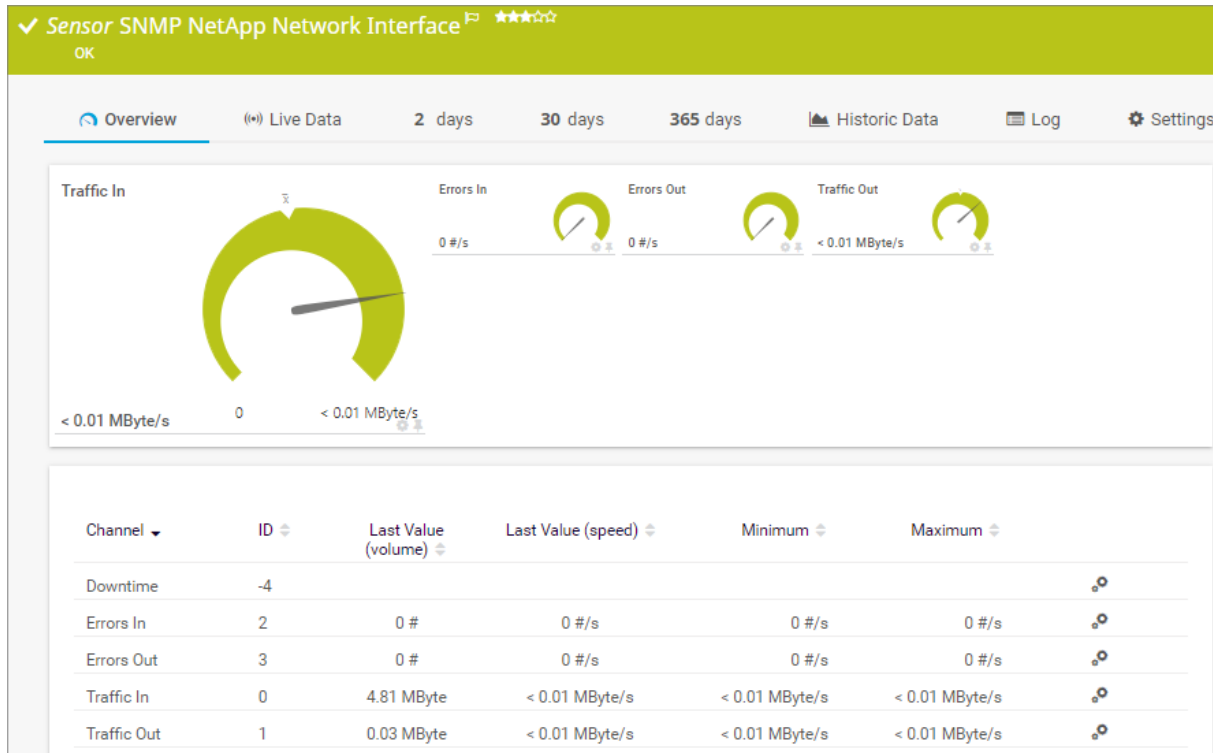

- [List of Available Sensor Types](#)⁴⁵⁹¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷

- [Notification Triggers Settings](#) 

7.8.193 SNMP NetApp Network Interface Sensor

The SNMP NetApp Network Interface sensor monitors a network card of a NetApp storage system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP NetApp Network Interface Sensor

Sensor in Other Languages

- Dutch: SNMP NetApp Network Interface
- French: Interface réseau NetApp SNMP
- German: SNMP NetApp Netzwerkschnittstelle
- Japanese: SNMP NetApp ネットワークインターフェース
- Portuguese: Interface de rede SNMP NetApp
- Russian: NetApp SNMP
- Simplified Chinese: SNMP NetApp 网络接口
- Spanish: SNMP Interface de red NetApp

Remarks

- This sensor only supports NetApp versions up to 8.2.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.

- If you use NetApp cDOT 8.3 or NetApp ONTAP 9.0 or later, we recommend that you use the [NetApp NIC sensor](#) instead.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

NetApp Network Interface Settings

Setting	Description
Network Interface	<p>Select the network interfaces that you want to monitor. PRTG creates one sensor for each interface that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has a title bar 'Basic Sensor Settings'. Below the title bar, there are three main sections:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority**: A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags that the sensor inherits from its parent device , parent group , and parent probe . ⓘ This setting is for your information only. You cannot change it.
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited . ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor: <ul style="list-style-type: none"> ▪ snmpnetappnetworkinterfacesensor ▪ snmpnetapp ▪ netapp
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Part 7: Device and Sensor Setup | 8 Sensor Settings
193 SNMP NetApp Network Interface Sensor

My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Sensor Settings Overview

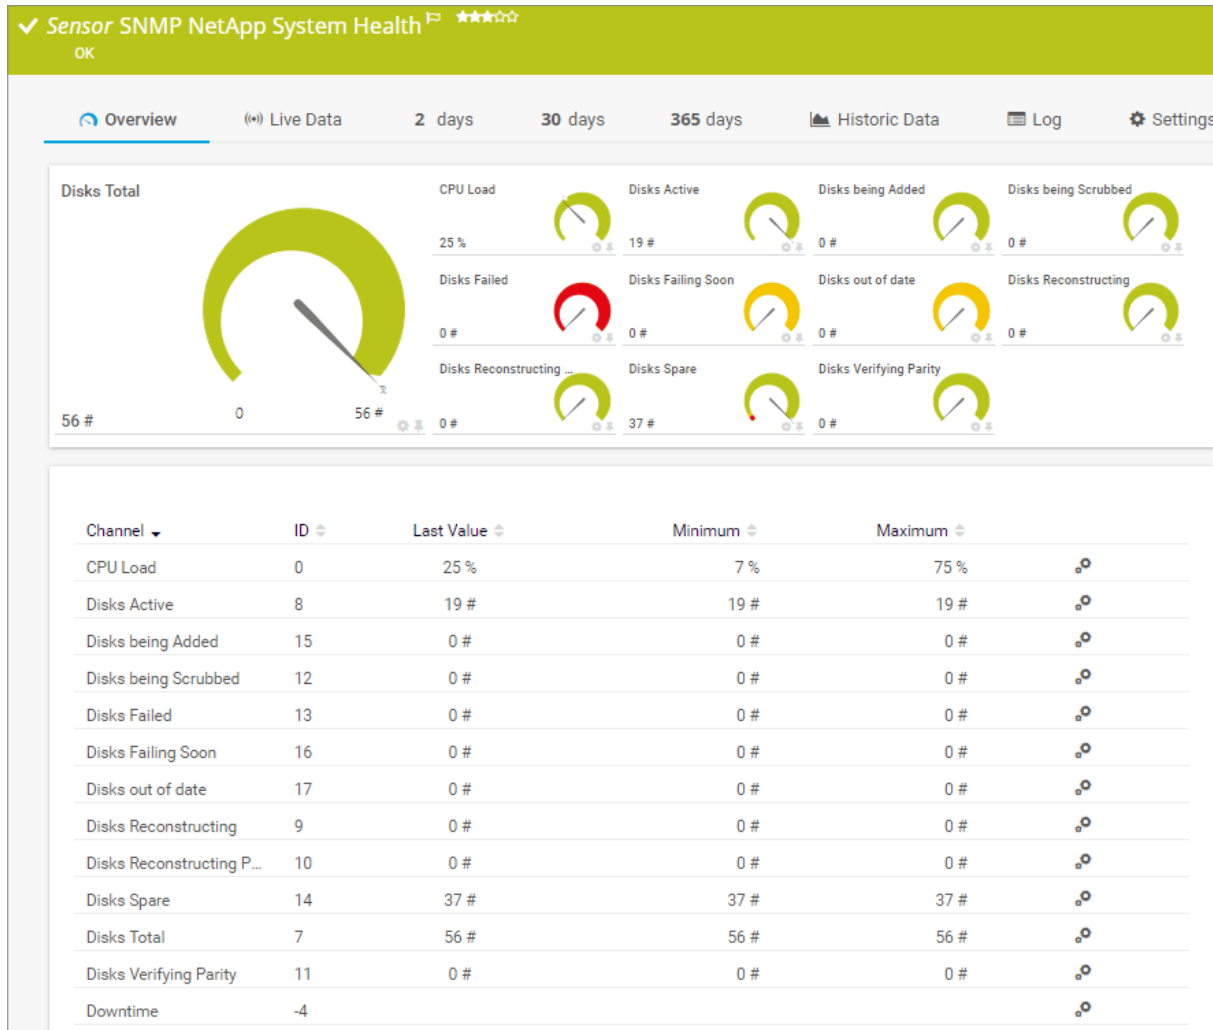

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.194 SNMP NetApp System Health Sensor

The SNMP NetApp System Health sensor monitors the status of a NetApp storage system via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP NetApp System Health Sensor

Sensor in Other Languages

- Dutch: SNMP NetApp Systemstatus
- French: Intégrité du système NetApp SNMP
- German: SNMP NetApp Systemzustand
- Japanese: SNMP NetApp システム正 常 性
- Portuguese: Funcionamento do sistema SNMP NetApp
- Russian: NetApp SNMP
- Simplified Chinese: SNMP NetApp 系统 健康 状况

- Spanish: SNMP Salud de sistema NetApp

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- If you use NetApp cDOT 8.3 or NetApp ONTAP 9.0 or later, we recommend that you use the [NetApp System Health sensor](#) instead.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A list of tags with "exampletag" selected. There are "X" and "+" icons for removing and adding tags.
- Priority:** A star rating system showing 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p>

Setting	Description
	<p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> snmpnetappsystemhealthsensor snmpnetapp netapp
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel.

Setting	Description
	<ul style="list-style-type: none"> Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁸ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes 30 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None ▼

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

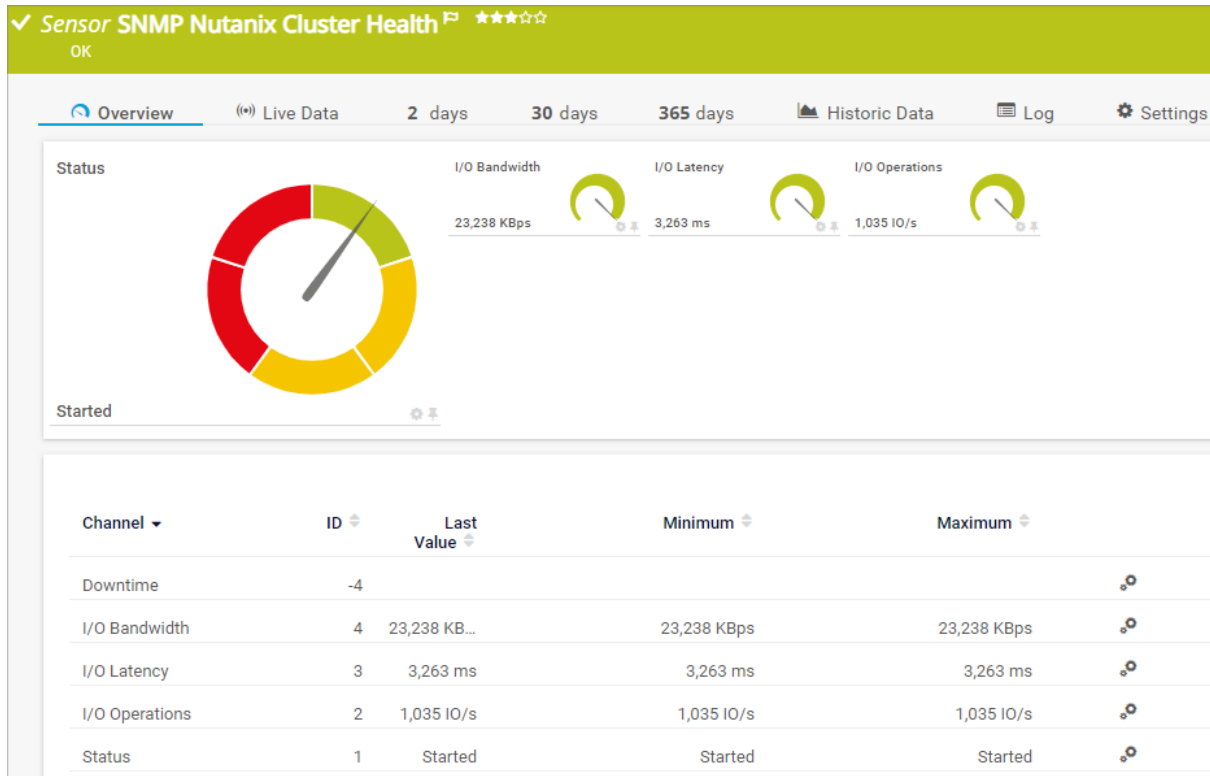

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972

- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.195 SNMP Nutanix Cluster Health Sensor

The SNMP Nutanix Cluster Health sensor monitors the status and the performance of a Nutanix cluster via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Nutanix Cluster Health Sensor

Sensor in Other Languages

- Dutch: SNMP Nutanix Cluster Health
- French: État de cluster SNMP Nutanix
- German: SNMP Nutanix Clusterzustand
- Japanese: SNMP Nutanix クラスターの正常性
- Portuguese: Funcionamento do cluster Nutanix SNMP
- Russian: SNMP Nutanix
- Simplified Chinese: SNMP Nutanix 群集运行状况
- Spanish: Estado de clúster Nutanix con SNMP

Remarks

- Nutanix devices only support [SNMP v3](#). Make sure that you select SNMP v3 in the [credentials for SNMP devices](#) settings of the parent device.
- This sensor supports the IPv6 protocol.

- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

System Specific

Setting	Description
Measurement	<p>Select the measurements that you want to monitor. PRTG creates one sensor for each measurement that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' to remove it and a plus sign to add more.
- Priority:** A section with five stars, where the first three are filled, indicating a priority of 3.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpnutanixclusterhealthsensor ▪ snmp ▪ nutanix
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

Sensor Settings Overview

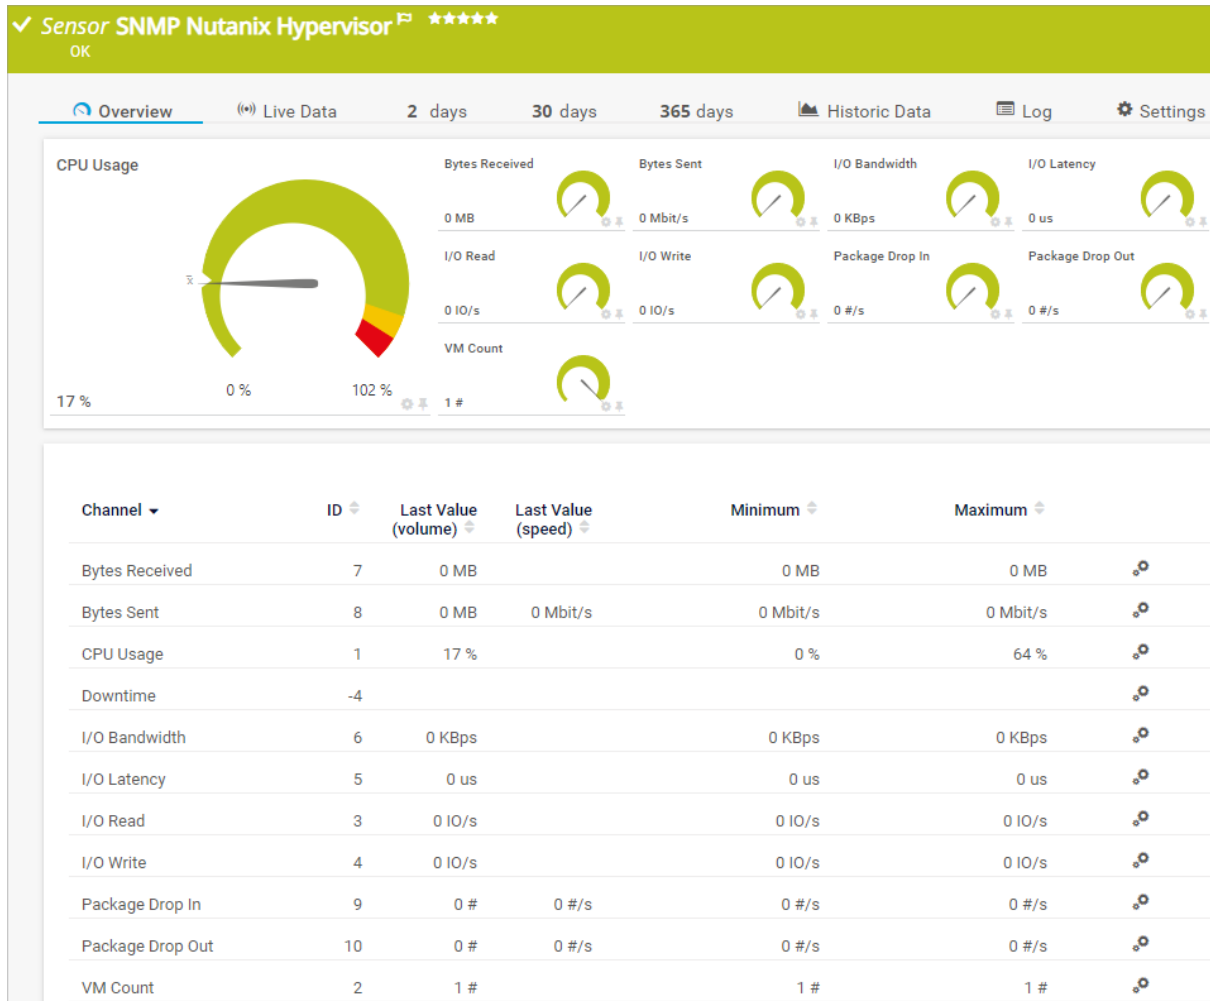

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁸⁷

7.8.196 SNMP Nutanix Hypervisor Sensor

The SNMP Nutanix Hypervisor sensor monitors a Nutanix hypervisor via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Nutanix Hypervisor Sensor

Sensor in Other Languages

- Dutch: SNMP Nutanix Hypervisor
- French: Hyperviseur SNMP Nutanix
- German: SNMP Nutanix Hypervisor
- Japanese: SNMP Nutanix ハイパーバイザー
- Portuguese: Hipervisor Nutanix SNMP
- Russian: SNMP Nutanix
- Simplified Chinese: SNMP Nutanix 虚拟机监控程序
- Spanish: Hipervisor Nutanix con SNMP

Remarks

- Nutanix devices only support **SNMP v3**. Make sure that you select SNMP v3 in the [credentials for SNMP devices](#) settings of the parent device.
- This sensor supports the IPv6 protocol.
- This sensor has a low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration^[4187] on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

7.8.197 SNMP Poseidon Environment Sensor

The SNMP Poseidon Environment sensor monitors performance counters for environmental measurements on Poseidon hardware via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Poseidon Environment Sensor

Sensor in Other Languages

- Dutch: SNMP Poseidon Omgeving
- French: Environnement Poseidon SNMP
- German: SNMP Poseidon-Umgebung
- Japanese: SNMP Poseidon 環境
- Portuguese: Ambiente Poseidon SNMP
- Russian: Poseidon SNMP
- Simplified Chinese: SNMP Poseidon 环境
- Spanish: Entorno Poseidon con SNMP

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- For a general introduction to the technology behind SNMP, see section [Monitoring via SNMP](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Sensor Settings Overview

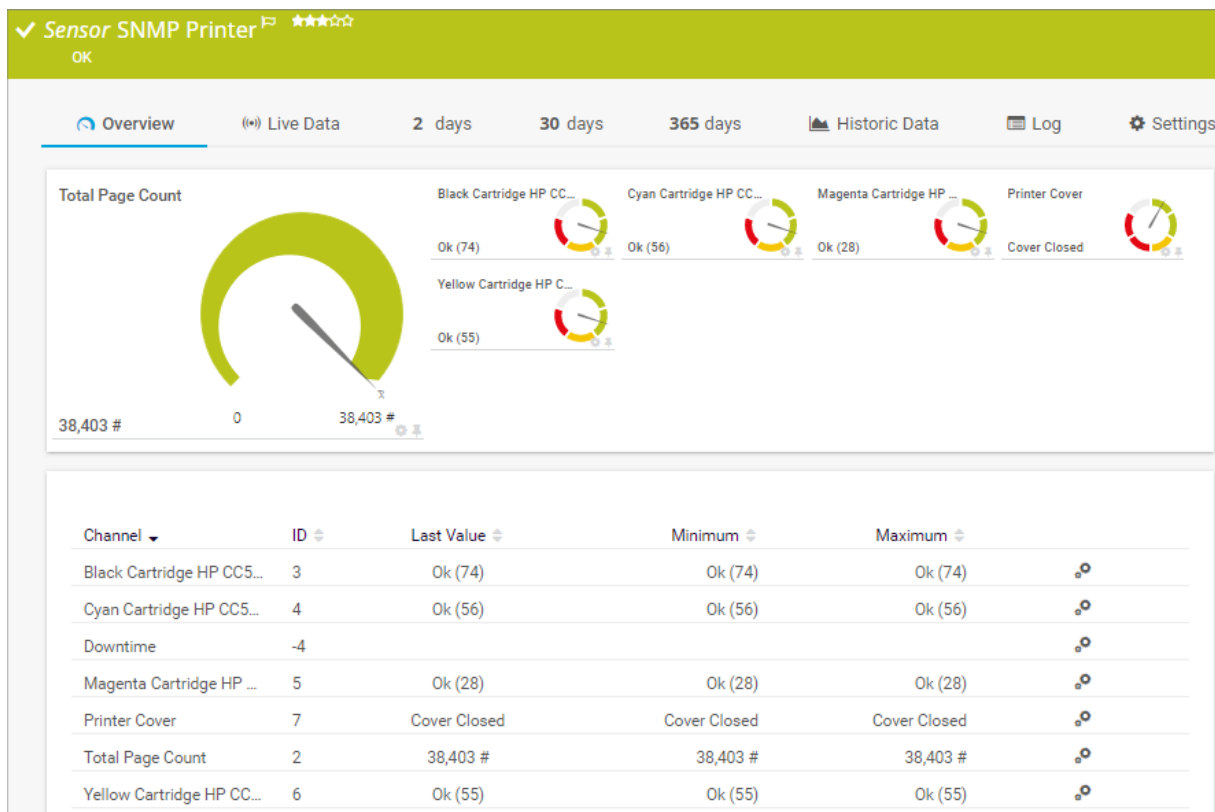

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.198 SNMP Printer Sensor

The SNMP Printer sensor monitors various types of printers via the Simple Network Management Protocol (SNMP).

- ① The sensor supports the following printers, among others: [HP OfficeJet](#) printers, [HP LaserJet](#) printers, [RICOH SP 5200](#), [SP 3410](#), [SP C242DN](#), [MP C3003](#), and [MP C2503](#).
- ① The sensor also shows the printer status as the sensor message.
- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Printer Sensor

Sensor in Other Languages

- Dutch: SNMP Printer
- French: Imprimante SNMP
- German: SNMP Drucker
- Japanese: SNMP プリンター
- Portuguese: Impressora de SNMP
- Russian: SNMP
- Simplified Chinese: SNMP 打印机
- Spanish: Impresora de SNMP

Remarks

- This sensor supports the following printers, among others: HP OfficeJet printers, HP LaserJet printers, RICOH SP 5200, SP 3410, SP C242DN, MP C3003, and MP C2503.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A tag input field containing "exampletag" with a close button (X) and an add button (+).
- Priority:** A section with five star icons, all of which are filled, indicating a priority of 5.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <ul style="list-style-type: none"> ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmp ▪ printer
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

7.8.199 SNMP QNAP Logical Disk Sensor

The SNMP QNAP Logical Disk sensor monitors a logical disk in a Quality Network Appliance Provider (QNAP) network-attached storage (NAS) via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP QNAP Logical Disk Sensor

Sensor in Other Languages

- Dutch: SNMP QNAP Logische Schijf
- French: Disque logique QNAP SNMP
- German: SNMP QNAP Logischer Datenträger
- Japanese: SNMP QNAP 論理ディスク
- Portuguese: Disco lógico QNAP SNMP
- Russian: QNAP SNMP
- Simplified Chinese: SNMP QNAP 逻辑磁盘
- Spanish: Disco lógico de QNAP con SNMP

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

QNAP NAS Settings

Setting	Description
Disk	<p>Select the logical disks that you want to monitor. PRTG creates one sensor for each logical disk that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with three stars selected.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁸⁷

7.8.200 SNMP QNAP Physical Disk Sensor

The SNMP QNAP Physical Disk sensor monitors a physical disk in a Quality Network Appliance Provider (QNAP) network-attached storage (NAS) via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP QNAP Physical Disk Sensor

Sensor in Other Languages

- Dutch: SNMP QNAP Fysieke Schijf
- French: Disque physique QNAP SNMP
- German: SNMP QNAP Physikalischer Datenträger
- Japanese: SNMP QNAP 物理ディスク
- Portuguese: Disco físico QNAP SNMP
- Russian: QNAP SNMP
- Simplified Chinese: SNMP QNAP 物理磁盘
- Spanish: Disco físico de QNAP con SNMP

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

QNAP NAS Settings

Setting	Description
Disk	<p>Select the physical disks that you want to monitor. PRTG creates one sensor for each physical disk that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>
Unit	<p>Select the unit of the temperature measurement:</p> <ul style="list-style-type: none"> ▪ Celsius ▪ Fahrenheit

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has a title bar 'Basic Sensor Settings'. Below it, there are three rows of settings:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority**: A row of five stars, with the first three filled (yellow) and the last two empty (white).

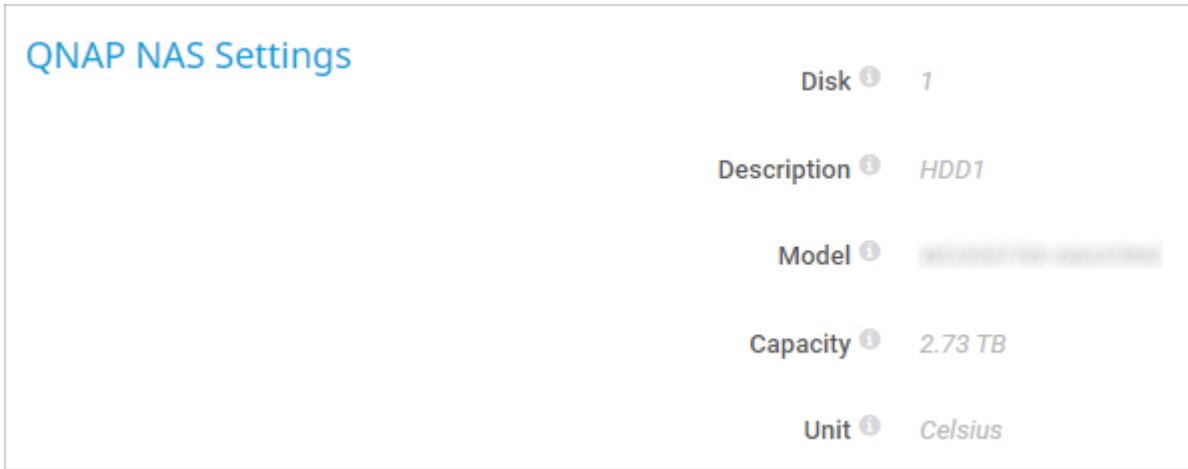

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpqnap ▪ qnap ▪ physicaldisk
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

QNAP NAS Settings

QNAP NAS Settings

Setting	Description
Disk	Shows the physical disk that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Description	Shows information about the physical disk that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Model	Shows the model of the physical disk that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Capacity	Shows the capacity of the physical disk that this sensor monitors. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Unit	Shows the unit of the temperature measurement. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click ⓘ to interrupt the [inheritance](#).

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Sensor Settings Overview

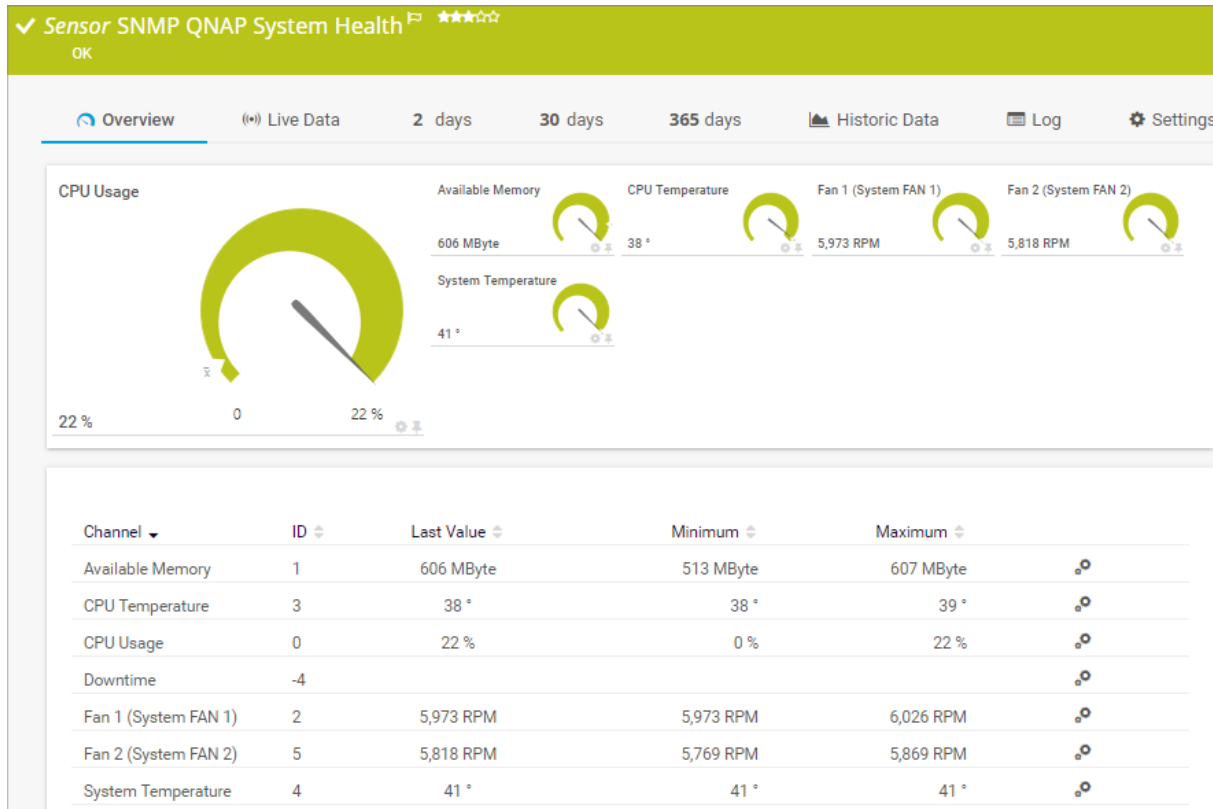

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.202 SNMP RMON Sensor

The SNMP RMON sensor monitors traffic on a device using the Remote Monitoring (RMON) standard via the Simple Network Management Protocol (SNMP).

i You can create it on an SNMP-compatible device that provides traffic data via RMON. Depending on the data that the device returns, PRTG displays traffic data for each port in different channels, which allows a detailed analysis. If available, the sensor queries 64-bit counters.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP RMON Sensor

Sensor in Other Languages

- Dutch: SNMP RMON
- French: RMON SNMP
- German: SNMP RMON
- Japanese: SNMP RMON
- Portuguese: SNMP RMON
- Russian: RMON SNMP
- Simplified Chinese: SNMP RMON

- Spanish: SNMP RMON

Remarks

- You can define the displayed sensor name with port name templates in the [SNMP compatibility options](#) ^[465] of the parent device.
- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `::1`). [Add this device to PRTG](#) ^[340] with the IP address that it has in your network and create the SNMP sensor on this device instead.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- See the Knowledge Base: [What value does the "Transmitted" channel of an RMON sensor show?](#)
- See the Knowledge Base: [Automatically update port name and number for SNMP Traffic sensors when the device changes them](#)
- See the Knowledge Base: [Where is the volume line in graphs?](#)

Add Sensor

The [Add Sensor](#) ^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

RMON Specific

Setting	Description
Ports	<p>Select the ports that you want to monitor. PRTG creates one sensor for each port that you select.</p> <ul style="list-style-type: none"> ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. ⓘ You can select interfaces and cancel the selection by clicking <code>Select all connected interfaces</code>, <code>Select all disconnected interfaces</code>, and <code>Deselect all interfaces</code>.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes 30 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. 7.8.203 SNMP SonicWall System Health Sensor

The SNMP SonicWall System Health sensor monitors health values of a SonicWall Network Security Appliance (NSA) via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP SonicWall System Health Sensor

Sensor in Other Languages

- Dutch: SNMP SonicWall Systeem Gezondheid
- French: État du système SNMP SonicWall
- German: SNMP SonicWall Systemzustand
- Japanese: SNMP SonicWall システム正常性
- Portuguese: Funcionamento do sistema SonicWall SNMP
- Russian: SonicWall SNMP
- Simplified Chinese: SNMP SonicWall 系统健康状况
- Spanish: Salud del sistema de SonicWall con SNMP

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- See the Knowledge Base: [Why does PRTG write error messages into my SonicWall log?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog box. It has a title bar 'Basic Sensor Settings' in blue. Below the title bar, there are three rows of settings:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A text input field containing 'exampletag' with a blue 'x' icon to the right and a plus sign icon to the left of the input field.
- Priority**: A star rating system showing three filled stars and two empty stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p>

Setting	Description

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent

 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.204 SNMP SonicWall VPN Traffic Sensor

The SNMP SonicWall VPN Traffic sensor monitors the traffic of an Internet Protocol Security (IPsec) VPN on a SonicWall Network Security Appliance (NSA) via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP SonicWall VPN Traffic Sensor

Sensor in Other Languages

- Dutch: SNMP SonicWall VPN Verkeer
- French: Trafic VPN SonicWall SNMP
- German: SNMP SonicWall VPN-Datenverkehr
- Japanese: SNMP SonicWall VPN トラフィック
- Portuguese: Tráfego de VPN SonicWall via SNMP
- Russian: VPN SonicWall SNMP
- Simplified Chinese: SNMP SonicWall VPN 流量
- Spanish: Tráfico SNMP de VPN SonicWall

Remarks

- This sensor supports the IPv6 protocol.

- This sensor has a very low performance impact.
- See the Knowledge Base: [Why does PRTG write error messages into my SonicWall log?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

SonicWall VPN Specific

Setting	Description
Connections	<p>Select the connections that you want to monitor. PRTG creates one sensor for each connection that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>
Identification Method	<p>Define how you want to identify the connection that you want to monitor:</p> <ul style="list-style-type: none"> ▪ Index: Every connection has a unique index. This is the safest method to identify your connection. If the connection is lost and reconnected, it receives a new index. ▪ Remote IP address: If the target of the VPN always has the same IP address, you can use this IP address to identify the connection. ▪ Security policy name: If you use a different security policy for every VPN, you can use its name to identify the connection. ▪ Remote IP address and security policy name: You can also combine both identification methods. ▪ Remote IP address, security policy name, and IP address ranges: If you use separate connections for specific IP address ranges, identify the connection by remote IP address, security policy name, and IP address ranges. ▪ IP address ranges: Use IP address ranges only to identify the connection. <p>i The sensor always uses the first connection that it finds that matches all criteria.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click to interrupt the [inheritance](#)¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
<input type="radio"/> inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Sensor Settings Overview

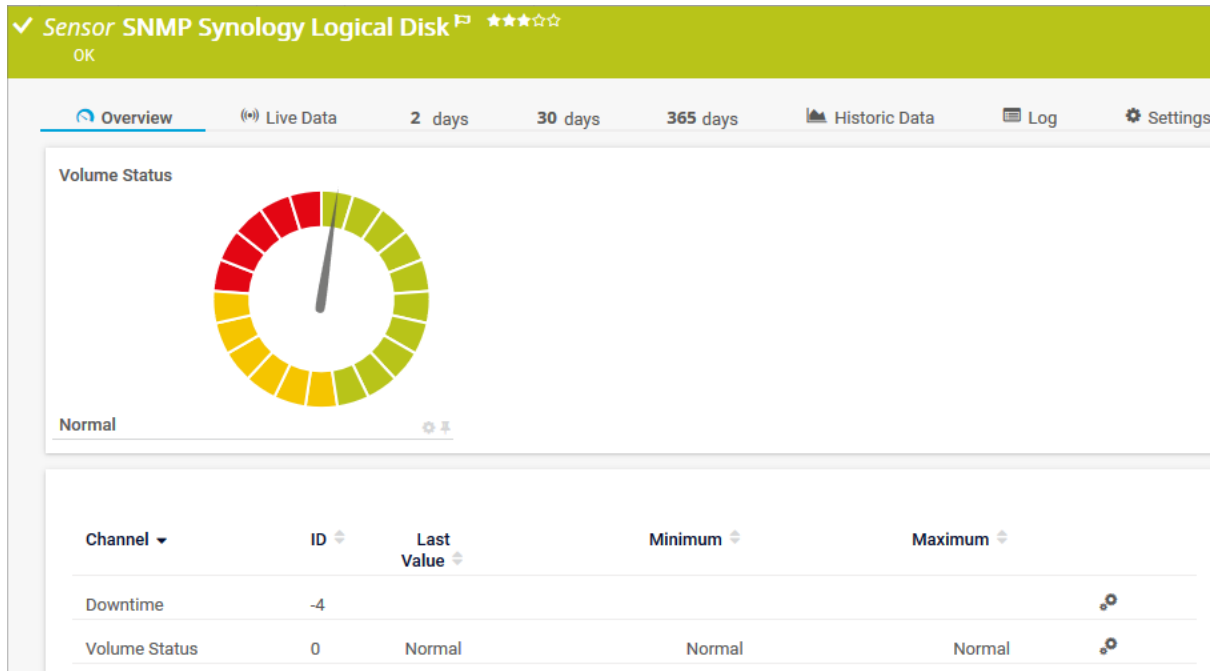

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.205 SNMP Synology Logical Disk Sensor

The SNMP Synology Logical Disk sensor monitors a logical disk in a Synology network-attached storage (NAS) via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Synology Logical Disk Sensor

Sensor in Other Languages

- Dutch: SNMP Synology Logische Schijf
- French: Disque logique Synology SNMP
- German: SNMP Synology Logischer Datenträger
- Japanese: SNMP Synology 論理ディスク
- Portuguese: Disco lógico Synology SNMP
- Russian: Synology SNMP
- Simplified Chinese: SNMP Synology 逻辑磁盘
- Spanish: Disco lógico de Synology con SNMP

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Synology NAS Settings

Setting	Description
Disk	<p>Select the logical disks that you want to monitor. PRTG creates one sensor for each logical disk that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' configuration window. It includes the following elements:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a plus sign icon to the right.
- Priority:** A field with five star icons, three of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	Shows tags [145] that the sensor inherits [145] from its parent device [140], parent group [139], and parent probe [139]. <p>i This setting is for your information only. You cannot change it.</p>
Tags	Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited [145]. <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpsynology ▪ synology ▪ logicaldisk
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁸⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays

Setting	Description
	<ul style="list-style-type: none"> ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency.

Setting	Description
	<ul style="list-style-type: none"> Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies [4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector [251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Sensor Settings Overview

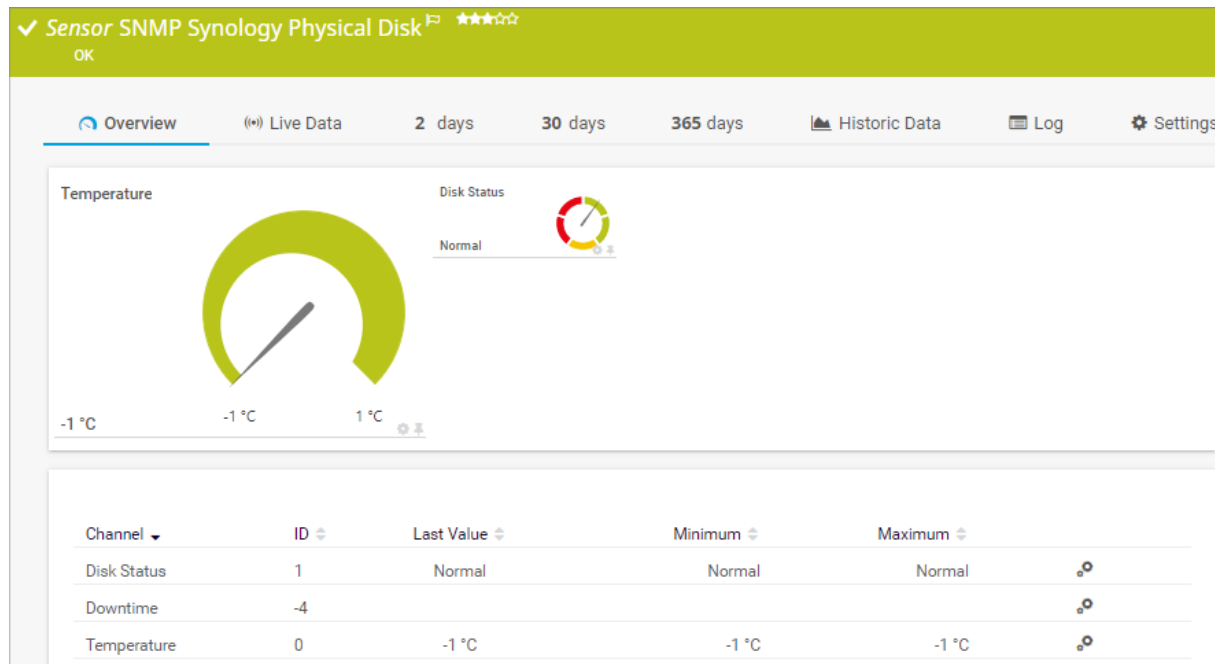

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.206 SNMP Synology Physical Disk Sensor

The SNMP Synology Physical Disk sensor monitors a physical disk in a Synology network-attached storage (NAS) via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Synology Physical Disk Sensor

Sensor in Other Languages

- Dutch: SNMP-Synology Fysieke Schijf
- French: Disque physique Synology SNMP
- German: SNMP Synology Physikalischer Datenträger
- Japanese: SNMP Synology 物理ディスク
- Portuguese: Disco físico Synology SNMP
- Russian: Synology SNMP
- Simplified Chinese: SNMP Synology 物理磁盘
- Spanish: Disco físico de Synology con SNMP

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Synology NAS Settings

Setting	Description
Disk	<p>Select the physical disks that you want to monitor. PRTG creates one sensor for each physical disk that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with three stars selected.

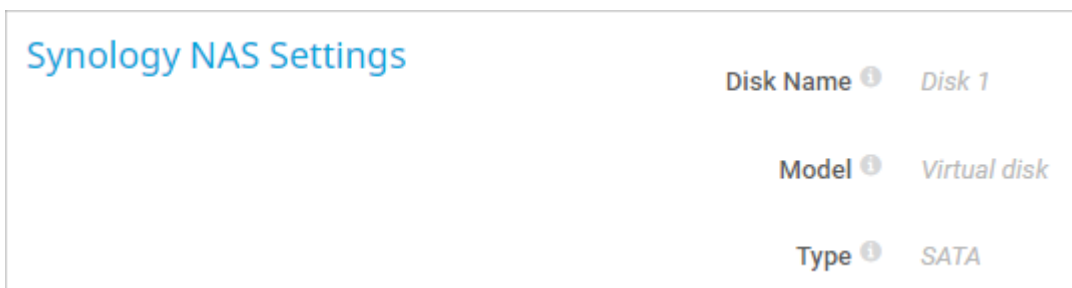

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>

Setting	Description
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpsynology ▪ synology ▪ physicaldisk
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Synology NAS Settings

Synology NAS Settings

Setting	Description
Disk Name	Shows the name of the disk that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Model	Shows the model of the physical disk that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Type	Shows the type of the physical disk that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Sensor Settings Overview

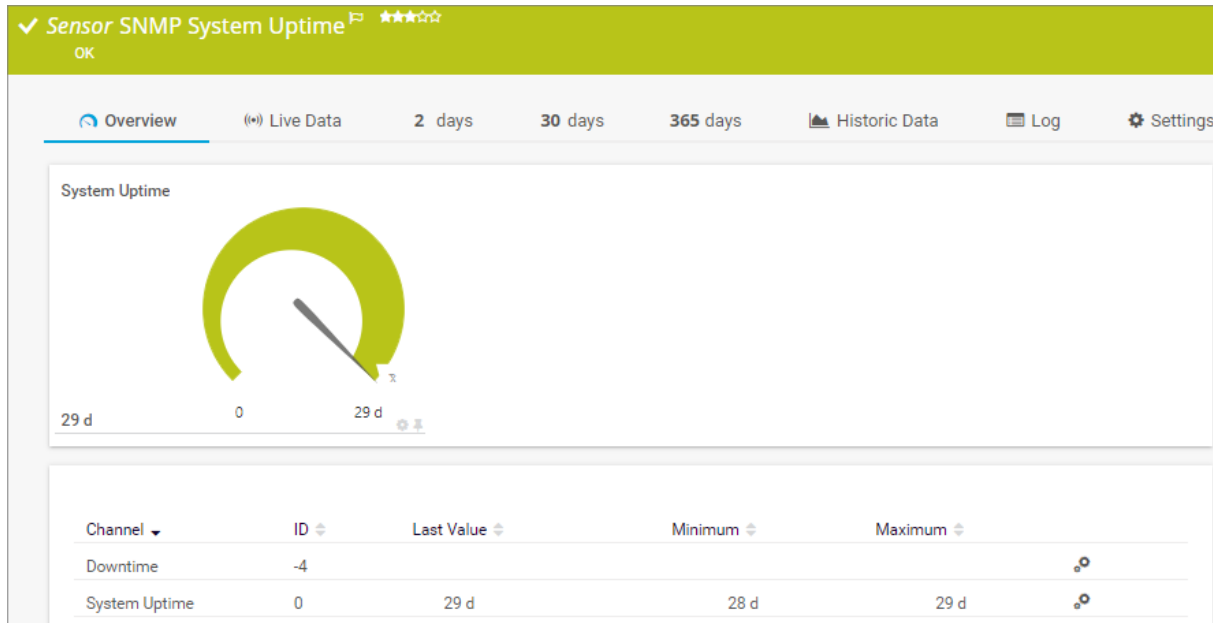

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.208 SNMP System Uptime Sensor

The SNMP System Uptime sensor monitors the uptime of a device via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP System Uptime Sensor

Sensor in Other Languages

- Dutch: SNMP Systeem Uptime
- French: Disponibilité du système SNMP
- German: SNMP Laufzeit
- Japanese: SNMP システムアップタイム
- Portuguese: Tempo de atividade do sistema SNMP
- Russian: SNMP
- Simplified Chinese: SNMP 系统正常运行时间
- Spanish: Disponibilidad SNMP

Remarks

- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `::1`). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- See the Knowledge Base: [Why does the SNMP System Uptime sensor report wrong values?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name**: A text input field containing "Example Name".
- Tags**: A list of tags with "exampletag" selected, and a plus sign to add more.
- Priority**: A star rating system showing 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p>

Setting	Description
	<ul style="list-style-type: none"> snmpuptimesensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Sensor Display

Primary Channel **ⓘ** Downtime

Graph Type **ⓘ** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

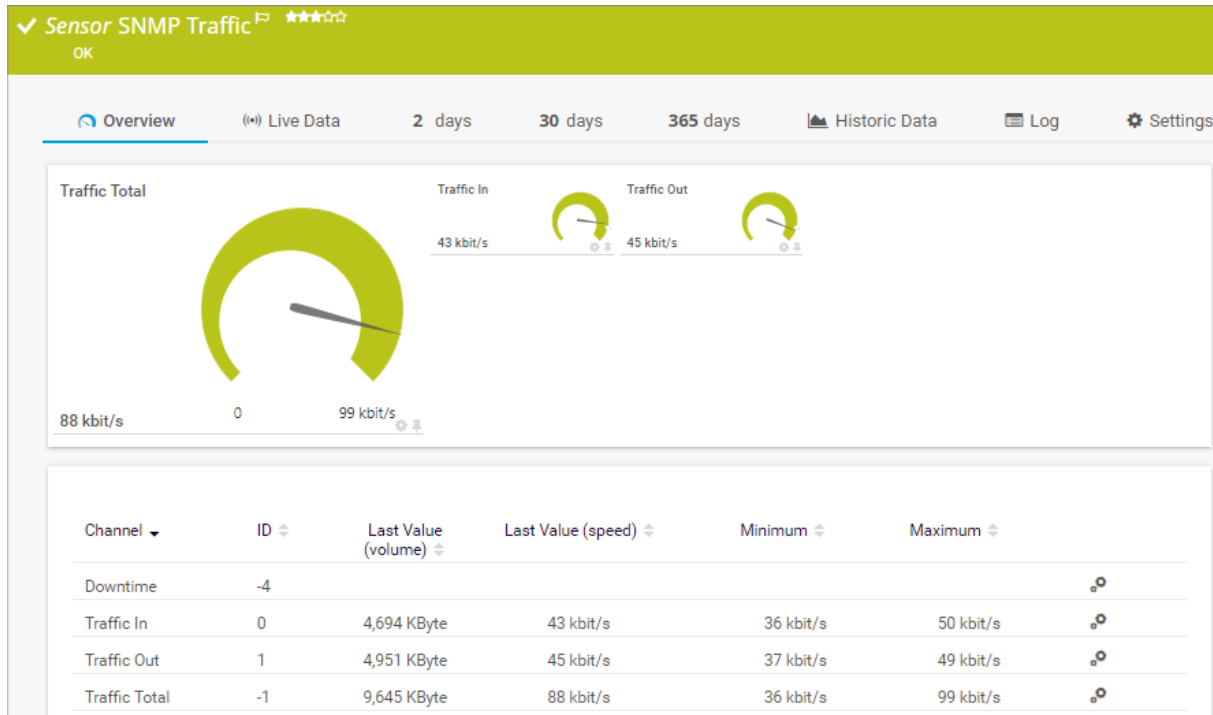

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.209 SNMP Traffic Sensor

The SNMP Traffic sensor monitors traffic on a device via the Simple Network Management Protocol (SNMP).

i You can create the sensor on a device that provides traffic data.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)³¹⁰⁵.

SNMP Traffic Sensor

Sensor in Other Languages

- Dutch: SNMP Verkeer
- French: Traffic SNMP
- German: SNMP Datenverkehr
- Japanese: SNMP トラフィック
- Portuguese: Tráfego SNMP
- Russian: SNMP
- Simplified Chinese: SNMP 流量
- Spanish: SNMP tráfico

Remarks

- You can define the displayed sensor name with port name templates in the [SNMP compatibility options](#)⁴⁶³ of the parent device.

- We recommend that you select SNMP v2c (most common) or SNMP v3 in the [credentials for SNMP devices](#)^[455] of the parent device (if supported by the device that you monitor). SNMP v1 does not support 64-bit counters, which may result in invalid data. For details, see the Knowledge Base: [SNMP Traffic Sensor suddenly drops at 610Mbps](#)
- It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). [Add this device to PRTG](#)^[340] with the IP address that it has in your network and create the SNMP sensor on this device instead.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- The [auto-discovery](#)^[296] always creates SNMP Traffic sensors for all interfaces whose SNMP traffic counters are above 0. As a result, every interface that has had traffic since the last restart of the monitored device is added, even if it is currently disconnected or disabled. For details, see the Knowledge Base: [How does auto-discovery with SNMP Traffic sensors work?](#)
- See the Knowledge Base: [Automatically update port name and number for SNMP Traffic sensors when the device changes them](#)
- See the Knowledge Base: [Where is the volume line in graphs?](#)

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Traffic Specific

Setting	Description
Interface Number	<p>Select the ports on SNMP devices with multiple interfaces that you want to monitor. PRTG creates one sensor for each port that you select.</p> <ul style="list-style-type: none"> ❗ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner. ❗ You can see the connection status of an interface in the respective table column. ❗ You can select interfaces and cancel the selection by clicking Select all connected interfaces, Select all disconnected interfaces, and Deselect all interfaces.
Name for Traffic In Channel	<p>For the standard channel Traffic In, enter the channel name here. The sensor shows it in graphs and tables. You can change this description and the description of all other channels in the channel settings^[397] later.</p>
Name for Traffic Out Channel	<p>For the standard channel Traffic Out, enter the channel name here. The sensor shows it in graphs and tables. You can change this description and the description of all other channels in the channel settings later.</p>

Setting	Description
Name for Traffic Total Channel	For the standard channel Traffic Total, enter the channel name here. The sensor shows it in graphs and tables. You can change this description and the description of all other channels in the channel settings later.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' configuration page. It includes the following elements:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A list of tags with 'exampletag' selected, accompanied by a close button (X) and an add button (+).
- Priority:** A star rating system showing 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ bandwidthsensor ▪ snmptrafficsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Alias Availability ⓘ 2

Traffic Specific

Setting	Description
Interface Number	<p>Shows the number and name of the interface in the physical device that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. We strongly recommend that you only change it if the Paessler support team explicitly asks you to do so. Wrong usage can result in incorrect monitoring data.</p>
Additional Channels	<p>By default, each SNMP Traffic sensor creates the channels Traffic In, Traffic Out, and Traffic Total. Select additional channels for all interfaces. Click the respective channel names to mark the channels and to monitor their data.</p> <p>You can choose between the following additional channels:</p> <ul style="list-style-type: none"> ▪ Errors in and Errors out: The number of incoming and outgoing packets that could not be delivered because of errors. ▪ Discards in and Discards out: The number of discarded incoming and outgoing packets even though no errors have been detected. ▪ Unicast packets in and Unicast packets out: The number of unicast packets that have been delivered. ▪ Non Unicast packets in and Non Unicast packets out (32-bit only): The number of non-unicast packets that have been delivered. ▪ Multicast packets in and Multicast packets out (64-bit only): The number of delivered packets that were addressed to a multicast address. ▪ Broadcast packets in and Broadcast packets out (64-bit only): The number of delivered packets that were addressed to a broadcast address ▪ Unknown Protocols: The number of received packets that were discarded because of an unknown or unsupported protocol. <p>i You cannot delete additional channels later. You can only disable them.</p> <p>i If the sensor shows the Warning status ¹⁹⁷ with the message Channels not available, you can disable the affected channels to remove the warning.</p>
Connection Status Handling	<p>Define how PRTG reacts when an interface is operational. An interface that is not operational is, for example, an Ethernet port on a switch with no cable plugged in. This setting is valid for all selected interfaces. Choose between:</p> <ul style="list-style-type: none"> ▪ Show down status for all disconnected states: Show the Down status for a disconnected interface. This applies if the ifOperStatus of the interface is not "up". ▪ Show down status when disconnected, ignore when deactivated: Show the Down status for a disconnected interface only if it is not deliberately deactivated in the configuration. This applies if the ifOperStatus of the interface is not "up" and the ifAdminStatus is "up". So the sensor stays in the Up status when the interface has been deactivated. ▪ Ignore all disconnected states: Show the Up status. <p>i Monitoring is discontinued without notice.</p>

 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷). ▪ Show in and out traffic as positive and negative area graph: Show channels for incoming and outgoing traffic as positive and negative area graph. This visualizes your traffic in a clear way. <ul style="list-style-type: none"> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings). Manual scaling is not possible if you choose this option. ⓘ You cannot show a positive/negative graph for a channel if you choose to display its data in percent of maximum (available in the channel settings).
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
<input type="radio"/> inherit from  Root	Scanning Interval ⓘ 60 seconds
	If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays

Setting	Description
	<ul style="list-style-type: none"> ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency.

Setting	Description
	<ul style="list-style-type: none"> Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies [4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector [257] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Discards In	The number of incoming discards per second
Discards Out	The number of outgoing discards per second
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Errors In	The number of incoming errors per second
Errors Out	The number of outgoing errors per second
Non-Unicast In	The number of incoming non-unicast packets per second
Non-Unicast Out	The number of outgoing non-unicast packets per second
Traffic In	The incoming traffic in bytes per second
Traffic Out	The outgoing traffic in bytes per second
Traffic Total	<p>The total traffic in bytes per second</p> <p> This channel is the primary channel by default.</p>

Channel	Description
Unicast In	The number of incoming unicast packets per second
Unicast Out	The number of outgoing unicast packets per second
Unknown Protocols In	The number of incoming, unknown protocols per second

Sensor Settings Overview

For more information about sensor settings, see the following sections:

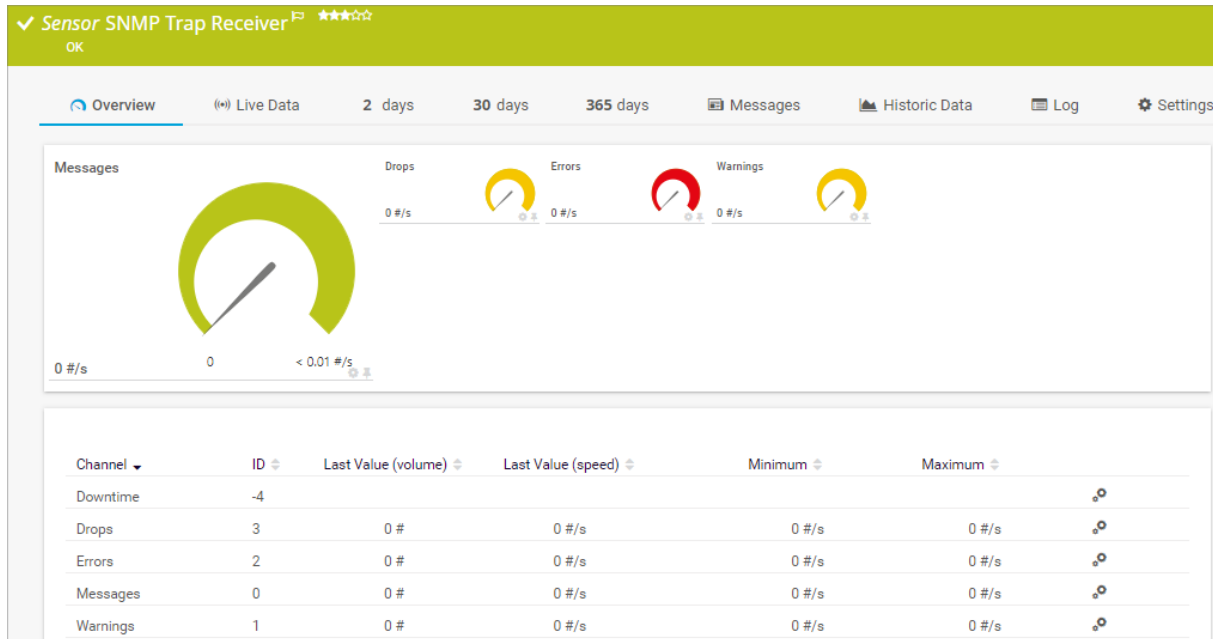

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.210 SNMP Trap Receiver Sensor

The SNMP Trap Receiver sensor receives and analyzes Simple Network Management Protocol (SNMP) traps.

i The sensor can also show the actual trap messages.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Trap Receiver Sensor

Sensor in Other Languages

- Dutch: SNMP Trap-ontvanger
- French: Récepteur de traps SNMP
- German: SNMP-Trap-Empfänger
- Japanese: SNMP トラップレシーバー
- Portuguese: Receptor de trap SNMP
- Russian: SNMP
- Simplified Chinese: SNMP 陷阱接收程序
- Spanish: Receptor de trap SNMP

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- This sensor does not support SNMP v3 traps. Use SNMP v1 or v2c instead.
- This sensor only supports the User Datagram Protocol (UDP).

- Add this sensor to the probe device to receive all messages of the remote probe system.
 - Add this sensor to a specific device to directly receive all messages from this device. This makes this sensor faster than when you use source filters.
 - This sensor supports the IPv6 protocol.
 - You can use specific placeholders in email [notification templates](#) ⁴¹³⁶ to see the messages when you receive an email notification. See section [List of Placeholders for Notifications](#) ⁴⁶⁶².
 - The [sensor states](#) ¹⁹⁷ of this sensor persist for one scanning interval only. After showing a Warning status or a Down status, and if there is no warning or error message in the following scanning interval, the sensor shows an Up status again. For a workaround, see the Knowledge Base: [How can I configure sensors using speed limits to keep the status for more than one interval?](#)
 - With the available filter options, you can individually define which types of messages the sensor considers for monitoring, and which messages it categorizes as warning or error messages. Depending on the filters, received messages are counted in the respective channels.
 - If you do not add the sensor to a probe device but to a different device in PRTG, be careful with the configuration: Ensure that the IP address or Domain Name System (DNS) name of the parent device matches the proper sender. For example, if you want to receive messages from a storage area network (SAN), you might have to add a device to PRTG using the IP address of a specific array member that sends the messages. Providing a DNS name that points to the IP address of a whole group might not work for SANs.
 - In PRTG on premises, you can copy the Management Information Base (MIB) file for your traps into the \MIB subfolder of the [PRTG program directory](#) ⁴⁵²⁶ to translate the object identifiers (OID) for the traps into readable messages. For details, see the Knowledge Base: [How can I show the name of a received OID in PRTG?](#)
 - You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
 - See the Knowledge Base: [How do I test an SNMP Trap Receiver Sensor?](#)
 - For a general introduction to the receiver's configuration, see section [Monitoring Syslogs and SNMP Traps](#) ⁴³²⁸.
-  You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.
-  To import MIB files into PRTG Hosted Monitor, [contact the Paessler support team](#) ⁴²⁶⁶.

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

SNMP Trap Specific

Setting	Description
Port	Enter the number of the port on which the sensor listens for SNMP traps. The default port is 162. Enter an integer value. ⓘ We recommend that you use the default value.
Purge Messages After	Define for how long PRTG stores received trap messages for analysis. Choose a period of time from the dropdown list.

Filter

■ For detailed information, see section [Filter Rules](#) ³¹¹⁹.

Filter

Filters are formulas using AND, OR, NOT, brackets, and the following fields:

Field	Parameters	Examples
source[ip]	Enter a UDP source IP, IP range, or IP hostmask	source[10.0.23.50] source[10.0.23.10-50] source[10.0.23.10/24]
agent[text]	Enter the IP of the object that generates the trap (V1 only)	agent[10.0.0.1]
enterprise[oid]	Enter the OID of the object that generates the trap (V1 only)	enterprise[1.3.6.1.4.1.2.6.182.1.2.31.1.0]
bindings[text]	Enter a substring to match on all OIDs and values in the bindings	bindings[ERROR] bindings[1.3.6.1.4.1.2.6.182] bindings[*port blocked*]
bindings[oid,value]	Enter an OID and a substring (comma separated) to match a value in the defined OID	bindings[1.3.6.1.4.1.2.6.182.1.2.71.1.0,...]
bindings[oid,value,mode]	Enter an OID, a substring, and a mode (comma separated) to match a value in the bindings. Mode can be <ul style="list-style-type: none"> • <i>substring</i> • <i>exact</i> • <i>equal, greater, greaterorequal, less, lessorequal</i> 	bindings[1.3.6.1.4.1.2.6.182.1.2.71.1.0,...] bindings[1.3.6.1.4.1.2.6.182.1.2.71.1.0,...]
gentrap[number]	Enter a number or range of the generic trap type	gentrap[6] gentrap[2-4]
spectrap[number]	Enter a number or range of the specific trap code	spectrap[0] spectrap[1-2]
version[number]	Enter the SNMP version (1 or 2)	version[1] version[2]
community[text]	Enter the community string to match (exact, case sensitive)	community[public] community[private]

Fixed Include Filter *This sensor runs on a specific device, so the sensor filters incoming traps for the source IP address of this device and shows matching messages only. If you want to see all messages that are sent to the probe, create this sensor on the probe device.*

Include Filter ⓘ any

Exclude Filter ⓘ

Warning Filter ⓘ

Error Filter ⓘ

Filter

Setting	Description
Include Filter	Define if you want to filter traps. If you leave this field empty or use the keyword any , the sensor processes all data. To include only specific types of traps, define filters using a special syntax.
Exclude Filter	Define which types of traps the sensor discards and does not process. To exclude specific types of traps, define filters using a special syntax.
Warning Filter	Define which types of traps count for the Warnings channel. To categorize received traps as warning messages, define filters using a special syntax.

Setting	Description
	<p>i The sensor collects messages until a scanning interval ends. As long as the scanning interval is running, no status change happens. By default, the sensor changes to the Warning status^[197] after a scanning interval finishes and there was at least one warning message (and no error message) during this scanning interval. The sensor shows the Warning status at least until the succeeding scanning interval finishes. If the sensor does not receive any warning or error message in this scanning interval, its status changes to the Up status again with the start of the next scanning interval.</p>
Error Filter	<p>Define which types of traps count for the Errors channel. To categorize received traps as error messages, define filters using a special syntax.</p> <p>i The sensor collects messages until a scanning interval ends. As long as the scanning interval is running, no status change happens. By default, the sensor changes to the Down status after a scanning interval finishes and there was at least one error message during this scanning interval. The sensor shows the Down status at least until the succeeding scanning interval finishes. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Setting	Description
User Group Access	<p>Define the user groups^[4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management^[153].</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#)^[142].

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

inherit from Root

Channel Unit Types ⓘ

Channel Type	Unit
Bytes (Bandwidth)	KB
	kbit
	/
	sec...
Bytes (Memory)	MB
Bytes (Disk)	MB
Bytes (File)	Byte

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>ⓘ Custom channel types are only available on sensor level.</p>

Debug Options

Debug Options

Result Handling ⓘ

Discard result

Store result

Debug Options

Setting	Description
Result Handling	Define what PRTG does with the sensor result:

Setting	Description
	<ul style="list-style-type: none"> ▪ Discard result (recommended): Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\debug subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. This setting is for debugging purposes. <p>i Use with caution. We recommend that you only use this setting for a short time because it can create huge data files.</p>

Filter Rules for Traps

Filter rules are used for the include, exclude, warning, and error definition fields of the SNMP Trap Receiver sensor. They are based on the following format:

```
field[filter]
```

You can use include and exclude filters to define which traps to monitor or use warning and error filters to define how to categorize received traps. Provide these filters in the sensor settings as formulas. Formulas are fields that you can combine with boolean operators ([AND](#), [OR](#), [NOT](#)) and brackets.

Field	Parameter	Examples
source[ip]	Enter an IP address where the UDPs come from. IP masks and ranges ⁴⁴⁸³ are also possible.	source[10.0.23.50], source[10.0.23.10-50], source[10.0.23.10/24]
agent[ip]	Enter an IP address that specifies the object that creates agent[10.0.0.1] the SNMP trap. i agent[ip] only supports v1.	
enterprise[oid]	Enter an OID that specifies the object that originates the trap. i enterprise[oid] only supports v1.	enterprise[1.3.6.1.4.1.2.6.182.1.2.31.1.0]
bindings[text]	Enter a substring to match all OIDs and values in the bindings.	bindings[ERROR], bindings[1.3.6.1.4.1.2.6.182.1.2.31.1.0], bindings["port blocked"] i It is not necessary to use quotation marks (") to find strings. If the string contains quotation marks that you want to include in the filter, you need to escape them with quotation marks.
bindings[oid,value]	Enter an OID and a substring to match a value in the specified OID. Separate the OID and the value with a comma.	bindings[1.3.6.1.4.1.2.6.182.1.2.31.1.0,error]

Field	Parameter	Examples
bindings	Enter an OID, a substring, and a mode to match a value in the specified OID. Separate the OID, the value, and the mode with a comma. The mode can be: <ul style="list-style-type: none"> ▪ substring: This is the default mode that works like bindings[oid,value]. ▪ exact: This mode enforces an exact match of a value. ▪ equal, greater, greaterorequal, less, or lessorequal: This interprets and compares values as numbers. <ul style="list-style-type: none"> ❗ This mode only supports integer values without extra characters and without thousands separators. ❗ It also supports hex format. 	bindings[1.3.6.1.4.1.2.6.182.1.2.31.1.0,error,exact] bindings[1.3.6.1.4.1.2.6.182.1.2.31.1.0,10,equal]
gentrap	Enter a number that specifies the generic trap type. <ul style="list-style-type: none"> ❗ You can also enter ranges. 	gentrap[3], gentrap[2-6]
spectrap	Enter a number that defines the specific trap code. <ul style="list-style-type: none"> ❗ You can also enter ranges. 	spectrap[4], spectrap[0-3]
version	Enter a number (1 or 2) that specifies the SNMP version.	version[1], version[2]
community	Enter a community string for an exact, case-sensitive match.	community[public], community[private]

Messages Tab: Review and Analyze Traps

PRTG stores received traps as common files in the \Trap Database subfolder of the PRTG data directory. To review and analyze all received messages, you can directly access the most recent data in a [table list](#) in the PRTG web interface. You can access this list via the sensor's Overview tab.

❗ PRTG only shows received traps in the table on the Overview tab after an (automatic) page refresh following a sensor scan. The default value for [auto refresh](#) is 30 seconds.

For more details and further filter options, click the Messages tab of the SNMP Trap Receiver sensor. You see all received messages in a table list. At the top, you have display filter options to drill down into the data for specific events of your interest. The filters are the same as those that are available in the sensor settings, but you can define them without using formulas. Provide the desired parameters and PRTG automatically loads the filtered list.

❗ PRTG automatically applies boolean operators to the filters in the following manner: parameters across all columns are combined with **AND**, and parameters within a single column are combined with **OR**.

❗ The parameters that you enter in the filters have to **exactly** match the parameters in the message. They are case sensitive.

❗ You can automatically add a filter by clicking the content of a column.

Advanced Filter Settings

You can open advanced filter settings by clicking  in the Filter row. The Advanced Filter appears in a popup window. In the text field, you can define a filter using the syntax as described in section [Filter Rules for Traps](#) ³¹¹⁹.

If you provided filter parameters on the Messages tab, the advanced filter already includes them as a corresponding formula with the correct syntax. You can adjust this filter to your needs. You can also copy the automatically created and manually adjusted formula for usage in the filter fields of the sensor settings.

Channel List

-  Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Drops	The number of dropped packets per second on the SNMP trap collector port
Errors	The number of messages categorized as "error" per second
Messages	The overall number of received traps per second  This channel is the primary channel by default.
Warnings	The number of messages categorized as "warning" per second

Sensor Settings Overview

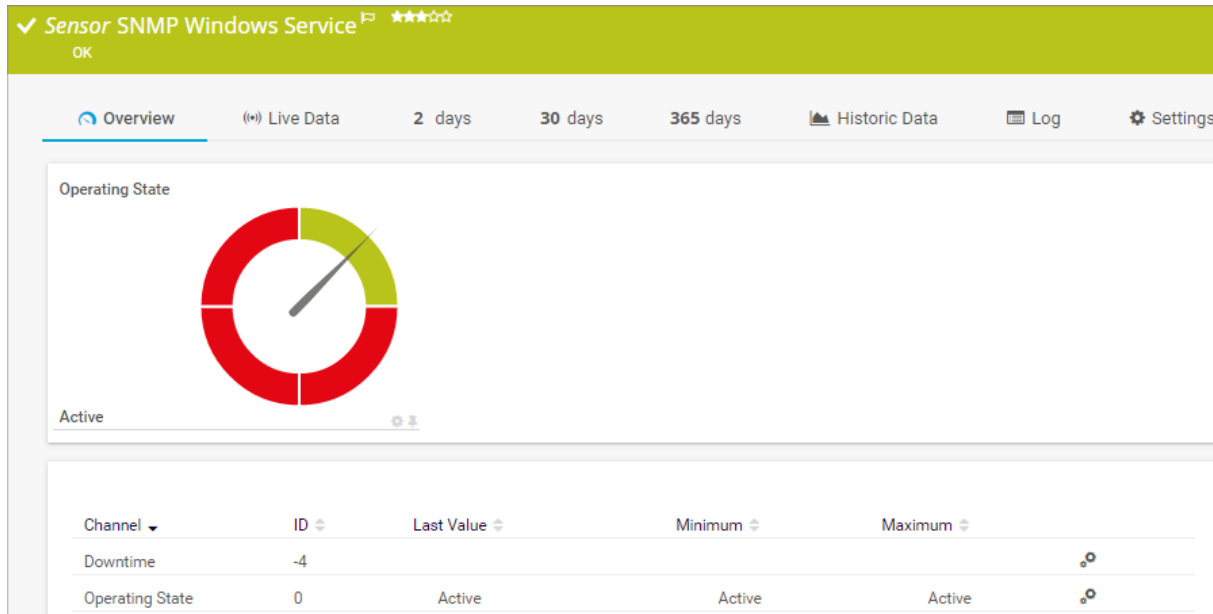

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.211 SNMP Windows Service Sensor

The SNMP Windows Service sensor monitors a Windows service via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SNMP Windows Service Sensor

Sensor in Other Languages

- Dutch: SNMP Windows Service
- French: Service Windows SNMP
- German: SNMP Windows-Dienst
- Japanese: SNMP Windows サービス
- Portuguese: Serviço Windows SNMP
- Russian: Windows SNMP
- Simplified Chinese: SNMP Windows 服务
- Spanish: Servicio de Windows de SNMP

Remarks

- This sensor cannot distinguish the status "not installed" from "not running".
- It might not work to query data from a probe device via SNMP (querying [localhost](#), [127.0.0.1](#), or [::1](#)). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.

- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

SNMP Windows Service Monitor

Setting	Description
Services	<p>Select the services that you want to monitor. PRTG creates one sensor for each service that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority:** A section with five stars, where the first three are filled, indicating a priority of 3.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ snmpservicesensor ▪ servicesensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

SNMP Windows Service Monitor

SNMP Windows Service Monitor

Service **i** Power

SNMP Windows Service Monitor

Setting	Description
Service	Shows the Windows service that this sensor monitors.

Setting	Description
	<p> PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type 
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Sensor Specific

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ↑ below a channel gauge on the sensor's Overview tab.</p>

Setting	Description
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

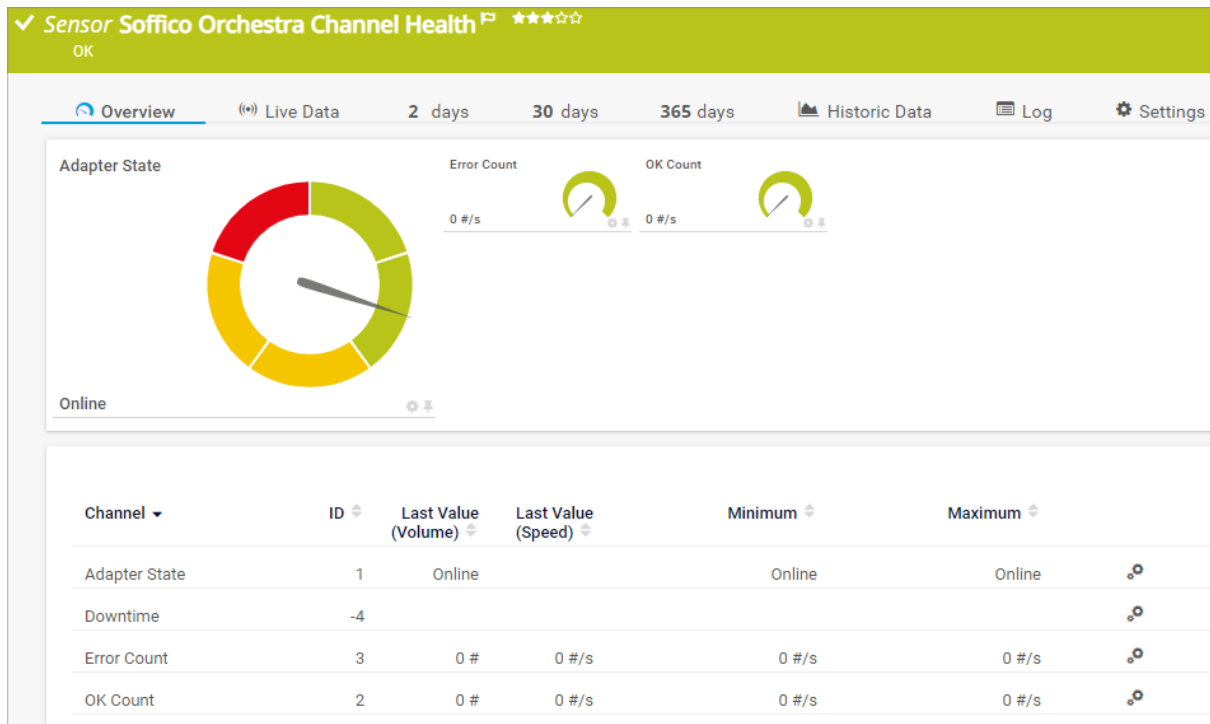

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.213 Soffico Orchestra Channel Health Sensor

The Soffico Orchestra Channel Health sensor monitors the state and the overall number of successful or unsuccessful channel calls.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Soffico Orchestra Channel Health sensor

Sensor in Other Languages

- Dutch: Soffico Orchestra Channel Health
- French: Soffico Orchestra Channel Health
- German: Soffico Orchestra Channel Health
- Japanese: Soffico Orchestra Channel Health
- Portuguese: Soffico Orchestra Channel Health
- Russian: Soffico Orchestra Channel Health
- Simplified Chinese: Soffico Orchestra Channel Health
- Spanish: Soffico Orchestra Channel Health

Remarks

- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- This sensor requires credentials for Soffico Orchestra in the [settings of the parent device](#).

- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Orchestra Channel Specific

Setting	Description
Channel Name	<p>Select the Orchestra channels that you want to monitor. PRTG creates one sensor for each channel that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has a title bar 'Basic Sensor Settings'. Below the title bar, there are three rows of settings:

- Sensor Name**: Labeled 'Example Name'.
- Tags**: A text input field containing 'exampletag' with a blue 'x' to remove it and a '+' to add more.
- Priority**: A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ orchestra ▪ orchestrachannelhealth ▪ soffico
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

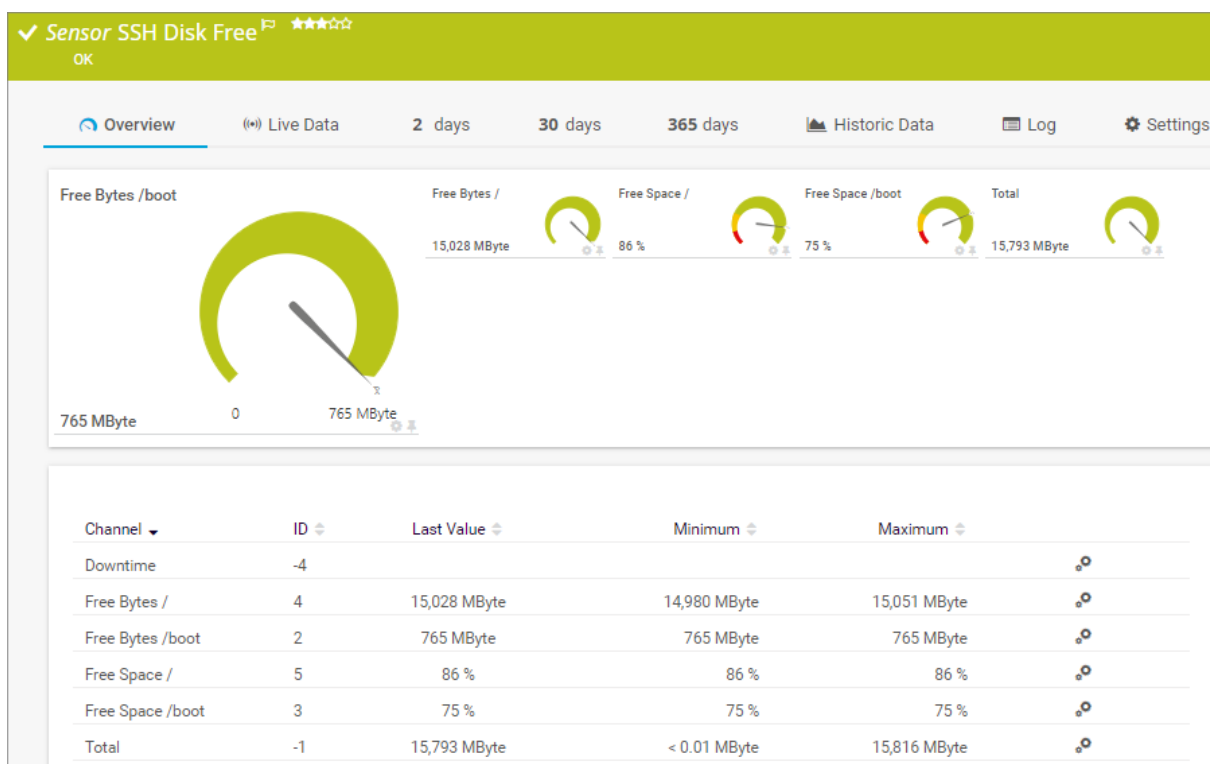

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.214 SSH Disk Free Sensor

The SSH Disk Free sensor monitors the free space on disks of a Linux/Unix system using Secure Shell (SSH).

i The free space that this sensor returns shows the available disk space of the volume, minus a reserve defined for this volume (for example, for redundancy purposes). So, this sensor shows the disk space that is actually available for use. The size of the reserved disk space can be defined with `tune2fs`. For details, see the Knowledge Base: [Why do SSH Disk Free and SNMP Linux Disk Free show different values for my target Linux system?](#)

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SSH Disk Free Sensor

Sensor in Other Languages

- Dutch: SSH Disk vrij
- French: Espace disque disponible SSH
- German: SSH Laufwerkskapazität
- Japanese: SSH ディスク空き容量
- Portuguese: SSH Disco livre
- Russian: SSH
- Simplified Chinese: SSH 磁盘可用空间
- Spanish: SSH disco libre

Remarks

- This sensor requires [credentials for Linux/Solaris/macOS \(SSH/WBEM\) systems](#) in the settings of the parent device.
- This sensor cannot support all Linux/Unix and macOS distributions.
- This sensor has a medium performance impact.
- See the Knowledge Base: [SSH and SFTP sensors in Unknown status](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

SSH Disk Free

Setting	Description
Disk	<p>Select the disks that you want to monitor. PRTG creates two channels for each disk that you select.</p> <ul style="list-style-type: none"> ⓘ You can select up to 100 disks. If you select more disks, you cannot create the sensor. Add the sensor multiple times to monitor more than 100 disks with several sensors. ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p> ⓘ Ensure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after k has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Enter an integer value.</p> <p> ⓘ Ensure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.</p>
SSH Port	<p>Define which port this sensor uses for the SSH connection:</p> <ul style="list-style-type: none"> ▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems ^[452] section of the parent device settings. ▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings.
Use Port Number	<p>This setting is only visible if you select Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer value.</p>

Setting	Description
SSH Engine	<p>Select the method that you want to use to access data with this SSH sensor⁴³⁰¹. We strongly recommend that you use the default engine. You can still use the legacy mode for some time to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the object hierarchy¹³³³. If you have not changed the SSH engine, this is the recommended default engine. ▪ Default: This is the default monitoring method for SSH sensors. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option. ▪ Compatibility mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors running with the default SSH engine. <p>i The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID] (SSHv2).txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Set Limits Checked for ALL Disks

In this section, you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor shows the Warning or the Down [status](#)¹⁹⁷⁷, depending on the data provided by all drives that this sensor monitors. If you want to individually define limits for separate channels, use the limit settings in the [channel settings](#)³⁹⁷⁷.

i All limits that you define here are valid in addition to the limits defined in the particular Channel settings. The limits are valid simultaneously, so the first limit that is breached applies.

Set Limits Checked For ALL Disks

Use the channel settings to set separate error limits or warning limits for each disk.

Percentage Limit Check ⓘ Only use the limits in the settings of the percentage channels
 Use the limits of both the sensor and the channel settings

Upper Error Limit ⓘ

Upper Warning Limit ⓘ

Lower Warning Limit ⓘ 25

Lower Error Limit ⓘ 10

Size Limit Check ⓘ Only use the limits in the settings of the byte size channels
 Use the limits of both the sensor and the channel settings

Alarm on Missing/Removed Disk ⓘ Deactivate alarm (default)
 Activate alarm

Set Limits Checked For ALL Disks

Setting	Description
Percentage Limit Check	<p>Enable or disable a limit check for the free space in percentage channels of all drives. By default, the sensor enables percentage limits with a lower warning limit and a lower error limit. Choose between:</p> <ul style="list-style-type: none"> ▪ Only use the limits in the settings of the percentage channels: Do not define sensor limits that are valid for all percentage channels. The sensor only uses the limits that you define in the settings of the particular "free space in percent" channels to determine the status. ▪ Use the limits of both the sensor and the channel settings: Define sensor limits that are valid for all percentage channels. Additional fields appear below. The sensor shows the Warning or the Down status when free space limits are above or below the limits.
Upper Error Limit	<p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify an upper limit in percent for the Down status. If the free disk space of one of your drives exceeds this value, the sensor changes to the Down status. Enter an integer value or leave the field empty.</p> <p>i The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Upper Warning Limit	<p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify an upper limit in percent for the Warning status. If the free disk space of one of your drives exceeds this value, the sensor changes to the Warning status. Enter an integer value or leave the field empty.</p>

Setting	Description
Lower Warning Limit	<p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p> <p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify a lower limit in percent for the Warning status. If the free disk space of one of your drives falls below this value, the sensor changes to the Warning status. Enter an integer value or leave the field empty.</p>
Lower Error Limit	<p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p> <p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Lower Error Limit	<p>This setting is only visible if you select Use the limits of both the sensor and the channel settings above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MB). If the free disk space of one of your drives falls below this value, the sensor changes to the Down status. Enter an integer value or leave the field empty.</p> <p>i The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Alarm on Missing/Removed Disk	<p>If a monitored disk is removed or not found, the sensor sets the values to zero. Select the alarm approach in this case:</p> <ul style="list-style-type: none"> ▪ Deactivate alarm (default): Do not send an alert for a removed disk. ▪ Activate alarm: Send an alert if a monitored disk is removed or not found.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

7.8.215 SSH INodes Free Sensor

The SSH INodes Free sensor monitors the free index nodes on disks of Linux/Unix and macOS systems via Secure Shell (SSH).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SSH INodes Free Sensor

Sensor in Other Languages

- Dutch: SSH INodes Vrij
- French: INodes SSH disponibles
- German: SSH Freie INodes
- Japanese: SSH inode の空き領域
- Portuguese: SSH INodes livre
- Russian: INodes SSH
- Simplified Chinese: SSH INode 可用空间
- Spanish: SSH INodes libres

Remarks

- This sensor requires [credentials for Linux/Solaris/macOS \(SSH/WBEM\) systems](#) in the settings of the parent device.
- This sensor cannot support all Linux/Unix and macOS distributions.
- This sensor does not support ESX(i) hosts.
- This sensor has a medium performance impact.
- See the Knowledge Base: [SSH and SFTP sensors in Unknown status](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A list of tags with "exampletag" selected. There are "X" and "+" icons next to the tag.
- Priority:** A star rating system showing five stars, with the first four filled and the fifth empty.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <ul style="list-style-type: none"> ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ sshinodesfreesensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i Ensure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after k has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Enter an integer value.</p> <p>i Ensure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.</p>
SSH Port	<p>Define which port this sensor uses for the SSH connection:</p> <ul style="list-style-type: none"> ▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems^[452] section of the parent device settings. ▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings.
Use Port Number	<p>This setting is only visible if you select Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer value.</p>
SSH Engine	<p>Select the method that you want to use to access data with this SSH sensor^[430]. We strongly recommend that you use the default engine. You can still use the legacy mode for some time to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the object hierarchy^[138]. If you have not changed the SSH engine, this is the recommended default engine. ▪ Default: This is the default monitoring method for SSH sensors. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option. ▪ Compatibility mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors running with the default SSH engine. <p>i The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID] (SSHv2).txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

- [Notification Triggers Settings](#)  3987

7.8.216 SSH Load Average Sensor

The SSH Load Average sensor monitors the load average of a Linux/Unix system using Secure Shell (SSH).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SSH Load Average Sensor

Sensor in Other Languages

- Dutch: SSH Gemiddelde belasting
- French: Moyenne de la charge SSH
- German: SSH Durchschnittl. Last
- Japanese: SSH 負荷平均
- Portuguese: SSH Carga média
- Russian: SSH
- Simplified Chinese: SSH 负载平均值
- Spanish: SSH carga promedio

Remarks

- This sensor requires [credentials for Linux/Solaris/macOS \(SSH/WBEM\) systems](#) in the settings of the parent device.
- This sensor cannot support all Linux/Unix and macOS distributions.
- This sensor has a medium performance impact.
- See the Knowledge Base: [SSH and SFTP sensors in Unknown status](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p>

Setting	Description
	<ul style="list-style-type: none"> sshloadavgsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
1 Minute	<p>The average system load within a 1-minute interval</p> <p>i This channel is the primary channel by default.</p>
5 Minutes	The average system load within a 5-minute scanning interval
15 Minutes	The average system load within a 15-minute interval
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.

Sensor Settings Overview

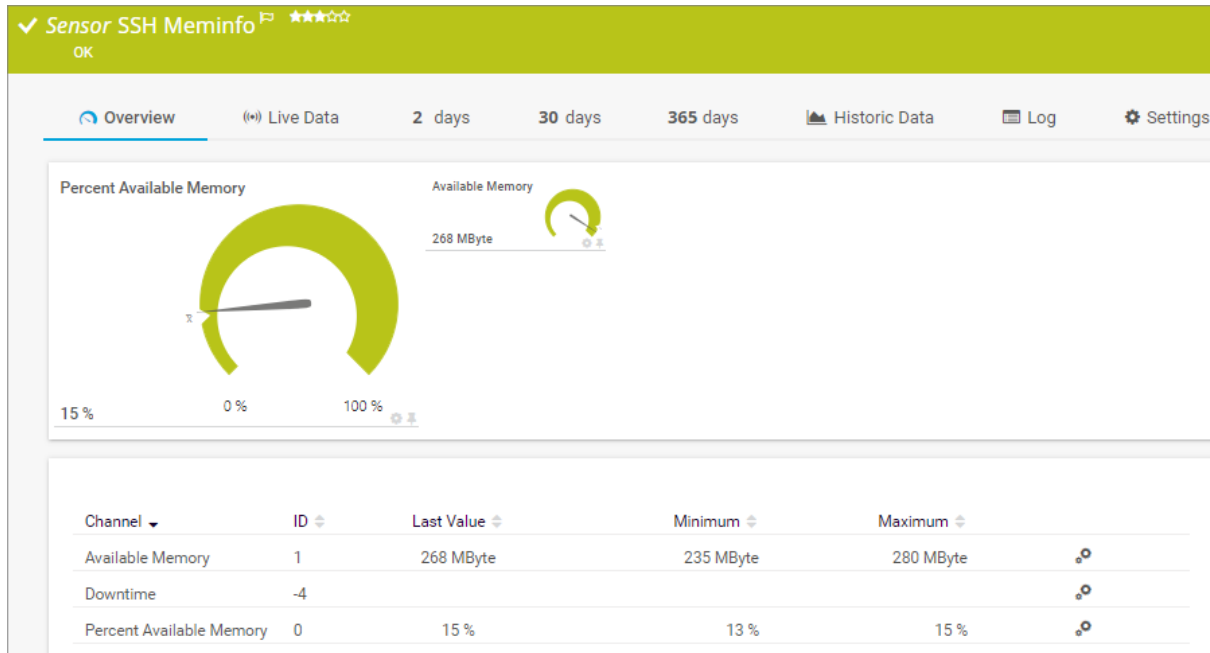

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3977

7.8.217 SSH Meminfo Sensor

The SSH Meminfo sensor monitors the memory usage of a Linux/Unix system using Secure Shell (SSH).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SSH Meminfo Sensor

Sensor in Other Languages

- Dutch: SSH Meminfo
- French: Info sur la mémoire SSH
- German: SSH Speicherinfo
- Japanese: SSH メモリ情報
- Portuguese: SSH Meminfo
- Russian: Meminfo SSH
- Simplified Chinese: SSH 内存信息
- Spanish: SSH información de memoria

Remarks

- This sensor requires [credentials for Linux/Solaris/macOS \(SSH/WBEM\) systems](#) in the settings of the parent device.
- This sensor cannot support all Linux/Unix distributions.
- This sensor does not support any macOS distributions.
- This sensor has a medium performance impact.

- See the Knowledge Base: [SSH and SFTP sensors in Unknown status](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a 'Basic Sensor Settings' dialog box. It has three main sections: 'Sensor Name' with the value 'Example Name', 'Tags' with a list containing 'exampletag', and 'Priority' set to 5 stars. Each section has an information icon (i) to its left.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ sshmeminfosensor ▪ memorysensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

SSH Specific

SSH Specific

Connection Timeout (Sec.) ⓘ 60

Shell Timeout (Sec.) ⓘ 10

SSH Port ⓘ Inherit port number from parent device (default)
 Enter custom port number

SSH Engine ⓘ Inherit from parent device (default)
 Default
 Compatibility Mode (deprecated)

Result Handling ⓘ Discard result
 Store result
 Store result in case of error

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i Ensure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.</p>

Setting	Description
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after k has sent its specific command (for example, cat /proc/loadavg). The maximum value is 300 seconds (5 minutes). Enter an integer value.</p> <p>i Ensure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.</p>
SSH Port	<p>Define which port this sensor uses for the SSH connection:</p> <ul style="list-style-type: none"> ▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems ^[452] section of the parent device settings. ▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings.
Use Port Number	<p>This setting is only visible if you select Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer value.</p>
SSH Engine	<p>Select the method that you want to use to access data with this SSH sensor ^[430]. We strongly recommend that you use the default engine. You can still use the legacy mode for some time to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the object hierarchy ^[133]. If you have not changed the SSH engine, this is the recommended default engine. ▪ Default: This is the default monitoring method for SSH sensors. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option. ▪ Compatibility mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors running with the default SSH engine. <p>i The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ^[452] on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID] (SSHv2).txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.

Setting	Description
	<ul style="list-style-type: none"> ▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status.
	<p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p>
	<p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

7.8.218 SSH Remote Ping Sensor

The SSH Remote Ping sensor remotely monitors the connectivity between a system running Linux/macOS X and another device, using Internet Control Message Protocol (ICMP) echo requests (Ping) and Secure Shell (SSH).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SSH Remote Ping Sensor

Sensor in Other Languages

- Dutch: SSH Remote Ping
- French: Ping distant SSH
- German: SSH Remote Ping
- Japanese: SSH リモート Ping 実行
- Portuguese: SSH Ping remoto
- Russian: SSH
- Simplified Chinese: SSH 远程 Ping
- Spanish: Ping remoto SSH

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires [credentials for Linux/Solaris/macOS \(SSH/WBEM\) systems](#) in the settings of the parent device.

- This sensor cannot support all Linux/Unix and macOS distributions.
- See the Knowledge Base: [SSH and SFTP sensors in Unknown status](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A text input field containing "exampletag" with a close button (X) and a plus button (+) to the right.
- Priority:** A section with five star icons, all of which are filled, indicating a priority of 5.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

Setting	Description
	<p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ sshremotepingsensor ▪ pingsensor ▪ remotepingsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

SSH Remote Ping Configuration

SSH Remote Ping Configuration

Target i	192.0.2.0

Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Avg Response	The average response time measured from the remote device in milliseconds (msec)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Max Response	The maximum response time measured from the remote device in msec
Min Response	The minimum response time measured from the remote device in msec
Packet Loss	The packet loss in percent
	 This channel is the primary channel by default.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

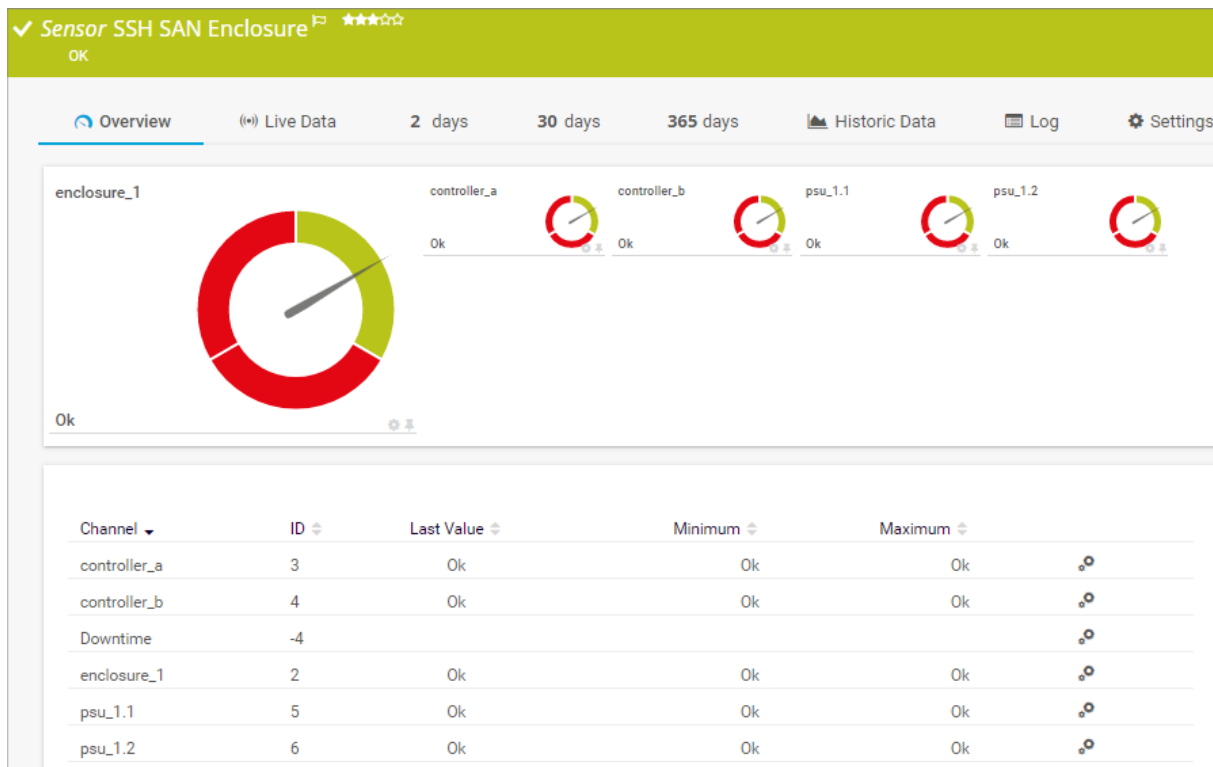

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.219 SSH SAN Enclosure Sensor

The SSH SAN Enclosure sensor monitors a storage area network (SAN) enclosure via Secure Shell (SSH).

i The SAN must provide a command-line interface (CLI) for this purpose.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SSH SAN Enclosure Sensor

Sensor in Other Languages

- Dutch: SSH SAN behuizing
- French: Boîtier SAN SSH
- German: SSH SAN Enclosure
- Japanese: SSH SAN エンクロージャ
- Portuguese: SSH Gabinete de SAN
- Russian: SAN SSH
- Simplified Chinese: SSH SAN 机箱
- Spanish: Carcasa de SAN de SSH

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.

- This sensor requires [credentials for Linux/Solaris/macOS \(SSH/WBEM\) systems](#)^[452] in the settings of the parent device.
- This sensor does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, the HP P2000.
- It might happen that the controller of your target device breaks down. Experience shows that this issue strongly depends on the hardware model you monitor. Increase the scanning interval to discharge the controller and try again.
- After a firmware update of the target device, this sensor might show incorrect channel values. Add this sensor anew in this case.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)^[448].
- Sometimes the devices you monitor with this SSH SAN sensor return status values that are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information on this issue, see the Knowledge Base: [Why does my SSH SAN sensor show a wrong status?](#)

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p> ⓘ This sensor has a fixed timeout of 300 seconds. If you change the value, it does not have an effect on the timeout.</p> <p> ⓘ Ensure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after k has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Enter an integer value.</p> <p> ⓘ This sensor has a fixed timeout of 300 seconds. If you change the value, it does not have an effect on the timeout.</p> <p> ⓘ Ensure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.</p>
SSH Port	<p>Define which port this sensor uses for the SSH connection:</p> <ul style="list-style-type: none"> ▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems^[452] section of the parent device settings. ▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings.

Setting	Description
Use Port Number	This setting is only visible if you select Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer value.
SSH Engine	<p>Select the method that you want to use to access data with this SSH sensor⁴³⁰¹. We strongly recommend that you use the default engine. You can still use the legacy mode for some time to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the object hierarchy¹³⁸¹. If you have not changed the SSH engine, this is the recommended default engine. ▪ Default: This is the default monitoring method for SSH sensors. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option. ▪ Compatibility mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors running with the default SSH engine. <p> The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID] (SSHv2).txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

- This sensor does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, the HP P2000.

- It might happen that the controller of your target device breaks down. Experience shows that this issue strongly depends on the hardware model you monitor. Increase the scanning interval to discharge the controller and try again.
- After a firmware update of the target device, this sensor might show incorrect channel values. Add this sensor anew in this case.
- This sensor has a medium performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)⁴⁴⁸⁵.
- Sometimes the devices you monitor with this SSH SAN sensor return status values that are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information on this issue, see the Knowledge Base: [Why does my SSH SAN sensor show a wrong status?](#)

Add Sensor

The [Add Sensor](#)³⁶⁷ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

 Store result in case of error

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i This sensor has a fixed timeout of 300 seconds. If you change the value, it does not have an effect on the timeout.</p> <p>i Ensure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after k has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Enter an integer value.</p> <p>i This sensor has a fixed timeout of 300 seconds. If you change the value, it does not have an effect on the timeout.</p> <p>i Ensure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.</p>
SSH Port	Define which port this sensor uses for the SSH connection:

Setting	Description
Use Port Number	<ul style="list-style-type: none"> ▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems⁴⁵² section of the parent device settings. ▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings. <p>This setting is only visible if you select Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer value.</p>
SSH Engine	<p>Select the method that you want to use to access data with this SSH sensor⁴³⁰¹. We strongly recommend that you use the default engine. You can still use the legacy mode for some time to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the object hierarchy¹³⁸¹. If you have not changed the SSH engine, this is the recommended default engine. ▪ Default: This is the default monitoring method for SSH sensors. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option. ▪ Compatibility mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors running with the default SSH engine. <p> The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID] (SSHv2).txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁸⁷

7.8.221 SSH SAN Physical Disk Sensor

The SSH SAN Physical Disk sensor monitors a physical disk on a storage area network (SAN) via Secure Shell (SSH).

i The SAN must provide a command-line interface (CLI) for this purpose.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SSH SAN Physical Disk Sensor

Sensor in Other Languages

- Dutch: SSH SAN Fysieke Schijf
- French: Disque physique SSH SAN
- German: SSH SAN Physikalisches Laufwerk
- Japanese: SSH SAN 物理ディスク
- Portuguese: SSH SAN Disco físico
- Russian: SAN SSH
- Simplified Chinese: SSH SAN 物理磁盘
- Spanish: Disco físico de SAN de SSH

Remarks

- This sensor requires [credentials for Linux/Solaris/macOS \(SSH/WBEM\) systems](#) in the settings of the parent device.

- This sensor does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, the HP P2000.
- It might happen that the controller of your target device breaks down. Experience shows that this issue strongly depends on the hardware model you monitor. Increase the scanning interval to discharge the controller and try again.
- After a firmware update of the target device, this sensor might show incorrect channel values. Add this sensor anew in this case.
- This sensor has a medium performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#)^[448].
- Sometimes the devices you monitor with this SSH SAN sensor return status values that are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information on this issue, see the Knowledge Base: [Why does my SSH SAN sensor show a wrong status?](#)

Add Sensor

The [Add Sensor](#)^[36] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Why does my SSH SAN sensor show a wrong status?

- <https://kb.paessler.com/en/topic/60145>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

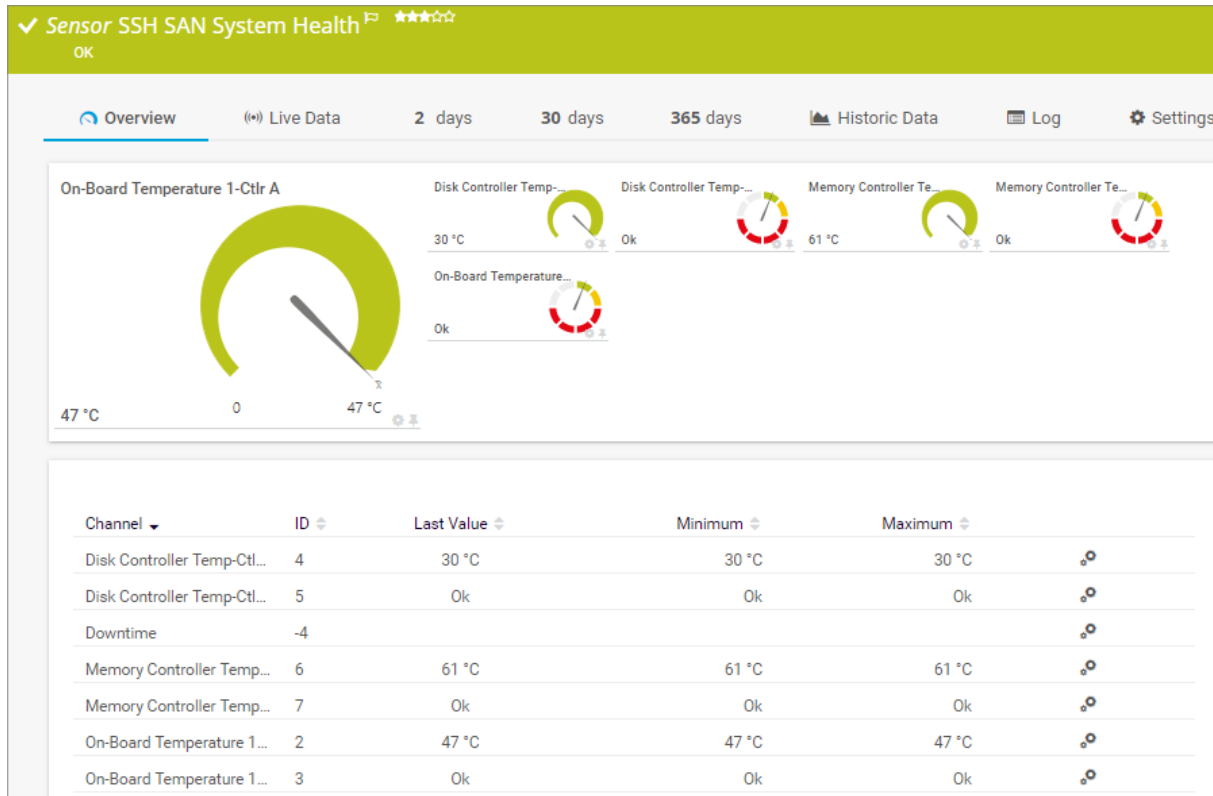

- [List of Available Sensor Types](#)⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#)³⁹⁷²
- [Channel Settings](#)³⁹⁷⁷
- [Notification Triggers Settings](#)³⁹⁸⁷

7.8.222 SSH SAN System Health Sensor

The SSH SAN System Health sensor monitors the system health of a storage area network (SAN) via Secure Shell (SSH).

i The SAN must provide a command-line interface (CLI) for this purpose.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SSH SAN System Health Sensor

Sensor in Other Languages

- Dutch: SSH SAN systeemstatus
- French: L'état du système SSH SAN
- German: SSH SAN Systemzustand
- Japanese: SSH SAN システムの正常性
- Portuguese: SSH SAN Funcionamento do sistema
- Russian: SAN SSH
- Simplified Chinese: SSH SAN 系统健康状况
- Spanish: Estado del sistema de SAN de SSH

Remarks

- This sensor requires [credentials for Linux/Solaris/macOS \(SSH/WBEM\) systems](#) ^[452] in the settings of the parent device.
- This sensor does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, the HP P2000.
- It might happen that the controller of your target device breaks down. Experience shows that this issue strongly depends on the hardware model you monitor. Increase the scanning interval to discharge the controller and try again.
- After a firmware update of the target device, this sensor might show incorrect channel values. Add this sensor anew in this case.
- This sensor has a medium performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#) ^[448].
- Sometimes the devices you monitor with this SSH SAN sensor return status values that are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information on this issue, see the Knowledge Base: [Why does my SSH SAN sensor show a wrong status?](#)

Add Sensor

The [Add Sensor](#) ^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <ul style="list-style-type: none"> ⓘ This sensor has a fixed timeout of 300 seconds. If you change the value, it does not have an effect on the timeout. ⓘ Ensure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after k has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Enter an integer value.</p> <ul style="list-style-type: none"> ⓘ This sensor has a fixed timeout of 300 seconds. If you change the value, it does not have an effect on the timeout. ⓘ Ensure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.
SSH Port	<p>Define which port this sensor uses for the SSH connection:</p> <ul style="list-style-type: none"> ▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems^[452] section of the parent device settings. ▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings.

Setting	Description
Use Port Number	This setting is only visible if you select Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer value.
SSH Engine	<p>Select the method that you want to use to access data with this SSH sensor⁴³⁰¹. We strongly recommend that you use the default engine. You can still use the legacy mode for some time to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the object hierarchy¹³⁸¹. If you have not changed the SSH engine, this is the recommended default engine. ▪ Default: This is the default monitoring method for SSH sensors. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option. ▪ Compatibility mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors running with the default SSH engine. <p> The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID] (SSHv2).txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

KNOWLEDGE BASE

Why does my SSH SAN sensor show a wrong status?

- <https://kb.paessler.com/en/topic/60145>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

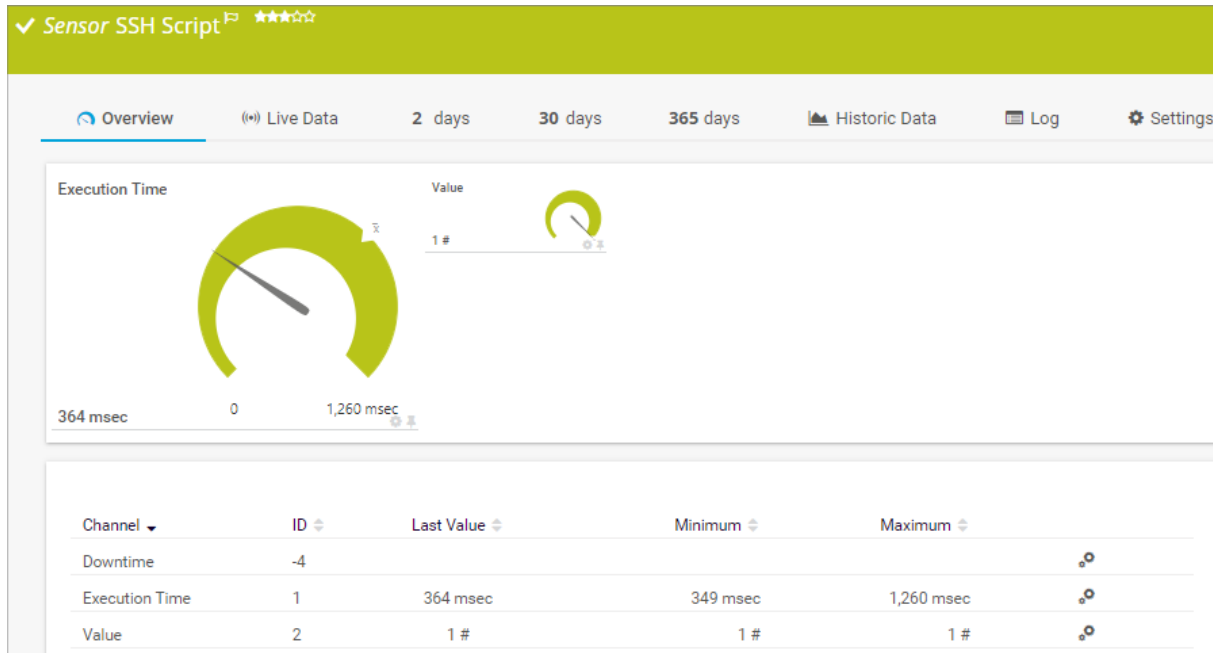

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3967

7.8.223 SSH Script Sensor

The SSH Script sensor connects to a Linux/Unix system via Secure Shell (SSH) and executes a script file that is located on the target system. This option is available as part of the PRTG API.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SSH Script Sensor

Sensor in Other Languages

- Dutch: SSH Script
- French: Script SSH
- German: SSH-Skript
- Japanese: SSH スクリプト
- Portuguese: SSH Script
- Russian: SSH
- Simplified Chinese: SSH 脚本
- Spanish: Secuencia de comandos de SSH

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- For security reasons, you must store your script file in the `/var/prtg/scripts` directory on the target system. Make sure that the script has executable rights. If the script is not available or was deleted from the directory, you get the error message [Script not found \(237\)](#).

- This sensor requires [credentials for Linux/Solaris/macOS \(SSH/WBEM\) systems](#)^[452] in the settings of the parent device.
- This sensor cannot support all Linux/Unix and macOS distributions.
- For details about the return value format, see section [Custom Sensors](#)^[439].
- See the Knowledge Base: [SSH and SFTP sensors in Unknown status](#)

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Sensor Settings

Setting	Description
Script	<p>Select a script file from the dropdown list. It shows all script files that are available in the <code>/var/prtg/scripts</code> directory on the target Linux/Unix system. For a script file to appear in this list, store the target file in this directory.</p> <ul style="list-style-type: none"> ❗ Make sure that the script has executable rights. ❗ To show the expected sensor value and status^[197], your file must use the correct format for the returned values. In this case, it is <code>exitcode:value:message</code> to standard output <code>stdout</code>. The exit code determines the sensor status. ■ For detailed information on how to create custom sensors and for the return format, see section Custom Sensors^[439]. ■ For an example script, see the Knowledge Base: Is there a shell script example for the SSH Script sensor?
Value Type	<p>Define the type of the values that your executable or script file returns:</p> <ul style="list-style-type: none"> ▪ Integer: An integer is expected as return value. If the script returns a float, PRTG displays the value 0. ▪ Float: A float is expected as return value, with a dot (.) between the predecimal position and the decimal places. <ul style="list-style-type: none"> ❗ The sensor also displays integer values unless they produce a buffer overflow. ▪ Counter: Your script returns an integer that increases. PRTG shows the difference between the values of two sensor scans. <ul style="list-style-type: none"> ❗ A counter must return an integer. It does not support float values. ❗ The sensor does not support string values.
Channel Name	<p>Enter a name for the channel in which the sensor shows returned values. Enter a string. This is for display purposes only. You can change the name later in the channel settings^[397].</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ sshscript
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

Sensor Settings

Sensor Settings

The sensor executes the script on the parent device. The working directory for the script is the parent directory on the target Linux/Unix system.

Script ⓘ

Character Encoding ⓘ UTF-8 (default)
 ASCII

Parameters ⓘ

Mutex Name ⓘ

Unit String ⓘ

Value Type ⓘ

If Value Changes ⓘ Ignore changes
 Trigger 'change' notification

Sensor Settings

Setting	Description
Script	Shows the name of the script that the sensor executes with each scanning interval. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Character Encoding	Define the character encoding that you use in your script to correctly display the sensor message: <ul style="list-style-type: none"> ▪ UTF-8 (default) ▪ ASCII
Parameters	If your script file catches command-line parameters, define them here. You can also use placeholders. Enter a string or leave the field empty. ⓘ For a full list of all placeholders, see section Custom Sensors 4449 . ⓘ You must escape special characters and whitespaces in your parameters and surround them with double quotes. See section Escape Special Characters and Whitespaces in Parameters 3285 for details. ⓘ In SSH scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.
Mutex Name	Define a mutual exclusion (mutex) name for the process. Enter a string or leave the field empty.

Setting	Description
	<p>i PRTG runs all custom script sensors that have the same mutex name serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes that run running at the same time.</p> <p>■ See the Knowledge Base: What is the Mutex Name in the PRTG EXE/Script settings?</p>
Unit String	Define a unit for the channel value. Enter a string. This is for display purposes only and is the default unit for a new channel. You can change the unit after sensor creation in the sensor's channel settings.
Value Type	Shows the expected type of the returned value. i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
If Value Changes	Define what the sensor does when the sensor value changes: <ul style="list-style-type: none"> Ignore changes (default): Take no action on change. Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger⁴¹³⁸, you can use this mechanism to trigger a notification³⁹⁸⁷ whenever the sensor value changes.

Connection Timeout (Sec.) ⓘ 60

Shell Timeout (Sec.) ⓘ 10

SSH Port ⓘ Inherit port number from parent device (default)
 Enter custom port number

SSH Engine ⓘ Inherit from parent device (default)
 Default
 Compatibility Mode (deprecated)

Result Handling ⓘ Discard result
 Store result
 Store result in case of error

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i Ensure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after k has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Enter an integer value.</p> <p>i Ensure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.</p>
SSH Port	<p>Define which port this sensor uses for the SSH connection:</p> <ul style="list-style-type: none"> ▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems^[452] section of the parent device settings. ▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings.
Use Port Number	<p>This setting is only visible if you select Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer value.</p>
SSH Engine	<p>Select the method that you want to use to access data with this SSH sensor^[430]. We strongly recommend that you use the default engine. You can still use the legacy mode for some time to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the object hierarchy^[138]. If you have not changed the SSH engine, this is the recommended default engine. ▪ Default: This is the default monitoring method for SSH sensors. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option. ▪ Compatibility mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors running with the default SSH engine. <p>i The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID] (SSHv2).txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> ⓘ Custom channel types are only available on sensor level.</p>

Escape Special Characters and Whitespaces in Parameters

You need to escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure that the characters are correctly interpreted. PowerShell scripts in particular require adequate escaping so that the parameters are passed in a valid PowerShell syntax. PRTG automatically does most of the escaping for you.

Follow these rules to escape special characters and whitespaces in the parameters fields:

- Use quotes for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotes for parameters that contain single quotes.

```
-name "Mr 'John Q' Public"
```

- Use single quotes for parameters that contain double quotes.

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quote.

```
-name pub\"lic
```

- Use double quotes for parameters that contain double and single quotes and escape double quotes.

```
-name "pu'b\"lic"
```

- ❗ In SSH scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.
- ❗ We recommend that you do not pass passwords in parameters. Use placeholders instead. See section [Custom Sensors](#)⁴⁴⁵⁰ for details.

Channel List

- ❗ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Execution Time	The execution time in milliseconds (msec) ❗ This channel is the primary channel by default.
[Value]	The value that the script file returns in one channel ■ For details about the return value format, see section Custom Sensors ⁴⁴³⁹ .

Sensor Settings Overview

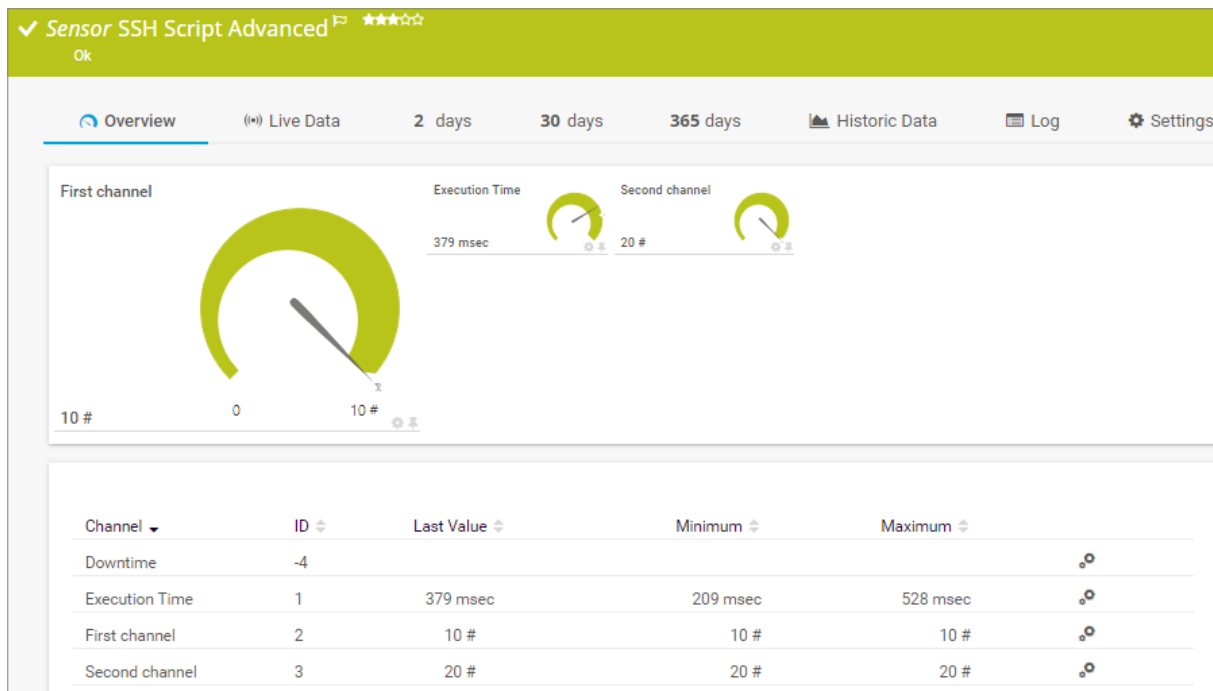

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.224 SSH Script Advanced Sensor

The SSH Script Advanced sensor connects to a Linux/Unix system via Secure Shell (SSH) and executes a script file that is located on the target system. This option is available as part of the PRTG API.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SSH Script Advanced Sensor

Sensor in Other Languages

- Dutch: SSH Script Geavanceerd
- French: Script SSH avancé
- German: SSH-Skript (Erweitert)
- Japanese: SSH スクリプト(詳細)
- Portuguese: SSH Script Avançado
- Russian: SSH
- Simplified Chinese: 高级 SSH 脚本
- Spanish: Secuencia de comandos SSH avanzada

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- For security reasons, you must store the script file in the `/var/prtg/scriptsxml` directory on the target system. Make sure that the script has executable rights.

- This sensor requires [credentials for Linux/Solaris/macOS \(SSH/WBEM\) systems](#) ⁴⁵² in the settings of the parent device.
- This sensor cannot support all Linux/Unix and macOS distributions.
- This sensor does not officially support more than 50 channels. Depending on the data used with this sensor, you might exceed the maximum number of supported channels. In this case, PRTG tries to display all channels. Be aware, however, that you experience limited usability and performance.
- For details about the return value format, see section [Custom Sensors](#) ⁴⁴⁴.
- See the Knowledge Base: [SSH and SFTP sensors in Unknown status](#)

Add Sensor

The [Add Sensor](#) ³⁶⁷ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Sensor Settings

Setting	Description
Script	<p>Select a script file from the dropdown list. It shows all script files that are available in the <code>/var/prtg/scripts</code> directory on the target Linux/Unix system. For a script file to appear in this list, store the target file in this directory.</p> <ul style="list-style-type: none">  Make sure that the script has executable rights.  To show the expected sensor value and status ¹⁹⁷, your files must return the expected XML or JSON format to standard output <code>stdout</code>. The values and message must be embedded in the XML or JSON.  For detailed information on how to create custom sensors and for the return format, see section Custom Sensors ⁴⁴⁴.

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> sshscript
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

Sensor Settings

Sensor Settings

Important: The script is executed on the device the sensor is created on. The working directory for the script is the scripts parent directory on the target Linux/Unix system.

Script

Parameters

Mutex Name

Sensor Settings

Setting	Description
Script	Shows the script that the sensor executes with each scanning interval. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Parameters	If your script file catches command-line parameters, you can define them here. You can use also placeholders. Enter a string or leave the field empty. ■ For a full list of all placeholders, see section Custom Sensors ⁴⁴⁴⁹ . ⓘ You must escape special characters and whitespaces in your parameters and surround them with double quotes. See section Escape Special Characters and Whitespaces in Parameters ³²⁹⁹ for details. ⓘ In SSH scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.
Mutex Name	Define a mutual exclusion (mutex) name for the process. Enter a string or leave the field empty. ⓘ PRTG runs all custom script sensors that have the same mutex name serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes that run running at the same time. ■ See the Knowledge Base: What is the Mutex Name in the PRTG EXE/Script settings?

SSH Specific

 Store result
 Store result in case of error

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i Ensure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after k has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Enter an integer value.</p> <p>i Ensure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.</p>
SSH Port	<p>Define which port this sensor uses for the SSH connection:</p> <ul style="list-style-type: none"> ▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems^[452] section of the parent device settings. ▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings.
Use Port Number	<p>This setting is only visible if you select Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer value.</p>
SSH Engine	<p>Select the method that you want to use to access data with this SSH sensor^[430]. We strongly recommend that you use the default engine. You can still use the legacy mode for some time to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the object hierarchy^[138]. If you have not changed the SSH engine, this is the recommended default engine. ▪ Default: This is the default monitoring method for SSH sensors. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option. ▪ Compatibility mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors running with the default SSH engine. <p>i The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID] (SSHv2).txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. ▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Bytes (File)	Byte ▼

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> ⓘ Custom channel types are only available on sensor level.</p>

Escape Special Characters and Whitespaces in Parameters

You need to escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure that the characters are correctly interpreted. PowerShell scripts in particular require adequate escaping so that the parameters are passed in a valid PowerShell syntax. PRTG automatically does most of the escaping for you.

Follow these rules to escape special characters and whitespaces in the parameters fields:

- Use quotes for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotes for parameters that contain single quotes.

```
-name "Mr 'John Q' Public"
```

- Use single quotes for parameters that contain double quotes.

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quote.

```
-name pub\"lic
```

- Use double quotes for parameters that contain double and single quotes and escape double quotes.

```
-name "pu'b\"lic"
```

- ❗ In SSH scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.
- ❗ We recommend that you do not pass passwords in parameters. Use placeholders instead. See section [Custom Sensors](#)⁴⁴⁵⁰ for details.

Channel List

- ❗ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Execution Time	The execution time in milliseconds (msec)
[Value]	The values that the script file returns in several channels <ul style="list-style-type: none"> ■ For details about the return value format, see section Custom Sensors⁴⁴⁴⁰.

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.225 SSL Certificate Sensor

The SSL Certificate sensor monitors the certificate of a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection.

i The sensor also shows the certificate common name and the certificate thumbprint in the sensor message.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Channel	ID	Last Value	Minimum	Maximum
Common Name Check	7	Disabled	Disabled	Disabled
Days to Expiration	2	64	64	64
Downtime	-4			
Public Key Length	5	Good (2048)	Good (2048)	Good (2048)
Revoked	4	No	Unable to check revocation...	No
Root Authority Trusted	3	Yes	Yes	Yes
Self-Signed	6	No	No	No

SSL Certificate Sensor

Sensor in Other Languages

- Dutch: SSL Certificaat
- French: Certificat SSL
- German: SSL-Zertifikat
- Japanese: SSL 証明書
- Portuguese: Certificado SSL
- Russian: SSL
- Simplified Chinese: SSL 证书
- Spanish: Certificado SSL

Remarks

- Enter the Domain Name System (DNS) name in the [settings of the parent device](#) exactly as it is written in your certificate. You can also use [wildcards](#).
- To check the revocation status of a certificate, the sensor uses WinHTTP to auto-detect the proxy server to use. You can also manually define a server. If you do not define a proxy server, PRTG uses the default WinHTTP proxy settings. For more information, see the Knowledge Base: [How can I configure the WinHTTP proxy settings for the SSL Certificate Sensor?](#)
- This sensor has predefined limits for several metrics. You can individually change these limits in the channel settings. For detailed information about channel limits, see section [Channel Settings](#).
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).

i This sensor supersedes the deprecated HTTP Certificate Expiry sensor.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog box. It has a title bar 'Basic Sensor Settings' and a close button. The main area contains three rows of settings:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A text input field containing 'exampletag' with a blue 'X' delete button and a '+' add button.
- Priority**: A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ sslcertificate ▪ ssl ▪ certificate
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the TCP read request. Enter an integer value. The maximum timeout value is 300 seconds (5 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

SSL Certificate Specific

SSL Certificate Specific

Port

Virtual Host (SNI Domain)

Certificate Name Validation Do not compare common name (CN) with device address or SNI (default)
 Compare and show down status if common name (CN) and address/SNI do not match
 Compare and show down status if common name (CN)/alternative names (SAN) and address/SNI do not match

SSL Certificate Specific

Setting	Description
Port	Enter the number of the port to which this sensor connects. Enter an integer value. The default port is 443.
Virtual Host (SNI Domain)	<p>Define the host name that the sensor tries to query if your server has multiple certificates on the same IP address and port combination. Enter a string.</p> <p>i In the case of virtual hosting, you must identify the specific certificate for a specific domain while all domains use the same IP address, you can use SNI, which is an extension of TLS.</p> <p>i If you select Certificate Name Validation below, the sensor compares the common name and optionally alternative names with the SNI. Leave this field empty to validate the common name with the host address of the parent device.</p>
Certificate Name Validation	<p>Define if you want the sensor to validate the certificate name:</p> <ul style="list-style-type: none"> ▪ Do not compare common name (CN) with device address or SNI (default): Do not check if the certificate name is valid by comparing it with the address of the parent device or the defined SNI. ▪ Compare and show down status if common name (CN) and address/SNI do not match: Check the common name to validate the certificate name. If you define an SNI above, the sensor compares the common name with the SNI. If you do not define an SNI, the sensor uses the host address of the parent device. If the common name and the checked address/SNI do not match, the sensor shows the Down status¹⁹⁷. ▪ Compare and show down status if common name (CN)/alternative names (SAN) and address/SNI do not match: Check the common name and the Subject Alternative Names (SAN) to validate the certificate. If you define an SNI domain above, the sensor compares the common name and alternative names with the SNI. If you do not define an SNI, the sensor uses the host address of the parent device. If the common name or alternative names and the checked address/SNI do not match, the sensor shows the Down status.

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds 60 seconds 5 minutes 10 minutes 15 minutes 30 minutes

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below.

Setting	Description
	<p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: if the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

KNOWLEDGE BASE

How can I configure the WinHTTP proxy settings for the SSL Certificate sensor?

- <https://kb.paessler.com/en/topic/86280>

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

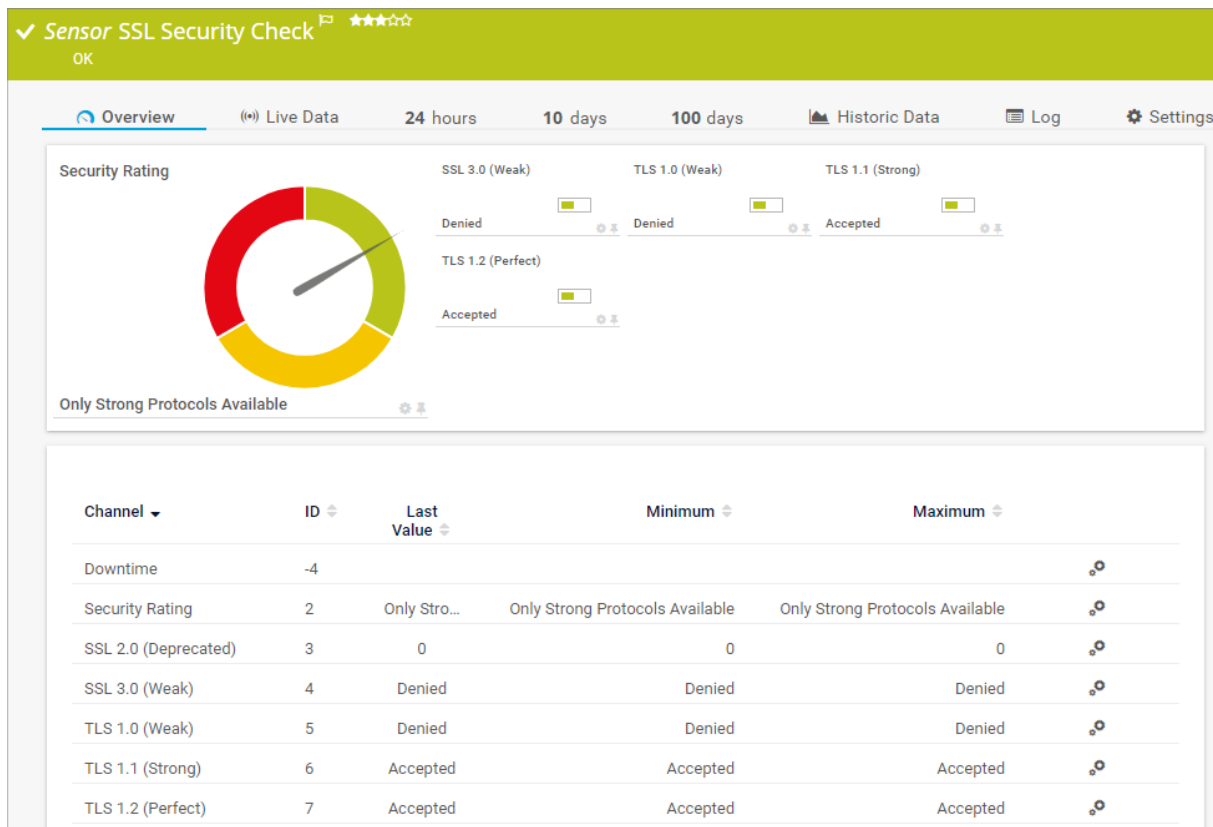

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#) ⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#) ³⁹⁷²
- [Channel Settings](#) ³⁹⁷⁷
- [Notification Triggers Settings](#) ³⁹⁸⁷

7.8.226 SSL Security Check Sensor

The SSL Security Check sensor monitors Secure Sockets Layer (SSL)/Transport Layer Security (TLS) connectivity to the port of a device. It tries to connect to the specified TCP/IP port number of a device with different SSL/TLS versions and shows if the device supports a particular protocol.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

SSL Security Check Sensor

Sensor in Other Languages

- Dutch: SSL Security Check
- French: Vérification de sécurité SSL
- German: SSL-Sicherheitsüberprüfung
- Japanese: SSL セキュリティーチェック
- Portuguese: Verificação de segurança SSL
- Russian: SSL
- Simplified Chinese: SSL 安全检查
- Spanish: Comprobación de seguridad SSL

Remarks

- This sensor only checks accepted protocols, it does not consider the used ciphers.

- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).
- See the Knowledge Base: [How do you determine the protocol security ratings of the SSL Security Check sensor?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name:** A text input field containing "Example Name".
- Tags:** A list of tags with "exampletag" selected. There are "X" and "+" icons for removing and adding tags.
- Priority:** A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p>

Setting	Description
	<p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ sslsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

SSL Security Specific

SSL Security Specific

Timeout (Sec.) **i**

Port **i**

Virtual Host (SNI Domain) **i**

SSL Security Specific

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
Port	Enter the number of the port to which this sensor connects. Enter an integer value. The default port is 443.

Setting	Description
Virtual Host (SNI Domain)	Enter the host name that the sensor queries. The sensor uses this host for the connection if the target server has multiple certificates on the same IP address and IP port when using Server Name Identification (SNI).

Connection Specific

Connection Specific

 Do not use SOCKS proxy (default)
 Use SOCKS proxy

Connection Specific

Setting	Description
Use SOCKS Proxy (v5 only)	<p>Define if the sensor uses a SOCKS proxy server for the sensor connection:</p> <ul style="list-style-type: none"> ▪ Do not use SOCKS proxy (default): Directly connect to the target host without using a SOCKS proxy. ▪ Use SOCKS proxy: Connect using SOCKS5. Provide data for the SOCKS connection below. <ul style="list-style-type: none"> ⓘ Other SOCKS versions are not supported. ⓘ This sensor only supports SOCKS5 proxies. It does not support HTTP proxies.
Proxy Server	This setting is only visible if you select Use SOCKS proxy above. Enter the IP address or host name of the proxy server that the sensor uses for connection.
Proxy Server Port	This setting is only visible if you select Use SOCKS proxy above. Enter the port number of the proxy server that the sensor uses for connection.
Proxy Server User Name	This setting is only visible if you select Use SOCKS proxy above. If the proxy server requires authentication, enter a username.
Proxy Server Password	This setting is only visible if you select Use SOCKS proxy above. If the proxy server requires authentication, enter the password for the user you specified above.

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click ⓘ to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Sensor Settings Overview

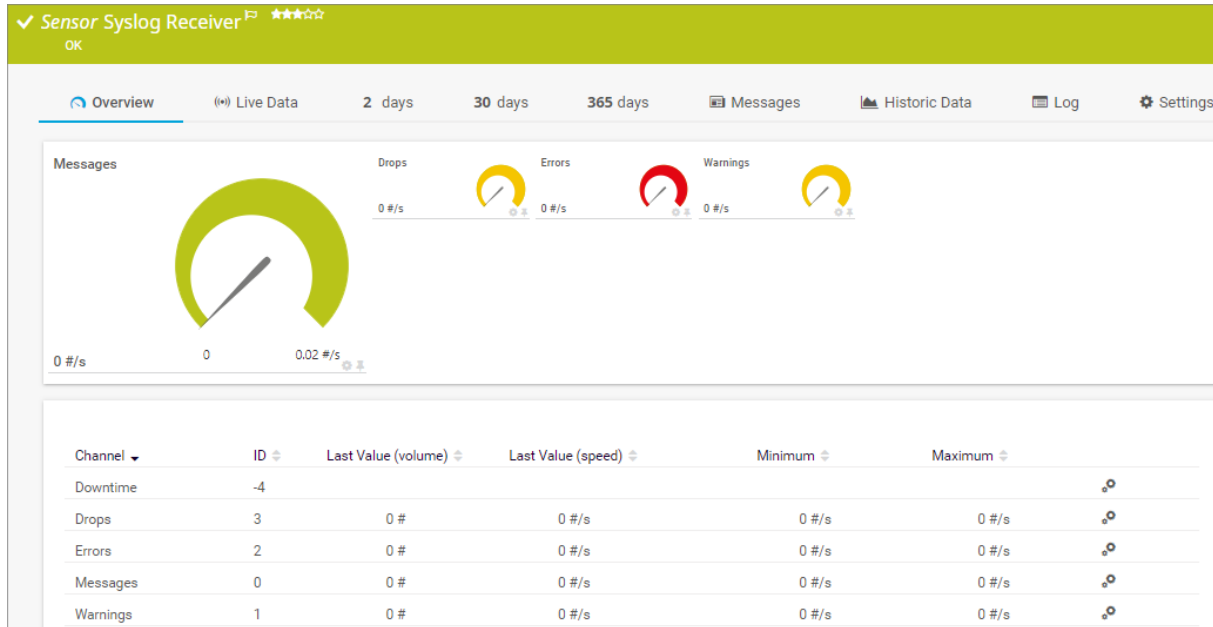

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.227 Syslog Receiver Sensor

The Syslog Receiver sensor receives and analyzes Syslog messages.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Syslog Receiver Sensor

Sensor in Other Languages

- Dutch: Syslog ontvanger
- French: Récepteur Syslog
- German: Syslog-Empfänger
- Japanese: Syslog レシーバー
- Portuguese: Destinatário de syslog
- Russian: Syslog
- Simplified Chinese: 系统日志接收程序
- Spanish: Receptor Syslog

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- This sensor only supports the User Datagram Protocol (UDP).

- If you do not add the sensor to a probe device but to a different device in PRTG, be careful with the configuration: Ensure that the IP address or Domain Name System (DNS) name of the parent device matches the proper sender. For example, if you want to receive messages from a storage area network (SAN), you might have to add a device to PRTG using the IP address of a specific array member that sends the messages. Providing a DNS name that points to the IP address of a whole group might not work for SANs.
- With the available filter options, you can individually define which types of messages the sensor considers for monitoring, and which messages it categorizes as warning or error messages. Depending on the filters, received messages are counted in the respective channels.
- Add this sensor to the probe device to receive all messages of the remote probe system.
- Add this sensor to a specific device to directly receive all messages from this device. This makes this sensor faster than when you use source filters.
- This sensor supports the IPv6 protocol.
- You cannot use this sensor in cluster mode. You can only set it up on a local probe or a remote probe but not on a cluster probe.
- For a general introduction to the receiver's configuration, see section [Monitoring Syslogs and SNMP Traps](#)⁴³²⁸.
- You can use specific placeholders in email [notification templates](#)⁴¹³⁸ to see the messages when you receive an email notification. See section [List of Placeholders for Notifications](#)⁴⁶⁶².
- The [sensor states](#)¹⁹⁷ of this sensor persist for one scanning interval only. After showing a Warning status or a Down status, and if there is no warning or error message in the following scanning interval, the sensor shows an Up status again. For a workaround, see the Knowledge Base: [How can I configure sensors using speed limits to keep the status for more than one interval?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#)³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[406], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ syslogsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Syslog Specific

Syslog Specific

Port **i** 514

Purge Messages After **i** 32 days

Syslog Specific

Setting	Description
Port	Enter the number of the port on which the sensor listens for Syslog messages. The default port is 514. Enter an integer value.  We recommend that you use the default value.
Purge Messages After	Define how long PRTG stores received Syslog messages for analysis. Select a period of time from the dropdown list.

Filter

For detailed information, see section [Filter Rules](#) ³³³⁷.

Filter

Filters are formulas using AND, OR, NOT, brackets and the following fields:

Field	Parameters	Examples
source[ip]	Enter a UDP source IP, IP range, or IP hostmask	source[10.0.23.50], source[10.0.23.10-50], source[10.0.23.10/24]
facility[number]	Enter a number or range of the facility code, between 0 and 23	facility[2], facility[5-7]
severity[number]	Enter a single number or range of the severity code, between 0 (Emergency) and 7 (Debug)	severity[4], severity[1-3]
hostname[text]	Enter the hostname string to match (exact, case sensitive)	hostname[www.paessler.com]
tag[text]	Enter the tag string to match (exact, case sensitive)	tag[su]
appname[text]	Enter the app name string to match (exact, case sensitive)	appname[myproc]
procid[text]	Enter the process ID string to match (exact, case sensitive)	procid[8710]
msgid[text]	Enter the message ID string to match (exact, case sensitive)	msgid[ID47]
message[parttext]	Enter a substring to match the message field (partial, case insensitive)	message[Error]
data[parttext] data[id,param] data[id,param,value]	Enter a substring to match on structured data as displayed in the table (partial, case sensitive); or enter an ID and a parameter (comma separated) to check if the parameter exists in the ID element, or enter an ID, a parameter, and a value (comma separated) to match on a structured data value (RFC 5424)	data[exampleSDID@32473], data[exampleSDID@32473, eventSource], data[exampleSDID@32473, eventSource, Application]

Include Filter  severity[0-6]

Exclude Filter 

Warning Filter  severity[4]

Error Filter  severity[0-3]

Syslog Specific

Setting	Description
Include Filter	Define if you want to filter Syslog messages. If you leave this field empty or use the keyword any , the sensor processes all data. To only include specific types of messages, define filters using a special syntax.
Exclude Filter	Define which types of Syslog messages the sensor discards and does not process. To exclude specific types of messages, define filters using a special syntax.
Warning Filter	<p>Define which types of Syslog messages count for the Warnings channel. To categorize received messages as warning messages, define filters using a special syntax.</p> <p>i The sensor collects messages until a scanning interval ends. As long as the scanning interval is running, the sensor does not change its status. By default, the sensor changes to the Warning status ^[197] after a scanning interval finishes and there was at least one warning message (and no error message) during this scanning interval. The sensor shows the Warning at least until the succeeding scanning interval finishes. If the sensor does not receive any warning or error message in this scanning interval, its status changes to the Up status again with the start of the next scanning interval.</p>
Error Filter	<p>Define which types of Syslog messages count for the Errors channel. To categorize received messages as error messages, define filters using a special syntax.</p> <p>i The sensor collects messages until a scanning interval ends. As long as the scanning interval is running, the sensor does not change its status. By default, the sensor changes to the Down status after a scanning interval finishes and there was at least one error message during this scanning interval. The sensor shows the Down status at least until the succeeding scanning interval finishes. If the sensor does not receive any warning or error message in this scanning interval, its status changes to the Up status again with the start of the next scanning interval.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

i Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

inherit from  Root

Channel Unit Types **i**

Channel Type	Unit
Bytes (Bandwidth)	KB ▼
	kbit ▼
	/ ▼
	sec... ▼
Bytes (Memory)	MB ▼
Bytes (Disk)	MB ▼
Bytes (File)	Byte ▼

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Debug Options

Debug Options

Result Handling ⓘ

Discard result

Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result (recommended): Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\debug subfolder of the PRTG data directory on the probe system. This setting is for debugging purposes. <p>ⓘ Use with caution. We recommend that you only use this setting for a short time because it can create huge data files.</p>

Filter Rules for Syslog Messages

Filter rules are used for the include, exclude, warning, and error definition fields of the Syslog Receiver sensor. They are based on the following format:

```
field[filter]
```

You can use various filters suitable to your needs. Include and exclude filters define which messages to monitor. Warning and error filters define how to categorize received messages. Provide these filters in the sensor settings as formulas. Formulas are fields that you can combine with boolean operators ([AND](#), [OR](#), [NOT](#)) and brackets.

Field	Parameter	Example
source[ip]	Enter an IP address where the messages come from. IP masks and ranges are also possible.	<ul style="list-style-type: none"> ▪ source[10.0.23.50] ▪ source[10.0.23.10-50] ▪ source[10.0.23.10/24]
facility[number]	Enter any number or range from 0 to 23 specifying the program type that sends the message.	<ul style="list-style-type: none"> ▪ facility[2] ▪ facility[5-7] ▪ facility[5] OR facility[6]
severity[number]	Enter any number or range from 0 (emergency) to 7 (debug) specifying the message type.	<ul style="list-style-type: none"> ▪ severity[4] ▪ severity[1-3] ▪ severity[1] AND severity[2]

Field	Parameter	Example
hostname[text]	Enter any string that specifies the hostname of a device in the message.	hostname[www.example.com]
tag[text]	Enter any string that specifies the tag of a program or process in the message.	tag[su]
appname[text]	Enter any string that specifies the appname part of the message.	appname[myproc] appname[demo] AND msgid[m42]
procid[text]	Enter any string that specifies the process identifier part of the message.	procid[1860]
msgid[text]	Enter any string that specifies the message identifier part of the message.	msgid[ID47]
message[parttext]	Enter any string that specifies the message part of the message. (Any substring matches. This value is case insensitive.)	message[Error]
data[id,param,value]	This checks the SD-ID block of the message's structured data for a parameter matching the specified value.	data[exampleSDID@12345,eventSource,Application]
data[parttext]	This checks if the specified substring matches structured data as displayed in the corresponding table.	data[exampleSDID@1234]
data[id,param]	This checks if the parameter exists in the specified ID element.	data[exampleSDID@1234,eventSource]

i String parameters (except the substring in message) have to **exactly** match the particular parts of the message. They are case sensitive.

Messages Tab: Review and Analyze Syslog Messages

PRTG stores received Syslog messages as common files in the \Syslog Database subfolder of the PRTG data directory. To review and analyze all received messages, you can directly access the most recent data in a [table list](#)^[246] on the PRTG web interface. You can access this list via the sensor's Overview tab.

i Received Syslog messages are only shown in the table on the Overview tab after an (automatic) page refresh following a sensor scan. The default value for [auto refresh](#)^[4123] is 30 seconds.

For more details and further filter options, click the Messages tab of the Syslog Receiver sensor. You see all received messages in a table list. On the top, you have display filter options to drill down into the data for specific events of your interest. The filters are the same as those available in the sensor settings, but you can define them without using formulas. Provide the desired parameters and PRTG automatically loads the filtered list.

i You can automatically add a filter by clicking the content of a column.

Advanced Filter Settings

You can open advanced filter settings by clicking  in the Filter row. The Advanced Filter appears in a popup window. In the text field, you can define a filter using the syntax as specified in section [Filter Rules for Syslog Messages](#) ³³³⁷.

If you provided filter parameters on the Messages tab, the advanced filter already includes them as a corresponding formula with the correct syntax. You can adjust this filter to your needs. You can also copy the automatically created and manually adjusted formula for usage in the filter fields of the sensor settings.

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Drops	The number of dropped packets per second on the syslog port
Errors	The number of messages categorized as "error" per second
Messages	The number of received Syslog messages per second  This channel is the primary channel by default.
Warnings	The number of messages categorized as "warning" per second

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Available Memory	The amount of free memory available on the system. This value should not fall below 500 MB. This way, PRTG can still request resources during report generation or auto-discoveries, for example.
Available Memory Percent	The available memory in percent
CPU Load	<p>The CPU load in percent on the probe system. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value should usually stay below 50%.</p> <p>i This channel is the primary channel by default.</p>
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Health	The sum of the probe state as a value between 100% (healthy) and 0% (failing). Investigate frequent or repeated health values below 100%.

Sensor Settings Overview

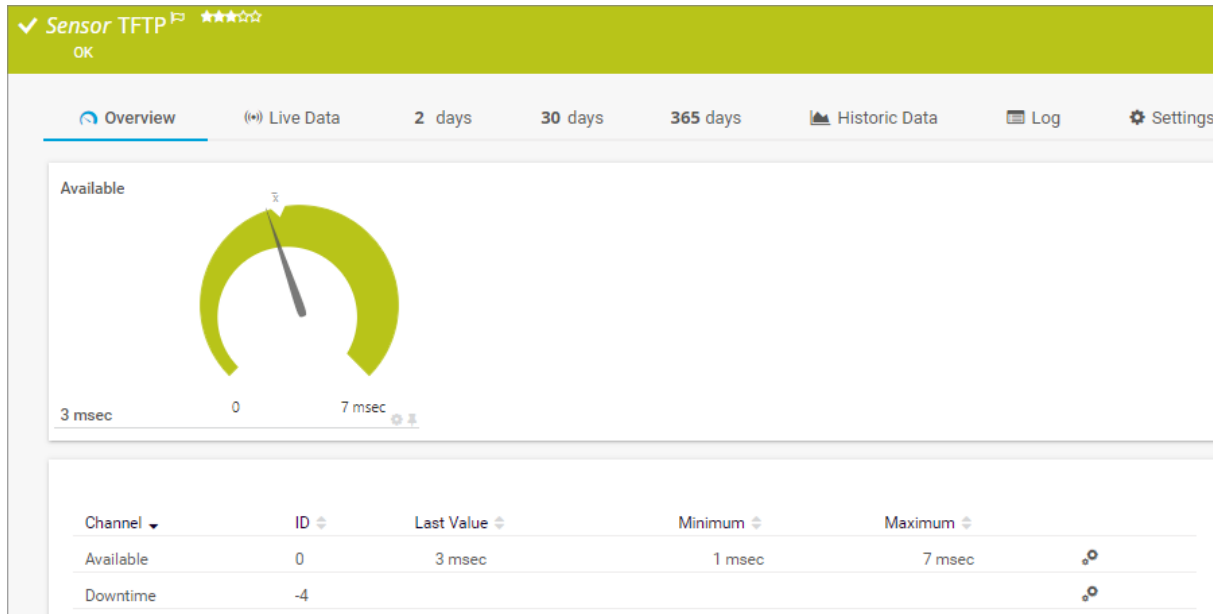

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.229 TFTP Sensor

The TFTP sensor monitors a Trivial File Transfer Protocol (TFTP) server and checks if a certain file is available for download.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

TFTP Sensor

Sensor in Other Languages

- Dutch: TFTP
- French: TFTP
- German: TFTP
- Japanese: TFTP
- Portuguese: TFTP
- Russian: TFTP
- Simplified Chinese: TFTP
- Spanish: TFTP

Remarks

- This sensor has a medium performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[409], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> trivialftpsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)⁴⁴⁶ for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Specific

Sensor Specific

	Timeout (Sec.) i	5
	Port i	69
	File Name i	tftp.c

Sensor Specific

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer value. The maximum timeout value is 900 seconds (15 minutes).</p> <p>i If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
Port	<p>Enter the number of the port that the TFTP service runs on. The sensor connects to this port. Enter an integer value.</p>
File Name	<p>Enter the name of the file that this sensor checks. If the file is not available on the server, the sensor shows the Down status¹⁹⁷. Enter a string.</p>

Sensor Display

Sensor Display

Primary Channel i	Downtime
Graph Type i	<input checked="" type="radio"/> Show channels independently (default) <input type="radio"/> Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

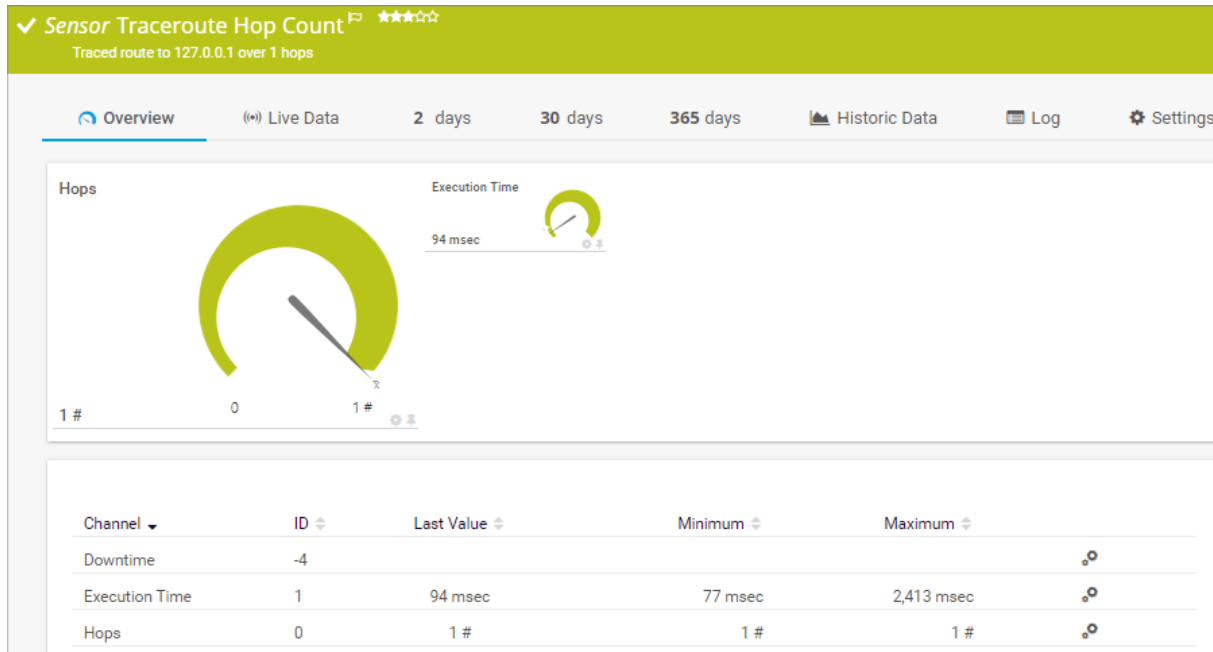

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.230 Traceroute Hop Count Sensor

The Traceroute Hop Count sensor traces the number of hops from the probe system to the IP Address/DNS Name of the parent device.

i If the number of hops (the route) changes, you can additionally define a different [sensor status](#).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Traceroute Hop Count Sensor

Sensor in Other Languages

- Dutch: Traceroute Hop Count
- French: Nombre de sauts Traceroute
- German: Traceroute Hop-Anzahl
- Japanese: Traceroute ホップ数
- Portuguese: Contagem de hops do rastreo de rotas
- Russian: -
- Simplified Chinese: 跟踪路由跳跃计数
- Spanish: Cuenta de hops de traceroute

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires .NET 4.7.2 or later on the probe system. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.

- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor supports the IPv6 protocol.

Detailed Requirements

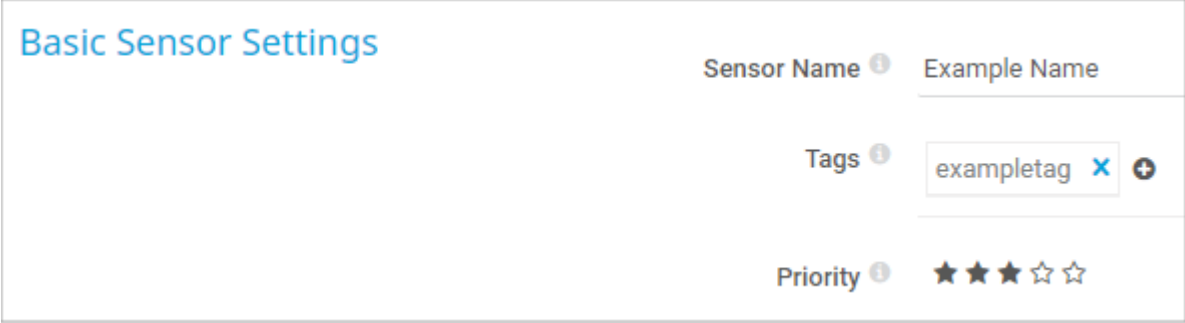

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus icon, and a 'Priority' field with five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵³.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.

Channel	Description
Execution Time	The execution time in milliseconds (msec)
Hops	The number of hops  This channel is the primary channel by default.

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

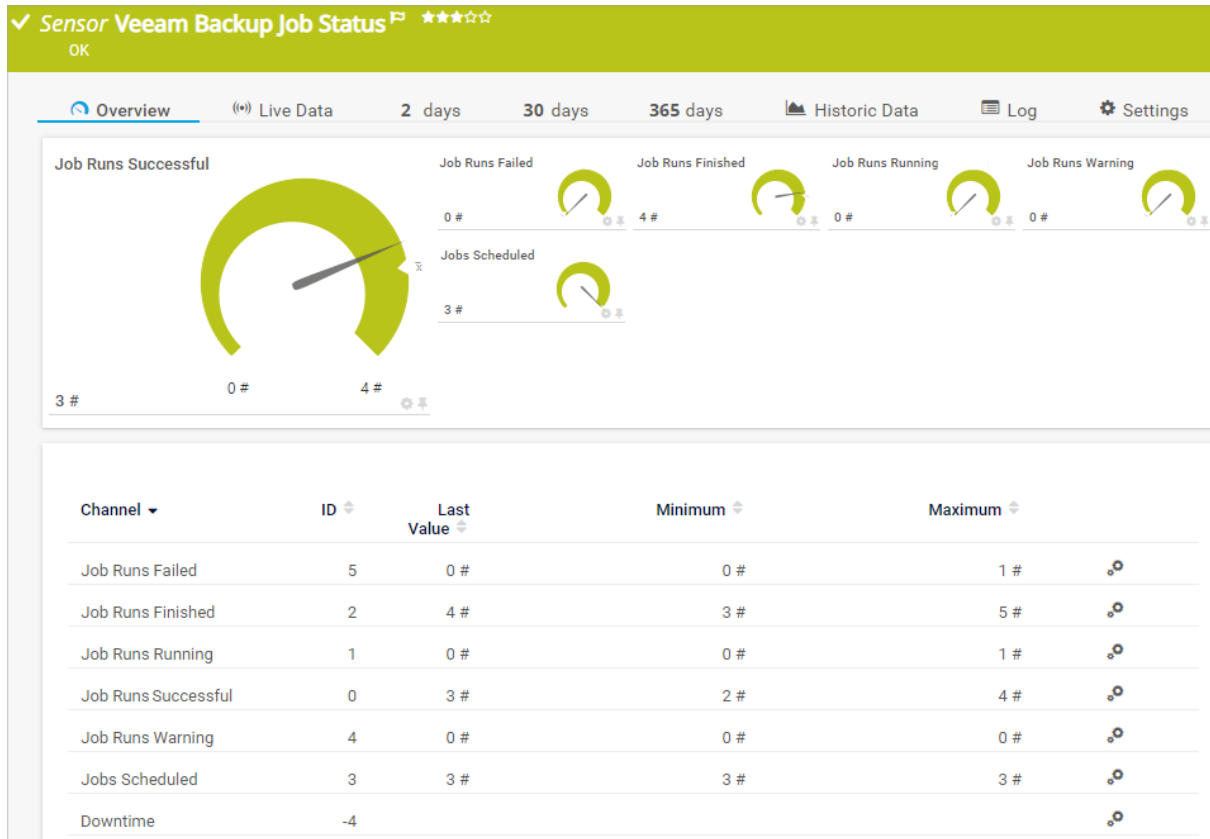

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.231 Veeam Backup Job Status Sensor

The Veeam Backup Job Status sensor monitors the status of all backup job runs on the Veeam Backup Enterprise Manager in the last 24 hours.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Veeam Backup Job Status Sensor

Sensor in Other Languages

- Dutch: Veeam Backup Job Status
- French: Veeam Backup Job Status
- German: Veeam Backup Job Status
- Japanese: Veeam Backup Job Status
- Portuguese: Veeam Backup Job Status
- Russian: Veeam Backup Job Status
- Simplified Chinese: Veeam Backup Job Status
- Spanish: Veeam Backup Job Status

Remarks

- This sensor requires [credentials for Veeam](#) in settings that are higher in the [object hierarchy](#), for example, in the settings of the parent device.

- This sensor requires an installation of the [Veeam Backup Enterprise Manager 10](#) with the [Enterprise Plus](#) license.
- This sensor only supports version [1.5](#) of the Representational State Transfer (REST) application programming interface (API).
- This sensor supports the IPv6 protocol.
- This sensor has a very low performance impact.

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p>

Setting	Description
	<p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ veeam ▪ veeambackup ▪ veeamenterprisemanager
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i** Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking ⌵ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel.

Setting	Description
	<ul style="list-style-type: none"> Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Debug Options

Debug Options

Result Handling 

Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

 User Group	 Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Job Runs Failed	The number of failed job runs
Job Runs Finished	<p>The number of finished job runs</p> <p>i The Job Runs Finished channel shows the total number of all job runs in a warning state, successful job runs, and failed job runs.</p>
Job Runs Running	The number of running job runs
Job Runs Successful	<p>The number of successful job runs</p> <p>i This channel is the primary channel by default.</p>
Job Runs Warning	The number of job runs in a warning state
Jobs Scheduled	The number of scheduled backup jobs

More

KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Sensor Settings Overview

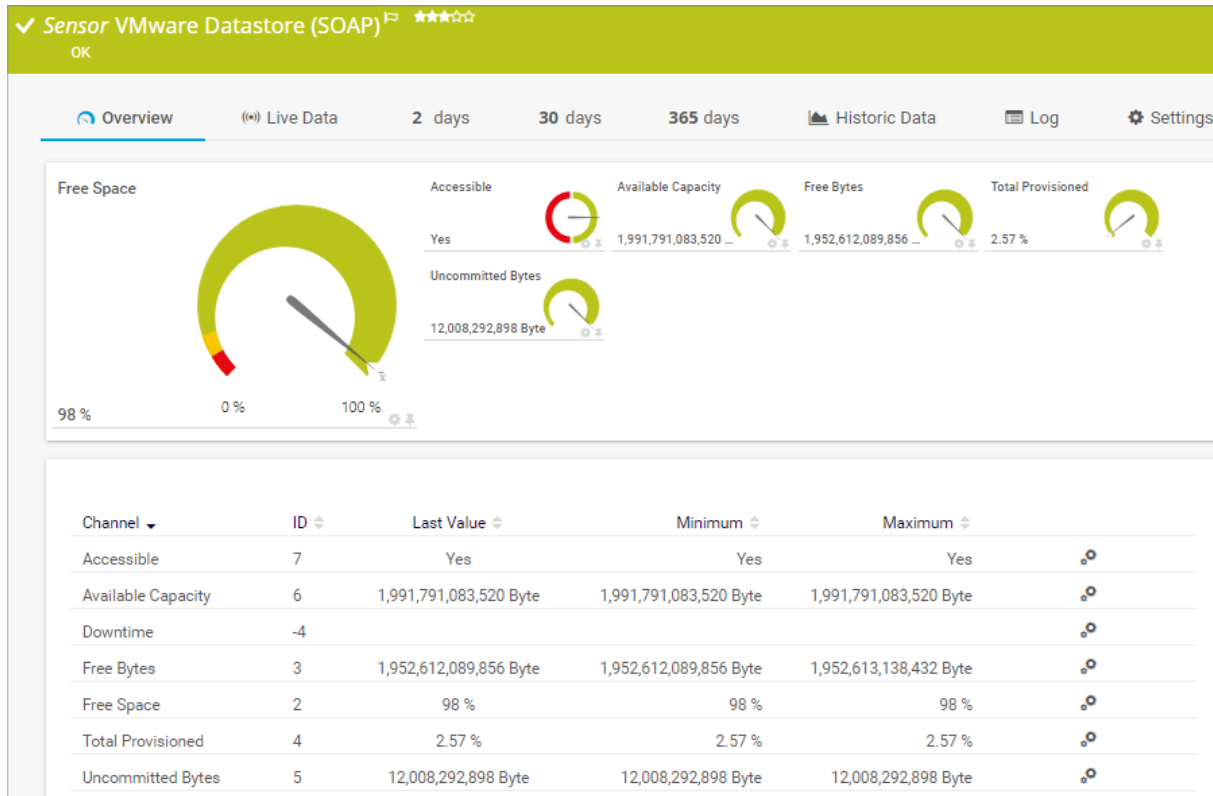

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.232 VMware Datastore (SOAP) Sensor

The VMware Datastore (SOAP) sensor monitors the disk usage of a VMware datastore using the Simple Object Access Protocol (SOAP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

VMware Datastore (SOAP) Sensor

Sensor in Other Languages

- Dutch: VMware Datastore (SOAP)
- French: VMware Datastore (SOAP)
- German: VMware Datastore (SOAP)
- Japanese: VMware Datastore(SOAP)
- Portuguese: VMware Datastore (SOAP)
- Russian: VMware (SOAP)
- Simplified Chinese: VMware 数据存储 (SOAP)
- Spanish: Almacén de datos VMware (SOAP)

Remarks

- The parent device must be a VMware ESXi server version 5.2 or later or vCenter.
- This sensor requires [credentials for VMware/XenServer](#) in the settings of the parent device. Ensure that you enter a user with sufficient access rights to obtain statistics (read-only usually works).

- This sensor requires .NET 4.7.2 or later on the probe system.
 - We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
 - This sensor supports the IPv6 protocol.
 - This sensor has a very low performance impact.
 - This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#) ⁴⁴⁸⁵.
 - This sensor has predefined limits for several metrics. You can individually change these limits in the channel settings. For detailed information about channel limits, see section [Channel Settings](#) ³⁹⁷⁷.
 - See the Knowledge Base: [I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?](#)
 - See the Knowledge Base: [Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?](#)
- i** This sensor supersedes the outdated SSH VMWare ESX(i) Disk sensor. We recommend that you use this new VMware Datastore (SOAP) sensor to monitor VMware datastores.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i If the framework is missing, you cannot create this sensor.</p> <p>■ For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#) ⁴⁵⁰³ or when running a [cluster](#) ¹³⁵¹), you might need to change the settings of your VMware host so that it accepts more incoming connections. Otherwise, you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

- For details about this setting, see the Knowledge Base: [How can I increase the connection limit on VMware systems?](#)

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Datastore Settings

Setting	Description
Datstores	<p>Select the datastores that you want to monitor. PRTG creates one sensor for each datastore that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p>

Setting	Description
	<p>ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> vmwaredatastoreexternsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

ⓘ Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click  to interrupt the inheritance.

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click to interrupt the [inheritance](#) ¹⁴².

Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

Channel Unit Types ⓘ

inherit from Root

Channel Type	Unit
Bytes (Bandwidth)	KB
	kbit
	/ sec...
Bytes (Memory)	MB
Bytes (Disk)	MB
Bytes (File)	Byte

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>ⓘ Custom channel types are only available on sensor level.</p>

Channel List

ⓘ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Accessible	<p>The accessibility of the datastore</p> <ul style="list-style-type: none"> ▪ Up status¹⁹⁷: Yes ▪ Down status: No

Channel	Description
Available Capacity	The available capacity in bytes (the physically or virtually available size of the datastore)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Free Bytes	The free space in bytes (the disk space that is not used by virtual machines (VM). Used disk space can be either thick-provisioned or used by thin-provisioned virtual disks)
Free Space	The free space in percent (the disk space that is not used by VMs. Used disk space can be either thick-provisioned or used by thin-provisioned virtual disks)  This channel is the primary channel by default.
Total Provisioned	The total provisioned disk space in percent (the sum of all potentially used disk space of thin-provisioned and thick-provisioned VM hard drives, that is, the uncommitted bytes plus used bytes)
Uncommitted Bytes	The uncommitted bytes (the disk space that is provisioned for thin-provisioned VMs but not used yet)

Sensor Settings Overview

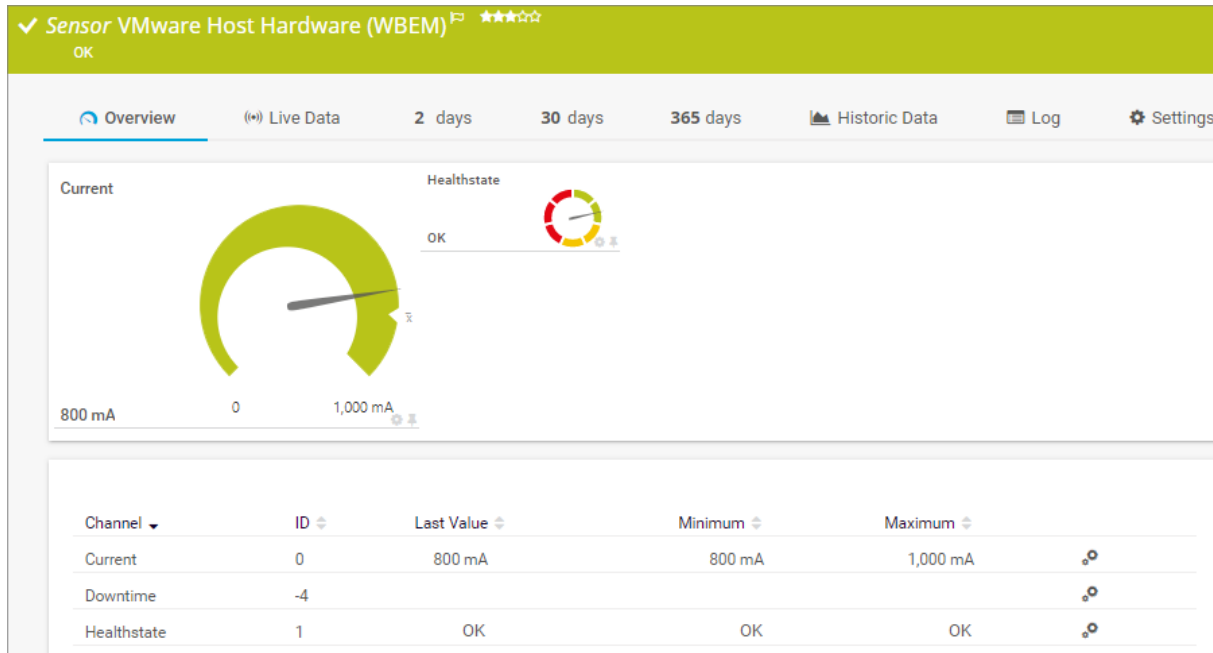

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.233 VMware Host Hardware (WBEM) Sensor

The VMware Host Hardware (WBEM) sensor monitors information about the hardware of an ESXi server using Web-based Enterprise Management (WBEM).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

VMware Host Hardware (WBEM) Sensor

Sensor in Other Languages

- Dutch: VMware Host Hardware (WBEM)
- French: Matériel hôte VMware (WBEM)
- German: VMware Host Hardware (WBEM)
- Japanese: VMware ホストハードウェア (WBEM)
- Portuguese: VMware Hardware de host (WBEM)
- Russian: VMware (WBEM)
- Simplified Chinese: VMware 主机硬件 (WBEM)
- Spanish: Hardware de host VMware (WBEM)

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor [requires](#) that the CIM interface is enabled on the ESXi host. On ESXi 6.5 and later, you have to manually enable CIM.
- This sensor requires [credentials for Linux/Solaris/macOS \(SSH/WBEM\) systems](#) in the settings of the parent device.

- The parent device must be a VMware ESXi server version 5.2 or later.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#).
- See the Knowledge Base: [Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?](#)

Detailed Requirements

Requirement	Description
Enabled CIM Interface on ESXi Host	<p>To access the ESXi host and retrieve monitoring data via WBEM, the CIM interface must be enabled on the ESXi host. On ESXi 6.5, CIM is disabled by default, so you have to manually activate it.</p> <p>■ For details, see the Knowledge Base: How do I enable the CIM interface on VMware ESXi 6.5?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

ESXi Server Elements

Setting	Description
Hardware Elements	<p>Select the hardware elements that you want to monitor. PRTG creates one sensor for each element that you select.</p> <p>ⓘ Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

ESXi Server Elements

ESXi Server Elements

Hardware Element ⓘ *Power Supply 1 Current 1*

This sensor monitors the health of an element as reported by the ESXi server. The sensor can automatically change to a Warning status when the ESXi server returns Degraded/Warning for this particular element. It can change to a Down status when the server reports any of the following errors: Minor / Major / Critical / Non recoverable.

Automatic Sensor Status ⓘ

Set sensor to warning or down status
 Report the current reading

Result Handling ⓘ

Discard result
 Store result

ESXi Server Elements

Setting	Description
Hardware Element	Shows the hardware element that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Automatic Sensor Status	Define if the sensor changes its status ^[197] depending on the health status reading: <ul style="list-style-type: none"> ▪ Set sensor to warning or down status: Set the sensor to the Warning or the Down status when the server returns respective values. The sensor also changes to the Down status if the connection to the server fails. ▪ Report the current reading: Never change the sensor's status dependent on the values returned by the server. The sensor only changes to the Down status if the connection to the server fails.
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ^[4526] on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings ³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click ⓘ to interrupt the [inheritance](#) ¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

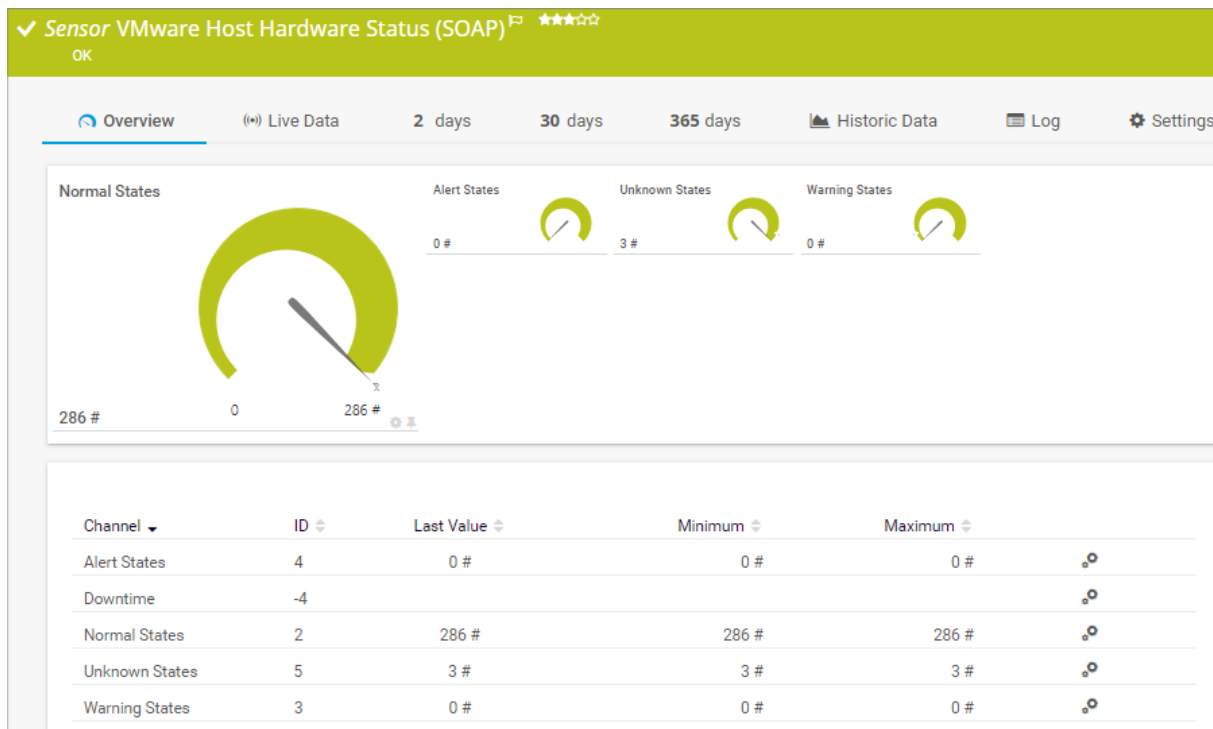

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.234 VMware Host Hardware Status (SOAP) Sensor

The VMware Host Hardware Status (SOAP) sensor monitors the hardware status of a VMware host server using the Simple Object Access Protocol (SOAP). It gives you a general status overview of the host.

i The sensor also shows any states other than **normal** in the sensor message.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

VMware Host Hardware Status (SOAP) Sensor

Sensor in Other Languages

- Dutch: VMware Host Hardware Status (SOAP)
- French: État du matériel du serveur hôte VMware (SOAP)
- German: VMware Hostserver Hardware-Zustand (SOAP)
- Japanese: VMware ホストハードウェアの状態 (SOAP)
- Portuguese: VMware Status do hardware de host (SOAP)
- Russian: VMware (SOAP)
- Simplified Chinese: VMware 主机硬件状态 (SOAP)
- Spanish: Estado de hardware de VMware Host (SOAP)

Remarks

- This sensor requires .NET 4.7.2 or later on the probe system.

- This sensor requires [credentials for VMware/XenServer](#) ^[455] in the settings of the parent device. Ensure that you enter a user with sufficient access rights to obtain statistics (read-only usually works).
- The parent device must be a VMware ESXi server version 5.2 or later. We recommend that you do not use this sensor on your vCenter. Reliable hardware information can only be provided when this sensor is created on your physical host server as parent device.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- This sensor only shows items that report an actual status, so you might see more "sensors" in your vSphere client than the number of states available in the channels of this sensor
- See the Knowledge Base: [I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?](#)
- See the Knowledge Base: [Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?](#)

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#) ^[450] or when running a [cluster](#) ^[135]), you might need to change the settings of your VMware host so that it accepts more incoming connections. Otherwise, you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

-  For details about this setting, see the Knowledge Base: [How can I increase the connection limit on VMware systems?](#)

Add Sensor

The [Add Sensor](#) ^[36] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

-  The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

VMware Host Settings

Setting	Description
Host Servers	<p>Select the host servers that you want to monitor. PRTG creates one sensor for each host server that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' interface. It includes a 'Sensor Name' field with the value 'Example Name', a 'Tags' field with 'exampletag' and a plus sign, and a 'Priority' field with five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ esxserverhosthealthsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

 Do not show unknown states

Result Handling **i** Discard result
 Store result

VMware Host Settings

Setting	Description
Managed Object Identifier (MOID)	<p>Shows the managed object identifier of the host that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Known Warnings	<p>Enter one or more warning messages from the VMware host that you want to ignore. Use semicolons (;) as separators, for example, Power Supply 7;Power Supply 8. Enter a string or leave the field empty.</p>

Setting	Description
	<p> Warning messages that you enter do not affect the sensor status¹⁹⁷.</p> <p> We strongly recommend that you use this filter for known issues only. For example, for states that systems return because of errors in the vendors' CIM extensions. Because of this, the sensor might never show the Up status although the vSphere client does not show any warnings.</p>
Known Errors	<p>Enter one or more error messages from the VMware host that you want to ignore. Use semicolons (;) as separators, for example, Power Supply 7;Power Supply 8. Enter a string or leave the field empty.</p> <p> Error messages that you enter do not affect the sensor status.</p> <p> We strongly recommend that you use this filter for known issues only. For example, for states that systems return because of errors in the vendors' CIM extensions. Because of this, the sensor might never show the Up status although the vSphere client does not show any errors.</p>
Handling of Unknown States	<p>Define the sensor behavior when the vSphere client reports unknown states:</p> <ul style="list-style-type: none"> ▪ Show unknown states (default): Show unknown states in the status message and set the sensor to the Warning status. ▪ Do not show unknown states: Do not show unknown states in the status message and do not change the sensor status.
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click ⓘ to interrupt the [inheritance](#).

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>For more details on access rights, see section Access Rights Management.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Alert States	The total number of items in the alert status as the vSphere client reports
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Normal States	<p>The total number of items in the normal status as the vSphere client reports</p> <p>i This channel is the primary channel by default.</p>
Unknown States	The total number of items in the unknown status as the vSphere client reports
Warning States	The total number of items in the warning status as the vSphere client reports

Sensor Settings Overview

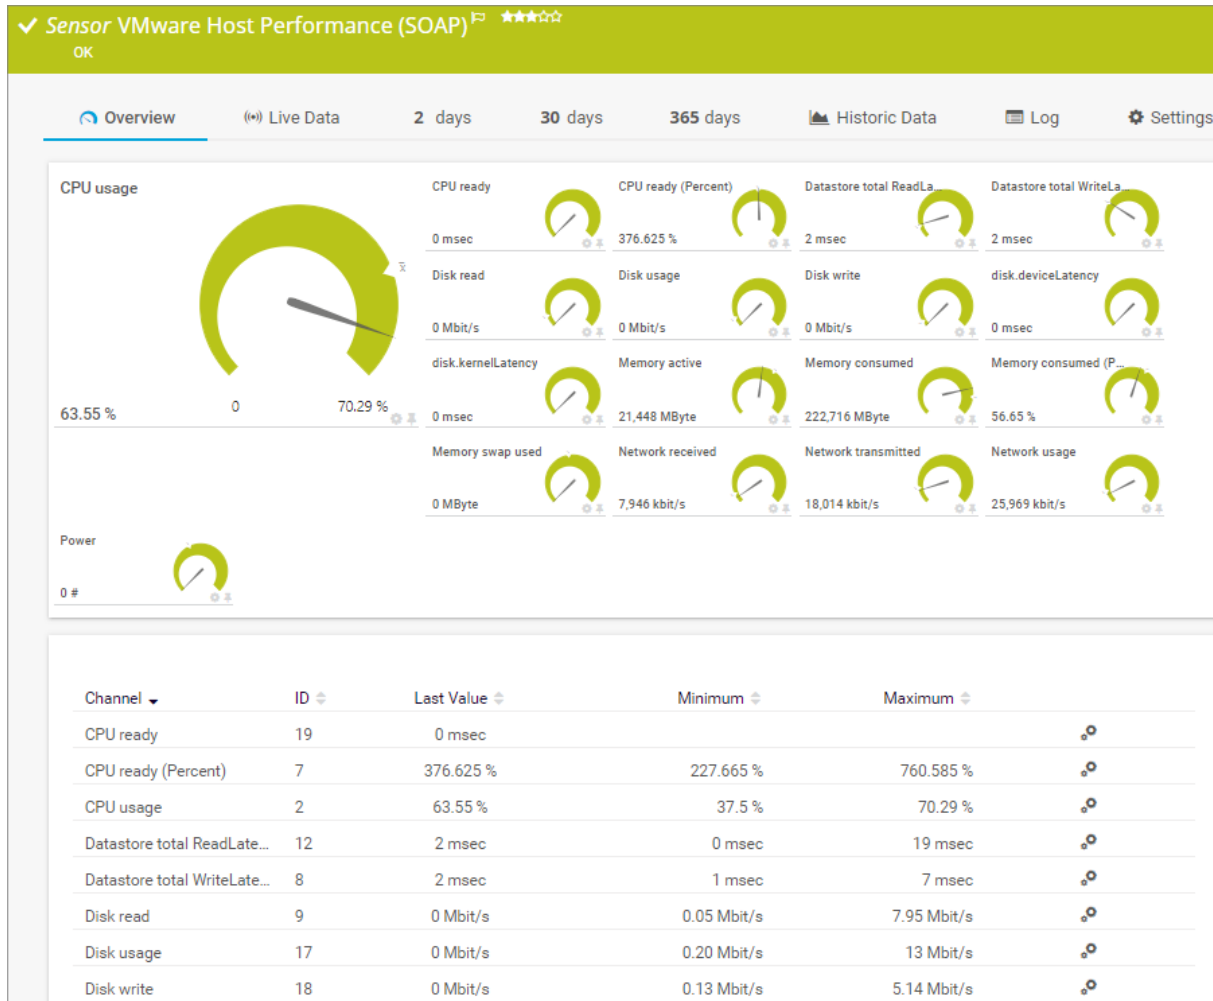

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.235 VMware Host Performance (SOAP) Sensor

The VMware Host Performance (SOAP) sensor monitors a VMware host server using the Simple Object Access Protocol (SOAP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

VMware Host Performance (SOAP) Sensor

Sensor in Other Languages

- Dutch: VMware Host Prestaties (SOAP)
- French: Performances de l'hôte VMware (SOAP)
- German: VMware Hostserver Leistung (SOAP)
- Japanese: VMware ホストパフォーマンス (SOAP)
- Portuguese: VMware Performance do host (SOAP)
- Russian: VMware (SOAP)
- Simplified Chinese: VMware 主机性能 (SOAP)
- Spanish: Rendimiento de VMware Host (SOAP)

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- This sensor requires .NET 4.7.2 or later on the probe system.
- The parent device must be a VMware ESXi server version 5.2 or later. We recommend that you do not use this sensor on your vCenter. Reliable hardware information can only be provided when this sensor is created on your physical host server as parent device.
- This sensor requires [credentials for VMware/XenServer](#)^[455] in the settings of the parent device. Ensure that you enter a user with sufficient access rights to obtain statistics (read-only usually works).
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?](#)
- See the Knowledge Base: [Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?](#)

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#)^[4503] or when running a [cluster](#)^[135]), you might need to change the settings of your VMware host so that it accepts more incoming connections. Otherwise, you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

- For details about this setting, see the Knowledge Base: [How can I increase the connection limit on VMware systems?](#)

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[409], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> esxserverhostsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

Graph Type ⓘ

Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels

Setting	Description
	<p>are available for this sensor.</p> <p>i You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval **i** 60 seconds

 inherit from  Root

If a Sensor Query Fails **i** Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> 30 seconds

Setting	Description
	<ul style="list-style-type: none"> ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **None**

Maintenance Window **Do not set up a one-time maintenance window**
 Set up a one-time maintenance window

Dependency Type **Use parent**
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

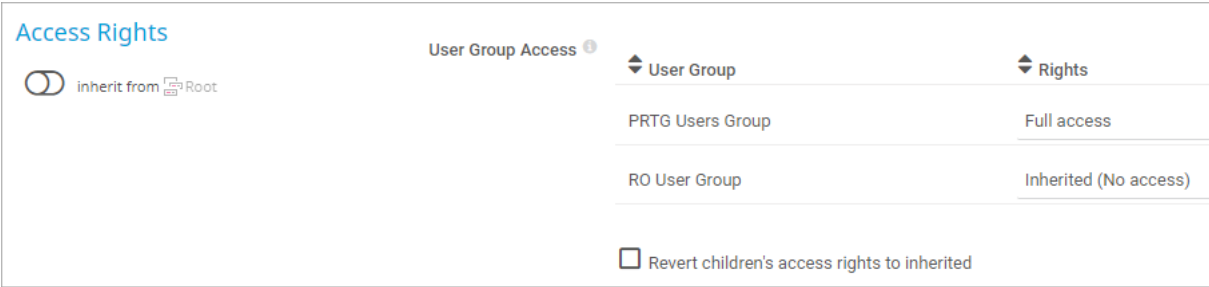

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [421] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

i Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

inherit from  Root

Channel Unit Types **i**

Channel Type	Unit
Bytes (Bandwidth)	KB ▼
	kbit ▼
	/ ▼
	sec... ▼
Bytes (Memory)	MB ▼
Bytes (Disk)	MB ▼
Bytes (File)	Byte ▼

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>i Custom channel types are only available on sensor level.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
CPU Ready (Percent)	The CPU readiness in percent
CPU Usage	The CPU usage in percent  This channel is the primary channel by default.
Datastore Total ReadLatency	The datastore total read latency in milliseconds (msec)
Datastore Total WriteLatency	The datastore total write latency in msec
Disk Read	The disk read speed in bytes per second
Disk Usage	The disk usage per second
Disk Write	The disk write speed in bytes per second
Disk.DeviceLatency	The disk device latency in msec
Disk.KernelLatency	The disk kernel latency in msec
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Memory Active	The active memory in bytes
Memory Consumed	The consumed memory in bytes
Memory Consumed (Percent)	The memory consumed in percent
Memory Swap Used	The used memory swap
Network Received	The received bytes per second
Network Transmitted	The transmitted bytes per second
Network Usage	The total network usage in bytes per second
Power	The power status

Sensor Settings Overview

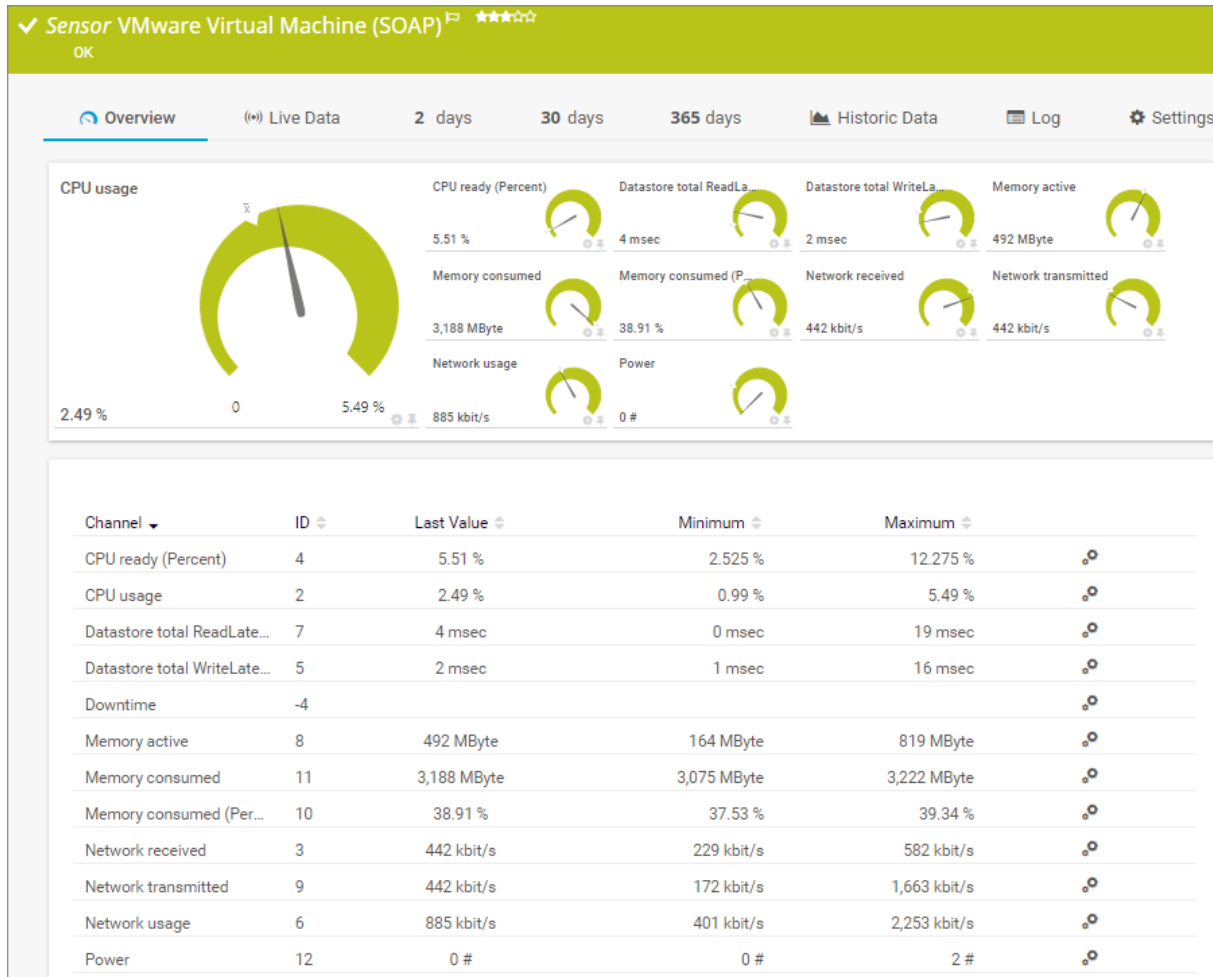

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.236 VMware Virtual Machine (SOAP) Sensor

The VMware Virtual Machine (SOAP) sensor monitors a virtual machine (VM) on a VMware host server using the Simple Object Access Protocol (SOAP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

VMware Virtual Machine (SOAP) Sensor

Sensor in Other Languages

- Dutch: VMware Virtuele Machine (SOAP)
- French: Machine virtuelle VMware (SOAP)
- German: VMware Virtual Machine (SOAP)
- Japanese: VMware 仮想マシン (SOAP)
- Portuguese: VMware Máquina virtual (SOAP)
- Russian: VMware (SOAP)
- Simplified Chinese: VMware 虚拟机 (SOAP)
- Spanish: Máquina virtual VMware (SOAP)

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor requires [credentials for VMware/XenServer](#) in the settings of the parent device. Ensure that you enter a user with sufficient access rights to obtain statistics (read-only usually works).
- We recommend that you use vCenter as parent device. If the monitored VM changes the host server via vMotion, PRTG can still continue monitoring. The sensor can monitor VMware ESXi server version 5.2 or later.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- For VMware virtual machines, disk usage channels are only available as of virtual hardware version 8.
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?](#)
- See the Knowledge Base: [Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?](#)

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#) or when running a [cluster](#)), you might need to change the settings of your VMware host so that it accepts more incoming connections. Otherwise, you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

- For details about this setting, see the Knowledge Base: [How can I increase the connection limit on VMware systems?](#)

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

i PRTG requests a full list of all VMs configured on the target device. Because of this, it might take a few seconds before the dialog appears.

VMware Virtual Machine Settings

Setting	Description
Virtual Machines	You see a list of all VMs available on the host server on this device, including the ones that do not run. PRTG lists all VMs by name and the operating system that they run on. Select the VMs that you want to monitor. PRTG creates one sensor for each VM that you select.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections: 'Sensor Name' with the value 'Example Name', 'Tags' with 'exampletag' and a plus icon, and 'Priority' with five stars, the last one being filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[403], reports^[406], maps^[405], libraries^[407], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p>

Setting	Description
	<p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> esxservervmsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

Handling of "Powered Off" VM **i**

Ignore "powered off" state (default)

Alarm when VM is "powered off"

Result Handling **i**

Discard result

Store result

VMware Virtual Machine Settings

Setting	Description
Managed Object Identifier (MOID)	<p>Shows the managed object identifier (MOID) of the VM that this sensor monitors.</p> <p>i PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.</p>
Handling of "Powered Off" VM	<p>Define the sensor behavior for a VM that is powered off:</p> <ul style="list-style-type: none"> Ignore "powered off" state (default): Do not show the Down status¹⁹⁷ if the VM is powered off. The sensor reports zero values instead. Alarm when VM is "powered off": Show the Down status if the VM is powered off. <p>i If the sensor is in the Down status, it does not record any data in any of its channels.</p>

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory^[4526] on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[3977]).</p>

Setting	Description
Stack Unit	This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) ³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#) ¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#) ¹⁴².

Scanning Interval

 inherit from  Root

Scanning Interval ⓘ 60 seconds

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click to interrupt the [inheritance](#) ¹⁴².

ⓘ Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

Channel Unit Types ⓘ

inherit from Root

Channel Type	Unit
Bytes (Bandwidth)	KB
	kbit
	/
	sec...
Bytes (Memory)	MB
Bytes (Disk)	MB
Bytes (File)	Byte

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p>ⓘ Custom channel types are only available on sensor level.</p>

Channel List

ⓘ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
CPU Ready (Percent)	The CPU readiness in percent
CPU Usage	<p>The CPU usage in percent</p> <p>ⓘ This channel is the primary channel by default.</p>

Channel	Description
Datastore Total Read Latency	The datastore total read latency in milliseconds (msec)
Datastore Total Write Latency	The datastore total write latency in msec
Disk Read	The disk read speed in bytes per second
Disk Usage	The disk usage per second
Disk Write	The disk write speed in bytes per second
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Memory Active	The active memory in bytes
Memory Consumed	The consumed memory in bytes
Memory Consumed (Percent)	The memory consumed in percent
Network Received	The received bytes per second
Network Transmitted	The transmitted bytes per second
Network Usage	The total network usage in bytes per second
Power	The power status

Sensor Settings Overview

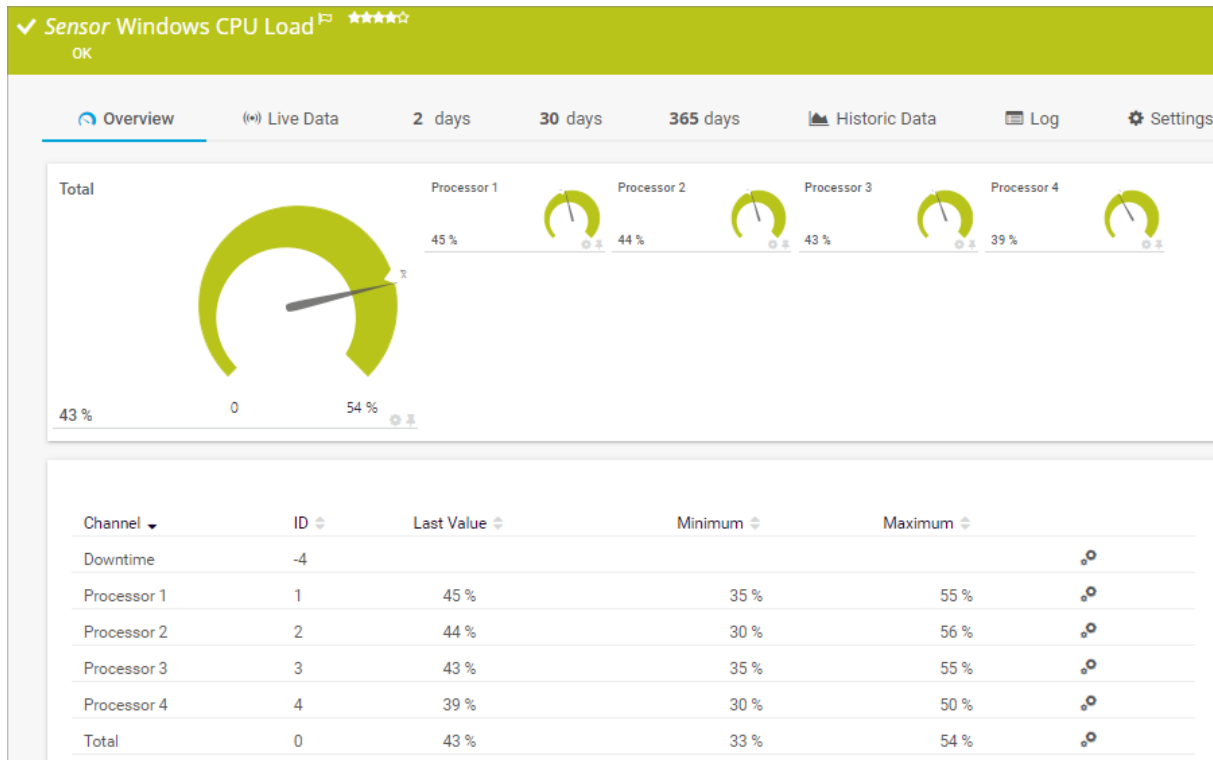

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.237 Windows CPU Load Sensor

The Windows CPU Load sensor monitors the CPU load on a computer via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) ^[464] of the parent device.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ^[3451].

Windows CPU Load Sensor

Sensor in Other Languages

- Dutch: Windows Processor Belasting
- French: Charge CPU de Windows
- German: Windows Prozessorlast
- Japanese: Windows CPU 負荷
- Portuguese: Windows Carga de CPU
- Russian: Windows
- Simplified Chinese: Windows CPU 负载
- Spanish: WMI carga de procesador

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires [credentials for Windows systems](#) ^[452] in the settings of the parent device.

- This sensor requires Windows Server 2008 R2 or later on the probe system.
- This sensor requires that the Remote Registry Windows service runs on the target computer.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports the IPv6 protocol.
- This sensor can use a hybrid approach with Windows performance counters and WMI as fallback to query data.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Hybrid Approach: Performance Counters and WMI

i By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#)^[464] on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

i Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[493] for load balancing.

i For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)^[426].

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog box. It has three main sections: 'Sensor Name' with a text input field containing 'Example Name'; 'Tags' with a text input field containing 'exampletag' and a plus sign icon; and 'Priority' with a star rating of five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[4031], reports^[4069], maps^[4095], libraries^[4047], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <ul style="list-style-type: none"> i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). i For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ cpuloadsensor ▪ wmicpuloadsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[448] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Debug Options

Debug Options

Result Handling **i**

Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ^[4526] on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Alternative WMI Query

Alternative WMI Query

WMI sensors use the most efficient and accurate WMI queries possible. However, different Windows versions and even different patch levels on the target systems can lead to changes in some WMI classes. These changes often result in errors like class not valid or invalid data. If these errors persist, try using the option Query Method.

Query Method [ⓘ] Use the default WMI query method
 Use the alternative WMI query method

Alternative WMI Query

Setting	Description
Query Method	<p>Select the method that the sensor uses to query via WMI:</p> <ul style="list-style-type: none"> ▪ Use the default WMI query method: Use the standard method to query WMI. We recommend that you use this option. ▪ Use the alternative WMI query method: Use an alternative method to query WMI for better compatibility if WMI sensors return errors such as class not valid or invalid data.

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours

Setting	Description
If a Sensor Query Fails	<ul style="list-style-type: none"> ▪ 24 hours <p>ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p> <p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>ⓘ If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>ⓘ If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

ⓘ You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> None Saturdays Sundays Weekdays Weekdays Eight-To-Eight (08:00 - 20:00) Weekdays Nights (17:00 - 09:00) Weekdays Nights (20:00 - 08:00) Weekdays Nine-To-Five (09:00 - 17:00) Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3957

7.8.238 Windows IIS 6.0 SMTP Received Sensor

The Windows IIS 6.0 SMTP Received sensor monitors the number of received emails for a Microsoft Internet Information Services (IIS) 6.0 Simple Mail Transfer Protocol (SMTP) service (Exchange 2003) via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#)^[464] of the parent device.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)^[3462].

Sensor in Other Languages

- Dutch: Windows IIS 6.0 SMTP Ontvangen
- French: Windows IIS 6.0 SMTP reçu
- German: WMI IIS 6.0 SMTP Empfangen
- Japanese: Windows IIS 6.0 SMTP 受信
- Portuguese: Windows IIS 6.0 SMTP recebido
- Russian: Windows IIS 6.0 SMTP
- Simplified Chinese: 已接收 Windows IIS 6.0 SMTP
- Spanish: WMI IIS 6.0 SMTP Recibidos

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor requires Windows Server 2008 R2 or later on the probe system.
- This sensor requires that the Remote Registry Windows service runs on the target computer.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor can use a hybrid approach with Windows performance counters and WMI as fallback to query data.
- This sensor supports the IPv6 protocol.
- This service is not used by Exchange Server 2007 and higher. Exchange Server 2007 uses its own SMTP stack implemented in the Microsoft Exchange Transport service.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Hybrid Approach: Performance Counters and WMI

- i** By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#)^[464] on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.
- i** Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[4503] for load balancing.
- i** For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)^[4256].

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p>

Setting	Description
	<ul style="list-style-type: none"> wmiiissmtpreceivedsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory ⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p> ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings^[397]).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

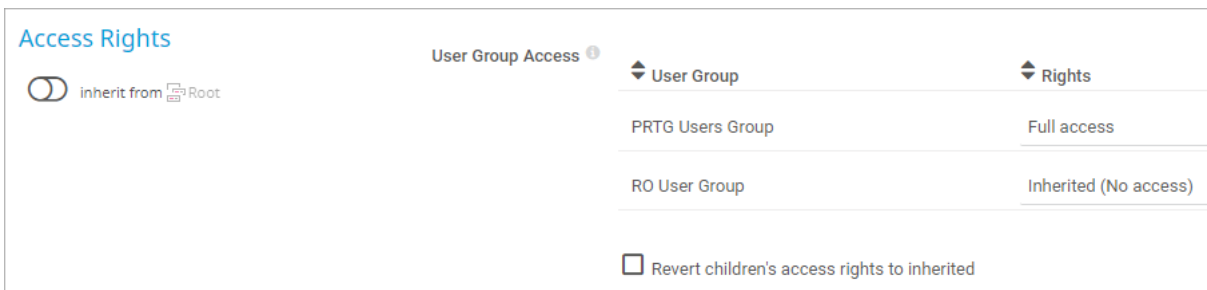

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel Unit Configuration

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.239 Windows IIS 6.0 SMTP Sent Sensor

The Windows IIS 6.0 SMTP Sent sensor monitors the number of sent emails for a Microsoft Internet Information Services (IIS) 6.0 Simple Mail Transfer Protocol (SMTP) service (Exchange 2003) via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#)^[464] of the parent device.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)^[3473].

Sensor in Other Languages

- Dutch: Windows IIS 6.0 SMTP Verzonden
- French: Windows IIS 6.0 SMTP envoyé
- German: WMI IIS 6.0 SMTP Verschickt
- Japanese: Windows IIS 6.0 SMTP 送信
- Portuguese: Windows IIS 6.0 SMTP enviado
- Russian: Windows IIS 6.0 SMTP
- Simplified Chinese: 已发送 Windows IIS 6.0 SMTP
- Spanish: WMI IIS 6.0 SMTP Enviados

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor requires Windows Server 2008 R2 or later on the probe system.
- This sensor requires that the Remote Registry Windows service runs on the target computer.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor can use a hybrid approach with Windows performance counters and WMI as fallback to query data.
- This sensor supports the IPv6 protocol.
- This service is not used by Exchange Server 2007 and higher. Exchange Server 2007 uses its own SMTP stack implemented in the Microsoft Exchange Transport service.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Hybrid Approach: Performance Counters and WMI

- i** By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#)^[464] on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.
- i** Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[4503] for load balancing.
- i** For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)^[4256].

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has a title bar 'Basic Sensor Settings'. Below the title bar, there are three sections: 'Sensor Name' with an information icon and the text 'Example Name'; 'Tags' with an information icon and a text input field containing 'exampletag', a close button (X), and a plus button (+); and 'Priority' with an information icon and five star icons, three of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p>

Setting	Description
	<ul style="list-style-type: none"> wmiiissmtpsentsensor
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **None**

Maintenance Window **Do not set up a one-time maintenance window**

Dependency Type **Use parent**

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Sensor Settings Overview

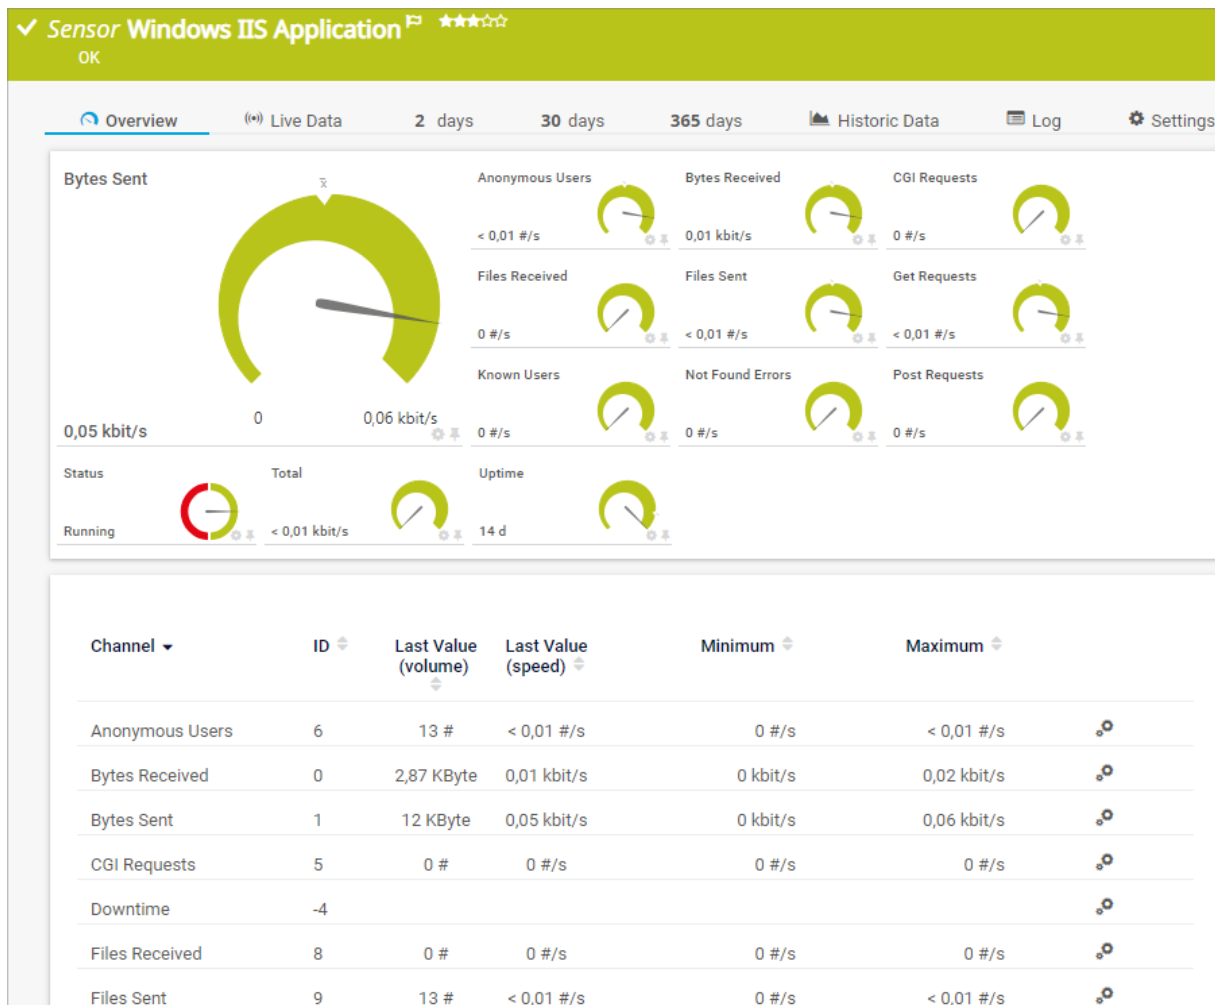

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.240 Windows IIS Application Sensor

The Windows IIS Application sensor monitors a Microsoft Internet Information Services (IIS) server via Windows Management Instrumentation (WMI). It can also monitor applications that use IIS, such as Microsoft SharePoint or Microsoft Reporting Services (SSRS).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Windows IIS Application Sensor

Sensor in Other Languages

- Dutch: Windows IIS Toepassing
- French: Application Windows IIS
- German: Windows IIS-Anwendung
- Japanese: Windows IIS アプリケーション
- Portuguese: Windows Aplicação IIS
- Russian: Windows IIS
- Simplified Chinese: Windows IIS 应用程序

- Spanish: Aplicación IIS WMI

Remarks

- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports the IPv6 protocol.
- This sensor has a medium performance impact.
- The sensor cannot return data for the channels Status, Uptime, and Total when using performance counters. We recommend that you use WMI only (recommended) as Preferred Data Source in the [Windows Compatibility Options](#)^[464] of the parent device.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Settings Overview

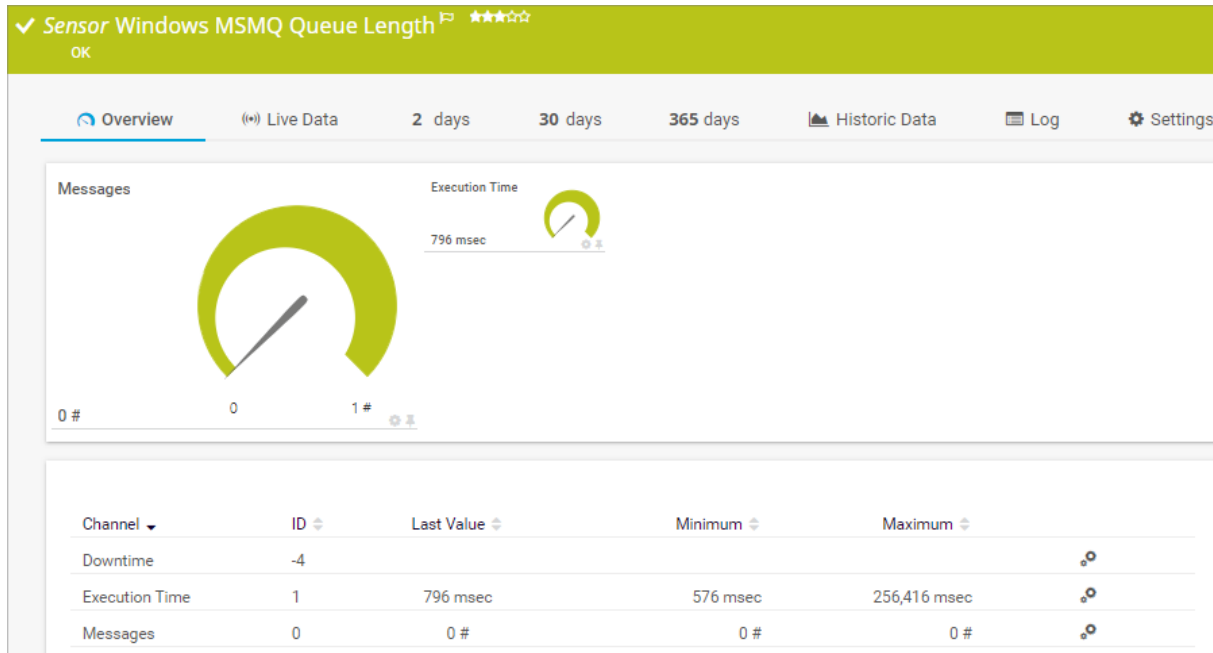

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.241 Windows MSMQ Queue Length Sensor

The Windows MSMQ Queue Length sensor reads the number of messages in a Microsoft message queue of the parent device.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Windows MSMQ Queue Length Sensor

Sensor in Other Languages

- Dutch: Windows MSMQ wachtrijlengte
- French: Longueur de la file d'attente MSMQ de Windows
- German: Windows MSMQ Queue-Länge
- Japanese: Windows MSMQ キュー長
- Portuguese: Windows Comprimento da fila MSMQ
- Russian: Windows MSMQ
- Simplified Chinese: Windows MSMQ 队列长度
- Spanish: Largo de queue de Windows MSMQ

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor [requires](#) that the Microsoft Message Queuing (MSMQ) service runs on both the probe system and the target system.
- This sensor requires .NET 4.7.2 or later on the probe system. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.

- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor supports the IPv6 protocol.
- See the Knowledge Base: [How do I activate Message Queuing in my Windows installation?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i If the framework is missing, you cannot create this sensor.</p> <p>■ For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Windows credentials	<p>This sensor requires credentials for Windows systems^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, the sensor cannot correctly connect.</p>
Message Queuing service	<p>For this sensor to work, the MSMQ service must be started both on the target system and on the probe system. Additionally, the MSMQ service must also be started on the target computer.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p> <p>Depending on your Windows version, you might first need to install the MSMQ Server.</p> <p>i When installing MSMQ Server, make sure that you install it including the Directory Service. Depending on your Windows installation, this might have a different name, such as:</p> <ul style="list-style-type: none"> ▪ MSMQ Active Directory Domain Service Integration ▪ Directory Service Integration ▪ Active Directory Integration <p>■ For details, see the Knowledge Base: How do I activate Message Queuing in my Windows installation?</p>

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Settings

Setting	Description
Message Queues	<p>Select the message queues that you want to monitor. PRTG creates one sensor for each message queue that you select.</p> <ul style="list-style-type: none"> i If no message queues are available, you see a corresponding message. i This sensor cannot monitor subqueues. <ul style="list-style-type: none"> i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

Basic Sensor Settings

Sensor Name ⁱ

Tags ⁱ x +

Priority ⁱ ★★☆☆☆

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ¹⁸³¹, as well as in alarms ²²⁸¹, logs ²³⁷¹, notifications ⁴⁰³¹, reports ⁴⁰⁶⁹, maps ⁴⁰⁹⁶, libraries ⁴⁰⁴⁷, and tickets ²⁴⁰¹.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ ptfsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

Sensor Settings

Sensor Settings

Message Queue **i** *All Outgoing Queues*

Message Queue Type **i** *OUTGOING*

Minimum Message Age **i** _____

If Value Changes **i** Ignore changes
 Trigger 'change' notification

Sensor Settings

Setting	Description
Message Queue	Shows the name of the message queue that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Message Queue Type	Shows the type of the message queue that this sensor monitors. ⓘ PRTG shows this value for reference purposes only. If you need to change this value, add the sensor anew.
Minimum Message Age	Optionally define an age in minutes that the message must be for the sensor to count it. If you set a minimum message age, the sensor does not regard messages that are younger than this age. If you leave this field empty, the sensor does not check for the message age. Enter an integer value or leave the field empty.
If Value Changes	Define what the sensor does when the sensor value changes: <ul style="list-style-type: none"> ▪ Ignore changes (default): Take no action on change. ▪ Trigger 'change' notification: Send an internal message indicating that the sensor value has changed. In combination with a change trigger⁴¹³⁸, you can use this mechanism to trigger a notification³⁹⁸⁷ whenever the sensor value changes.

Debug Options

Debug Options

Result Handling ⓘ

Discard result

Store result

Debug Options

Setting	Description
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click ⓘ to interrupt the [inheritance](#).

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
Maintenance Window	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p> <p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management.</p>

Channel List

i Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Execution Time	The execution time in milliseconds (msec)
Messages	<p>The total number of messages in the queue</p> <p>i This channel is the primary channel by default.</p>

Sensor Settings Overview

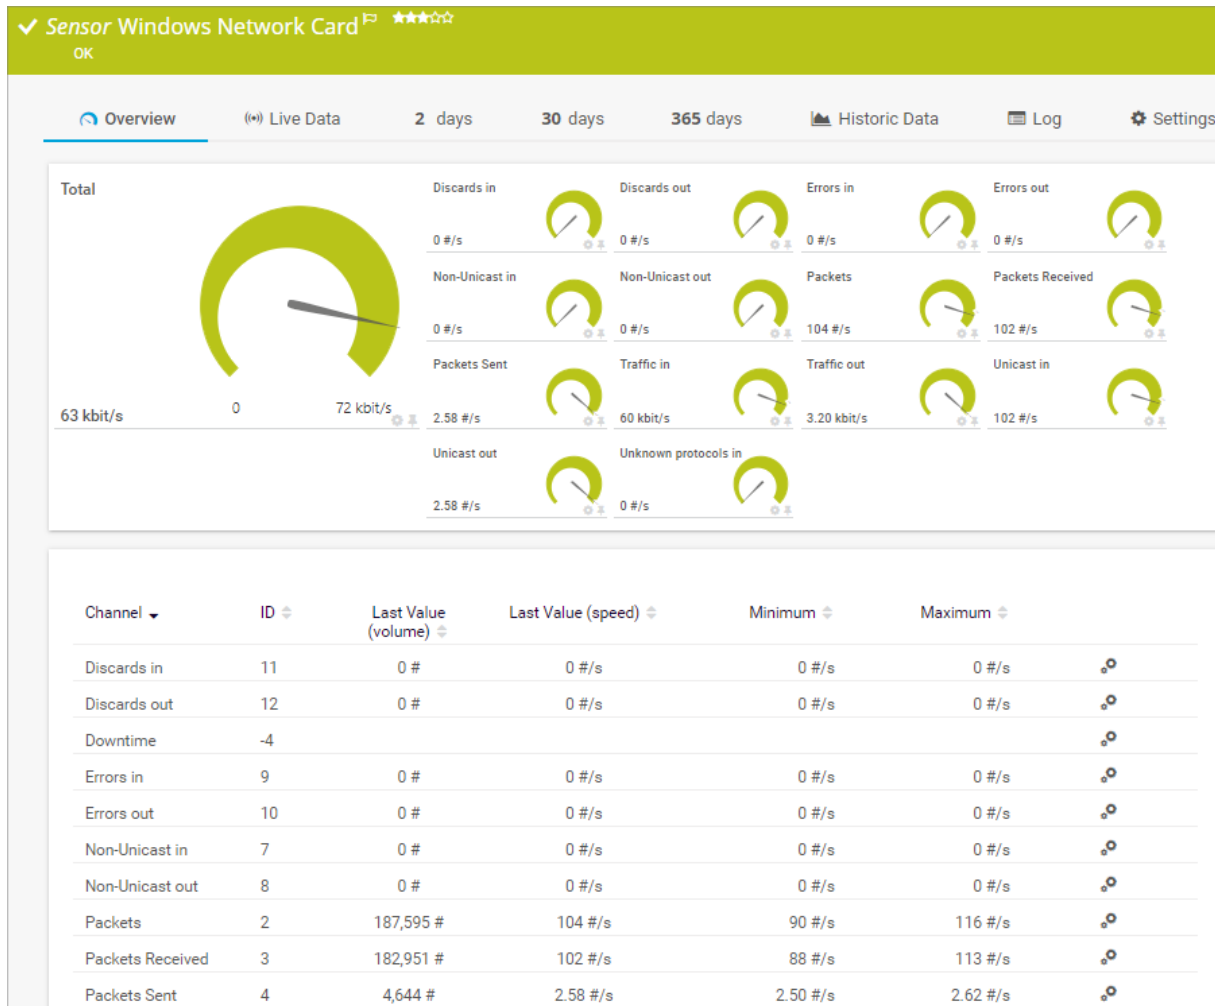

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3977

7.8.242 Windows Network Card Sensor

The Windows Network Card sensor monitors the bandwidth usage and traffic of a network interface via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#)^[464] of the parent device.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)^[3510].

Windows Network Card Sensor

Sensor in Other Languages

- Dutch: Windows Netwerkkkaart
- French: Carte réseau Windows
- German: WMI Netzwerkadapter
- Japanese: Windows ネットワークカード
- Portuguese: Windows Adaptador de rede
- Russian: Windows
- Simplified Chinese: Windows 网卡

- Spanish: Windows tarjeta de red

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor [requires](#)^[3500] Windows 2008 R2 or later on the probe system to work with Windows performance counters.
- This sensor requires that the Windows Remote Registry service runs on the target computer.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor requires Windows Server 2008 R2 or Windows 7 or later to monitor 64-bit counters of the class [Network Adapter](#) (virtual network interfaces). On older target systems, the sensor can only monitor 32-bit counters of the class [Network Interface](#) (the physical interface) and shows fewer channels.
- This sensor can use a hybrid approach with Windows performance counters and WMI as fallback to query data.
- This sensor supports teamed network adapters ("network interface card (NIC) teaming") on Windows Server 2012.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>

Requirement	Description
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Hybrid Approach: Performance Counters and WMI

i By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#)^[464] on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

i Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[4503] for load balancing.

i For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)^[4258].

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Sensor Specific

Setting	Description
Network Cards	<p>Select the network cards that you want to monitor. PRTG creates one sensor for each network card that you select.</p> <p>i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.</p>

Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.

Sensor Display

Sensor Display Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷). ▪ Show in and out traffic as positive and negative area graph: Show channels for incoming and outgoing traffic as positive and negative area graph. This visualizes your traffic in a clear way. <ul style="list-style-type: none">  You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings). Manual scaling is not possible if you choose this option.  You cannot show a positive/negative graph for a channel if you choose to display its data in percent of maximum (available in the channel settings).
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i**

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
Maintenance Window	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules⁴¹⁷⁰.</p>
Maintenance Begins	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Discards In	The number of incoming discards per second
Discards Out	The number of outgoing discards per second
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Errors In	The number of incoming errors per second
Errors Out	The number of outgoing errors per second
Non-Unicast In	The number of incoming non-unicast packets per second
Non-Unicast Out	The number of outgoing non-unicast packets per second
Packets	The number of packets in total
Packets Received	The number of packets received per second
Packets Sent	The number of packets sent per second

Channel	Description
Total	The total traffic in bytes per second  This channel is the primary channel by default.
Traffic In	The incoming traffic in bytes per second
Traffic Out	The outgoing traffic in bytes per second
Unicast In	The number of incoming unicast packets per second
Unicast Out	The number of outgoing unicast packets per second
Unknown Protocols In	The number of unknown protocols per second

My Windows sensors do not work when using direct performance counter access. What can I do?

- <https://kb.paessler.com/en/topic/47263>

Sensor Settings Overview

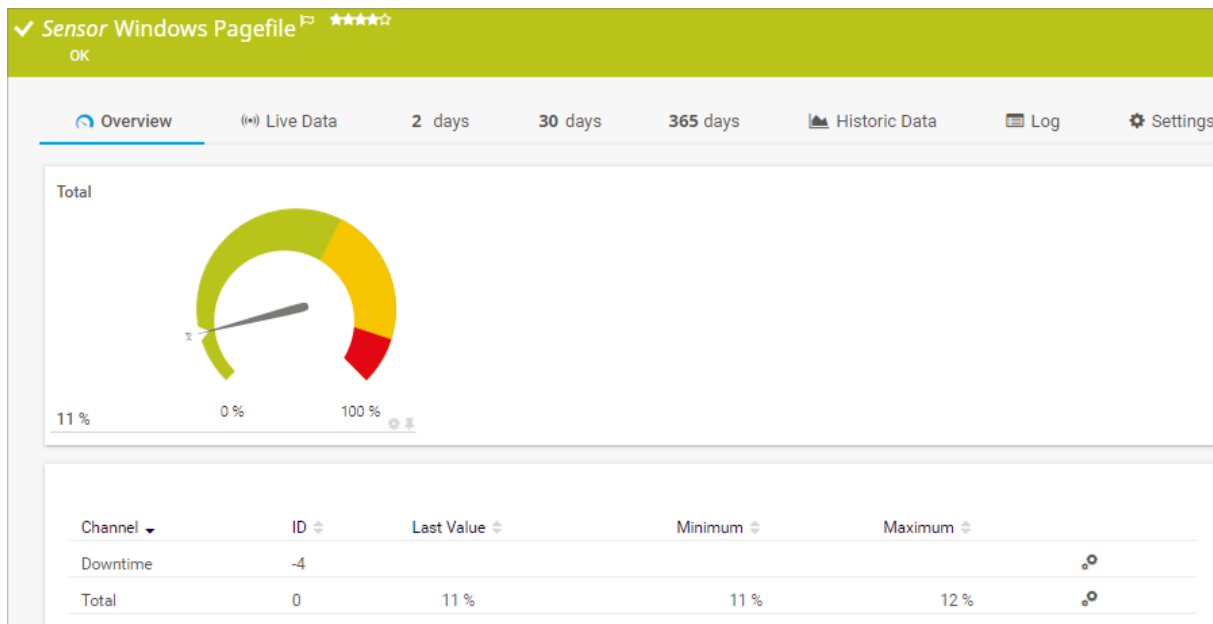

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.243 Windows Pagefile Sensor

The Windows Pagefile sensor monitors the Windows pagefile usage via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) ^[464] of the parent device.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ^[3521].

Windows Pagefile Sensor

Sensor in Other Languages

- Dutch: Windows Wisselbestand
- French: Fichier d'échange Windows
- German: WMI Auslagerungsdatei
- Japanese: Windows ページファイル
- Portuguese: Windows Arquivo de Paginação (Pagefile)
- Russian: Windows
- Simplified Chinese: Windows 页面文件
- Spanish: Archivo de página Windows

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires [credentials for Windows systems](#) ^[452] in the settings of the parent device.
- This sensor requires Windows Server 2008 R2 or later on the probe system.
- This sensor requires that the Remote Registry Windows service runs on the target computer.

- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor does not work with Windows 2000 because the respective WMI class does not exist on this operating system.
- This sensor can use a hybrid approach with Windows performance counters and WMI as fallback to query data.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Hybrid Approach: Performance Counters and WMI

i By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#)^[464] on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

i Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[4503] for load balancing.

i For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)^[4298].

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows a dialog box titled "Basic Sensor Settings". It contains three main sections:

- Sensor Name**: A text input field containing "Example Name".
- Tags**: A list box containing "exampletag" with a close button (X) and an add button (+).
- Priority**: A star rating system showing 5 stars, with the first three filled and the last two empty.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[4031], reports^[4069], maps^[4095], libraries^[4047], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ pagefilesensor ▪ wmiimagefilesensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

Debug Options

Debug Options

Result Handling **i**
 Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel **i** Downtime

Graph Type **i**
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval

Scanning Interval  60 seconds

 inherit from  Root

If a Sensor Query Fails  Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans.</p>

Setting	Description
	<p>Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p>i You can change the available intervals in the system administration on PRTG on premises installations.</p>
<p>If a Sensor Query Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p>

Setting	Description
	<p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule **None**

Maintenance Window **Do not set up a one-time maintenance window**
 Set up a one-time maintenance window

Dependency Type **Use parent**
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

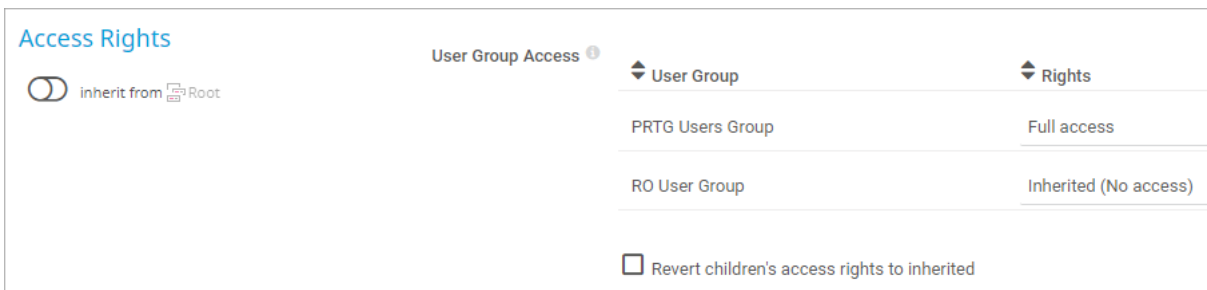

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules.</p>

Setting	Description
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> Use parent: Use the dependency type of the parent object. Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector²⁵¹ to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p>

Setting	Description
	<p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p>i This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings [446] or in its parent group settings [413].</p>

Access Rights

Click  to interrupt the [inheritance](#) [142].

Access Rights

Setting	Description
User Group Access	<p>Define the user groups [4219] that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management [158].</p>

Channel List

-  Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Total	The total pagefile usage in percent  This channel is the primary channel by default.

7.8.244 Windows Physical Disk I/O Sensor

The Windows Physical Disk I/O sensor monitors the input/output (I/O) parameters of a hard disk on a Windows system via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) [464] of the parent device.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) [3533].

Windows Physical Disk I/O Sensor

Sensor in Other Languages

- Dutch: Windows Fysieke Schijf I/O
- French: E/S du disque physique de Windows
- German: Windows Physikalischer Datenträger E/A
- Japanese: Windows 物理ディスク I/O
- Portuguese: Windows E/S de Disco físico
- Russian: - Windows

- Simplified Chinese: Windows 物理磁盘 I/O
- Spanish: Operaciones de E/S de disco físico Windows

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires [credentials for Windows systems](#) ^[452] in the settings of the parent device.
- This sensor requires Windows Server 2008 R2 or later on the probe system.
- This sensor requires that the Remote Registry Windows service runs on the target computer.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor can use a hybrid approach with Windows performance counters and WMI as fallback to query data.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems ^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p>

Requirement	Description
	To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Hybrid Approach: Performance Counters and WMI

i By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#)^[464] on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

i Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[4503] for load balancing.

i For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)^[4258].

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Windows Physical Disk Specific

Setting	Description
Disk	Select the physical disks that you want to monitor. PRTG creates one sensor for each physical disk that you select. i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p>ⓘ PRTG only stores the result of this sensor if you select WMI only (recommended) as Preferred Data Source in the Windows Compatibility Options^[464] of the parent device.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click ⓘ under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

Scanning Interval

Click ⓘ to interrupt the [inheritance](#).

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** None

Maintenance Window **i** Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i** Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel Unit Configuration

Click  to interrupt the [inheritance](#) ¹⁴².

 Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows [No configurable channels](#).

Channel Unit Configuration

 inherit from  Root

Channel Unit Types 

Channel Type	Unit
Bytes (Bandwidth)	KB 
	kbit 
	/ 
	sec... 
Bytes (Memory)	MB 
Bytes (Disk)	MB 
Bytes (File)	Byte 

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> ▪ Bandwidth ▪ Memory ▪ Disk ▪ File ▪ Custom <p> Custom channel types are only available on sensor level.</p>

Channel List

 Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Avg Bytes Per Read	The average number of bytes per read
Avg Bytes Per Transfer	The average number of bytes per transfer
Avg Bytes Per Write	The average number of bytes per write
Avg Queue	The average number of items in the queue
Avg Read Queue	The average number of items in the read queue
Avg Read Time	The average read time in milliseconds (msec)
Avg Transfer Time	The average transfer time in msec
Avg Write Queue	The average number of items in the write queue
Avg Write Time	The average write time in msec
Current Queue	The current number of items in the queue
Disk IOs	The number of disk input/output (I/O) operations per second

Channel	Description
Disk Read	The disk read speed in bytes per second
Disk Read IOs	The number of disk read I/O operations per second
Disk Read Time %	The disk read time in percent i This channel is the primary channel by default.
Disk Time %	The disk time in percent
Disk Transfer	The disk transfer speed in bytes per second
Disk Write	The disk write speed in bytes per second
Disk Write IOs	The number of disk write I/O operations per second
Disk Write Time %	The disk write time in percent
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Idle Time %	The idle time in percent
Split IOs	The number of split I/O operations per second

Sensor Settings Overview

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#) ⁴⁵⁸¹
- [Additional Sensor Types \(Custom Sensors\)](#) ³⁹⁷²
- [Channel Settings](#) ³⁹⁷⁷
- [Notification Triggers Settings](#) ³⁹⁸⁷

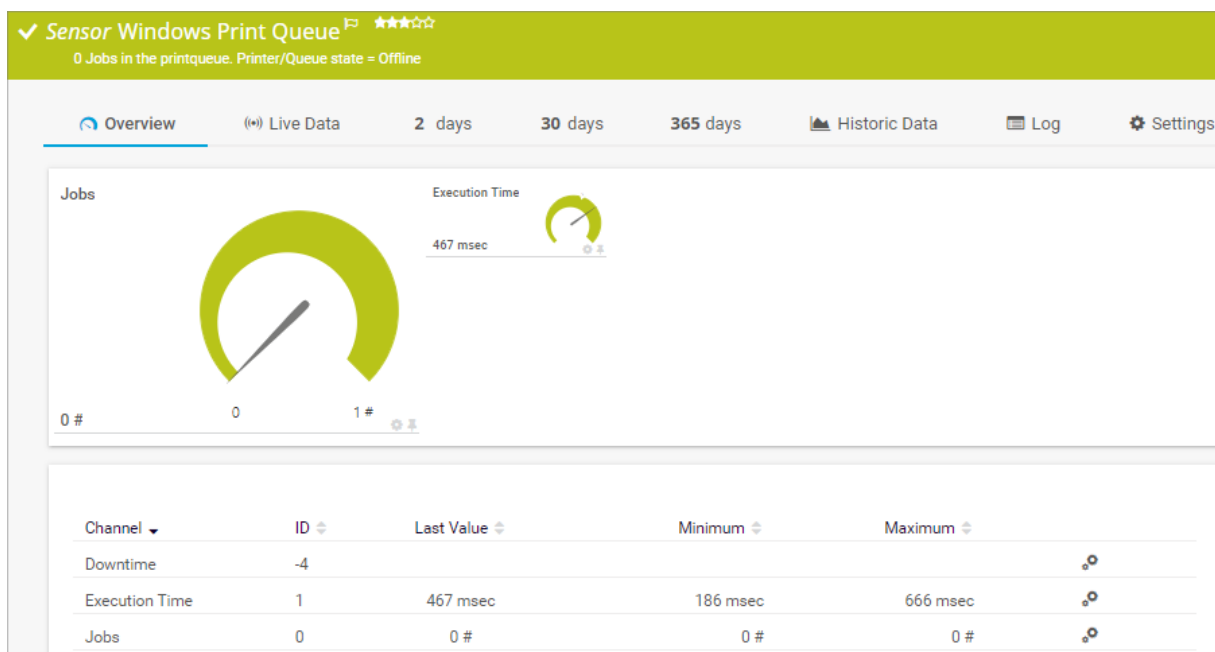

7.8.245 Windows Print Queue Sensor

The Windows Print Queue sensor reads the print queue on the parent device and returns the number of jobs in the print queue. It can monitor queues for all printers that are locally installed.

i You can use this sensor to monitor all print queues on your Windows print server and to retrieve information about all available jobs that are in the queue longer than defined.

i Additionally, this sensor can change to a defined status if there is a printer problem. See section [Sensor Settings](#)³⁵³⁷ for available parameters.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)³⁵⁴⁷.

Windows Print Queue Sensor

Sensor in Other Languages

- Dutch: Windows Print Queue
- French: File d'attente d'impression Windows
- German: Windows Druckwarteschlange
- Japanese: Windows プリントキュー
- Portuguese: Windows Fila de impressão
- Russian: Windows
- Simplified Chinese: Windows 打印队列
- Spanish: Queue de impresión Windows

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor [requires](#) ³⁵³⁶ that the Print Spooler Windows service runs on the target device.
- This sensor requires .NET 4.7.2 or later on the probe system. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.
- This sensor requires [credentials for Windows systems](#) ⁴⁵² in the settings of the parent device.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor supports the IPv6 protocol.
- You can add a [change trigger](#) ⁴¹³⁸ to this sensor to get a notification when the number of jobs in the queue changes.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Windows credentials	<p>This sensor requires credentials for Windows systems ⁴⁵² in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p> If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, the sensor cannot correctly connect.</p>
Print Spooler service	<p>For this sensor to work, the Spooler "Print Spooler" service must be started on the target computer.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Add Sensor

The [Add Sensor](#) ³⁶¹ dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

- i** The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.

Sensor Settings

Setting	Description
Print Queues	<p>Select the print queues that you want to monitor. PRTG creates one sensor for each print queue that you select.</p> <ul style="list-style-type: none"> i If no print queues are available, you see a corresponding message. i If a printer name changes after sensor creation, you need to add the sensor anew. i Add check marks in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A list of tags with 'exampletag' selected, and buttons for 'x' (remove) and '+' (add).
- Priority**: A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ¹⁸³¹, as well as in alarms ²²⁸¹, logs ²³⁷¹, notifications ⁴⁰³¹, reports ⁴⁰⁶⁹, maps ⁴⁰⁹⁶, libraries ⁴⁰⁴⁷, and tickets ²⁴⁰¹.</p>

Setting	Description
	<p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ ptfsensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#)^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking + below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)^[366] if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)^[142].

Scanning Interval

Click  to interrupt the [inheritance](#)^[142].

Scanning Interval

Scanning Interval ⓘ 60 seconds

 inherit from  Root

If a Sensor Query Fails ⓘ Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> You can change the available intervals in the system administration^[4187] on PRTG on premises installations.</p>

Setting	Description
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails. ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup⁴⁴⁸⁵ values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

inherit from Root

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p> To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>

Setting	Description
Maintenance Ends	This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p> To test your dependencies ^[4023], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from Root

User Group Access ⓘ	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups ⁴²¹⁹ that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p> For more details on access rights, see section Access Rights Management ¹⁵⁵.</p>

Channel List

- Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Execution Time	The execution time in milliseconds (msec)
Jobs	The number of jobs in the queue

This channel is the primary channel by default.

Sensor Settings Overview

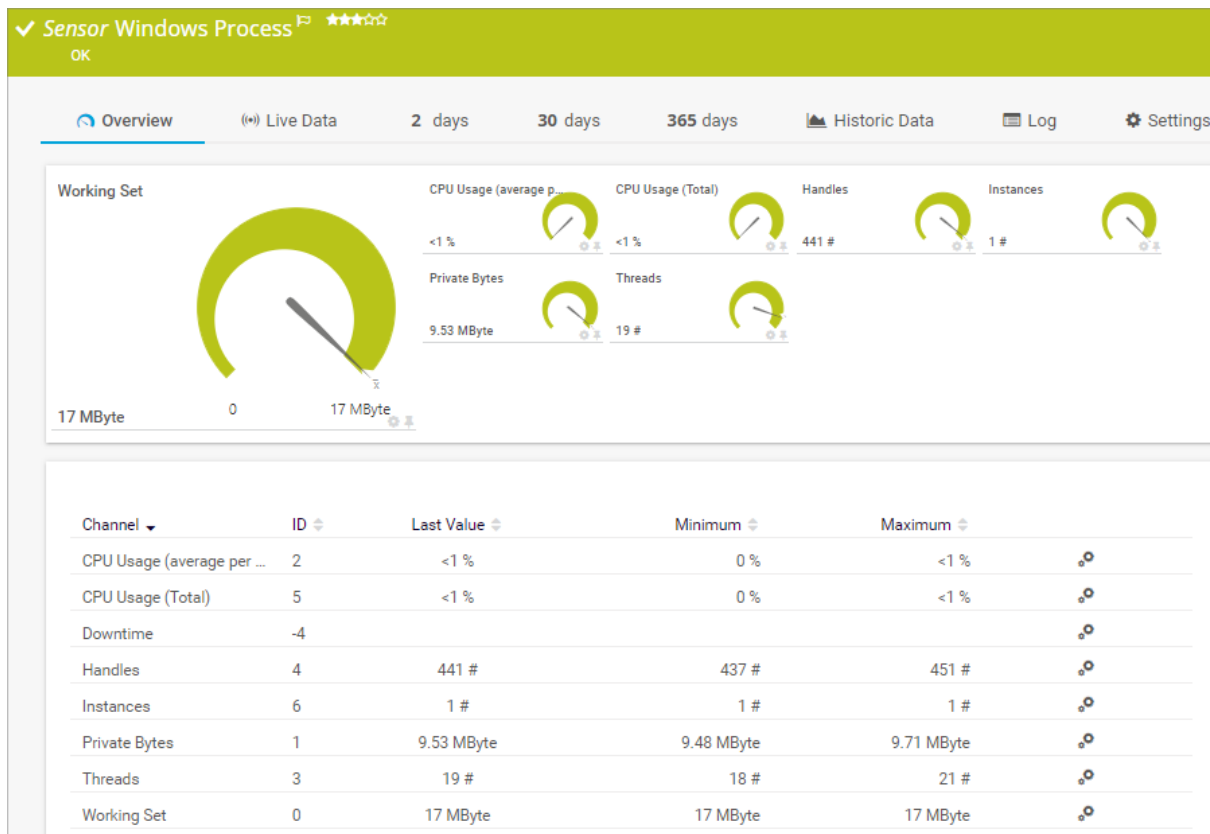

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3967

7.8.246 Windows Process Sensor

The Windows Process sensor monitors a Windows process via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) ^[464] of the parent device.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) ^[3559].

Windows Process Sensor

Sensor in Other Languages

- Dutch: Windows Proces
- French: Processus Windows
- German: Windows Prozess
- Japanese: Windows プロセス
- Portuguese: Windows Processo
- Russian: Windows
- Simplified Chinese: Windows 进程
- Spanish: Proceso de Windows

Remarks

- This sensor has a high performance impact. Use it with care. We recommend that you use no more than 200 sensors of this sensor type on each probe.
- This sensor requires [credentials for Windows systems](#) ^[452] in the settings of the parent device.
- This sensor requires Windows Server 2008 R2 or later on the probe system.
- This sensor requires that the Remote Registry Windows service runs on the target computer.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- The sensor cannot show values above 4 GB for 64-bit processes if you use performance counters.
- This sensor can use a hybrid approach with Windows performance counters and WMI as fallback to query data.
- This sensor supports the IPv6 protocol.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems ^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Hybrid Approach: Performance Counters and WMI

i By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#)^[464] on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

i Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[493] for load balancing.

i For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)^[426].

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog box. It has three main sections: 'Sensor Name' with the value 'Example Name', 'Tags' with a list containing 'exampletag' and a plus sign to add more, and 'Priority' set to 5 stars.

Basic Sensor Settings

Setting	Description
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[183] , as well as in alarms ^[228] , logs ^[237] , notifications ^[4031] , reports ^[4069] , maps ^[4095] , libraries ^[4047] , and tickets ^[240] . i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?
Parent Tags	Shows tags ^[145] that the sensor inherits ^[145] from its parent device ^[140] , parent group ^[139] , and parent probe ^[139] . i This setting is for your information only. You cannot change it.

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited ^[145].</p> <ul style="list-style-type: none"> ❗ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>). ❗ For performance reasons, it can take some minutes until you can filter for new tags that you added. <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> ▪ wmiprocesssensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

Windows Process Monitor

Windows Process Monitor Executable ⓘ

Windows Process Monitor

Setting	Description
Executable	<p>Enter the name of the process that you want to monitor. Provide the name of an executable file without the <code>.exe</code> extension (for example, enter <code>firefox</code> to monitor <code>firefox.exe</code>).</p> <ul style="list-style-type: none"> ❗ The sensor shows the Down status ^[197] if the process is not active on the target device.

Debug Options

Debug Options Result Handling ⓘ Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory⁴⁵²⁶ on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel  Downtime

Graph Type  Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

Scanning Interval

Sensor Settings Overview

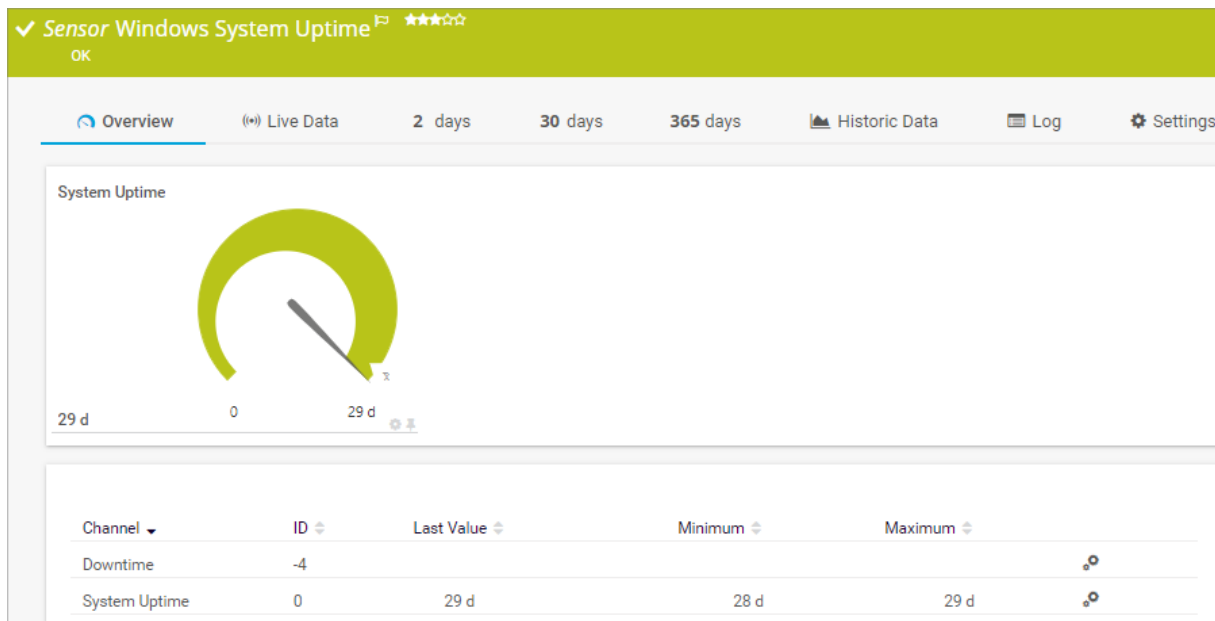

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.247 Windows System Uptime Sensor

The Windows System Uptime sensor monitors the uptime of a Windows system via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#)^[464] of the parent device.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)^[3570].

Windows System Uptime Sensor

Sensor in Other Languages

- Dutch: Windows System Uptime
- French: Disponibilité du système Windows
- German: Windows-Systemlaufzeit
- Japanese: Windows システムアップタイム
- Portuguese: Windows Tempo de ativação do sistema
- Russian: Windows
- Simplified Chinese: Windows 系统正常运行时间
- Spanish: Tiempo disponible Windows

Remarks

- This sensor requires [credentials for Windows systems](#)^[452] in the settings of the parent device.
- This sensor requires Windows Server 2008 R2 or later on the probe system.
- This sensor requires that the Remote Registry Windows service runs on the target computer.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.

- This sensor can use a hybrid approach with Windows performance counters and WMI as fallback to query data.
- This sensor supports the IPv6 protocol.
- This sensor has a high performance impact.

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
Windows credentials	<p>This sensor requires credentials for Windows systems^[452] in the settings of the parent device. Preferably, use Windows domain credentials.</p> <p>i If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target computer. Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Windows version	<p>For this sensor to work with Windows performance counters, make sure that a Windows version 2008 or later is installed on the probe system (on every cluster node, if on a cluster probe).</p> <p>i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry service	<p>For this sensor to work with Windows performance counters, make sure that the Remote Registry Windows service runs on the target computer. If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p>To enable the service, log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>

Hybrid Approach: Performance Counters and WMI

i By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#)^[464] on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

i Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)^[130]. Above this number, consider using multiple [remote probes](#)^[4503] for load balancing.

i For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)^[4286].

Add Sensor

The [Add Sensor](#)^[361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog. It has three main sections: 'Sensor Name' with a text input field containing 'Example Name'; 'Tags' with a text input field containing 'exampletag' and a plus icon; and 'Priority' with a star rating of five stars.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[183], as well as in alarms^[228], logs^[237], notifications^[4031], reports^[4069], maps^[4055], libraries^[4047], and tickets^[240].</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags^[145] that the sensor inherits^[145] from its parent device^[140], parent group^[139], and parent probe^[139].</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited^[145].</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p>

Setting	Description
	<p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p> <ul style="list-style-type: none"> wmiuptimesensor
Priority	<p>Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆) to the highest priority (★★★★★).</p>

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) [446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Debug Options

Debug Options

Result Handling **i**

Discard result
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> Discard result: Do not store the sensor result. Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory [4526] on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval. <p>i In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show a graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

Scanning Interval	
Scanning Interval ⓘ	60 seconds
inherit from Root	
If a Sensor Query Fails ⓘ	Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none"> ▪ 30 seconds ▪ 60 seconds ▪ 5 minutes ▪ 10 minutes ▪ 15 minutes ▪ 30 minutes ▪ 1 hour ▪ 4 hours ▪ 6 hours ▪ 12 hours ▪ 24 hours <p> ⓘ You can change the available intervals in the system administration ⁴¹⁸⁷ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status ¹⁹⁷. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none"> ▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails. ▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status. ▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails. ▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.

Setting	Description
	<ul style="list-style-type: none"> ▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails. ▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails. <p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

inherit from Root

Schedule **i** ▼
None

Maintenance Window **i**
 Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type **i**
 Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00) ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules <small>4170</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency.

Setting	Description
	<p> To test your dependencies ^[4025], select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>
Dependency	<p>This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings ^[446] or in its parent group settings ^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#) ^[142].

Access Rights

inherit from  Root

User Group Access 

User Group	Rights
PRTG Users Group	Full access
RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>■ For more details on access rights, see section Access Rights Management.</p>

Channel List

- ❗ Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
System Uptime	<p>The system uptime</p> <p>❗ This channel is the primary channel by default.</p>

Sensor Settings Overview

For more information about sensor settings, see the following sections:

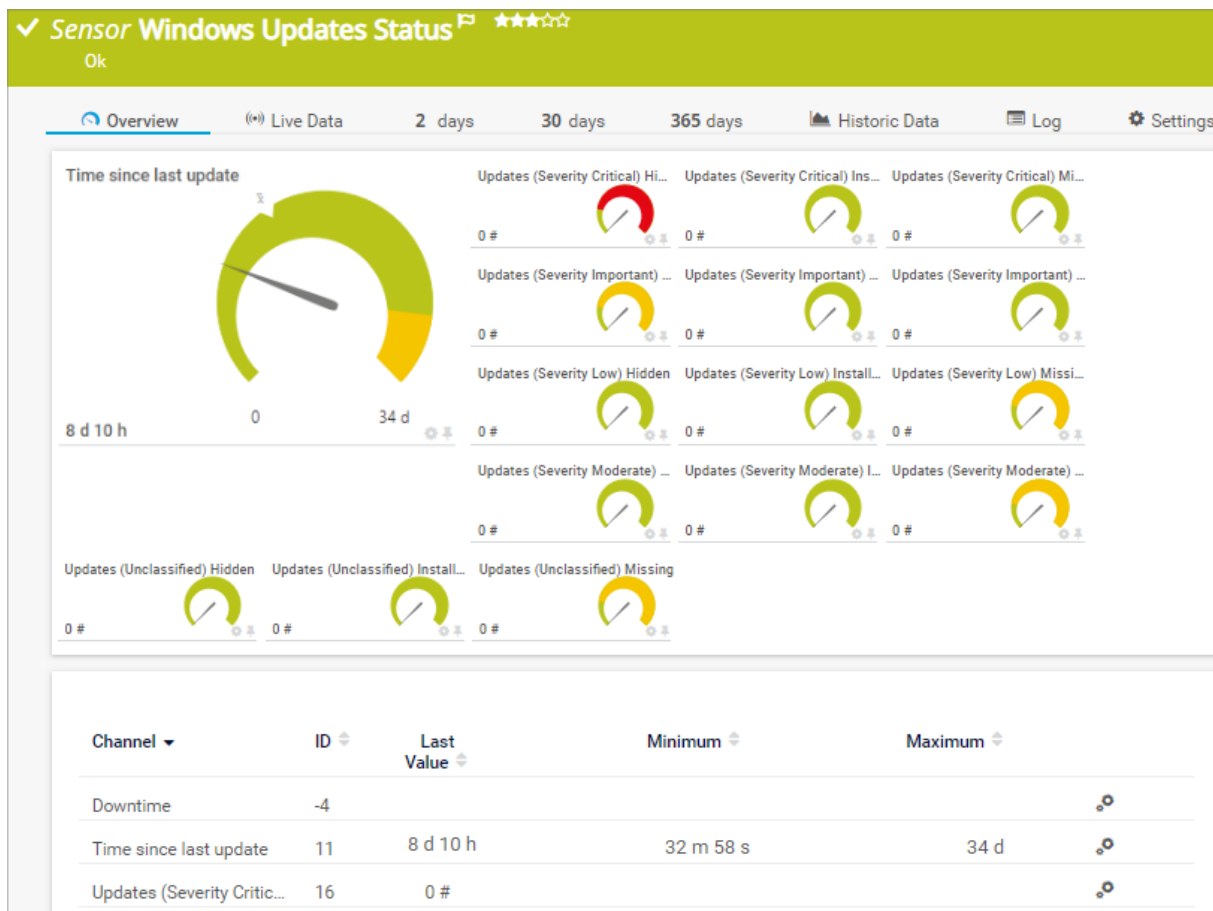

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.248 Windows Updates Status (PowerShell) Sensor

The Windows Updates Status (PowerShell) sensor monitors the status of Windows updates on a computer and counts the available and installed Windows updates that are either from Microsoft or from the local Windows Server Update Services (WSUS) server.

i You can find the updates that the sensor considers in the [Server Manager \(WSUS\)](#) under Roles | Windows Server Update Services | Update Services | Computers | Reports.

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

Windows Updates Status (PowerShell) Sensor

Sensor in Other Languages

- Dutch: Windows Updates Status (PowerShell)
- French: Statut de mises à jour Windows (PowerShell)
- German: Windows Updates Status (PowerShell)
- Japanese: Windows アップデートステータス (PowerShell)
- Portuguese: Status de atualizações do Windows (PowerShell)
- Russian: Windows (PowerShell)
- Simplified Chinese: Windows 更新状态 (PowerShell)

- Spanish: Estados de actualizaciones de Windows (PowerShell)

Remarks

- This sensor has a very high performance impact. Use it with care. We recommend that you use no more than 50 sensors of this sensor type on each probe.
- This sensor [requires](#)³⁵⁷³ that Remote PowerShell is enabled on the target system and PowerShell 3.0 on both the probe system and the target system.
- This sensor requires .NET 4.7.2 or later on the probe system.
- This sensor requires [credentials for Windows systems](#)⁴⁵² in the settings of the parent device.
- We recommend that you set the [scanning interval](#)³⁵⁷⁷ of this sensor to at least 12 hours to limit the load on the server that is monitored.
- This sensor supports the IPv6 protocol.
- The minimum scanning interval for this sensor is 1 hour.
- In certain cases, it might take some time until the sensor receives data for the first time.
- If the sensor cannot determine any values for the Time since last update channel (for example, because the list of updates is empty), it shows the value -1s and changes to the Warning [status](#)¹⁹⁷.
- When monitoring a [Remote Desktop Server \(RDS\) system](#) with the option Roaming Profiles enabled, this sensor creates a temporary user profile folder for each scanning interval. To minimize this effect, we recommend that you set the sensor's scanning interval to at least 7 days.
- See the Knowledge Base: [Where can I find more information about PowerShell sensors?](#)

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Detailed Requirements

Requirement	Description
.NET Framework	<p>This sensor requires the Microsoft .NET Framework. .NET 4.7.2 or later must be installed on the probe system (on every cluster node, if on a cluster probe).</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: Which .NET version does PRTG require?</p>
Remote PowerShell	<p>This sensor uses PowerShell commands. To monitor devices with this sensor, Remote PowerShell access must be enabled on the target computer. Also make sure that you have installed PowerShell 3.0 or later on both the probe system and the target system.</p> <p> If you receive an error message regarding issues with the WinRM connection, make sure that remote commands have been enabled in PowerShell. For more details, see the Knowledge Base: How do I enable and use remote commands in Windows PowerShell?</p>

Add Sensor

The [Add Sensor](#) dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

Basic Sensor Settings

Click the Settings tab of a sensor to change its settings.

The screenshot shows the 'Basic Sensor Settings' dialog box. It has a title bar 'Basic Sensor Settings' in blue. Below the title bar, there are three rows of settings:

- Sensor Name**: A text input field containing 'Example Name'.
- Tags**: A text input field containing 'exampletag' with a blue 'x' icon to the right and a plus sign icon to the far right.
- Priority**: A star rating system with five stars, all of which are filled.

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.</p> <p>i If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: What security features does PRTG include?</p>
Parent Tags	<p>Shows tags that the sensor inherits from its parent device, parent group, and parent probe.</p> <p>i This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically inherited.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).</p> <p>i For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p>The sensor has the following default tags that are automatically predefined in the sensor's settings when you add the sensor:</p>

Setting	Description
	<ul style="list-style-type: none"> ▪ windowsupdatesstatus
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).

i Usually, a sensor connects to the IP Address or DNS Name of the parent device. See the [device settings](#) ^[446] for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

Sensor Specific

Sensor Specific

Port **i** 5985

Port in SPN **i** Exclude port in SPN (default)
 Include port in SPN

Authentication Method **i** Kerberos authentication (default)
 Negotiate authentication

Sensor Specific

Setting	Description
Port	Enter the number of the port to which this sensor connects. Enter an integer value. The default port is 5985.
Port in SPN	<p>Define whether to include the port number in the Service Principal Name (SPN) used for Kerberos authentication, for example, on devices where Microsoft Internet Information Services (IIS) or similar services are installed.</p> <ul style="list-style-type: none"> ▪ Exclude port in SPN (default): Do not include the port number in the SPN. ▪ Include port in SPN: Include the port number in the SPN. <p>i With this option, a client that uses a non-default SPN can authenticate against a remote computer that uses Kerberos authentication.</p>
Authentication Method	Select the authentication method for the connection to the host via PowerShell. Choose between:

Setting	Description
	<ul style="list-style-type: none"> ▪ Kerberos authentication (default): The sensor uses Kerberos authentication. ▪ Negotiate authentication: The sensor uses Negotiate authentication. For more information about Negotiate authentication, see the Knowledge Base: Facing issues with the Windows Update Status (PowerShell) sensor - can you help me?

Debug Options

Debug Options

Result Handling ⓘ

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> ▪ Discard result: Do not store the sensor result. ▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the PRTG data directory on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval. <p> ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Sensor Display

Sensor Display

Primary Channel ⓘ Downtime

Graph Type ⓘ
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel is always displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels are shown for this sensor:</p> <ul style="list-style-type: none"> Show channels independently (default): Show a graph for each channel. Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <p>i You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings³⁹⁷⁷).</p>
Stack Unit	<p>This setting is only visible if you enable Stack channels on top of each other as Graph Type. Select a unit from the list. All channels with this unit are stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all of the following settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)³⁶⁶ if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)¹⁴².

Scanning Interval

Click  to interrupt the [inheritance](#)¹⁴².

i This sensor has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in the [Monitoring](#)⁴¹⁸⁷ settings are not available for this sensor.

Scanning Interval

 inherit from  Root

Scanning Interval **i** 60 seconds

If a Sensor Query Fails **i** Set sensor to warning for 1 interval, then set to down (recommended)

Scanning Interval

Setting	Description
Scanning Interval	<p>Select a scanning interval from the dropdown list. The scanning interval determines the amount of time that the sensor waits between two scans. Choose from:</p> <ul style="list-style-type: none">▪ 30 seconds▪ 60 seconds▪ 5 minutes▪ 10 minutes▪ 15 minutes▪ 30 minutes▪ 1 hour▪ 4 hours▪ 6 hours▪ 12 hours▪ 24 hours <p> You can change the available intervals in the system administration on PRTG on premises installations.</p> <p> The minimum scanning interval for this sensor is 1 hour.</p>
If a Sensor Query Fails	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor query fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down status. This can avoid false alarms if the monitored device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status. Choose from:</p> <ul style="list-style-type: none">▪ Set sensor to down immediately: Set the sensor to the Down status immediately after the first request fails.▪ Set sensor to warning for 1 interval, then set to down (recommended): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.▪ Set sensor to warning for 2 intervals, then set to down: Set the sensor to the Down status only after the third request fails.▪ Set sensor to warning for 3 intervals, then set to down: Set the sensor to the Down status only after the fourth request fails.▪ Set sensor to warning for 4 intervals, then set to down: Set the sensor to the Down status only after the fifth request fails.▪ Set sensor to warning for 5 intervals, then set to down: Set the sensor to the Down status only after the sixth request fails.

Setting	Description
	<p>i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p>i If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p>i If a channel uses lookup values, the sensor immediately shows the Down status. None of the interval options apply.</p>

Schedules, Dependencies, and Maintenance Windows

i You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

Schedules, Dependencies, and Maintenance Windows

Dependencies, schedules, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all subobjects and the inheritance cannot be disabled. Below you can set additional schedules, maintenance windows, or dependencies that will be used in parallel to any inherited setting.

Inherit from Root

Schedule None

Maintenance Window Do not set up a one-time maintenance window
 Set up a one-time maintenance window

Dependency Type Use parent
 Select a sensor
 Master sensor for parent

Schedules, Dependencies, and Maintenance Windows

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week. Choose from:</p> <ul style="list-style-type: none"> ▪ None ▪ Saturdays ▪ Sundays ▪ Weekdays ▪ Weekdays Eight-To-Eight (08:00 - 20:00) ▪ Weekdays Nights (17:00 - 09:00) ▪ Weekdays Nights (20:00 - 08:00) ▪ Weekdays Nine-To-Five (09:00 - 17:00)

Setting	Description
	<ul style="list-style-type: none"> ▪ Weekends <p>i You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section Schedules ⁴¹⁷⁰.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window. During a maintenance window, monitoring stops for the selected object and all child objects. They show the Paused status instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not set up a one-time maintenance window: Do not set up a one-time maintenance window. Monitoring is always active. ▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring. You can define a time span for the pause below. <p>i To terminate an active maintenance window before the defined end date, change the time entry in Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p>This setting is only visible if you enable Set up a one-time maintenance window above. Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object. You can choose from:</p> <ul style="list-style-type: none"> ▪ Use parent: Use the dependency type of the parent object. ▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency. ▪ Master sensor for parent: Make this sensor the master object for its parent device. The sensor influences the behavior of its parent device: If the sensor is in the Down status, the device is paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor is paused if the parent group is paused by another dependency. <p>i To test your dependencies ⁴⁰²³, select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices Dependencies in the main menu bar.</p>

Setting	Description
Dependency	This setting is only visible if you enable Select a sensor above. Click  and use the object selector ^[251] to select a sensor on which the current object will depend.
Dependency Delay (Sec.)	<p>This setting is only visible if you enable Select a sensor above. Define a time span in seconds for the dependency delay.</p> <p>After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer value.</p> <p> This setting is not available if you set this sensor to Use parent or to be the Master sensor for parent. In this case, define delays in the parent device settings^[446] or in its parent group settings^[413].</p>

Access Rights

Click  to interrupt the [inheritance](#)^[142].

Access Rights

 inherit from  Root

User Group Access 	User Group	Rights
	PRTG Users Group	Full access
	RO User Group	Inherited (No access)

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the sensor. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> ▪ Inherited: Inherit the access rights settings of the parent object. ▪ No access: Users in this user group cannot see or edit the sensor. The sensor neither shows up in lists nor in the device tree. ▪ Read access: Users in this group can see the sensor and view its monitoring results. They cannot edit any settings. ▪ Write access: Users in this group can see the sensor, view its monitoring results, and edit its settings. They cannot edit its access rights settings. ▪ Full access: Users in this group can see the sensor, view its monitoring results, edit its settings, and edit its access rights settings. <p>For more details on access rights, see section Access Rights Management.</p>

Channel List

- i** Which channels the sensor actually shows might depend on the monitored device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status in percent.
Time Since Last Update	<p>The time passed since the last update</p> <p>i This channel is the primary channel by default.</p> <p>i The sensor always creates the channel Time Since Last Update. All other channels are optional and only show up if the sensor can retrieve respective data.</p>
Updates (Severity Critical) Hidden	The number of hidden updates with critical severity
Updates (Severity Critical) Installed	The number of installed updates with critical severity
Updates (Severity Critical) Missing	The number of missing updates with critical severity

Channel	Description
Updates (Severity Important) Hidden	The number of hidden updates with important severity
Updates (Severity Important) Installed	The number of installed updates with important severity
Updates (Severity Important) Missing	The number of missing updates with important severity
Updates (Severity Low) Hidden	The number of hidden updates with low severity
Updates (Severity Low) Installed	The number of installed updates with low severity
Updates (Severity Low) Missing	The number of missing updates with low severity
Updates (Severity Moderate) Hidden	The number of hidden updates with moderate severity
Updates (Severity Moderate) Installed	The number of installed updates with moderate severity
Updates (Severity Moderate) Missing	The number of missing updates with moderate severity
Updates (Unclassified) Hidden	The number of hidden updates with unclassified severity
Updates (Unclassified) Installed	The number of installed updates with unclassified severity
Updates (Unclassified) Missing	The number of missing updates with unclassified severity

Sensor Settings Overview

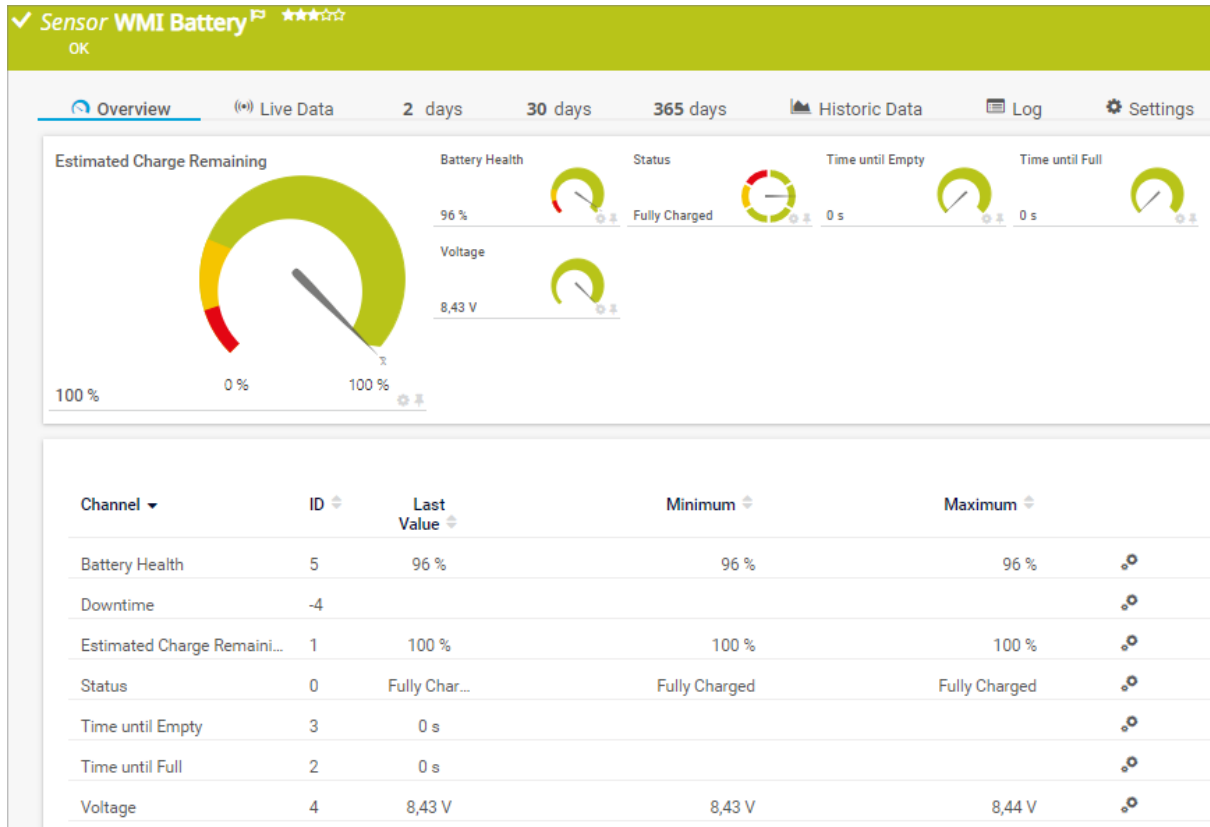

For more information about sensor settings, see the following sections:

- [List of Available Sensor Types](#)  4581
- [Additional Sensor Types \(Custom Sensors\)](#)  3972
- [Channel Settings](#)  3977
- [Notification Triggers Settings](#)  3987

7.8.249 WMI Battery Sensor

The WMI Battery sensor monitors the available capacity and the state of connected batteries of a Windows-based device via Windows Management Instrumentation (WMI).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

WMI Battery Sensor

Sensor in Other Languages

- Dutch: WMI batterij
- French: Batterie de WMI
- German: WMI Batterie
- Japanese: WMI バッテリー
- Portuguese: Bateria WMI
- Russian: WMI
- Simplified Chinese: WMI 电池
- Spanish: Bateria WMI

Remarks

- This sensor has a high performance impact. Try to stay below 200 WMI sensors in total per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.

- This sensor requires [credentials for Windows systems](#) [452] in the settings of the parent device.
- This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- This sensor supports the IPv6 protocol.
- This sensor uses lookups to determine the status values of one or more channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that the channel uses. For details, see section [Define Lookups](#) [448].

☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Add Sensor

The [Add Sensor](#) [361] dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. Therefore, you do not see all settings in this dialog. You can change nearly all settings on the sensor's Settings tab after creation.

ⓘ The settings that you select in the Add Sensor dialog are valid for all sensors that you create when you finish the dialog.
